- **binding** (*str*) -- The binding to edit. This is a combination of the IP address, port, and hostheader. It is in the following format: `ipaddress:port:hostheader`. For example, `*:80:` or `*:80:salt.com`
- **hostheader** (*str*) -- The host header of the binding. Usually the hostname.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*int*) -- The TCP port of the binding.
- **sslflags** (*str*) -- The flags representing certificate type and storage of the binding.

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

The following will set the host header of binding `*:80:` for `site0` to `example.com`

```
salt '*' win_iis.modify_binding site='site0' binding='*:80:' hostheader='example.  
↳com'
```

`salt.modules.win_iis.modify_site`(*name*, *sourcepath=None*, *appool=None*)

Modify a basic website in IIS.

New in version 2017.7.0.

**Parameters**

- **name** (*str*) -- The IIS site name.
- **sourcepath** (*str*) -- The physical path of the IIS site.
- **appool** (*str*) -- The name of the IIS application pool.

**Returns** True if successful, otherwise False.

**Return type** `bool`

---

**Note:** If an application pool is specified, and that application pool does not already exist, it will be created.

---

CLI Example:

```
salt '*' win_iis.modify_site name='My Test Site' sourcepath='c:\new_path' appool=  
↳'NewTestPool'
```

`salt.modules.win_iis.remove_app(name, site)`

Remove an IIS application.

**Parameters**

- **name** (*str*) -- The application name.
- **site** (*str*) -- The IIS site name.

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' win_iis.remove_app name='app0' site='site0'
```

`salt.modules.win_iis.remove_apppool(name)`

Remove an IIS application pool.

**Parameters** **name** (*str*) -- The name of the IIS application pool.

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' win_iis.remove_apppool name='MyTestPool'
```

`salt.modules.win_iis.remove_backup(name)`

Remove an IIS Configuration backup from the System.

New in version 2017.7.0.

**Parameters** **name** (*str*) -- The name of the backup to remove

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' win_iis.remove_backup backup_20170209
```

`salt.modules.win_iis.remove_binding(site, hostheader=u'', ipaddress=u'', port=80)`

Remove an IIS binding.

**Parameters**

- **site** (*str*) -- The IIS site name.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*int*) -- The TCP port of the binding.

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' win_iis.remove_binding site='site0' hostheader='example.com' ipaddress='*'
↳ ' port='80'
```

`salt.modules.win_iis.remove_cert_binding(name, site, hostheader=u'', ipaddress=u'', port=443)`

Remove a certificate from an IIS Web Binding.

New in version 2016.11.0.

---

**Note:** This function only removes the certificate from the web binding. It does not remove the web binding itself.

---

**Parameters**

- **name** (*str*) -- The thumbprint of the certificate.
- **site** (*str*) -- The IIS site name.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*int*) -- The TCP port of the binding.

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```
salt '*' win_iis.remove_cert_binding name='AAA000' site='site0' hostheader=
↳ 'example.com' ipaddress='*' port='443'
```

**salt.modules.win\_iis.remove\_site**(*name*)

Delete a website from IIS.

**Parameters** **name** (*str*) -- The IIS site name.

**Returns** True if successful, otherwise False

**Return type** bool

---

**Note:** This will not remove the application pool used by the site.

---

CLI Example:

```
salt '*' win_iis.remove_site name='My Test Site'
```

**salt.modules.win\_iis.remove\_vdir**(*name, site, app=u''*)

Remove an IIS virtual directory.

**Parameters**

- **name** (*str*) -- The virtual directory name.
- **site** (*str*) -- The IIS site name.
- **app** (*str*) -- The IIS application.

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```
salt '*' win_iis.remove_vdir name='vdir0' site='site0'
```

**salt.modules.win\_iis.restart\_appool**(*name*)

Restart an IIS application pool.

New in version 2016.11.0.

**Parameters** **name** (*str*) -- The name of the IIS application pool.

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```
salt '*' win_iis.restart_appool name='MyTestPool'
```

**salt.modules.win\_iis.restart\_site**(*name*)

Restart a Web Site in IIS.

New in version 2017.7.0.

**Parameters** **name** (*str*) -- The name of the website to restart.

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```
salt '*' win_iis.restart_site name='My Test Site'
```

`salt.modules.win_iis.set_container_setting(name, container, settings)`

Set the value of the setting for an IIS container.

New in version 2016.11.0.

**Parameters**

- **name** (*str*) -- The name of the IIS container.
- **container** (*str*) -- The type of IIS container. The container types are: AppPools, Sites, SslBindings
- **settings** (*dict*) -- A dictionary of the setting names and their values.

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' win_iis.set_container_setting name='MyTestPool' container='AppPools'
settings="{ 'managedPipeLineMode': 'Integrated' }"
```

`salt.modules.win_iis.set_webapp_settings(name, site, settings)`

Configure an IIS application. .. note:

This function only configures existing app.  
Params are case sensitive.

**Parameters**

- **name** (*str*) -- The IIS application.
- **site** (*str*) -- The IIS site name.
- **settings** (*str*) -- A dictionary of the setting names and their values.

**Available settings** `physicalPath`: The physical path of the webapp.

`: applicationPool`: The application pool for the webapp. `: userName`: ``connectAs" user : `password`: ``connectAs" password for user `:return`: A boolean representing whether all changes succeeded. `:rtype`: `bool` ..

`versionadded`:: 2017.7.0 CLI Example: .. code-block:: bash

```
salt '*' win_iis.set_webapp_settings name='app0' site='site0' settings="{ 'physicalPath': `C:site0`,
`appool': `site0`}"
```

`salt.modules.win_iis.start_appool(name)`

Start an IIS application pool.

New in version 2017.7.0.

**Parameters** **name** (*str*) -- The name of the App Pool to start.

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' win_iis.start_appool name='MyTestPool'
```

`salt.modules.win_iis.start_site(name)`

Start a Web Site in IIS.

New in version 2017.7.0.

**Parameters** **name** (*str*) -- The name of the website to start.

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' win_iis.start_site name='My Test Site'
```

`salt.modules.win_iis.stop_appool(name)`

Stop an IIS application pool.

New in version 2017.7.0.

**Parameters** `name` (*str*) -- The name of the App Pool to stop.

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' win_iis.stop_appool name='MyTestPool'
```

`salt.modules.win_iis.stop_site(name)`

Stop a Web Site in IIS.

New in version 2017.7.0.

**Parameters** `name` (*str*) -- The name of the website to stop.

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' win_iis.stop_site name='My Test Site'
```

#### 14.7.422 salt.modules.win\_ip

The networking module for Windows based systems

`salt.modules.win_ip.disable(iface)`

Disable an interface

CLI Example:

```
salt -G 'os_family:Windows' ip.disable 'Local Area Connection #2'
```

`salt.modules.win_ip.enable(iface)`

Enable an interface

CLI Example:

```
salt -G 'os_family:Windows' ip.enable 'Local Area Connection #2'
```

`salt.modules.win_ip.get_all_interfaces()`

Return configs for all interfaces

CLI Example:

```
salt -G 'os_family:Windows' ip.get_all_interfaces
```

`salt.modules.win_ip.get_default_gateway()`

Set DNS source to DHCP on Windows

CLI Example:

```
salt -G 'os_family:Windows' ip.get_default_gateway
```

`salt.modules.win_ip.get_interface(iface)`

Return the configuration of a network interface

CLI Example:

```
salt -G 'os_family:Windows' ip.get_interface 'Local Area Connection'
```

`salt.modules.win_ip.get_subnet_length(mask)`

Convenience function to convert the netmask to the CIDR subnet length

CLI Example:

```
salt -G 'os_family:Windows' ip.get_subnet_length 255.255.255.0
```

`salt.modules.win_ip.is_disabled(iface)`

Returns True if interface is disabled, otherwise False

CLI Example:

```
salt -G 'os_family:Windows' ip.is_disabled 'Local Area Connection #2'
```

`salt.modules.win_ip.is_enabled(iface)`

Returns True if interface is enabled, otherwise False

CLI Example:

```
salt -G 'os_family:Windows' ip.is_enabled 'Local Area Connection #2'
```

`salt.modules.win_ip.raw_interface_configs()`

Return raw configs for all interfaces

CLI Example:

```
salt -G 'os_family:Windows' ip.raw_interface_configs
```

`salt.modules.win_ip.set_dhcp_all(iface)`

Set both IP Address and DNS to DHCP

CLI Example:

```
salt -G 'os_family:Windows' ip.set_dhcp_all 'Local Area Connection'
```

`salt.modules.win_ip.set_dhcp_dns(iface)`

Set DNS source to DHCP on Windows

CLI Example:

```
salt -G 'os_family:Windows' ip.set_dhcp_dns 'Local Area Connection'
```

`salt.modules.win_ip.set_dhcp_ip(iface)`

Set Windows NIC to get IP from DHCP

CLI Example:

```
salt -G 'os_family:Windows' ip.set_dhcp_ip 'Local Area Connection'
```

`salt.modules.win_ip.set_static_dns(iface, *addrs)`

Set static DNS configuration on a Windows NIC

CLI Example:

```
salt -G 'os_family:Windows' ip.set_static_dns 'Local Area Connection' '192.168.1.1'  
salt -G 'os_family:Windows' ip.set_static_dns 'Local Area Connection' '192.168.1.  
↪252' '192.168.1.253'
```

`salt.modules.win_ip.set_static_ip`(*iface*, *addr*, *gateway=None*, *append=False*)

Set static IP configuration on a Windows NIC

**iface** The name of the interface to manage

**addr** IP address with subnet length (ex. 10.1.2.3/24). The `ip.get_subnet_length` function can be used to calculate the subnet length from a netmask.

**gateway** [None] If specified, the default gateway will be set to this value.

**append** [False] If True, this IP address will be added to the interface. Default is False, which overrides any existing configuration for the interface and sets `addr` as the only address on the interface.

CLI Example:

```
salt -G 'os_family:Windows' ip.set_static_ip 'Local Area Connection' 10.1.2.3/24ⓧ  
↪gateway=10.1.2.1  
salt -G 'os_family:Windows' ip.set_static_ip 'Local Area Connection' 10.1.2.4/24ⓧ  
↪append=True
```

## 14.7.423 salt.modules.win\_lgpo module

Manage Local Policy on Windows

This module allows configuring local group policy (i.e. `gpedit.msc`) on a Windows server.

New in version 2016.11.0.

### Administrative Templates

Administrative template policies are dynamically read from ADMX/ADML files on the server.

### Windows Settings

Policies contained in the "Windows Settings" section of the `gpedit.msc` GUI are statically defined in this module. Each policy is configured for the section (Machine/User) in the module's `_policy_info` class. The `_policy_info` class contains a "policies" dict on how the module will configure the policy, where the policy resides in the GUI (for display purposes), data validation data, data transformation data, etc.

### Current known limitations

- At this time, start/shutdown scripts policies are displayed, but are not configurable.
- Not all "Security Settings" policies exist in the `_policy_info` class

#### depends

- pywin32 Python module
- lxml
- uuid
- codecs
- struct

- salt.modules.reg

`salt.modules.win_lgpo.get`(*policy\_class=None, return\_full\_policy\_names=True, hierarchical\_return=False, adml\_language='en-US', return\_not\_configured=False*)

Get a policy value

#### Parameters

- **policy\_class** (*str*) -- Some policies are both user and computer, by default all policies will be pulled, but this can be used to retrieve only a specific policy class User/USER/user = retrieve user policies Machine/MACHINE/machine/Computer/COMPUTER/computer = retrieve machine/computer policies
- **return\_full\_policy\_names** (*bool*) -- True/False to return the policy name as it is seen in the `gpedit.msc` GUI or to only return the policy key/id.
- **hierarchical\_return** (*bool*) -- True/False to return the policy data in the hierarchy as seen in the `gpedit.msc` GUI. The default of False will return data split only into User/Computer configuration sections
- **adml\_language** (*str*) -- The ADML language to use for processing display/descriptive names and enumeration values of ADMX template data, defaults to en-US
- **return\_not\_configured** (*bool*) -- Include Administrative Template policies that are 'Not Configured' in the return data

**Returns** A dictionary containing the policy values for the specified class

**Return type** `dict`

CLI Example:

```
salt '*' lgpo.get machine return_full_policy_names=True
```

`salt.modules.win_lgpo.get_policy_info`(*policy\_name, policy\_class, adml\_language='en-US'*)

Returns information about a specified policy

#### Parameters

- **policy\_name** (*str*) -- The name of the policy to lookup
- **policy\_class** (*str*) -- The class of policy, i.e. machine, user, both
- **adml\_language** (*str*) -- The ADML language to use for Administrative Template data lookup

**Returns** Information about the specified policy

**Return type** `dict`

CLI Example:

```
salt '*' lgpo.get_policy_info 'Maximum password age' machine
```

`salt.modules.win_lgpo.set`(*computer\_policy=None, user\_policy=None, cumulative\_rights\_assignments=True, adml\_language='en-US'*)

Set a local server policy.

#### Parameters

- **computer\_policy** (*dict*) -- A dictionary of ``policyname: value`` pairs of computer policies to set. `value` should be how it is displayed in the `gpedit` GUI, i.e. if a setting can be 'Enabled'/'Disabled', then that should be passed

Administrative Template data may require dicts within dicts, to specify each element of the Administrative Template policy. Administrative Templates policies are always cumulative.

Policy names can be specified in a number of ways based on the type of policy:

Windows Settings Policies:

These policies can be specified using the GUI display name or the key name from the `_policy_info` class in this module.

The GUI display name is also contained in the `_policy_info` class in this module.

#### Administrative Template Policies:

These can be specified using the policy name as displayed in the GUI (case sensitive). Some policies have the same name, but a different location (for example, ``Access data sources across domains``). These can be differentiated by the ``path`` in the GUI (for example, ``Windows ComponentsInternet ExplorerInternet Control PanelSecurity PageInternet ZoneAccess data sources across domains``).

Additionally, policies can be specified using the ``name`` and ``id`` attributes from the ADMX files.

For Administrative Templates that have policy elements, each element can be specified using the text string as seen in the GUI or using the ID attribute from the ADMX file. Due to the way some of the GUI text is laid out, some policy element names could include descriptive text that appears before the policy element in the GUI.

Use the `get_policy_info` function for the policy name to view the element ID/names that the module will accept.

- **user\_policy** (*dict*) -- The same setup as the `computer_policy`, except with data to configure the local user policy.
- **cumulative\_rights\_assignments** (*bool*) -- Determine how user rights assignment policies are configured.

If True, user right assignment specifications are simply added to the existing policy

If False, only the users specified will get the right (any existing will have the right revoked)

- **adml\_language** (*str*) -- The language files to use for looking up Administrative Template policy data (i.e. how the policy is displayed in the GUI). Defaults to `'en-US'` (U.S. English).

**Returns** True is successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' lgpo.set computer_policy="{ 'LockoutDuration': 2, 'RestrictAnonymous':
↳ 'Enabled', 'AuditProcessTracking': 'Success, Failure' }"
```

```
salt.modules.win_lgpo.set_computer_policy(name, setting, cumulative_rights_assignments=True, adml_language='en-US')
```

Set a single computer policy

#### Parameters

- **name** (*str*) -- The name of the policy to configure
- **setting** (*str*) -- The setting to configure the named policy with
- **cumulative\_rights\_assignments** (*bool*) -- Determine how user rights assignment policies are configured. If True, user right assignment specifications are simply added to the existing policy. If False, only the users specified will get the right (any existing will have the right revoked)
- **adml\_language** (*str*) -- The language files to use for looking up Administrative Template policy data (i.e. how the policy is displayed in the GUI). Defaults to `'en-US'` (U.S. English).

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' lgpo.set_computer_policy LockoutDuration 1440
```

`salt.modules.win_lgpo.set_user_policy`(*name*, *setting*, *adml\_language*='en-US')

Set a single user policy

**Parameters**

- **name** (*str*) -- The name of the policy to configure
- **setting** (*str*) -- The setting to configure the named policy with
- **adml\_language** (*str*) -- The language files to use for looking up Administrative Template policy data (i.e. how the policy is displayed in the GUI). Defaults to 'en-US' (U.S. English).

**Returns** True if successful, Otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' lgpo.set_user_policy "Control Panel\Display\Disable the Display Control
↳Panel" Enabled
```

#### 14.7.424 salt.modules.win\_license module

This module allows you to manage windows licensing via slmgr.vbs

```
salt '*' license.install XXXXX-XXXXX-XXXXX-XXXXX-XXXXX
```

`salt.modules.win_license.activate`()

Attempt to activate the current machine via Windows Activation

CLI Example:

```
salt '*' license.activate
```

`salt.modules.win_license.info`()

Return information about the license, if the license is not correctly activated this will return None.

CLI Example:

```
salt '*' license.info
```

`salt.modules.win_license.install`(*product\_key*)

Install the given product key

CLI Example:

```
salt '*' license.install XXXXX-XXXXX-XXXXX-XXXXX-XXXXX
```

`salt.modules.win_license.installed`(*product\_key*)

Check to see if the product key is already installed.

**Note:** This is not 100% accurate as we can only see the last 5 digits of the license.

CLI Example:

```
salt '*' license.installed XXXXX-XXXXX-XXXXX-XXXXX-XXXXX
```

`salt.modules.win_license.licensed`()

Return true if the current machine is licensed correctly

CLI Example:

```
salt '*' license.licensed
```

`salt.modules.win_license.uninstall()`

Uninstall the current product key

CLI Example:

```
salt '*' license.uninstall
```

## 14.7.425 salt.modules.win\_network

Module for gathering and managing network information

`salt.modules.win_network.connect(host, port=None, **kwargs)`

Test connectivity to a host using a particular port from the minion.

New in version 2016.3.0.

CLI Example:

```
salt '*' network.connect archlinux.org 80
salt '*' network.connect archlinux.org 80 timeout=3
salt '*' network.connect archlinux.org 80 timeout=3 family=ipv4
salt '*' network.connect google-public-dns-a.google.com port=53 proto=udp timeout=3
```

`salt.modules.win_network.dig(host)`

Performs a DNS lookup with dig

Note: dig must be installed on the Windows minion

CLI Example:

```
salt '*' network.dig archlinux.org
```

`salt.modules.win_network.get_route(ip)`

Return routing information for given destination ip

New in version 2016.11.5.

CLI Example:

```
salt '*' network.get_route 10.10.10.10
```

`salt.modules.win_network.hw_addr(iface)`

Return the hardware address (a.k.a. MAC address) for a given interface

CLI Example:

```
salt '*' network.hw_addr 'Wireless Connection #1'
```

`salt.modules.win_network.hwaddr(iface)`

This function is an alias of `hw_addr`.

Return the hardware address (a.k.a. MAC address) for a given interface

CLI Example:

```
salt '*' network.hw_addr 'Wireless Connection #1'
```

`salt.modules.win_network.in_subnet(cidr)`  
Returns True if host is within specified subnet, otherwise False

CLI Example:

```
salt '*' network.in_subnet 10.0.0.0/16
```

`salt.modules.win_network.interfaces()`  
Return a dictionary of information about all the interfaces on the minion

CLI Example:

```
salt '*' network.interfaces
```

`salt.modules.win_network.interfaces_names()`  
Return a list of all the interfaces names

CLI Example:

```
salt '*' network.interfaces_names
```

`salt.modules.win_network.ip_addrs(interface=None, include_loopback=False)`  
Returns a list of IPv4 addresses assigned to the host. 127.0.0.1 is ignored, unless `include_loopback=True` is indicated. If `interface` is provided, then only IP addresses from that interface will be returned.

CLI Example:

```
salt '*' network.ip_addrs
```

`salt.modules.win_network.ip_addrs6(interface=None, include_loopback=False)`  
Returns a list of IPv6 addresses assigned to the host. ::1 is ignored, unless `include_loopback=True` is indicated. If `interface` is provided, then only IP addresses from that interface will be returned.

CLI Example:

```
salt '*' network.ip_addrs6
```

`salt.modules.win_network.ipaddrs(interface=None, include_loopback=False)`  
This function is an alias of `ip_addrs`.  
Returns a list of IPv4 addresses assigned to the host. 127.0.0.1 is ignored, unless `include_loopback=True` is indicated. If `interface` is provided, then only IP addresses from that interface will be returned.

CLI Example:

```
salt '*' network.ip_addrs
```

`salt.modules.win_network.ipaddrs6(interface=None, include_loopback=False)`  
This function is an alias of `ip_addrs6`.  
Returns a list of IPv6 addresses assigned to the host. ::1 is ignored, unless `include_loopback=True` is indicated. If `interface` is provided, then only IP addresses from that interface will be returned.

CLI Example:

```
salt '*' network.ip_addrs6
```

`salt.modules.win_network.netstat()`  
Return information on open ports and states

CLI Example:

```
salt '*' network.netstat
```

`salt.modules.win_network.nslookup(host)`  
Query DNS for information about a domain or ip address

CLI Example:

```
salt '*' network.nslookup archlinux.org
```

`salt.modules.win_network.ping(host, timeout=False, return_boolean=False)`  
Performs a ping to a host

CLI Example:

```
salt '*' network.ping archlinux.org
```

New in version 2016.11.0.

Return a True or False instead of ping output.

```
salt '*' network.ping archlinux.org return_boolean=True
```

Set the time to wait for a response in seconds.

```
salt '*' network.ping archlinux.org timeout=3
```

`salt.modules.win_network.subnets()`  
Returns a list of subnets to which the host belongs

CLI Example:

```
salt '*' network.subnets
```

`salt.modules.win_network.traceroute(host)`  
Performs a traceroute to a 3rd party host

CLI Example:

```
salt '*' network.traceroute archlinux.org
```

#### 14.7.426 salt.modules.win\_ntp

Management of NTP servers on Windows

New in version 2014.1.0.

`salt.modules.win_ntp.get_servers()`  
Get list of configured NTP servers

CLI Example:

```
salt '*' ntp.get_servers
```

`salt.modules.win_ntp.set_servers(*servers)`

Set Windows to use a list of NTP servers

CLI Example:

```
salt '*' ntp.set_servers 'pool.ntp.org' 'us.pool.ntp.org'
```

#### 14.7.427 salt.modules.win\_path

Manage the Windows System PATH

Note that not all Windows applications will rehash the PATH environment variable, Only the ones that listen to the WM\_SETTINGCHANGE message <http://support.microsoft.com/kb/104011>

`salt.modules.win_path.add(path, index=0)`

Add the directory to the SYSTEM path in the index location

**Returns** boolean True if successful, False if unsuccessful

CLI Example:

```
# Will add to the beginning of the path
salt '*' win_path.add 'c:\python27' 0

# Will add to the end of the path
salt '*' win_path.add 'c:\python27' index='-1'
```

`salt.modules.win_path.exists(path)`

Check if the directory is configured in the SYSTEM path Case-insensitive and ignores trailing backslash

**Returns** boolean True if path exists, False if not

CLI Example:

```
salt '*' win_path.exists 'c:\python27'
salt '*' win_path.exists 'c:\python27\'
salt '*' win_path.exists 'C:\pyThon27'
```

`salt.modules.win_path.get_path()`

Returns a list of items in the SYSTEM path

CLI Example:

```
salt '*' win_path.get_path
```

`salt.modules.win_path.rehash()`

Send a WM\_SETTINGCHANGE Broadcast to Windows to refresh the Environment variables

CLI Example:

```
... code-block:: bash
salt '*' win_path.rehash
```

`salt.modules.win_path.remove(path)`

Remove the directory from the SYSTEM path

**Returns** boolean True if successful, False if unsuccessful

CLI Example:

```
# Will remove C:\Python27 from the path
salt '*' win_path.remove 'c:\\python27'
```

## 14.7.428 salt.modules.win\_pkg

A module to manage software on Windows

---

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to ``pkg.install' is not available`), see [here](#).

---

The following functions require the existence of a *windows repository* metadata DB, typically created by running `pkg.refresh_db`:

- `pkg.get_repo_data`
- `pkg.install`
- `pkg.latest_version`
- `pkg.list_available`
- `pkg.list_pkgs`
- `pkg.list_upgrades`
- `pkg.remove`

If a metadata DB does not already exist and one of these functions is run, then one will be created from the repo SLS files that are present.

As the creation of this metadata can take some time, the `winrepo_cache_expire_min` minion config option can be used to suppress refreshes when the metadata is less than a given number of seconds old.

`salt.modules.win_pkg.compare_versions(ver1='u', oper='u'==, ver2='u')`

Compare software package versions

Parameters

- **ver1** (*str*) -- A software version to compare
- **oper** (*str*) -- The operand to use to compare
- **ver2** (*str*) -- A software version to compare

Returns True if the comparison is valid, otherwise False

Return type `bool`

CLI Example:

```
salt '*' pkg.compare_versions 1.2 >= 1.3
```

`salt.modules.win_pkg.genrepo(**kwargs)`

Generate package metadata db based on files within the `winrepo_source_dir`

Kwargs:

`saltenv` (*str*): Salt environment. Default: `base`

**verbose** (*bool*): Return verbose data structure which includes ``success_list'`, a list of all sls files and the package names contained within. Default ``False'`

**failhard** (*bool*): If True, an error will be raised if any repo SLS files failed to process. If False, no error will be raised, and a dictionary containing the full results will be returned.

Returns A dictionary of the results of the command

Return type `dict`

CLI Example:

```
salt-run pkg.genrepo
salt -G 'os:windows' pkg.genrepo verbose=true failhard=false
salt -G 'os:windows' pkg.genrepo saltenv=base
```

`salt.modules.win_pkg.get_repo_data(saltenv='base')`

Returns the existing package metadata db. Will create it, if it does not exist, however will not refresh it.

**Parameters** `saltenv` (*str*) -- Salt environment. Default base

**Returns** A dict containing contents of metadata db.

**Return type** `dict`

CLI Example:

```
salt '*' pkg.get_repo_data
```

`salt.modules.win_pkg.install(name=None, refresh=False, pkgs=None, **kwargs)`

Install the passed package(s) on the system using winrepo

**Parameters**

- **name** (*str*) -- The name of a single package, or a comma-separated list of packages to install. (no spaces after the commas)
- **refresh** (*bool*) -- Boolean value representing whether or not to refresh the winrepo db
- **pkgs** (*list*) -- A list of packages to install from a software repository. All packages listed under `pkgs` will be installed via a single command.

You can specify a version by passing the item as a dict:

CLI Example:

```
# will install the latest version of foo and bar
salt '*' pkg.install pkgs='["foo", "bar"]'

# will install the latest version of foo and version 1.2.3 of bar
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3"}]'
```

**Kwargs:**

**version** (*str*): The specific version to install. If omitted, the latest version will be installed. Recommend for use when installing a single package.

If passed with a list of packages in the `pkgs` parameter, the version will be ignored.

CLI Example:

```
# Version is ignored
salt '*' pkg.install pkgs="['foo', 'bar']" version=1.2.3
```

If passed with a comma separated list in the `name` parameter, the version will apply to all packages in the list.

CLI Example:

```
# Version 1.2.3 will apply to packages foo and bar
salt '*' pkg.install foo,bar version=1.2.3
```

**extra\_install\_flags** (*str*): Additional install flags that will be appended to the `install_flags` defined in the software definition file. Only applies when single package is passed.

**saltenv** (*str*): Salt environment. Default `'base'`

**report\_reboot\_exit\_codes** (*bool*): If the installer exits with a recognized exit code indicating that a reboot is required, the module function

`win_system.set_reboot_required_witnessed`

will be called, preserving the knowledge of this event for the remainder of the current boot session. For the time being, 3010 is the only recognized exit code. The value of this param defaults to True.

New in version 2016.11.0.

**Returns**

Return a dict containing the new package names and versions

If the package is installed by `pkg.install`:

```
{<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

If the package is already installed:

```
{<package>': {'current': '<current-version>'}}
```

Return type `dict`

The following example will refresh the winrepo and install a single package, 7zip.

CLI Example:

```
salt '*' pkg.install 7zip refresh=True
```

CLI Example:

```
salt '*' pkg.install 7zip
salt '*' pkg.install 7zip,filezilla
salt '*' pkg.install pkgs='["7zip","filezilla"]'
```

WinRepo Definition File Examples:

The following example demonstrates the use of `cache_file`. This would be used if you have multiple installers in the same directory that use the same `install.ini` file and you don't want to download the additional installers.

```
ntp:
  4.2.8:
    installer: 'salt://win/repo/ntp/ntp-4.2.8-win32-setup.exe'
    full_name: Meinberg NTP Windows Client
    locale: en_US
    reboot: False
    cache_file: 'salt://win/repo/ntp/install.ini'
    install_flags: '/USEFILE=C:
↪\salt\var\cache\salt\minion\files\base\win\repo\ntp\install.ini'
    uninstaller: 'NTP/uninst.exe'
```

The following example demonstrates the use of `cache_dir`. It assumes a file named `install.ini` resides in the same directory as the installer.

```
ntp:
  4.2.8:
    installer: 'salt://win/repo/ntp/ntp-4.2.8-win32-setup.exe'
    full_name: Meinberg NTP Windows Client
    locale: en_US
    reboot: False
    cache_dir: True
    install_flags: '/USEFILE=C:
↪\salt\var\cache\salt\minion\files\base\win\repo\ntp\install.ini'
    uninstaller: 'NTP/uninst.exe'
```

`salt.modules.win_pkg.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

Parameters **names** (*str*) -- A single or multiple names to lookup

Kwargs: saltenv (str): Salt environment. Default base refresh (bool): Refresh package metadata. Default True

Returns A dictionary of packages with the latest version available

Return type `dict`

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.win_pkg.list_available(*names, **kwargs)`

Return a list of available versions of the specified package.

Parameters **names** (*str*) -- One or more package names

Kwargs:

saltenv (str): The salt environment to use. Default base.

refresh (bool): Refresh package metadata. Default True.

return\_dict\_always (bool): Default False dict when a single package name is queried.

Returns The package name with its available versions

Return type `dict`

```
{'<package name>': ['<version>', '<version>', ]}
```

CLI Example:

```
salt '*' pkg.list_available <package name> return_dict_always=True
salt '*' pkg.list_available <package name01> <package name02>
```

`salt.modules.win_pkg.list_pkgs(versions_as_list=False, **kwargs)`

List the packages currently installed

Parameters **version\_as\_list** (*bool*) -- Returns the versions as a list

Kwargs: saltenv (str): The salt environment to use. Default base. refresh (bool): Refresh package metadata. Default ``False``.

Returns A dictionary of installed software with versions installed

Return type `dict`

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

`salt.modules.win_pkg.list_upgrades(refresh=True, **kwargs)`

List all available package upgrades on this system

Parameters **refresh** (*bool*) -- Refresh package metadata. Default True

Kwargs: saltenv (str): Salt environment. Default base

Returns A dictionary of packages with available upgrades

Return type `dict`

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.win_pkg.purge` (*name=None, pkgs=None, version=None, \*\*kwargs*)

Package purges are not supported, this function is identical to `remove()`.

New in version 0.16.0.

#### Parameters

- **name** (*str*) -- The name of the package to be deleted.
- **version** (*str*) -- The version of the package to be deleted. If this option is used in combination with the `pkgs` option below, then this version will be applied to all targeted packages.
- **pkgs** (*list*) -- A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

**Kwargs:** `saltenv` (*str*): Salt environment. `base refresh` (*bool*): Refresh package metadata. Default `False`

**Returns** A dict containing the changes.

**Return type** `dict`

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs=['foo', 'bar']
```

`salt.modules.win_pkg.refresh_db` (*\*\*kwargs*)

Fetches metadata files and calls `pkg.genrepo` to compile updated repository metadata.

**Kwargs:**

`saltenv` (*str*): Salt environment. Default: `base`

**verbose** (*bool*): Return verbose data structure which includes `'success_list'`, a list of all sls files and the package names contained within. Default `'False'`

**failhard** (*bool*): If `True`, an error will be raised if any repo SLS files failed to process. If `False`, no error will be raised, and a dictionary containing the full results will be returned.

**Returns** A dictionary containing the results of the database refresh.

**Return type** `dict`

**Warning:** When calling this command from a state using `module.run` be sure to pass `failhard: False`. Otherwise the state will report failure if it encounters a bad software definition file.

CLI Example:

```
salt '*' pkg.refresh_db
salt '*' pkg.refresh_db saltenv=base
```

`salt.modules.win_pkg.remove` (*name=None, pkgs=None, version=None, \*\*kwargs*)

Remove the passed package(s) from the system using `winrepo`

New in version 0.16.0.

#### Parameters

- **name** (*str*) -- The name(s) of the package(s) to be uninstalled. Can be a single package or a comma delimited list of packages, no spaces.
- **version** (*str*) -- The version of the package to be uninstalled. If this option is used to to uninstall multiple packages, then this version will be applied to all tar-

geted packages. Recommended using only when uninstalling a single package. If this parameter is omitted, the latest version will be uninstalled.

- **pkgs** (*list*) -- A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

**Kwargs:** saltenv (str): Salt environment. Default base refresh (bool): Refresh package metadata. Default False

#### Returns

Returns a dict containing the changes.

If the package is removed by pkg.remove:

```
{<package>: {`old`: `<old-version>`, `new`: `<new-version>`}}
```

If the package is already uninstalled:

```
{<package>: {`current`: `not installed`}}
```

**Return type** dict

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

**salt.modules.win\_pkg.upgrade** (*\*\*kwargs*)

Upgrade all software. Currently not implemented

**Kwargs:** saltenv (str): The salt environment to use. Default base. refresh (bool): Refresh package metadata. Default True.

---

**Note:** This feature is not yet implemented for Windows.

---

**Returns** Empty dict, until implemented

**Return type** dict

CLI Example:

```
salt '*' pkg.upgrade
```

**salt.modules.win\_pkg.upgrade\_available** (*name, \*\*kwargs*)

Check whether or not an upgrade is available for a given package

**Parameters** **name** (*str*) -- The name of a single package

**Kwargs:** refresh (bool): Refresh package metadata. Default True saltenv (str): The salt environment. Default base

**Returns** True if new version available, otherwise False

**Return type** bool

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

**salt.modules.win\_pkg.version** (*\*names, \*\*kwargs*)

Returns a version if the package is installed, else returns an empty string

**Parameters** **name** (*str*) -- One or more package names

**Kwargs:** saltenv (str): The salt environment to use. Default base. refresh (bool): Refresh package metadata. Default False.

**Returns** The package name(s) with the installed versions.

Return type `dict`

```
{'<package name>': ['<version>', '<version>', ]}
```

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package name01> <package name02>
```

### 14.7.429 salt.modules.win\_pki module

Microsoft certificate management via the PKI Client PowerShell module. <https://technet.microsoft.com/en-us/itpro/powershell/windows/pkiclient/pkiclient>

The PKI Client PowerShell module is only available on Windows 8+ and Windows Server 2012+. [https://technet.microsoft.com/en-us/library/hh848636\(v=wps.620\).aspx](https://technet.microsoft.com/en-us/library/hh848636(v=wps.620).aspx)

**platform** Windows

**depends**

- PowerShell 4
- PKI Client Module (Windows 8+ / Windows Server 2012+)

New in version 2016.11.0.

`salt.modules.win_pki.export_cert`(*name*, *thumbprint*, *cert\_format*='cer', *context*='LocalMachine', *store*='My', *password*='')

Export the certificate to a file from the given certificate store.

**Parameters**

- **name** (*str*) -- The destination path for the exported certificate file.
- **thumbprint** (*str*) -- The thumbprint value of the target certificate.
- **cert\_format** (*str*) -- The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.
- **context** (*str*) -- The name of the certificate store location context.
- **store** (*str*) -- The name of the certificate store.
- **password** (*str*) -- The password of the certificate. Only applicable to pfx format. Note that if used interactively, the password will be seen by all minions. To protect the password, use a state and get the password from pillar.

**Returns** A boolean representing whether all changes succeeded.

**Return type** `bool`

CLI Example:

```
salt '*' win_pki.export_cert name='C:\certs\example.cer' thumbprint='AAA000'
```

`salt.modules.win_pki.get_cert_file`(*name*, *cert\_format*='cer', *password*='')

Get the details of the certificate file.

**Parameters**

- **name** (*str*) -- The filesystem path of the certificate file.
- **cert\_format** (*str*) -- The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.
- **password** (*str*) -- The password of the certificate. Only applicable to pfx format. Note that if used interactively, the password will be seen by all minions. To protect the password, use a state and get the password from pillar.

**Returns** A dictionary of the certificate thumbprints and properties.

**Return type** `dict`

CLI Example:

```
salt '*' win_pki.get_cert_file name='C:\certs\example.cer'
```

`salt.modules.win_pki.get_certs(context='LocalMachine', store='My')`

Get the available certificates in the given store.

Parameters

- **context** (*str*) -- The name of the certificate store location context.
- **store** (*str*) -- The name of the certificate store.

Returns A dictionary of the certificate thumbprints and properties.

Return type `dict`

CLI Example:

```
salt '*' win_pki.get_certs
```

`salt.modules.win_pki.get_stores()`

Get the certificate location contexts and their corresponding stores.

Returns A dictionary of the certificate location contexts and stores.

Return type `dict`

CLI Example:

```
salt '*' win_pki.get_stores
```

`salt.modules.win_pki.import_cert(name, cert_format='cer', context='LocalMachine', store='My', exportable=True, password='', saltenv='base')`

Import the certificate file into the given certificate store.

Parameters

- **name** (*str*) -- The path of the certificate file to import.
- **cert\_format** (*str*) -- The certificate format. Specify `cer` for X.509, or `pfx` for PKCS #12.
- **context** (*str*) -- The name of the certificate store location context.
- **store** (*str*) -- The name of the certificate store.
- **exportable** (*bool*) -- Mark the certificate as exportable. Only applicable to pfx format.
- **password** (*str*) -- The password of the certificate. Only applicable to pfx format. Note that if used interactively, the password will be seen by all minions. To protect the password, use a state and get the password from pillar.
- **saltenv** (*str*) -- The environment the file resides in.

Returns A boolean representing whether all changes succeeded.

Return type `bool`

CLI Example:

```
salt '*' win_pki.import_cert name='salt://cert.cer'
```

`salt.modules.win_pki.remove_cert(thumbprint, context='LocalMachine', store='My')`

Remove the certificate from the given certificate store.

Parameters

- **thumbprint** (*str*) -- The thumbprint value of the target certificate.
- **context** (*str*) -- The name of the certificate store location context.
- **store** (*str*) -- The name of the certificate store.

Returns A boolean representing whether all changes succeeded.

Return type `bool`

CLI Example:

```
salt '*' win_pki.remove_cert thumbprint='AAA000'
```

```
salt.modules.win_pki.test_cert(thumbprint, context='LocalMachine', store='My', untrusted_root=False, dns_name='', eku='')
```

Check the certificate for validity.

#### Parameters

- **thumbprint** (*str*) -- The thumbprint value of the target certificate.
- **context** (*str*) -- The name of the certificate store location context.
- **store** (*str*) -- The name of the certificate store.
- **untrusted\_root** (*bool*) -- Whether the root certificate is required to be trusted in chain building.
- **dns\_name** (*str*) -- The DNS name to verify as valid for the certificate.
- **eku** (*str*) -- The enhanced key usage object identifiers to verify for the certificate chain.

**Returns** A boolean representing whether the certificate was considered valid.

**Return type** `bool`

CLI Example:

```
salt '*' win_pki.test_cert thumbprint='AAA000' dns_name='example.test'
```

### 14.7.430 salt.modules.win\_powercfg

This module allows you to control the power settings of a windows minion via powercfg.

New in version 2015.8.0.

```
salt '*' powercfg.set_monitor_timeout 0 power=dc
salt '*' powercfg.set_disk_timeout 120 power=ac
```

```
salt.modules.win_powercfg.get_disk_timeout(scheme=None)
```

Get the current disk timeout of the given scheme

CLI Example:

```
salt '*' powercfg.get_disk_timeout
```

**scheme** The scheme to use, leave as None to use the current.

```
salt.modules.win_powercfg.get_hibernate_timeout(scheme=None)
```

Get the current hibernate timeout of the given scheme

CLI Example:

```
salt '*' powercfg.get_hibernate_timeout
```

**scheme** The scheme to use, leave as None to use the current.

```
salt.modules.win_powercfg.get_monitor_timeout(scheme=None)
```

Get the current monitor timeout of the given scheme

CLI Example:

```
salt '*' powercfg.get_monitor_timeout
```

**scheme** The scheme to use, leave as None to use the current.

`salt.modules.win_powercfg.get_standby_timeout` (*scheme=None*)

Get the current standby timeout of the given scheme

CLI Example:

```
salt '*' powercfg.get_standby_timeout
```

**scheme** The scheme to use, leave as None to use the current.

`salt.modules.win_powercfg.set_disk_timeout` (*timeout, power='ac', scheme=None*)

Set the disk timeout in minutes for the given power scheme

CLI Example:

```
salt '*' powercfg.set_disk_timeout 30 power=dc
```

**timeout** The amount of time in minutes before the disk will timeout

**power** Should we set the value for AC or DC (battery)? Valid options ac,dc.

**scheme** The scheme to use, leave as None to use the current.

`salt.modules.win_powercfg.set_hibernate_timeout` (*timeout, power='ac', scheme=None*)

Set the hibernate timeout in minutes for the given power scheme

CLI Example:

```
salt '*' powercfg.set_hibernate_timeout 30 power=pc
```

**timeout** The amount of time in minutes before the computer hibernates

**power** Should we set the value for AC or DC (battery)? Valid options ac,dc.

**scheme** The scheme to use, leave as None to use the current.

`salt.modules.win_powercfg.set_monitor_timeout` (*timeout, power='ac', scheme=None*)

Set the monitor timeout in minutes for the given power scheme

CLI Example:

```
salt '*' powercfg.set_monitor_timeout 30 power=ac
```

**timeout** The amount of time in minutes before the monitor will timeout

**power** Should we set the value for AC or DC (battery)? Valid options ac,dc.

**scheme** The scheme to use, leave as None to use the current.

`salt.modules.win_powercfg.set_standby_timeout` (*timeout, power='ac', scheme=None*)

Set the standby timeout in minutes for the given power scheme

CLI Example:

```
salt '*' powercfg.set_standby_timeout 30 power=dc
```

**timeout** The amount of time in minutes before the computer sleeps

**power** Should we set the value for AC or DC (battery)? Valid options ac,dc.

**scheme** The scheme to use, leave as None to use the current.

### 14.7.431 salt.modules.win\_psget module

Module for managing PowerShell through PowerShellGet (PSGet)

**depends**

- PowerShell 5.0

- PSGet

Support for PowerShell

`salt.modules.win_psget.avail_modules(desc=False)`

List available modules in registered Powershell module repositories.

**Parameters** `desc` (bool) -- If True, the verbose description will be returned.

CLI Example:

```
salt 'win01' psget.avail_modules
salt 'win01' psget.avail_modules desc=True
```

`salt.modules.win_psget.bootstrap()`

Make sure that nuget-anycpu.exe is installed. This will download the official nuget-anycpu.exe from the internet.

CLI Example:

```
salt 'win01' psget.bootstrap
```

`salt.modules.win_psget.get_repository(name)`

Get the details of a local PSGet repository

**Parameters** `name` (str) -- Name of the repository

CLI Example:

```
salt 'win01' psget.get_repository MyRepo
```

`salt.modules.win_psget.install(name, minimum_version=None, required_version=None, scope=None, repository=None)`

Install a Powershell module from powershell gallery on the system.

**Parameters**

- **name** (str) -- Name of a Powershell module
- **minimum\_version** (str) -- The maximum version to install, e.g. 1.23.2
- **required\_version** (str) -- Install a specific version
- **scope** (str) -- The scope to install the module to, e.g. CurrentUser, Computer
- **repository** (str) -- The friendly name of a private repository, e.g. MyREpo

CLI Example:

```
salt 'win01' psget.install PowerPlan
```

`salt.modules.win_psget.list_modules(desc=False)`

List currently installed PSGet Modules on the system.

**Parameters** `desc` (bool) -- If True, the verbose description will be returned.

CLI Example:

```
salt 'win01' psget.list_modules
salt 'win01' psget.list_modules desc=True
```

`salt.modules.win_psget.psversion()`

Returns the Powershell version

This has been deprecated and has been replaced by `cmd.shell_info` Note the minimum version return is 5 as dsc is not available for version less than 5. This function will be removed in 'Oxygen' release.

CLI Example:

```
salt 'win01' dsc.psversion
```

`salt.modules.win_psget.register_repository`(*name*, *location*, *installation\_policy=None*)

Register a PSGet repository on the local machine

**Parameters**

- **name** (str) -- The name for the repository
- **location** (str) -- The URI for the repository
- **installation\_policy** (str) -- The installation policy for packages, e.g. Trusted, Untrusted

CLI Example:

```
salt 'win01' psget.register_repository MyRepo https://myrepo.mycompany.com/
↳ packages
```

`salt.modules.win_psget.remove`(*name*)

Remove a Powershell DSC module from the system.

**Parameters** **name** (str) -- Name of a Powershell DSC module

CLI Example:

```
salt 'win01' psget.remove PowerPlan
```

`salt.modules.win_psget.update`(*name*, *maximum\_version=None*, *required\_version=None*)

Update a PowerShell module to a specific version, or the newest

**Parameters**

- **name** (str) -- Name of a Powershell module
- **maximum\_version** (str) -- The maximum version to install, e.g. 1.23.2
- **required\_version** (str) -- Install a specific version

CLI Example:

```
salt 'win01' psget.update PowerPlan
```

## 14.7.432 salt.modules.win\_repo

Module to manage Windows software repo on a Standalone Minion

`file_client:` local must be set in the minion config file.

For documentation on Salt's Windows Repo feature, see [here](#).

`salt.modules.win_repo.genrepo`()

Generate winrepo\_cache file based on sls files in the winrepo\_dir

CLI Example:

```
salt-call winrepo.genrepo
```

`salt.modules.win_repo.show_sls`(*name*, *saltenv='base'*)

New in version 2015.8.0.

Display the rendered software definition from a specific sls file in the local winrepo cache. This will parse all Jinja. Run `pkg.refresh_db` to pull the latest software definitions from the master.

---

**Note:** This function does not ask a master for an sls file to render. Instead it directly processes the file specified in *name*

---

**Parameters**

- **str** (*saltenv*) -- The name/path of the package you want to view. This can be the

- **path to a file on the minion file system or a file on the local** (*full*) --
- **cache.** (*minion*) --
- **str** -- The default environment is base

**Returns** Returns a dictionary containing the rendered data structure

**Return type** dict

---

**Note:** To use a file from the minion cache start from the local winrepo root (C:\salt\var\cache\salt\minion\files\base\win\repo-ng). If you have .sls files organized in subdirectories you'll have to denote them with .. For example, if you have a test directory in the winrepo root with a gvim.sls file inside, would target that file like so: test.gvim. Directories can be targeted as well as long as they contain an init.sls inside. For example, if you have a node directory with an init.sls inside, target that like so: node.

---

CLI Example:

```
salt '*' winrepo.show_sls gvim
salt '*' winrepo.show_sls test.npp
salt '*' winrepo.show_sls C:\test\gvim.sls
```

`salt.modules.win_repo.update_git_repos` (*clean=False*)

Checkout git repos containing *Windows Software Package Definitions*.

---

**Important:** This function requires *Git for Windows* to be installed in order to work. When installing, make sure to select an installation option which permits the git executable to be run from the Command Prompt.

---

**clean** [False] Clean repo cachedirs which are not configured under *winrepo\_remotes*.

---

**Note:** This option only applies if either *pygit2* or *GitPython* is installed into Salt's bundled Python.

---

**Warning:** This argument should not be set to True if a mix of git and non-git repo definitions are being used, as it will result in the non-git repo definitions being removed.

New in version 2015.8.0.

CLI Example:

```
salt-call winrepo.update_git_repos
```

### 14.7.433 salt.modules.win\_servermanager

Manage Windows features via the ServerManager powershell module

`salt.modules.win_servermanager.install` (*feature*, *recurse=False*, *restart=False*, *source=None*, *exclude=None*)

Install a feature

---

**Note:** Some features require reboot after un/installation, if so until the server is restarted other features can

not be installed!

---

**Note:** Some features take a long time to complete un/installation, set `-t` with a long timeout

---

#### Parameters

- **feature** (*str*) -- The name of the feature to install
- **recurse** (*bool*) -- Install all sub-features. Default is False
- **source** (*str*) -- Path to the source files if missing from the target system. None means that the system will use windows update services to find the required files. Default is None
- **restart** (*bool*) -- Restarts the computer when installation is complete, if required by the role/feature installed. Default is False
- **exclude** (*str*) -- The name of the feature to exclude when installing the named feature.

---

**Note:** As there is no exclude option for the `Add-WindowsFeature` command, the feature will be installed with other sub-features and will then be removed.

---

- **restart** -- Restarts the computer when installation is complete, if required by the role feature installed.

**Returns** A dictionary containing the results of the install

**Return type** *dict*

CLI Example:

```
salt '*' win_servermanager.install Telnet-Client
salt '*' win_servermanager.install SNMP-Service True
salt '*' win_servermanager.install TFTP-Client source=d:\side-by-side
```

`salt.modules.win_servermanager.list_available()`

List available features to install

**Returns** A list of available features

**Return type** *list*

CLI Example:

```
salt '*' win_servermanager.list_available
```

`salt.modules.win_servermanager.list_installed()`

List installed features. Supported on Windows Server 2008 and Windows 8 and newer.

**Returns** A list of installed features

**Return type** *list*

CLI Example:

```
salt '*' win_servermanager.list_installed
```

`salt.modules.win_servermanager.remove(feature, remove_payload=False, restart=False)`

Remove an installed feature

---

**Note:** Some features require a reboot after installation/uninstallation. If one of these features are modified, then other features cannot be installed until the server is restarted. Additionally, some features take a while to complete installation/uninstallation, so it is a good idea to use the `-t` option to set a longer timeout.

---

**Parameters**

- **feature** (*str*) -- The name of the feature to remove
- **remove\_payload** (*bool*) -- True will cause the feature to be removed from the side-by-side store (%SystemDrive%\Windows\WinSxS). Default is False
- **restart** (*bool*) -- Restarts the computer when uninstall is complete, if required by the role/feature removed. Default is False

**Returns** A dictionary containing the results of the uninstall

**Return type** dict

CLI Example:

```
salt -t 600 '*' win_servermanager.remove Telnet-Client
```

### 14.7.434 salt.modules.win\_service

Windows Service module.

Changed in version 2016.11.0: - Rewritten to use PyWin32

**salt.modules.win\_service.available**(*name*)

Check if a service is available on the system.

**Parameters** **name** (*str*) -- The name of the service to check

**Returns** True if the service is available, False otherwise

**Return type** bool

CLI Example:

```
salt '*' service.available <service name>
```

**salt.modules.win\_service.config**(*name, bin\_path=None, display\_name=None, svc\_type=None, start\_type=None, error=None, group=None, tag=None, depend=None, obj=None, password=None, \*\*kwargs*)

Deprecated since version 2016.11.0: Use `service.modify` instead

Modify the named service. Because this is deprecated it will use the passed parameters to run `service.modify` instead.

**Parameters**

- **name** (*str*) -- Specifies the service name. This is not the `display_name`
- **bin\_path** (*str*) -- Specifies the path to the service binary file. Backslashes must be escaped, eg: C:\path\to\binary.exe
- **display\_name** (*str*) -- the name to be displayed in the service manager
- **svc\_type** (*str*) -- Specifies the service type. Default is `own`. Valid options are as follows:
  - `kernel`: Driver service
  - `filesystem`: File system driver service
  - `adapter`: Adapter driver service (reserved)
  - `recognizer`: Recognizer driver service (reserved)
  - `own` (default): Service runs in its own process
  - `share`: Service shares a process with one or more other services
- **start\_type** (*str*) -- Specifies the service start type. Valid options are as follows:
  - `boot`: Device driver that is loaded by the boot loader
  - `system`: Device driver that is started during kernel initialization
  - `auto`: Service that automatically starts
  - `manual` (default): Service must be started manually
  - `disabled`: Service cannot be started

- **error** (*str*) -- The severity of the error, and action taken, if this service fails to start. Valid options are as follows:
  - normal (normal): Error is logged and a message box is displayed
  - severe: Error is logged and computer attempts a restart with the last known good configuration
  - critical: Error is logged, computer attempts to restart with the last known good configuration, system halts on failure
  - ignore: Error is logged and startup continues, no notification is given to the user
- **group** -- The name of the load order group to which this service belongs
- **depend** (*list*) -- A list of services or load ordering groups that must start before this service
- **obj** (*str*) -- The name of the account under which the service should run. For own type services this should be in the domain\username format. The following are examples of valid built-in service accounts:
  - NT Authority\LocalService
  - NT Authority\NetworkService
  - NT Authority\LocalSystem
  - .\LocalSystem
- **password** (*str*) -- The password for the account name specified in `account_name`. For the above built-in accounts, this can be None. Otherwise a password must be specified.

**Returns** a dictionary of changes made

**Return type** dict

CLI Example:

```
salt '*' service.config <service name> <path to exe> display_name='<display name>'
```

```
salt.modules.win_service.create(name, bin_path, exe_args=None, display_name=None, description=None, service_type='own', start_type='manual', start_delayed=False, error_control='normal', load_order_group=None, dependencies=None, account_name='.\LocalSystem', account_password=None, run_interactive=False, **kwargs)
```

Create the named service.

New in version 2015.8.0.

#### Parameters

- **name** (*str*) -- Specifies the service name. This is not the `display_name`
- **bin\_path** (*str*) -- Specifies the path to the service binary file. Backslashes must be escaped, eg: C:\path\to\binary.exe
- **exe\_args** (*str*) -- Any additional arguments required by the service binary.
- **display\_name** (*str*) -- the name to be displayed in the service manager. If not passed, the name will be used
- **description** (*str*) -- A description of the service
- **service\_type** (*str*) -- Specifies the service type. Default is own. Valid options are as follows:
  - kernel: Driver service
  - filesystem: File system driver service
  - adapter: Adapter driver service (reserved)
  - recognizer: Recognizer driver service (reserved)
  - own (default): Service runs in its own process
  - share: Service shares a process with one or more other services
- **start\_type** (*str*) -- Specifies the service start type. Valid options are as follows:
  - boot: Device driver that is loaded by the boot loader

- system: Device driver that is started during kernel initialization
- auto: Service that automatically starts
- manual (default): Service must be started manually
- disabled: Service cannot be started
- **start\_delayed** (*bool*) -- Set the service to Auto(Delayed Start). Only valid if the `start_type` is set to `Auto`. If `service_type` is not passed, but the service is already set to `Auto`, then the flag will be set. Default is `False`
- **error\_control** (*str*) -- The severity of the error, and action taken, if this service fails to start. Valid options are as follows:
  - normal (normal): Error is logged and a message box is displayed
  - severe: Error is logged and computer attempts a restart with the last known good configuration
  - critical: Error is logged, computer attempts to restart with the last known good configuration, system halts on failure
  - ignore: Error is logged and startup continues, no notification is given to the user
- **load\_order\_group** -- The name of the load order group to which this service belongs
- **dependencies** (*list*) -- A list of services or load ordering groups that must start before this service
- **account\_name** (*str*) -- The name of the account under which the service should run. For own type services this should be in the `domain\username` format. The following are examples of valid built-in service accounts:
  - NT Authority\LocalService
  - NT Authority\NetworkService
  - NT Authority\LocalSystem
  - .\LocalSystem
- **account\_password** (*str*) -- The password for the account name specified in `account_name`. For the above built-in accounts, this can be `None`. Otherwise a password must be specified.
- **run\_interactive** (*bool*) -- If this setting is `True`, the service will be allowed to interact with the user. Not recommended for services that run with elevated privileges.

**Returns** A dictionary containing information about the new service

**Return type** `dict`

CLI Example:

```
salt '*' service.create <service name> <path to exe> display_name='<display name>'
```

`salt.modules.win_service.create_win_salt_restart_task()`

Create a task in Windows task scheduler to enable restarting the salt-minion

**Returns** `True` if successful, otherwise `False`

**Return type** `bool`

CLI Example:

```
salt '*' service.create_win_salt_restart_task()
```

`salt.modules.win_service.delete(name)`

Delete the named service

**Parameters** `name` (*str*) -- The name of the service to delete

**Returns** `True` if successful, `False` otherwise

**Return type** `bool`

CLI Example:

```
salt '*' service.delete <service name>
```

`salt.modules.win_service.disable`(*name*, *\*\*kwargs*)

Disable the named service to start at boot

**Parameters** *name* (*str*) -- The name of the service to disable

**Returns** True if disabled, False otherwise

**Return type** *bool*

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.win_service.disabled`(*name*)

Check to see if the named service is disabled to start on boot

**Parameters** *name* (*str*) -- The name of the service to check

**Returns** True if the service is disabled

**Return type** *bool*

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.win_service.enable`(*name*, *\*\*kwargs*)

Enable the named service to start at boot

**Parameters** *name* (*str*) -- The name of the service to enable.

**Returns** True if successful, False otherwise

**Return type** *bool*

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.win_service.enabled`(*name*, *\*\*kwargs*)

Check to see if the named service is enabled to start on boot

**Parameters** *name* (*str*) -- The name of the service to check

**Returns** True if the service is set to start

**Return type** *bool*

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.win_service.execute_salt_restart_task`()

Run the Windows Salt restart task

**Returns** True if successful, otherwise False

**Return type** *bool*

CLI Example:

```
salt '*' service.execute_salt_restart_task()
```

`salt.modules.win_service.get_all`()

Return all installed services

**Returns** Returns a list of all services on the system.

**Return type** *list*

CLI Example:

```
salt '*' service.get_all
```

**salt.modules.win\_service.get\_disabled()**

Return a list of disabled services. Disabled is defined as a service that is marked `Disabled` or `Manual`.

**Returns** A list of disabled services.

**Return type** *list*

CLI Example:

```
salt '*' service.get_disabled
```

**salt.modules.win\_service.get\_enabled()**

Return a list of enabled services. Enabled is defined as a service that is marked to Auto Start.

**Returns** A list of enabled services

**Return type** *list*

CLI Example:

```
salt '*' service.get_enabled
```

**salt.modules.win\_service.get\_service\_name(\*args)**

The Display Name is what is displayed in Windows when services.msc is executed. Each Display Name has an associated Service Name which is the actual name of the service. This function allows you to discover the Service Name by returning a dictionary of Display Names and Service Names, or filter by adding arguments of Display Names.

If no args are passed, return a dict of all services where the keys are the service Display Names and the values are the Service Names.

If arguments are passed, create a dict of Display Names and Service Names

**Returns** A dictionary of display names and service names

**Return type** *dict*

CLI Examples:

```
salt '*' service.get_service_name
salt '*' service.get_service_name 'Google Update Service (gupdate)' 'DHCP Client'
```

**salt.modules.win\_service.getsid(name)**

Return the SID for this windows service

**Parameters** **name** (*str*) -- The name of the service for which to return the SID

**Returns** A string representing the SID for the service

**Return type** *str*

CLI Example:

```
salt '*' service.getsid <service name>
```

**salt.modules.win\_service.info(name)**

Get information about a service on the system

**Parameters** **name** (*str*) -- The name of the service. This is not the display name. Use `get_service_name` to find the service name.

**Returns** A dictionary containing information about the service.

**Return type** *dict*

CLI Example:

```
salt '*' service.info spooler
```

**salt.modules.win\_service.missing(name)**

The inverse of service.available.

**Parameters** **name** (*str*) -- The name of the service to check

**Returns** True if the service is missing, False otherwise

Return type `bool`

CLI Example:

```
salt '*' service.missing <service name>
```

```
salt.modules.win_service.modify(name, bin_path=None, exe_args=None, display_name=None, description=None, service_type=None, start_type=None, start_delayed=None, error_control=None, load_order_group=None, dependencies=None, account_name=None, account_password=None, run_interactive=None)
```

Modify a service's parameters. Changes will not be made for parameters that are not passed.

New in version 2016.11.0.

#### Parameters

- **name** (*str*) -- The name of the service. Can be found using the `service.get_service_name` function
- **bin\_path** (*str*) -- The path to the service executable. Backslashes must be escaped, eg: `C:\path\to\binary.exe`
- **exe\_args** (*str*) -- Any arguments required by the service executable
- **display\_name** (*str*) -- The name to display in the service manager
- **description** (*str*) -- The description to display for the service
- **service\_type** (*str*) -- Specifies the service type. Default is `own`. Valid options are as follows:
  - `kernel`: Driver service
  - `filesystem`: File system driver service
  - `adapter`: Adapter driver service (reserved)
  - `recognizer`: Recognizer driver service (reserved)
  - `own` (default): Service runs in its own process
  - `share`: Service shares a process with one or more other services
- **start\_type** (*str*) -- Specifies the service start type. Valid options are as follows:
  - `boot`: Device driver that is loaded by the boot loader
  - `system`: Device driver that is started during kernel initialization
  - `auto`: Service that automatically starts
  - `manual`: Service must be started manually
  - `disabled`: Service cannot be started
- **start\_delayed** (*bool*) -- Set the service to `Auto(Delayed Start)`. Only valid if the `start_type` is set to `Auto`. If `service_type` is not passed, but the service is already set to `Auto`, then the flag will be set.
- **error\_control** (*str*) -- The severity of the error, and action taken, if this service fails to start. Valid options are as follows:
  - `normal`: Error is logged and a message box is displayed
  - `severe`: Error is logged and computer attempts a restart with the last known good configuration
  - `critical`: Error is logged, computer attempts to restart with the last known good configuration, system halts on failure
  - `ignore`: Error is logged and startup continues, no notification is given to the user
- **load\_order\_group** -- The name of the load order group to which this service belongs
- **dependencies** (*list*) -- A list of services or load ordering groups that must start before this service
- **account\_name** (*str*) -- The name of the account under which the service should run. For `own` type services this should be in the `domain\username` format. The following are examples of valid built-in service accounts:

- NT Authority\LocalService
- NT Authority\NetworkService
- NT Authority\LocalSystem
- .LocalSystem
- **account\_password** (*str*) -- The password for the account name specified in `account_name`. For the above built-in accounts, this can be `None`. Otherwise a password must be specified.
- **run\_interactive** (*bool*) -- If this setting is `True`, the service will be allowed to interact with the user. Not recommended for services that run with elevated privileges.

**Returns** a dictionary of changes made

**Return type** `dict`

CLI Example:

```
salt '*' service.modify spooler start_type=disabled
```

`salt.modules.win_service.restart`(*name*)

Restart the named service. This issues a stop command followed by a start.

**Parameters** **name** -- The name of the service to restart.

---

**Note:** If the name passed is `salt-minion` a scheduled task is created and executed to restart the salt-minion service.

---

**Returns** `True` if successful, `False` otherwise

**Return type** `bool`

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.win_service.start`(*name*)

Start the specified service.

**Warning:** You cannot start a disabled service in Windows. If the service is disabled, it will be changed to Manual start.

**Parameters** **name** (*str*) -- The name of the service to start

**Returns** `True` if successful, `False` otherwise

**Return type** `bool`

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.win_service.status`(*name*, *sig=None*)

Return the status for a service

**Parameters**

- **name** (*str*) -- The name of the service to check
- **sig** (*str*) -- Not supported on Windows

**Returns** `True` if running, `False` otherwise

**Return type** `bool`

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

`salt.modules.win_service.stop(name)`

Stop the specified service

**Parameters** `name` (*str*) -- The name of the service to stop

**Returns** True if successful, False otherwise

**Return type** `bool`

CLI Example:

```
salt '*' service.stop <service name>
```

### 14.7.435 salt.modules.win\_shadow

Manage the shadow file

---

**Important:** If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to `'shadow.info' is not available`), see [here](#).

---

`salt.modules.win_shadow.info(name)`

Return information for the specified user This is just returns dummy data so that salt states can work.

**Parameters** `name` (*str*) -- The name of the user account to show.

CLI Example:

```
salt '*' shadow.info root
```

`salt.modules.win_shadow.require_password_change(name)`

Require the user to change their password the next time they log in.

**Parameters** `name` -- The name of the user account to require a password change.

**Returns** True if successful. False if unsuccessful.

**Return type** `bool`

CLI Example:

```
salt '*' shadow.require_password_change <username>
```

`salt.modules.win_shadow.set_expire(name, expire)`

Set the expiration date for a user account.

**Parameters**

- **name** -- The name of the user account to edit.
- **expire** -- The date the account will expire.

**Returns** True if successful. False if unsuccessful.

**Return type** `bool`

CLI Example:

```
salt '*' shadow.set_expire <username> 2016/7/1
```

`salt.modules.win_shadow.set_password(name, password)`

Set the password for a named user.

**Parameters**

- **name** (*str*) -- The name of the user account
- **password** (*str*) -- The new password

**Returns** True if successful. False if unsuccessful.

**Return type** `bool`

CLI Example:

```
salt '*' shadow.set_password root mysecretpassword
```

`salt.modules.win_shadow.unlock_account(name)`

Unlocks a user account.

**Parameters** **name** -- The name of the user account to unlock.

**Returns** True if successful. False if unsuccessful.

**Return type** `bool`

CLI Example:

```
salt '*' shadow.unlock_account <username>
```

### 14.7.436 salt.modules.win\_smtp\_server module

Module for managing IIS SMTP server configuration on Windows servers. The Windows features 'SMTP-Server' and 'Web-WMI' must be installed.

**depends** `wmi`

`salt.modules.win_smtp_server.get_connection_ip_list(as_wmi_format=False, server='SmtpSvc/1')`

Get the IPGrant list for the SMTP virtual server.

**Parameters**

- **as\_wmi\_format** (`bool`) -- Returns the connection IPs as a list in the format WMI expects.
- **server** (`str`) -- The SMTP server name.

**Returns** A dictionary of the IP and subnet pairs.

**Return type** `dict`

CLI Example:

```
salt '*' win_smtp_server.get_connection_ip_list
```

`salt.modules.win_smtp_server.get_log_format(server='SmtpSvc/1')`

Get the active log format for the SMTP virtual server.

**Parameters** **server** (`str`) -- The SMTP server name.

**Returns** A string of the log format name.

**Return type** `str`

CLI Example:

```
salt '*' win_smtp_server.get_log_format
```

`salt.modules.win_smtp_server.get_log_format_types()`

Get all available log format names and ids.

**Returns** A dictionary of the log format names and ids.

**Return type** `dict`

CLI Example:

```
salt '*' win_smtp_server.get_log_format_types
```

`salt.modules.win_smtp_server.get_relay_ip_list(server='SmtpSvc/1')`

Get the RelayIpList list for the SMTP virtual server.

**Parameters** **server** (`str`) -- The SMTP server name.

**Returns** A list of the relay IPs.

**Return type** `list`

---

**Note:** A return value of None corresponds to the restrictive `Only the list below` GUI parameter with an empty access list, and setting an empty list/tuple corresponds to the more permissive `All except the list below` GUI parameter.

---

CLI Example:

```
salt '*' win_smtp_server.get_relay_ip_list
```

`salt.modules.win_smtp_server.get_server_setting(settings, server='SmtpSvc/1')`

Get the value of the setting for the SMTP virtual server.

Parameters

- **settings** (*str*) -- A list of the setting names.
- **server** (*str*) -- The SMTP server name.

Returns A dictionary of the provided settings and their values.

Return type `dict`

CLI Example:

```
salt '*' win_smtp_server.get_server_setting settings="['MaxRecipients']"
```

`salt.modules.win_smtp_server.get_servers()`

Get the SMTP virtual server names.

Returns A list of the SMTP virtual servers.

Return type `list`

CLI Example:

```
salt '*' win_smtp_server.get_servers
```

`salt.modules.win_smtp_server.set_connection_ip_list(addresses=None, grant_by_default=False, server='SmtpSvc/1')`

Set the IPGrant list for the SMTP virtual server.

Parameters

- **addresses** (*str*) -- A dictionary of IP + subnet pairs.
- **grant\_by\_default** (*bool*) -- Whether the addresses should be a blacklist or whitelist.
- **server** (*str*) -- The SMTP server name.

Returns A boolean representing whether the change succeeded.

Return type `bool`

CLI Example:

```
salt '*' win_smtp_server.set_connection_ip_list addresses="{ '127.0.0.1': '255.255.255.255' }"
```

`salt.modules.win_smtp_server.set_log_format(log_format, server='SmtpSvc/1')`

Set the active log format for the SMTP virtual server.

Parameters

- **log\_format** (*str*) -- The log format name.
- **server** (*str*) -- The SMTP server name.

Returns A boolean representing whether the change succeeded.

Return type `bool`

CLI Example:

```
salt '*' win_smtp_server.set_log_format 'Microsoft IIS Log File Format'
```

`salt.modules.win_smtp_server.set_relay_ip_list` (*addresses=None, server='SmtpSvc/1'*)

Set the RelayIpList list for the SMTP virtual server.

Due to the unusual way that Windows stores the relay IPs, it is advisable to retrieve the existing list you wish to set from a pre-configured server.

For example, setting `127.0.0.1` as an allowed relay IP through the GUI would generate an actual relay IP list similar to the following:

```
['24.0.0.128', '32.0.0.128', '60.0.0.128', '68.0.0.128', '1.0.0.0', '76.0.0.0',  
'0.0.0.0', '0.0.0.0', '1.0.0.0', '1.0.0.0', '2.0.0.0', '2.0.0.0', '4.0.0.0',  
'0.0.0.0', '76.0.0.128', '0.0.0.0', '0.0.0.0', '0.0.0.0', '0.0.0.0',  
'255.255.255.255', '127.0.0.1']
```

---

**Note:** Setting the list to None corresponds to the restrictive `Only the list below` GUI parameter with an empty access list configured, and setting an empty list/tuple corresponds to the more permissive `All except the list below` GUI parameter.

---

#### Parameters

- **addresses** (*str*) -- A list of the relay IPs. The order of the list is important.
- **server** (*str*) -- The SMTP server name.

**Returns** A boolean representing whether the change succeeded.

**Return type** `bool`

CLI Example:

```
salt '*' win_smtp_server.set_relay_ip_list addresses="['192.168.1.1', '172.16.1.1'  
↪']"
```

`salt.modules.win_smtp_server.set_server_setting` (*settings, server='SmtpSvc/1'*)

Set the value of the setting for the SMTP virtual server.

---

**Note:** The setting names are case-sensitive.

---

#### Parameters

- **settings** (*str*) -- A dictionary of the setting names and their values.
- **server** (*str*) -- The SMTP server name.

**Returns** A boolean representing whether all changes succeeded.

**Return type** `bool`

CLI Example:

```
salt '*' win_smtp_server.set_server_setting settings="{ 'MaxRecipients': '500' }"
```

## 14.7.437 salt.modules.win\_snmp module

Module for managing SNMP service settings on Windows servers. The Windows feature `SNMP-Service` must be installed.

`salt.modules.win_snmp.get_agent_service_types` ()

Get the sysServices types that can be configured.

**Returns** A list of service types.

**Return type** `list`

CLI Example:

```
salt '*' win_snmp.get_agent_service_types
```

`salt.modules.win_snmp.get_agent_settings()`

Determine the value of the SNMP sysContact, sysLocation, and sysServices settings.

**Returns** A dictionary of the agent settings.

**Return type** `dict`

CLI Example:

```
salt '*' win_snmp.get_agent_settings
```

`salt.modules.win_snmp.get_auth_traps_enabled()`

Determine whether the host is configured to send authentication traps.

**Returns** True if traps are enabled, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' win_snmp.get_auth_traps_enabled
```

`salt.modules.win_snmp.get_community_names()`

Get the current accepted SNMP community names and their permissions.

**Returns** A dictionary of community names and permissions.

**Return type** `dict`

CLI Example:

```
salt '*' win_snmp.get_community_names
```

`salt.modules.win_snmp.get_permission_types()`

Get the permission types that can be configured for communities.

**Returns** A list of permission types.

**Return type** `list`

CLI Example:

```
salt '*' win_snmp.get_permission_types
```

`salt.modules.win_snmp.set_agent_settings(contact=None, location=None, services=None)`

Manage the SNMP sysContact, sysLocation, and sysServices settings.

**Parameters**

- **contact** (*str, optional*) -- The SNMP contact.
- **location** (*str, optional*) -- The SNMP location.
- **services** (*list, optional*) -- A list of selected services. The possible service names can be found via `win_snmp.get_agent_service_types`. To disable all services pass a list of None, ie: ['None']

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' win_snmp.set_agent_settings contact='Contact Name' location='Place' ↵
↵services="['Physical']"
```

`salt.modules.win_snmp.set_auth_traps_enabled(status=True)`

Manage the sending of authentication traps.

**Parameters** **status** (*bool*) -- True to enable traps. False to disable.

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' win_snmp.set_auth_traps_enabled status='True'
```

`salt.modules.win_snmp.set_community_names` (*communities*)

Manage the SNMP accepted community names and their permissions.

**Parameters** **communities** (*dict*) -- A dictionary of SNMP community names and permissions. The possible permissions can be found via `win_snmp.get_permission_types`.

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' win_snmp.set_community_names communities="{ 'TestCommunity': 'Read Only' }"
```

### 14.7.438 `salt.modules.win_status`

Module for returning various status data about a minion. These data can be useful for compiling into stats later, or for problem solving if your minion is having problems.

New in version 0.12.0.

**depends**

- pythoncom
- wmi

`salt.modules.win_status.cpuload`()

New in version 2015.8.0.

Return the processor load as a percentage

CLI Example:

```
salt '*' status.cpuload
```

`salt.modules.win_status.diskusage` (*human\_readable=False, path=None*)

New in version 2015.8.0.

Return the disk usage for this minion

**human\_readable** [False] If True, usage will be in KB/MB/GB etc.

CLI Example:

```
salt '*' status.diskusage path=c:/salt
```

`salt.modules.win_status.master` (*master=None, connected=True*)

New in version 2015.5.0.

Fire an event if the minion gets disconnected from its master. This function is meant to be run via a scheduled job from the minion. If `master_ip` is an FQDN/Hostname, it must be resolvable to a valid IPv4 address.

CLI Example:

```
salt '*' status.master
```

`salt.modules.win_status.procs` (*count=False*)

Return the process data

**count** [False] If True, this function will simply return the number of processes.

New in version 2015.8.0.

CLI Example:

```
salt '*' status.procs
salt '*' status.procs count
```

**salt.modules.win\_status.saltmem**(*human\_readable=False*)

New in version 2015.8.0.

Returns the amount of memory that salt is using

**human\_readable** [False] return the value in a nicely formatted number

CLI Example:

```
salt '*' status.saltmem
salt '*' status.saltmem human_readable=True
```

**salt.modules.win\_status.uptime**(*human\_readable=False*)

New in version 2015.8.0.

Return the system uptime for this machine in seconds

**human\_readable** [False] If True, then return uptime in years, days, and seconds.

CLI Example:

```
salt '*' status.uptime
salt '*' status.uptime human_readable=True
```

### 14.7.439 salt.modules.win\_system

Module for managing windows systems.

**depends**

- pythoncom
- pywintypes
- win32api
- win32con
- win32net
- wmi

Support for reboot, shutdown, etc

**salt.modules.win\_system.get\_computer\_desc**()

Get the Windows computer description

**Returns** The computer description if found, otherwise False

**Return type** str

CLI Example:

```
salt 'minion-id' system.get_computer_desc
```

**salt.modules.win\_system.get\_computer\_name**()

Get the Windows computer name

**Returns** Returns the computer name if found. Otherwise returns False

**Return type** str

CLI Example:

```
salt 'minion-id' system.get_computer_name
```

`salt.modules.win_system.get_domain_workgroup()`

Get the domain or workgroup the computer belongs to.

New in version 2015.5.7.

New in version 2015.8.2.

**Returns** The name of the domain or workgroup

**Return type** `str`

CLI Example:

```
salt 'minion-id' system.get_domain_workgroup
```

`salt.modules.win_system.get_hostname()`

New in version 2016.3.0.

Get the hostname of the windows minion

**Returns** The hostname of the windows minion

**Return type** `str`

CLI Example:

```
salt 'minion-id' system.get_hostname
```

`salt.modules.win_system.get_pending_component_servicing()`

Determine whether there are pending Component Based Servicing tasks that require a reboot.

New in version 2016.11.0.

**Returns** True if a reboot is pending, otherwise False.

**Return type** `bool`

CLI Example:

```
salt '*' system.get_pending_component_servicing
```

`salt.modules.win_system.get_pending_computer_name()`

Get a pending computer name. If the computer name has been changed, and the change is pending a system reboot, this function will return the pending computer name. Otherwise, None will be returned. If there was an error retrieving the pending computer name, False will be returned, and an error message will be logged to the minion log.

**Returns** The pending name if restart is pending, otherwise returns None.

**Return type** `str`

CLI Example:

```
salt 'minion-id' system.get_pending_computer_name
```

`salt.modules.win_system.get_pending_domain_join()`

Determine whether there is a pending domain join action that requires a reboot.

New in version 2016.11.0.

**Returns** True if a reboot is pending, otherwise False.

**Return type** `bool`

CLI Example:

```
salt '*' system.get_pending_domain_join
```

`salt.modules.win_system.get_pending_file_rename()`

Determine whether there are pending file rename operations that require a reboot.

New in version 2016.11.0.

**Returns** True if a reboot is pending, otherwise False.

**Return type** `bool`

CLI Example:

```
salt '*' system.get_pending_file_rename
```

`salt.modules.win_system.get_pending_reboot()`

Determine whether there is a reboot pending.

New in version 2016.11.0.

**Returns** True if pending reboot, otherwise False.

**Return type** `bool`

CLI Example:

```
salt '*' system.get_pending_reboot
```

`salt.modules.win_system.get_pending_servermanager()`

Determine whether there are pending Server Manager tasks that require a reboot.

New in version 2016.11.0.

**Returns** True if a reboot is pending, otherwise False.

**Return type** `bool`

CLI Example:

```
salt '*' system.get_pending_servermanager
```

`salt.modules.win_system.get_pending_update()`

Determine whether there are pending updates that require a reboot.

New in version 2016.11.0.

**Returns** True if a reboot is pending, otherwise False.

**Return type** `bool`

CLI Example:

```
salt '*' system.get_pending_update
```

`salt.modules.win_system.get_reboot_required_witnessed()`

This tells us if, at any time during the current boot session the salt minion witnessed an event indicating that a reboot is required. (For the time being, this function will return True if an install completed with exit code 3010 during the current boot session and this usage can be extended where appropriate in the future)

New in version 2016.11.0.

**Returns** True if reboot required, otherwise False.

**Return type** `bool`

CLI Example:

```
salt '*' system.get_reboot_required_witnessed
```

`salt.modules.win_system.get_system_date()`

Get the Windows system date

**Returns** The system date

**Return type** `str`

CLI Example:

```
salt '*' system.get_system_date
```

`salt.modules.win_system.get_system_info()`

Get system information.

**Returns**

Returns a Dictionary containing information about the system to include name, description, version, etc...

**Return type** `dict`

CLI Example:

```
salt 'minion-id' system.get_info
```

`salt.modules.win_system.get_system_time()`

Get the system time.

**Returns** Returns the system time in HH:MM:SS AM/PM format.

**Return type** `str`

CLI Example:

```
salt 'minion-id' system.get_system_time
```

`salt.modules.win_system.halt(timeout=5, in_seconds=False)`

Halt a running system.

**Parameters**

- **timeout** (`int`) -- Number of seconds before halting the system. Default is
- **seconds**. (5) --
- **in\_seconds** (`bool`) -- Whether to treat timeout as seconds or minutes.

New in version 2015.8.0.

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' system.halt 5
```

`salt.modules.win_system.init(runlevel)`

Change the system runlevel on sysV compatible systems

CLI Example:

```
salt '*' system.init 3
```

`salt.modules.win_system.join_domain(domain, username=None, password=None, account_ou=None, account_exists=False, restart=False)`

Join a computer to an Active Directory domain. Requires reboot.

**Parameters**

- **domain** (`str`) -- The domain to which the computer should be joined, e.g. example.com
- **username** (`str`) -- Username of an account which is authorized to join computers to the specified domain. Need to be either fully qualified like user@domain.tld or simply user
- **password** (`str`) -- Password of the specified user
- **account\_ou** (`str`) -- The DN of the OU below which the account for this computer should be created when joining the domain, e.g. ou=computers,ou=departm\_432,dc=my-company,dc=com
- **account\_exists** (`bool`) -- If set to True the computer will only join the domain if the account already exists. If set to False the computer account will be created

- if it does not exist, otherwise it will use the existing account. Default is False.
- **restart** (*bool*) -- Restarts the computer after a successful join

New in version 2015.8.2/2015.5.7.

**Returns** Dictionary if successful

**Return type** *dict*

**Raises** `CommandExecutionError` -- Raises an error if `_join_domain` returns anything other than 0

CLI Example:

```
salt 'minion-id' system.join_domain domain='domain.tld' \
    username='joinuser' password='joinpassword' \
    account_ou='ou=clients,ou=org,dc=domain,dc=tld' \
    account_exists=False, restart=True
```

`salt.modules.win_system.lock()`

Lock the workstation.

**Returns** True if successful, otherwise False

**Return type** *bool*

CLI Example:

```
salt 'minion-id' system.lock
```

`salt.modules.win_system.poweroff(timeout=5, in_seconds=False)`

Power off a running system.

**Parameters**

- **timeout** (*int*) -- Number of seconds before powering off the system. Default is 5 seconds.
- **in\_seconds** (*bool*) -- Whether to treat timeout as seconds or minutes. .. version-added:: 2015.8.0

**Returns** True if successful, otherwise False

**Return type** *bool*

CLI Example:

```
salt '*' system.poweroff 5
```

`salt.modules.win_system.reboot(timeout=5, in_seconds=False, wait_for_reboot=False, only_on_pending_reboot=False)`

Reboot a running system.

**Parameters**

- **timeout** (*int*) -- Number of minutes/seconds before rebooting the system. Minutes vs seconds depends on the value of `in_seconds`. Default is 5 minutes.
- **in\_seconds** (*bool*) -- Whether to treat timeout as seconds or minutes.

New in version 2015.8.0.

- **wait\_for\_reboot** (*bool*) -- Sleeps for timeout + 30 seconds after reboot has been initiated. This may be useful for use in a highstate if a reboot should be performed and the return data of the highstate is not required. If return data is required, consider using the reboot state instead of this module.

New in version 2015.8.0.

- **only\_on\_pending\_reboot** (*bool*) -- If this is set to True, then the reboot will only proceed if the system reports a pending reboot. To optionally reboot in a highstate, consider using the reboot state instead of this module.

**Returns** True if successful (a reboot will occur), otherwise False

**Return type** *bool*

CLI Example:

```
salt '*' system.reboot 5
salt '*' system.reboot 5 True
```

As example of invoking this function from within a final housekeeping state is as follows:

Example:

```
final housekeeping:
  module.run:
    - name: system.reboot
    - only_on_pending_reboot: True
    - order: last
```

`salt.modules.win_system.set_computer_desc` (*desc=None*)

Set the Windows computer description

**Parameters** `desc` (*str*) -- The computer description

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt 'minion-id' system.set_computer_desc 'This computer belongs to Dave!'
```

`salt.modules.win_system.set_computer_name` (*name*)

Set the Windows computer name

**Parameters** `name` (*str*) -- The new name to give the computer. Requires a reboot to take effect.

**Returns**

Returns a dictionary containing the old and new names if successful. False if not.

**Return type** `dict`

CLI Example:

```
salt 'minion-id' system.set_computer_name 'DavesComputer'
```

`salt.modules.win_system.set_hostname` (*hostname*)

New in version 2016.3.0.

Set the hostname of the windows minion, requires a restart before this will be updated.

**Parameters** `hostname` (*str*) -- The hostname to set

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt 'minion-id' system.set_hostname newhostname
```

`salt.modules.win_system.set_reboot_required_witnessed` ()

This function is used to remember that an event indicating that a reboot is required was witnessed. This function relies on the salt-minion's ability to create the following volatile registry key in the *HKLM* hive:

*SYSTEM\CurrentControlSet\Services\salt-minion\Volatile-Data*

Because this registry key is volatile, it will not persist beyond the current boot session. Also, in the scope of this key, the name *'Reboot required'* will be assigned the value of *1*.

(For the time being, this this function is being used whenever an install completes with exit code 3010 and this usage can be extended where appropriate in the future.)

New in version 2016.11.0.

**Returns** True if registry entry set successfully, otherwise False.

**Return type** `bool`

CLI Example:

```
salt '*' system.set_reboot_required_witnessed
```

`salt.modules.win_system.set_system_date(newdate)`

Set the Windows system date. Use <mm-dd-yy> format for the date.

**Parameters** `newdate` (*str*) -- The date to set. Can be any of the following formats:

- YYYY-MM-DD
- MM-DD-YYYY
- MM-DD-YY
- MM/DD/YYYY
- MM/DD/YY
- YYYY/MM/DD

CLI Example:

```
salt '*' system.set_system_date '03-28-13'
```

`salt.modules.win_system.set_system_date_time(years=None, months=None, days=None, hours=None, minutes=None, seconds=None)`

Set the system date and time. Each argument is an element of the date, but not required. If an element is not passed, the current system value for that element will be used. For example, if you don't pass the year, the current system year will be used. (Used by `set_system_date` and `set_system_time`)

**Parameters**

- **years** (*int*) -- Years digit, ie: 2015
- **months** (*int*) -- Months digit: 1 - 12
- **days** (*int*) -- Days digit: 1 - 31
- **hours** (*int*) -- Hours digit: 0 - 23
- **minutes** (*int*) -- Minutes digit: 0 - 59
- **seconds** (*int*) -- Seconds digit: 0 - 59

**Returns** True if successful

**Return type** `bool`

**Raises** `CommandExecutionError` -- Raises an error if `SetLocalTime` function fails

CLI Example:

```
salt '*' system.set_system_date_time 2015 5 12 11 37 53
```

`salt.modules.win_system.set_system_time(newtime)`

Set the system time.

**Parameters** `newtime` (*str*) -- The time to set. Can be any of the following formats.

- HH:MM:SS AM/PM
- HH:MM AM/PM
- HH:MM:SS (24 hour)
- HH:MM (24 hour)

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt 'minion-id' system.set_system_time 12:01
```

`salt.modules.win_system.shutdown(message=None, timeout=5, force_close=True, reboot=False, in_seconds=False, only_on_pending_reboot=False)`

Shutdown a running system.

**Parameters**

- **message** (*str*) -- A message to display to the user before shutting down.
- **timeout** (*int*) -- The length of time that the shutdown dialog box should be displayed, in seconds. While this dialog box is displayed, the shutdown can be stopped

by the `shutdown_abort` function.

If `timeout` is not zero, `InitiateSystemShutdown` displays a dialog box on the specified computer. The dialog box displays the name of the user who called the function, displays the message specified by the `lpMessage` parameter, and prompts the user to log off. The dialog box beeps when it is created and remains on top of other windows in the system. The dialog box can be moved but not closed. A timer counts down the remaining time before a forced shutdown.

If `timeout` is zero, the computer shuts down without displaying the dialog box, and the shutdown cannot be stopped by `shutdown_abort`.

Default is 5 minutes

- **`in_seconds`** (*bool*) -- Whether to treat `timeout` as seconds or minutes.

New in version 2015.8.0.

- **`force_close`** (*bool*) -- True to force close all open applications. False displays a dialog box instructing the user to close the applications.
- **`reboot`** (*bool*) -- True restarts the computer immediately after shutdown. False caches to disk and safely powers down the system.
- **`only_on_pending_reboot`** (*bool*) -- If this is set to True, then the shutdown will only proceed if the system reports a pending reboot. To optionally shutdown in a highstate, consider using the shutdown state instead of this module.

**Returns**

True if successful (a shutdown or reboot will occur), otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' system.shutdown 5
```

`salt.modules.win_system.shutdown_abort()`

Abort a shutdown. Only available while the dialog box is being displayed to the user. Once the shutdown has initiated, it cannot be aborted.

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt 'minion-id' system.shutdown_abort
```

`salt.modules.win_system.shutdown_hard()`

Shutdown a running system with no timeout or warning.

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' system.shutdown_hard
```

`salt.modules.win_system.start_time_service()`

Start the Windows time service

**Returns** True if successful, otherwise False.

**Return type** `bool`

CLI Example:

```
salt '*' system.start_time_service
```

`salt.modules.win_system.stop_time_service()`

Stop the Windows time service

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' system.stop_time_service
```

```
salt.modules.win_system.unjoin_domain(username=None, password=None, domain=None,
                                       workgroup='WORKGROUP', disable=False,
                                       restart=False)
```

Unjoin a computer from an Active Directory Domain. Requires restart.

**Parameters**

- **username** (*str*) -- Username of an account which is authorized to manage computer accounts on the domain. Need to be fully qualified like `user@domain.tld` or `domain.tld\user`. If domain not specified, the passed domain will be used. If computer account doesn't need to be disabled, can be None.
- **password** (*str*) -- Password of the specified user
- **domain** (*str*) -- The domain from which to unjoin the computer. Can be None.
- **workgroup** (*str*) -- The workgroup to join the computer to. Default is WORKGROUP

New in version 2015.8.2/2015.5.7.

- **disable** (*bool*) -- Disable the computer account in Active Directory. True to disable. Default is False
- **restart** (*bool*) -- Restart the computer after successful unjoin

New in version 2015.8.2/2015.5.7.

**Returns** Dictionary if successful, otherwise False

**Return type** `dict`

CLI Example:

```
salt 'minion-id' system.unjoin_domain restart=True

salt 'minion-id' system.unjoin_domain username='unjoinuser' \\  
password='unjoinpassword' disable=True \\  
restart=True
```

#### 14.7.440 salt.modules.win\_task module

Windows Task Scheduler Module .. versionadded:: 2016.3.0

A module for working with the Windows Task Scheduler. You can add and edit existing tasks. You can add and clear triggers and actions. You can list all tasks, folders, triggers, and actions.

```
salt.modules.win_task.add_action(name=None, location='\\', action_type='Execute', **kwargs)
```

Add an action to a task.

**Parameters**

- **name** (*str*) -- The name of the task to which to add the action.
- **location** (*str*) -- A string value representing the location of the task.

Default is `\\` which is the root for the task scheduler (C:\Windows\System32\Tasks).

**Parameters** **action\_type** (*str*) -- The type of action to add. There are three action types. Each one requires its own set of Keyword Arguments (kwargs). Valid values are: - Execute - Email - Message

**kwargs**

Required kwargs for each value:

*Execute* Execute a command or an executable.

**Parameters**

- **cmd** (*str*) -- (required) The command / executable to run.
- **arguments** (*str*) -- (optional) Arguments to be passed to the command / executable. To launch a script the first command will need to be the interpreter for the script. For example, to run a vbscript you would pass *cscript.exe* in the *cmd* parameter and pass the script in the *arguments* parameter as follows:

```
•cmd='cscript.exe' arguments='c:\scripts\myscript.vbs'
```

Batch files do not need an interpreter and may be passed to the *cmd* parameter directly.

**Parameters** **start\_in** (*str*) -- (optional) The current working directory for the command.

*Email* Send an email. Requires *server*, *from*, and *to* or *cc*.

**Parameters**

- **from** (*str*) -- The sender
- **reply\_to** (*str*) -- Who to reply to
- **to** (*str*) -- The recipient
- **cc** (*str*) -- The CC recipient
- **bcc** (*str*) -- The BCC recipient
- **subject** (*str*) -- The subject of the email
- **body** (*str*) -- The Message Body of the email
- **server** (*str*) -- The server used to send the email
- **attachments** (*list*) -- A list of attachments. These will be the paths to the files to attach. ie: `attachments=['C:attachment1.txt', 'C:attachment2.txt']`

*Message* Display a dialog box. The task must be set to ``Run only when user is logged on'' in order for the dialog box to display. Both parameters are required.

**Parameters**

- **title** (*str*) -- The dialog box title.
- **message** (*str*) -- The dialog box message body

**Returns** True if successful, False if unsuccessful

**Return type** `bool`

CLI Example:

```
salt 'minion-id' task.add_action <task_name> cmd='del /Q /S C:\\Temp'
```

```
salt.modules.win_task.add_trigger(name=None, location='\\', trigger_type=None, trigger_enabled=True, start_date=None, start_time=None, end_date=None, end_time=None, random_delay=None, repeat_interval=None, repeat_duration=None, repeat_stop_at_duration_end=False, execution_time_limit=None, **kwargs)
```

**Parameters**

- **name** (*str*) -- The name of the task to which to add the trigger.
- **location** (*str*) -- A string value representing the location of the task.

Default is ``\\` which is the root for the task scheduler (C:WindowsSystem32tasks).

**Parameters** **trigger\_type** (*str*) -- The type of trigger to create. This is defined when the trigger is created and cannot be changed later. Options are as follows: - Event - Once - Daily - Weekly - Monthly - MonthlyDay - OnIdle - OnTaskCreation - OnBoot - OnLogon - OnSessionChange

**Parameters** **trigger\_enabled** (*bool*) -- Boolean value that indicates whether the trigger is enabled.

**Parameters** **start\_date** (*str*) -- The date when the trigger is activated. If no value is passed, the current date will be used. Can be one of the following formats: - %Y-%m-%d - %m-%d-%y - %m-%d-%Y - %m/%d/%y - %m/%d/%Y - %Y/%m/%d

**Parameters** **start\_time** (*str*) -- The time when the trigger is activated. If no value

is passed, midnight will be used. Can be one of the following formats: - %l:%M:%S %p - %l:%M %p - %H:%M:%S - %H:%M

**Parameters end\_date** (*str*) -- The date when the trigger is deactivated. The trigger cannot start the task after it is deactivated. Can be one of the following formats: - %Y-%m-%d - %m-%d-%y - %m-%d-%Y - %m/%d/%y - %m/%d/%Y - %Y/%m/%d

**Parameters end\_time** (*str*) -- The time when the trigger is deactivated. If the this is not passed with end\_date it will be set to midnight. Can be one of the following formats: - %l:%M:%S %p - %l:%M %p - %H:%M:%S - %H:%M

**Parameters random\_delay** (*str*) -- The delay time that is randomly added to the start time of the trigger. Valid values are: - 30 seconds = 1 minute - 30 minutes = 1 hour - 8 hours - 1 day

**Parameters repeat\_interval** (*str*) -- The amount of time between each restart of the task. Valid values are: - 5 minutes - 10 minutes - 15 minutes - 30 minutes - 1 hour

**Parameters repeat\_duration** (*str*) -- How long the pattern is repeated. Valid values are: - Indefinitely - 15 minutes - 30 minutes - 1 hour - 12 hours - 1 day

**Parameters repeat\_stop\_at\_duration\_end** (*bool*) -- Boolean value that indicates if a running instance of the task is stopped at the end of the repetition pattern duration.

**Parameters execution\_time\_limit** (*str*) -- The maximum amount of time that the task launched by the trigger is allowed to run. Valid values are: - 30 minutes - 1 hour - 2 hours - 4 hours - 8 hours - 12 hours - 1 day - 3 days (default)

## kwargs

There are optional keyword arguments determined by the type of trigger being defined. They are as follows:

*Event* :param str subscription: An event definition in xml format that fires the trigger. The easiest way to get this would is to create an event in windows task scheduler and then copy the xml text.

*Once* No special parameters required.

*Daily* :param int days\_interval: The interval between days in the schedule. An interval of 1 produces a daily schedule. An interval of 2 produces an every-other day schedule. If no interval is specified, 1 is used. Valid entries are 1 - 999.

*Weekly* :param int weeks\_interval: The interval between weeks in the schedule. An interval of 1 produces a weekly schedule. An interval of 2 produces an every-other week schedule. If no interval is specified, 1 is used. Valid entries are 1 - 52.

param list days\_of\_week: Sets the days of the week on which the task runs. Should be a list. ie: ['Monday','Wednesday','Friday']. Valid entries are the names of the days of the week.

*Monthly* :param list months\_of\_year: Sets the months of the year during which the task runs. Should be a list. ie: ['January','July']. Valid entries are the full names of all the months.

**Parameters days\_of\_month** (*list*) -- Sets the days of the month during which the task runs. Should be a list. ie: [1, 15, 'Last']. Options are all days of the month 1 - 31 and the word 'Last' to indicate the last day of the month.

**Parameters last\_day\_of\_month** (*bool*) -- Boolean value that indicates that the task runs on the last day of the month regardless of the actual date of that day.

You can set the task to run on the last day of the month by either including the word 'Last' in the list of days, or setting the parameter 'last\_day\_of\_month' equal to True.

*MonthlyDay* :param list months\_of\_year: Sets the months of the year during which the task runs. Should be a list. ie: ['January','July']. Valid entries are the full names of all the months.

**Parameters weeks\_of\_month** (*list*) -- Sets the weeks of the month during which the task runs. Should be a list. ie: ['First','Third']. Valid options are: - First - Second - Third - Fourth

**Parameters last\_week\_of\_month** (*bool*) -- Boolean value that indicates that the task runs on the last week of the month.

**Parameters days\_of\_week** (*list*) -- Sets the days of the week during which the

task runs. Should be a list. ie: ['Monday','Wednesday','Friday']. Valid entries are the names of the days of the week.

*OnIdle* No special parameters required.

*OnTaskCreation* No special parameters required.

*OnBoot* No special parameters required.

*OnLogon* No special parameters required.

*OnSessionChange*: param str session\_user\_name: Sets the user for the Terminal Server session. When a session state change is detected for this user, a task is started. To detect session status change for any user, do not pass this parameter.

**Parameters** **state\_change** (*str*) -- Sets the kind of Terminal Server session change that would trigger a task launch. Valid options are: - ConsoleConnect: When you connect to a user session (switch users) - ConsoleDisconnect: When you disconnect a user session (switch users) - RemoteConnect: When a user connects via Remote Desktop - RemoteDisconnect: When a user disconnects via Remote Desktop - SessionLock: When the workstation is locked - SessionUnlock: When the workstation is unlocked

**Returns** True if successful, False if unsuccessful

**Return type** bool

CLI Example:

```
salt 'minion-id' task.add_trigger <task_name> trigger_type=Once trigger_
↳enabled=True start_date=2016/12/1 start_time=12:01
```

**salt.modules.win\_task.clear\_triggers** (*name, location='\'*)

Remove all triggers from the task.

**Parameters**

- **name** (*str*) -- The name of the task from which to clear all triggers.
- **location** (*str*) -- A string value representing the location of the task.

Default is '\' which is the root for the task scheduler (C:WindowsSystem32tasks).

**Returns** True if successful, False if unsuccessful

**Return type** bool

CLI Example:

```
salt 'minion-id' task.clear_trigger <task_name>
```

**salt.modules.win\_task.create\_folder** (*name, location='\'*)

Create a folder in which to create tasks.

**Parameters** **name** (*str*) -- The name of the folder. This will be displayed in the task scheduler.

**Parameters** **location** (*str*) -- A string value representing the location in which to create the folder. Default is '\' which is the root for the task scheduler (C:WindowsSystem32tasks).

**Returns** True if successful, False if unsuccessful

**Return type** bool

CLI Example:

```
salt 'minion-id' task.create_folder <folder_name>
```

**salt.modules.win\_task.create\_task** (*name, location='\'*, *user\_name='System'*, *password=None*, *force=False*, *\*\*kwargs*)

Create a new task in the designated location. This function has many keyword arguments that are not listed here. For additional arguments see:

- py:function::edit\_task
- py:function::add\_action
- py:function::add\_trigger

Parameters **name** (*str*) -- The name of the task. This will be displayed in the task scheduler.

Parameters **location** (*str*) -- A string value representing the location in which to create the task. Default is ``\`` which is the root for the task scheduler (C:WindowsSystem32tasks).

Parameters **user\_name** (*str*) -- The user account under which to run the task. To specify the ``System`` account, use ``System``. The password will be ignored.

Parameters **password** (*str*) -- The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.

Parameters **force** (*bool*) -- If the task exists, overwrite the existing task.

Returns True if successful, False if unsuccessful

Return type `bool`

CLI Example:

```
salt 'minion-id' task.create_task <task_name> user_name=System force=True action_
↳type=Execute cmd='del /Q /S C:\\Temp' trigger_type=Once start_date=2016-12-1
↳start_time=01:00
```

```
salt.modules.win_task.create_task_from_xml(name, location='\\', xml_text=None,
                                          xml_path=None, user_name='System', pass-
                                          word=None)
```

Create a task based on XML. Source can be a file or a string of XML.

Parameters **name** (*str*) -- The name of the task. This will be displayed in the task scheduler.

Parameters **location** (*str*) -- A string value representing the location in which to create the task. Default is ``\`` which is the root for the task scheduler (C:WindowsSystem32tasks).

Parameters **xml\_text** (*str*) -- A string of xml representing the task to be created. This will be overridden by `xml_path` if passed.

Parameters **xml\_path** (*str*) -- The path to an XML file on the local system containing the xml that defines the task. This will override `xml_text`

Parameters **user\_name** (*str*) -- The user account under which to run the task. To specify the ``System`` account, use ``System``. The password will be ignored.

Parameters **password** (*str*) -- The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.

Returns True if successful, False if unsuccessful

Return type `bool`

CLI Example:

```
salt 'minion-id' task.create_task_from_xml <task_name> xml_path=C:\\task.xml
```

```
salt.modules.win_task.delete_folder(name, location='\\')
```

Delete a folder from the task scheduler.

Parameters

- **name** (*str*) -- The name of the folder to delete.
- **location** (*str*) -- A string value representing the location of the folder.

Default is ``\`` which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns True if successful, False if unsuccessful

Return type `bool`

CLI Example:

```
salt 'minion-id' task.delete_folder <folder_name>
```

```
salt.modules.win_task.delete_task(name, location='\\')
```

Delete a task from the task scheduler.

Parameters

- **name** (*str*) -- The name of the task to delete.

- **location** (*str*) -- A string value representing the location of the task.

Default is ``\`` which is the root for the task scheduler (C:\Windows\System32\tasks).

**Returns** True if successful, False if unsuccessful

**Return type** `bool`

CLI Example:

```
salt 'minion-id' task.delete_task <task_name>
```

```
salt.modules.win_task.edit_task(name=None, location='\\', user_name=None, password=None, description=None, enabled=None, hidden=None, run_if_idle=None, idle_duration=None, idle_wait_timeout=None, idle_stop_on_end=None, idle_restart=None, ac_only=None, stop_if_on_batteries=None, wake_to_run=None, run_if_network=None, network_id=None, network_name=None, allow_demand_start=None, start_when_available=None, restart_every=None, restart_count=3, execution_time_limit=None, force_stop=None, delete_after=None, multiple_instances=None, **kwargs)
```

Edit the parameters of a task. Triggers and Actions cannot be edited yet.

**Parameters name** (*str*) -- The name of the task. This will be displayed in the task scheduler.

**Parameters location** (*str*) -- A string value representing the location in which to create the task. Default is ``\`` which is the root for the task scheduler (C:\Windows\System32\tasks).

**Parameters user\_name** (*str*) -- The user account under which to run the task. To specify the 'System' account, use ``System'`. The password will be ignored.

**Parameters password** (*str*) -- The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.

---

**Note:** The combination of `user_name` and `password` determine how the task

---

runs. For example, if a username is passed without a password the task will only run when the user is logged in. If a password is passed as well the task will run whether the user is logged on or not. If you pass ``System'` as the username the task will run as the system account (the password parameter is ignored).

**Parameters description** (*str*) -- A string representing the text that will be displayed in the description field in the task scheduler.

**Parameters enabled** (*bool*) -- A boolean value representing whether or not the task is enabled.

**Parameters hidden** (*bool*) -- A boolean value representing whether or not the task is hidden.

**Parameters run\_if\_idle** (*bool*) -- Boolean value that indicates that the Task Scheduler will run the task only if the computer is in an idle state.

**Parameters idle\_duration** (*str*) -- A value that indicates the amount of time that the computer must be in an idle state before the task is run. Valid values are: - 1 minute - 5 minutes - 10 minutes - 15 minutes - 30 minutes - 1 hour

**Parameters idle\_wait\_timeout** (*str*) -- A value that indicates the amount of time that the Task Scheduler will wait for an idle condition to occur. Valid values are: - Do not wait - 1 minute - 5 minutes - 10 minutes - 15 minutes - 30 minutes - 1 hour - 2 hours

**Parameters idle\_stop\_on\_end** (*bool*) -- Boolean value that indicates that the Task Scheduler will terminate the task if the idle condition ends before the task is completed.

**Parameters idle\_restart** (*bool*) -- Boolean value that indicates whether the task is restarted when the computer cycles into an idle condition more than once.

**Parameters ac\_only** (*bool*) -- Boolean value that indicates that the Task Scheduler will launch the task only while on AC power.

Parameters **stop\_if\_on\_batteries** (*bool*) -- Boolean value that indicates that the task will be stopped if the computer begins to run on battery power.

Parameters **wake\_to\_run** (*bool*) -- Boolean value that indicates that the Task Scheduler will wake the computer when it is time to run the task.

Parameters **run\_if\_network** (*bool*) -- Boolean value that indicates that the Task Scheduler will run the task only when a network is available.

Parameters

- **network\_id** (*guid*) -- GUID value that identifies a network profile.
- **network\_name** (*str*) -- Sets the name of a network profile. The name is used for display purposes.

Parameters **allow\_demand\_start** (*bool*) -- Boolean value that indicates that the task can be started by using either the Run command or the Context menu.

Parameters **start\_when\_available** (*bool*) -- Boolean value that indicates that the Task Scheduler can start the task at any time after its scheduled time has passed.

Parameters **restart\_every** -- A value that specifies the interval between task restart attempts. Valid values are: :type: bool str - False (to disable) - 1 minute - 5 minutes - 10 minutes - 15 minutes - 30 minutes - 1 hour - 2 hours

Parameters **restart\_count** (*int*) -- The number of times the Task Scheduler will attempt to restart the task. Valid values are integers 1 - 999.

Parameters **execution\_time\_limit** -- The amount of time allowed to complete the task. Valid values are: :type: bool str - False (to disable) - 1 hour - 2 hours - 4 hours - 8 hours - 12 hours - 1 day - 3 days

Parameters **force\_stop** (*bool*) -- Boolean value that indicates that the task may be terminated by using TerminateProcess.

Parameters **delete\_after** -- The amount of time that the Task Scheduler will wait before deleting the task after it expires. Requires a trigger with an expiration date. Valid values are: :type: bool str - False (to disable) - Immediately - 30 days - 90 days - 180 days - 365 days

Parameters **multiple\_instances** (*str*) -- Sets the policy that defines how the Task Scheduler deals with multiple instances of the task. Valid values are: - Parallel - Queue - No New Instance - Stop Existing

Returns True if successful, False if unsuccessful

Return type *bool*

CLI Example:

```
salt 'minion-id' task.edit_task <task_name> description='This task is awesome'
```

`salt.modules.win_task.info`(*name*, *location*='\')

Get the details about a task in the task scheduler.

Parameters

- **name** (*str*) -- The name of the task for which to return the status
- **location** (*str*) -- A string value representing the location of the task.

Default is `\` which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns

Return type *dict*

CLI Example:

```
salt 'minion-id' task.info <task_name>
```

`salt.modules.win_task.list_actions`(*name*, *location*='\')

List all actions that pertain to a task in the specified location.

Parameters

- **name** (*str*) -- The name of the task for which list actions.
- **location** (*str*) -- A string value representing the location of the task

from which to list actions. Default is `\` which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns Returns a list of actions.

Return type *list*

CLI Example:

```
salt 'minion-id' task.list_actions <task_name>
```

`salt.modules.win_task.list_folders(location='\\')`

List all folders located in a specific location in the task scheduler.

**Parameters** **location** (*str*) -- A string value representing the folder from which you want to list tasks. Default is `\\` which is the root for the task scheduler (C:WindowsSystem32tasks).

**Returns** Returns a list of folders.

Return type *list*

CLI Example:

```
salt 'minion-id' task.list_folders
```

`salt.modules.win_task.list_tasks(location='\\')`

List all tasks located in a specific location in the task scheduler.

**Parameters** **location** (*str*) -- A string value representing the folder from which you want to list tasks. Default is `\\` which is the root for the task scheduler (C:WindowsSystem32tasks).

**Returns** Returns a list of tasks.

Return type *list*

CLI Example:

```
salt 'minion-id' task.list_tasks
```

`salt.modules.win_task.list_triggers(name, location='\\')`

List all triggers that pertain to a task in the specified location.

**Parameters**

- **name** (*str*) -- The name of the task for which list triggers.
- **location** (*str*) -- A string value representing the location of the task

from which to list triggers. Default is `\\` which is the root for the task scheduler (C:WindowsSystem32tasks).

**Returns** Returns a list of triggers.

Return type *list*

CLI Example:

```
salt 'minion-id' task.list_triggers <task_name>
```

`salt.modules.win_task.run(name, location='\\')`

Run a scheduled task manually.

**Parameters**

- **name** (*str*) -- The name of the task to run.
- **location** (*str*) -- A string value representing the location of the task.

Default is `\\` which is the root for the task scheduler (C:WindowsSystem32tasks).

**Returns** True if successful, False if unsuccessful

Return type *bool*

CLI Example:

```
salt 'minion-id' task.list_run <task_name>
```

`salt.modules.win_task.run_wait(name, location='\\')`

Run a scheduled task and return when the task finishes

**Parameters**

- **name** (*str*) -- The name of the task to run.
- **location** (*str*) -- A string value representing the location of the task.

Default is `\\` which is the root for the task scheduler (C:WindowsSystem32tasks).

**Returns** True if successful, False if unsuccessful

**Return type** `bool`

CLI Example:

```
salt 'minion-id' task.list_run_wait <task_name>
```

`salt.modules.win_task.status(name, location='\\')`

Determine the status of a task. Is it Running, Queued, Ready, etc.

**Parameters**

- **name** (*str*) -- The name of the task for which to return the status
- **location** (*str*) -- A string value representing the location of the task.

Default is `\\` which is the root for the task scheduler (C:WindowsSystem32tasks).

**Returns** The current status of the task. Will be one of the following:

- Unknown
- Disabled
- Queued
- Ready
- Running

**Return type** `string`

CLI Example:

```
salt 'minion-id' task.list_status <task_name>
```

`salt.modules.win_task.stop(name, location='\\')`

Stop a scheduled task.

**Parameters**

- **name** (*str*) -- The name of the task to stop.
- **location** (*str*) -- A string value representing the location of the task.

Default is `\\` which is the root for the task scheduler (C:WindowsSystem32tasks).

**Returns** True if successful, False if unsuccessful

**Return type** `bool`

CLI Example:

```
salt 'minion-id' task.list_stop <task_name>
```

#### 14.7.441 salt.modules.win\_timezone

Module for managing timezone on Windows systems.

`salt.modules.win_timezone.get_hwclock()`

Get current hardware clock setting (UTC or localtime)

CLI Example:

```
salt '*' timezone.get_hwclock
```

`salt.modules.win_timezone.get_offset()`

Get current numeric timezone offset from UCT (i.e. -0700)

CLI Example:

```
salt '*' timezone.get_offset
```

`salt.modules.win_timezone.get_zone()`

Get current timezone (i.e. America/Denver)

CLI Example:

```
salt '*' timezone.get_zone
```

`salt.modules.win_timezone.get_zonecode()`

Get current timezone (i.e. PST, MDT, etc)

CLI Example:

```
salt '*' timezone.get_zonecode
```

`salt.modules.win_timezone.set_hwclock(clock)`

Sets the hardware clock to be either UTC or localtime

CLI Example:

```
salt '*' timezone.set_hwclock UTC
```

`salt.modules.win_timezone.set_zone(timezone)`

Unlinks, then symlinks /etc/localtime to the set timezone.

The timezone is crucial to several system processes, each of which SHOULD be restarted (for instance, whatever your system uses as its cron and syslog daemons). This will not be magically done for you!

CLI Example:

```
salt '*' timezone.set_zone 'America/Denver'
```

`salt.modules.win_timezone.zone_compare(timezone)`

Checks the md5sum between the given timezone, and the one set in /etc/localtime. Returns True if they match, and False if not. Mostly useful for running state checks.

Example:

```
salt '*' timezone.zone_compare 'America/Denver'
```

#### 14.7.442 salt.modules.win\_update

Module for running windows updates.

This module is being deprecated and will be removed in Salt Fluorine. Please use the `win_wua` module instead.

##### depends

- win32com
- win32con
- win32api
- pywintypes

New in version 2014.7.0.

Set windows updates to run by category. Default behavior is to install all updates that do not require user interaction to complete. Optionally set `categories` to a category of your choice to only install certain updates. Default is to set to install all available but driver updates. The following example will install all Security and Critical Updates, and download but not install standard updates.

```
salt '*' win_update.install_updates categories="['Critical Updates', 'Security Updates']"
```

You can also specify a number of features about the update to have a fine grain approach to specific types of updates. These are the following features/states of updates available for configuring: .. code-block:: text

```
`UI` - User interaction required, skipped by default
`downloaded` - Already downloaded, included by default
`present` - Present on computer, included by default
`installed` - Already installed, skipped by default
`reboot` - Reboot required, included by default
`hidden` - Skip hidden updates, skipped by default
`software` - Software updates, included by default
`driver` - Driver updates, included by default
```

The following example installs all updates that don't require a reboot: .. code-block:: bash

```
salt '*' win_update.install_updates skips="{reboot:True}"
```

Once installed Salt will return a similar output:

```
2 : Windows Server 2012 Update (KB123456)
4 : Internet Explorer Security Update (KB098765)
2 : Malware Definition Update (KB321456)
...
```

The number at the beginning of the line is an OperationResultCode from the Windows Update Agent, it's enumeration is described here: [https://msdn.microsoft.com/en-us/library/windows/desktop/aa387095\(v=vs.85\).aspx](https://msdn.microsoft.com/en-us/library/windows/desktop/aa387095(v=vs.85).aspx). The result code is then followed by the update name and its KB identifier.

**salt.modules.win\_update.download\_updates** (*skips=None, retries=5, categories=None*)  
Downloads all available updates, skipping those that require user interaction.

Various aspects of the updates can be included or excluded. this feature is still in development.

**retries** Number of retries to make before giving up. This is total, not per step.

**categories** Specify the categories to update. Must be passed as a list.

```
salt '*' win_update.download_updates categories="['Updates']"
```

Categories include the following:

- Updates
- Windows 7
- Critical Updates
- Security Updates
- Update Rollups

CLI Examples:

```
# Normal Usage
salt '*' win_update.download_updates

# Download critical updates only
salt '*' win_update.download_updates categories="['Critical Updates']"
```

**salt.modules.win\_update.install\_updates** (*skips=None, retries=5, categories=None*)  
Downloads and installs all available updates, skipping those that require user interaction.

Add `cached` to only install those updates which have already been downloaded.

you can set the maximum number of retries to `n` in the search process by adding: `retries=n`

various aspects of the updates can be included or excluded. This function is still under development.

**retries** Number of retries to make before giving up. This is total, not per step.

**categories** Specify the categories to install. Must be passed as a list.

```
salt '*' win_update.install_updates categories="['Updates']"
```

Categories include the following:

- Updates
- Windows 7
- Critical Updates
- Security Updates
- Update Rollups

CLI Examples:

```
# Normal Usage
salt '*' win_update.install_updates

# Install all critical updates
salt '*' win_update.install_updates categories="['Critical Updates']"
```

`salt.modules.win_update.list_updates` (*verbose=False, fields=None, skips=None, retries=5, categories=None*)

Returns a summary of available updates, grouped into their non-mutually exclusive categories.

**verbose** Return full set of results, including several fields from the COM.

**fields** Return a list of specific fields for each update. The optional values here are those at the root level of the verbose list. This is superseded by the verbose option.

**retries** Number of retries to make before giving up. This is total, not per step.

**categories** Specify the categories to list. Must be passed as a list.

```
salt '*' win_update.list_updates categories="['Updates']"
```

Categories include, but are not limited to, the following:

- Updates
- Windows 7
- Critical Updates
- Security Updates
- Update Rollups

CLI Examples:

```
# Normal Usage
salt '*' win_update.list_updates

# Specific Fields
salt '*' win_update.list_updates fields="['Title', 'Description']"

# List all critical updates list in verbose detail
salt '*' win_update.list_updates categories="['Critical Updates']" verbose=True
```

### 14.7.443 salt.modules.win\_useradd

Module for managing Windows Users

---

**Important:** If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to `'user.info' is not available`), see [here](#).

---

**depends**

- pythoncom

- pywintypes
- win32api
- win32con
- win32net
- win32netcon
- win32profile
- win32security
- win32ts
- wmi

---

**Note:** This currently only works with local user accounts, not domain accounts

---

```
salt.modules.win_useradd.add(name, password=None, fullname=None, description=None,
                             groups=None, home=None, homedrive=None, profile=None, lo-
                             gonscript=None)
```

Add a user to the minion.

**Parameters**

- **name** (*str*) -- User name
- **password** (*str*, *optional*) -- User's password in plain text.
- **fullname** (*str*, *optional*) -- The user's full name.
- **description** (*str*, *optional*) -- A brief description of the user account.
- **groups** (*str*, *optional*) -- A list of groups to add the user to. (see chgroups)
- **home** (*str*, *optional*) -- The path to the user's home directory.
- **homedrive** (*str*, *optional*) -- The drive letter to assign to the home directory. Must be the Drive Letter followed by a colon. ie: U:
- **profile** (*str*, *optional*) -- An explicit path to a profile. Can be a UNC or a folder on the system. If left blank, windows uses it's default profile directory.
- **logonscript** (*str*, *optional*) -- Path to a login script to run when the user logs on.

**Returns** True if successful. False is unsuccessful.

**Return type** `bool`

CLI Example:

```
salt '*' user.add name password
```

```
salt.modules.win_useradd.addgroup(name, group)
```

Add user to a group

**Parameters**

- **name** (*str*) -- The user name to add to the group
- **group** (*str*) -- The name of the group to which to add the user

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' user.addgroup jsnuffy 'Power Users'
```

```
salt.modules.win_useradd.chfullname(name, fullname)
```

Change the full name of the user

**Parameters**

- **name** (*str*) -- The user name for which to change the full name

- **fullname** (*str*) -- The new value for the full name

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```
salt '*' user.chfullname user 'First Last'
```

`salt.modules.win_useradd.chgroups` (*name, groups, append=True*)

Change the groups this user belongs to, add `append=False` to make the user a member of only the specified groups

**Parameters**

- **name** (*str*) -- The user name for which to change groups
- **groups** (*str, list*) -- A single group or a list of groups to assign to the user. For multiple groups this can be a comma delimited string or a list.
- **append** (*bool, optional*) -- True adds the passed groups to the user's current groups. False sets the user's groups to the passed groups only. Default is True.

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```
salt '*' user.chgroups jsnuffy Administrators,Users True
```

`salt.modules.win_useradd.chhome` (*name, home, \*\*kwargs*)

Change the home directory of the user, pass True for `persist` to move files to the new home directory if the old home directory exist.

**Parameters**

- **name** (*str*) -- The name of the user whose home directory you wish to change
- **home** (*str*) -- The new location of the home directory

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```
salt '*' user.chhome foo \\filesERVER\home\foo True
```

`salt.modules.win_useradd.chprofile` (*name, profile*)

Change the profile directory of the user

**Parameters**

- **name** (*str*) -- The name of the user whose profile you wish to change
- **profile** (*str*) -- The new location of the profile

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```
salt '*' user.chprofile foo \\filesERVER\profiles\foo
```

`salt.modules.win_useradd.current` (*sam=False*)

Get the username that salt-minion is running under. If salt-minion is running as a service it should return the Local System account. If salt is running from a command prompt it should return the username that started the command prompt.

New in version 2015.5.6.

**Parameters** **sam** (*bool, optional*) -- False returns just the username without any domain notation. True returns the domain with the username in the SAM format. Ie: domain\username

**Returns** Returns username

**Return type** str

CLI Example:

```
salt '*' user.current
```

`salt.modules.win_useradd.delete`(*name*, *purge=False*, *force=False*)

Remove a user from the minion

**Parameters**

- **name** (*str*) -- The name of the user to delete
- **purge** (*bool*, *optional*) -- Boolean value indicating that the user profile should also be removed when the user account is deleted. If set to True the profile will be removed. Default is False.
- **force** (*bool*, *optional*) -- Boolean value indicating that the user account should be deleted even if the user is logged in. True will log the user out and delete user.

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' user.delete name
```

`salt.modules.win_useradd.getUserSid`(*username*)

Get the Security ID for the user

**Parameters** **username** (*str*) -- The user name for which to look up the SID

**Returns** The user SID

**Return type** `str`

CLI Example:

```
salt '*' user.getUserSid jsnuffy
```

`salt.modules.win_useradd.getent`(*refresh=False*)

Return the list of all info for all users

**Parameters** **refresh** (*bool*, *optional*) -- Refresh the cached user information. Useful when used from within a state function. Default is False.

**Returns** A dictionary containing information about all users on the system

**Return type** `dict`

CLI Example:

```
salt '*' user.getent
```

`salt.modules.win_useradd.info`(*name*)

Return user information

**Parameters** **name** (*str*) -- Username for which to display information

**Returns**

A dictionary containing user information

- fullname
- username
- SID
- passwd (will always return None)
- comment (same as description, left here for backwards compatibility)
- description
- active
- logonscript
- profile
- home
- homedrive

- groups
- password\_changed
- successful\_logon\_attempts
- failed\_logon\_attempts
- last\_logon
- account\_disabled
- account\_locked
- password\_never\_expires
- disallow\_change\_password
- gid

**Return type** `dict`

CLI Example:

```
salt '*' user.info jsnuffy
```

`salt.modules.win_useradd.list_groups(name)`

Return a list of groups the named user belongs to

**Parameters** `name (str)` -- The user name for which to list groups

**Returns** A list of groups to which the user belongs

**Return type** `list`

CLI Example:

```
salt '*' user.list_groups foo
```

`salt.modules.win_useradd.list_users()`

Return a list of all users on Windows

**Returns** A list of all users on the system

**Return type** `list`

CLI Example:

```
salt '*' user.list_users
```

`salt.modules.win_useradd.removegroup(name, group)`

Remove user from a group

**Parameters**

- **name (str)** -- The user name to remove from the group
- **group (str)** -- The name of the group from which to remove the user

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' user.removegroup jsnuffy 'Power Users'
```

`salt.modules.win_useradd.rename(name, new_name)`

Change the username for a named user

**Parameters**

- **name (str)** -- The user name to change
- **new\_name (str)** -- The new name for the current user

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' user.rename jsnuffy jshmoe
```

`salt.modules.win_useradd.setpassword(name, password)`

Set the user's password

**Parameters**

- **name** (*str*) -- The user name for which to set the password
- **password** (*str*) -- The new password

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' user.setpassword jsnuffy sup3rs3cr3t
```

`salt.modules.win_useradd.update` (*name*, *password=None*, *fullname=None*, *description=None*, *home=None*, *homedrive=None*, *logonscript=None*, *profile=None*, *expiration\_date=None*, *expired=None*, *account\_disabled=None*, *unlock\_account=None*, *password\_never\_expires=None*, *disallow\_change\_password=None*)

Updates settings for the windows user. Name is the only required parameter. Settings will only be changed if the parameter is passed a value.

New in version 2015.8.0.

**Parameters**

- **name** (*str*) -- The user name to update.
- **password** (*str*, *optional*) -- New user password in plain text.
- **fullname** (*str*, *optional*) -- The user's full name.
- **description** (*str*, *optional*) -- A brief description of the user account.
- **home** (*str*, *optional*) -- The path to the user's home directory.
- **homedrive** (*str*, *optional*) -- The drive letter to assign to the home directory. Must be the Drive Letter followed by a colon. ie: U:
- **logonscript** (*str*, *optional*) -- The path to the logon script.
- **profile** (*str*, *optional*) -- The path to the user's profile directory.
- **expiration\_date** (*date*, *optional*) -- The date and time when the account expires. Can be a valid date/time string. To set to never expire pass the string `Never`.
- **expired** (*bool*, *optional*) -- Pass *True* to expire the account. The user will be prompted to change their password at the next logon. Pass *False* to mark the account as `not expired`. You can't use this to negate the expiration if the expiration was caused by the account expiring. You'll have to change the *expiration\_date* as well.
- **account\_disabled** (*bool*, *optional*) -- True disables the account. False enables the account.
- **unlock\_account** (*bool*, *optional*) -- True unlocks a locked user account. False is ignored.
- **password\_never\_expires** (*bool*, *optional*) -- True sets the password to never expire. False allows the password to expire.
- **disallow\_change\_password** (*bool*, *optional*) -- True blocks the user from changing the password. False allows the user to change the password.

**Returns** True if successful. False is unsuccessful.

**Return type** `bool`

CLI Example:

```
salt '*' user.update bob password=secret profile=C:\Users\Bob
home=\\server\homeshare\bob homedrive=U:
```

#### 14.7.444 salt.modules.win\_wua

Module for managing Windows Updates using the Windows Update Agent.

List updates on the system using the following functions:

- available
- list

This is an easy way to find additional information about updates available to to the system, such as the GUID, KB number, or description.

Once you have the GUID or a KB number for the update you can get information about the update, download, install, or uninstall it using these functions:

- get
- download
- install
- uninstall

The get function expects a name in the form of a GUID, KB, or Title and should return information about a single update. The other functions accept either a single item or a list of items for downloading/installing/uninstalling a specific list of items.

The list and get functions are utility functions. In addition to returning information about updates they can also download and install updates by setting `download=True` or `install=True`. So, with list for example, you could run the function with the filters you want to see what is available. Then just add `install=True` to install everything on that list.

If you want to download, install, or uninstall specific updates, use download, install, or uninstall. To update your system with the latest updates use list and set `install=True`

You can also adjust the Windows Update settings using the `set_wu_settings` function. This function is only supported on the following operating systems:

- Windows Vista / Server 2008
- Windows 7 / Server 2008R2
- Windows 8 / Server 2012
- Windows 8.1 / Server 2012R2

As of Windows 10 and Windows Server 2016, the ability to modify the Windows Update settings has been restricted. The settings can be modified in the Local Group Policy using the `lgpo` module.

New in version 2015.8.0.

#### depends

- salt.utils.win\_update

`salt.modules.win_wua.available` (*software=True, drivers=True, summary=False, skip\_installed=True, skip\_hidden=True, skip\_mandatory=False, skip\_reboot=False, categories=None, severities=None*)

New in version 2017.7.0.

List updates that match the passed criteria. This allows for more filter options than `list()`. Good for finding a specific GUID or KB.

#### Parameters

- **software** (*bool*) -- Include software updates in the results (default is True)
- **drivers** (*bool*) -- Include driver updates in the results (default is True)
- **summary** (*bool*) --
  - True: Return a summary of updates available for each category.
  - False (default): Return a detailed list of available updates.
- **skip\_installed** (*bool*) -- Skip updates that are already installed. Default is False.

- **skip\_hidden** (*bool*) -- Skip updates that have been hidden. Default is True.
- **skip\_mandatory** (*bool*) -- Skip mandatory updates. Default is False.
- **skip\_reboot** (*bool*) -- Skip updates that require a reboot. Default is False.
- **categories** (*list*) -- Specify the categories to list. Must be passed as a list. All categories returned by default.

Categories include the following:

- Critical Updates
  - Definition Updates
  - Drivers (make sure you set drivers=True)
  - Feature Packs
  - Security Updates
  - Update Rollups
  - Updates
  - Update Rollups
  - Windows 7
  - Windows 8.1
  - Windows 8.1 drivers
  - Windows 8.1 and later drivers
  - Windows Defender
- **severities** (*list*) -- Specify the severities to include. Must be passed as a list. All severities returned by default.

Severities include the following:

- Critical
- Important

## Returns

Returns a dict containing either a summary or a list of updates:

```
List of Updates:
{'<GUID>': {'Title': <title>,
            'KB': <KB>,
            'GUID': <the globally unique identifier for the update>,
            'Description': <description>,
            'Downloaded': <has the update been downloaded>,
            'Installed': <has the update been installed>,
            'Mandatory': <is the update mandatory>,
            'UserInput': <is user input required>,
            'EULAAccepted': <has the EULA been accepted>,
            'Severity': <update severity>,
            'NeedsReboot': <is the update installed and awaiting
↵reboot>,
            'RebootBehavior': <will the update require a reboot>,
            'Categories': [ '<category 1>',
                           '<category 2>',
                           ...]
                          }
}

Summary of Updates:
{'Total': <total number of updates returned>,
 'Available': <updates that are not downloaded or installed>,
 'Downloaded': <updates that are downloaded but not installed>,
 'Installed': <updates installed (usually 0 unless installed=True)>,
 'Categories': { <category 1>: <total for that category>,
                 <category 2>: <total for category 2>,
                 ... }
```

```
}

```

**Return type** dict

CLI Examples:

```
# Normal Usage (list all software updates)
salt '*' win_wua.available

# List all updates with categories of Critical Updates and Drivers
salt '*' win_wua.available categories=["Critical Updates","Drivers"]

# List all Critical Security Updates
salt '*' win_wua.available categories=["Security Updates"] severities=["Critical"]

# List all updates with a severity of Critical
salt '*' win_wua.available severities=["Critical"]

# A summary of all available updates
salt '*' win_wua.available summary=True

# A summary of all Feature Packs and Windows 8.1 Updates
salt '*' win_wua.available categories=["Feature Packs","Windows 8.1"] summary=True

```

**salt.modules.win\_wua.download**(names)

New in version 2017.7.0.

Downloads updates that match the list of passed identifiers. It's easier to use this function by using `list_updates` and setting `install=True`.

**Parameters** **names** (*str*, *list*) -- A single update or a list of updates to download. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.

---

**Note:** An error will be raised if there are more results than there are items in the `names` parameter

---

**Returns** A dictionary containing the details about the downloaded updates**Return type** dict

CLI Examples:

```
# Normal Usage
salt '*' win_wua.download names=['12345678-abcd-1234-abcd-1234567890ab',
→ 'KB2131233']

```

**salt.modules.win\_wua.download\_update**(name)Deprecated since version 2017.7.0: Use `download()` instead

Downloads a single update.

**Parameters** **name** (*str*) -- The name of the update to download. This can be a GUID, a KB number, or any part of the name. To ensure a single item is matched the GUID is preferred.

---

**Note:** If more than one result is returned an error will be raised.

---

**Returns** A dictionary containing the results of the download**Return type** dict

CLI Examples:

```
salt '*' win_wua.download_update 12345678-abcd-1234-abcd-1234567890ab
salt '*' win_wua.download_update KB12312321
```

`salt.modules.win_wua.download_updates`(*names*)

Deprecated since version 2017.7.0: Use `download()` instead

Downloads updates that match the list of passed identifiers. It's easier to use this function by using `list_updates` and setting `install=True`.

**Parameters** `names` (`list`) -- A list of updates to download. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.

**Returns** A dictionary containing the details about the downloaded updates

**Return type** `dict`

CLI Examples:

```
# Normal Usage
salt '*' win_wua.download_updates guid=['12345678-abcd-1234-abcd-1234567890ab',
↳ 'KB2131233']
```

`salt.modules.win_wua.get`(*name*, *download=False*, *install=False*)

New in version 2017.7.0.

Returns details for the named update

**Parameters**

- **name** (`str`) -- The name of the update you're searching for. This can be the GUID, a KB number, or any part of the name of the update. GUIDs and KBs are preferred. Run `list` to get the GUID for the update you're looking for.
- **download** (`bool`) -- Download the update returned by this function. Run this function first to see if the update exists, then set `download=True` to download the update.
- **install** (`bool`) -- Install the update returned by this function. Run this function first to see if the update exists, then set `install=True` to install the update.

**Returns**

Returns a dict containing a list of updates that match the name if `download` and `install` are both set to `False`. Should usually be a single update, but can return multiple if a partial name is given.

If `download` or `install` is set to `true` it will return the results of the operation.

```
List of Updates:
{'<GUID>': {'Title': <title>,
           'KB': <KB>,
           'GUID': <the globally unique identifier for the update>,
           'Description': <description>,
           'Downloaded': <has the update been downloaded>,
           'Installed': <has the update been installed>,
           'Mandatory': <is the update mandatory>,
           'UserInput': <is user input required>,
           'EULAAccepted': <has the EULA been accepted>,
           'Severity': <update severity>,
           'NeedsReboot': <is the update installed and awaiting
↳reboot>,
           'RebootBehavior': <will the update require a reboot>,
           'Categories': [ '<category 1>',
                           '<category 2>',
                           ...]
```

```
    }  
}
```

**Return type** dict

CLI Examples:

```
# Recommended Usage using GUID without braces  
# Use this to find the status of a specific update  
salt '*' win_wua.get 12345678-abcd-1234-abcd-1234567890ab  
  
# Use the following if you don't know the GUID:  
  
# Using a KB number  
# Not all updates have an associated KB  
salt '*' win_wua.get KB3030298  
  
# Using part or all of the name of the update  
# Could possibly return multiple results  
# Not all updates have an associated KB  
salt '*' win_wua.get 'Microsoft Camera Codec Pack'
```

`salt.modules.win_wua.get_needs_reboot()`

Determines if the system needs to be rebooted.

**Returns** True if the system requires a reboot, otherwise False

**Return type** bool

CLI Examples:

```
salt '*' win_wua.get_needs_reboot
```

`salt.modules.win_wua.get_wu_settings()`

Get current Windows Update settings.

**Returns**

A dictionary of Windows Update settings:

**Featured Updates:** Boolean value that indicates whether to display notifications for featured updates.

**Group Policy Required (Read-only):** Boolean value that indicates whether Group Policy requires the Automatic Updates service.

**Microsoft Update:** Boolean value that indicates whether to turn on Microsoft Update for other Microsoft Products

**Needs Reboot:** Boolean value that indicates whether the machine is in a reboot pending state.

**Non Admins Elevated:** Boolean value that indicates whether non-administrators can perform some update-related actions without administrator approval.

**Notification Level:**

**Number 1 to 4 indicating the update level:**

1. Never check for updates
2. Check for updates but let me choose whether to download and install them
3. Download updates but let me choose whether to install them
4. Install updates automatically

**Read Only (Read-only):** Boolean value that indicates whether the Automatic Update settings are read-only.

**Recommended Updates:** Boolean value that indicates whether to include optional or recommended updates when a search for updates and installation of updates is performed.

**Scheduled Day:** Days of the week on which Automatic Updates installs or uninstalls updates.

**Scheduled Time:** Time at which Automatic Updates installs or uninstalls updates.

**Return type** `dict`

CLI Examples:

```
salt '*' win_wua.get_wu_settings
```

`salt.modules.win_wua.install(names)`

New in version 2017.7.0.

Installs updates that match the list of identifiers. It may be easier to use the `list_updates` function and set `install=True`.

**Parameters** `names (str, list)` -- A single update or a list of updates to install. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.

---

**Note:** An error will be raised if there are more results than there are items in the `names` parameter

---

**Returns** A dictionary containing the details about the installed updates

**Return type** `dict`

CLI Examples:

```
# Normal Usage
salt '*' win_wua.install KB12323211
```

`salt.modules.win_wua.install_update(name)`

Deprecated since version 2017.7.0: Use `install()` instead

Installs a single update

**Parameters**

- **name** (`str`) -- The name of the update to install. This can be a GUID, a KB
- **or any part of the name. To ensure a single item is matched the (number,)** --
- **is preferred.** (`GUID`) --

---

**Note:** If no results or more than one result is returned an error will be raised.

---

**Returns** A dictionary containing the results of the install

**Return type** `dict`

CLI Examples:

```
salt '*' win_wua.install_update 12345678-abcd-1234-abcd-1234567890ab
salt '*' win_wua.install_update KB12312231
```

`salt.modules.win_wua.install_updates(names)`

Deprecated since version 2017.7.0: Use `install()` instead

Installs updates that match the list of identifiers. It may be easier to use the `list_updates` function and set `install=True`.

**Parameters**

- **names** (`list`) -- A list of updates to install. This can be any combination
- **GUIDs, KB numbers, or names. GUIDs or KBs are preferred.** (`of`) --

**Returns** A dictionary containing the details about the installed updates

Return type `dict`

CLI Examples:

```
# Normal Usage
salt '*' win_wua.install_updates guid=['12345678-abcd-1234-abcd-1234567890ab',
→ 'KB12323211']
```

`salt.modules.win_wua.list` (*software=True, drivers=False, summary=False, skip\_installed=True, categories=None, severities=None, download=False, install=False*)

New in version 2017.7.0.

Returns a detailed list of available updates or a summary. If download or install is True the same list will be downloaded and/or installed.

Parameters

- **software** (*bool*) -- Include software updates in the results (default is True)
- **drivers** (*bool*) -- Include driver updates in the results (default is False)
- **summary** (*bool*) --
  - True: Return a summary of updates available for each category.
  - False (default): Return a detailed list of available updates.
- **skip\_installed** (*bool*) -- Skip installed updates in the results (default is False)
- **download** (*bool*) -- (Overrides reporting functionality) Download the list of updates returned by this function. Run this function first with `download=False` to see what will be downloaded, then set `download=True` to download the updates.
- **install** (*bool*) -- (Overrides reporting functionality) Install the list of updates returned by this function. Run this function first with `install=False` to see what will be installed, then set `install=True` to install the updates.
- **categories** (*list*) -- Specify the categories to list. Must be passed as a list. All categories returned by default.

Categories include the following:

- Critical Updates
- Definition Updates
- Drivers (make sure you set `drivers=True`)
- Feature Packs
- Security Updates
- Update Rollups
- Updates
- Update Rollups
- Windows 7
- Windows 8.1
- Windows 8.1 drivers
- Windows 8.1 and later drivers
- Windows Defender
- **severities** (*list*) -- Specify the severities to include. Must be passed as a list. All severities returned by default.

Severities include the following:

- Critical
- Important

Returns

Returns a dict containing either a summary or a list of updates:

```
List of Updates:
{'<GUID>': {'Title': <title>,
           'KB': <KB>,
           'GUID': <the globally unique identifier for the update>
```

```

        'Description': <description>,
        'Downloaded': <has the update been downloaded>,
        'Installed': <has the update been installed>,
        'Mandatory': <is the update mandatory>,
        'UserInput': <is user input required>,
        'EULAAccepted': <has the EULA been accepted>,
        'Severity': <update severity>,
        'NeedsReboot': <is the update installed and awaiting
↪reboot>,
        'RebootBehavior': <will the update require a reboot>,
        'Categories': [ '<category 1>',
                        '<category 2>',
                        ... ]
    }
}

Summary of Updates:
{'Total': <total number of updates returned>,
 'Available': <updates that are not downloaded or installed>,
 'Downloaded': <updates that are downloaded but not installed>,
 'Installed': <updates installed (usually 0 unless installed=True)>,
 'Categories': { <category 1>: <total for that category>,
                 <category 2>: <total for category 2>,
                 ... }
}

```

Return type `dict`

CLI Examples:

```

# Normal Usage (list all software updates)
salt '*' win_wua.list

# List all updates with categories of Critical Updates and Drivers
salt '*' win_wua.list categories=['Critical Updates','Drivers']

# List all Critical Security Updates
salt '*' win_wua.list categories=['Security Updates'] severities=['Critical']

# List all updates with a severity of Critical
salt '*' win_wua.list severities=['Critical']

# A summary of all available updates
salt '*' win_wua.list summary=True

# A summary of all Feature Packs and Windows 8.1 Updates
salt '*' win_wua.list categories=['Feature Packs','Windows 8.1'] summary=True

```

`salt.modules.win_wua.list_update` (*name*, *download=False*, *install=False*)

Deprecated since version 2017.7.0: Use `get()` instead

Returns details for all updates that match the search criteria

Parameters

- **name** (*str*) -- The name of the update you're searching for. This can be the GUID, a KB number, or any part of the name of the update. GUIDs and KBs are preferred. Run `list_updates` to get the GUID for the update you're looking for.
- **download** (*bool*) -- Download the update returned by this function. Run this function first to see if the update exists, then set `download=True` to download the update.

- **install** (*bool*) -- Install the update returned by this function. Run this function first to see if the update exists, then set `install=True` to install the update.

#### Returns

Returns a dict containing a list of updates that match the name if download and install are both set to False. Should usually be a single update, but can return multiple if a partial name is given.

If download or install is set to true it will return the results of the operation.

```
List of Updates:
{'<GUID>': {'Title': <title>,
           'KB': <KB>,
           'GUID': <the globally unique identifier for the update>
           'Description': <description>,
           'Downloaded': <has the update been downloaded>,
           'Installed': <has the update been installed>,
           'Mandatory': <is the update mandatory>,
           'UserInput': <is user input required>,
           'EULAAccepted': <has the EULA been accepted>,
           'Severity': <update severity>,
           'NeedsReboot': <is the update installed and awaiting
↳reboot>,
           'RebootBehavior': <will the update require a reboot>,
           'Categories': [ '<category 1>',
                          '<category 2>',
                          ...]
           }
}
```

#### Return type dict

#### CLI Examples:

```
# Recommended Usage using GUID without braces
# Use this to find the status of a specific update
salt '*' win_wua.list_update 12345678-abcd-1234-abcd-1234567890ab

# Use the following if you don't know the GUID:

# Using a KB number (could possibly return multiple results)
# Not all updates have an associated KB
salt '*' win_wua.list_update KB3030298

# Using part or all of the name of the update
# Could possibly return multiple results
# Not all updates have an associated KB
salt '*' win_wua.list_update 'Microsoft Camera Codec Pack'
```

`salt.modules.win_wua.list_updates` (*software=True, drivers=False, summary=False, skip\_installed=True, categories=None, severities=None, download=False, install=False*)

Deprecated since version 2017.7.0: Use `list()` instead

Returns a detailed list of available updates or a summary. If download or install is True the same list will be downloaded and/or installed.

#### Parameters

- **software** (*bool*) -- Include software updates in the results (default is True)
- **drivers** (*bool*) -- Include driver updates in the results (default is False)
- **summary** (*bool*) --

- True: Return a summary of updates available for each category.
- False (default): Return a detailed list of available updates.
- **skip\_installed** (*bool*) -- Skip installed updates in the results (default is False)
- **download** (*bool*) -- (Overrides reporting functionality) Download the list of updates returned by this function. Run this function first with `download=False` to see what will be downloaded, then set `download=True` to download the updates.
- **install** (*bool*) -- (Overrides reporting functionality) Install the list of updates returned by this function. Run this function first with `install=False` to see what will be installed, then set `install=True` to install the updates.
- **categories** (*list*) -- Specify the categories to list. Must be passed as a list. All categories returned by default.

Categories include the following:

- Critical Updates
  - Definition Updates
  - Drivers (make sure you set `drivers=True`)
  - Feature Packs
  - Security Updates
  - Update Rollups
  - Updates
  - Update Rollups
  - Windows 7
  - Windows 8.1
  - Windows 8.1 drivers
  - Windows 8.1 and later drivers
  - Windows Defender
- **severities** (*list*) -- Specify the severities to include. Must be passed as a list. All severities returned by default.

Severities include the following:

- Critical
- Important

## Returns

Returns a dict containing either a summary or a list of updates:

```
List of Updates:
{'<GUID>': {'Title': <title>,
           'KB': <KB>,
           'GUID': <the globally unique identifier for the update>,
           'Description': <description>,
           'Downloaded': <has the update been downloaded>,
           'Installed': <has the update been installed>,
           'Mandatory': <is the update mandatory>,
           'UserInput': <is user input required>,
           'EULAAccepted': <has the EULA been accepted>,
           'Severity': <update severity>,
           'NeedsReboot': <is the update installed and awaiting
↵reboot>,
           'RebootBehavior': <will the update require a reboot>,
           'Categories': [ '<category 1>',
                          '<category 2>',
                          ...]
          }
}

Summary of Updates:
```

```
{'Total': <total number of updates returned>,
  'Available': <updates that are not downloaded or installed>,
  'Downloaded': <updates that are downloaded but not installed>,
  'Installed': <updates installed (usually 0 unless installed=True)>,
  'Categories': { <category 1>: <total for that category>,
                  <category 2>: <total for category 2>,
                  ... }
}
```

Return type `dict`

CLI Examples:

```
# Normal Usage (list all software updates)
salt '*' win_wua.list_updates

# List all updates with categories of Critical Updates and Drivers
salt '*' win_wua.list_updates categories=['Critical Updates','Drivers']

# List all Critical Security Updates
salt '*' win_wua.list_updates categories=['Security Updates'] severities=[
  ↪'Critical']

# List all updates with a severity of Critical
salt '*' win_wua.list_updates severities=['Critical']

# A summary of all available updates
salt '*' win_wua.list_updates summary=True

# A summary of all Feature Packs and Windows 8.1 Updates
salt '*' win_wua.list_updates categories=['Feature Packs','Windows 8.1'] ↪
  ↪summary=True
```

`salt.modules.win_wua.set_wu_settings` (*level=None, recommended=None, featured=None, elevated=None, msupdate=None, day=None, time=None*)

Change Windows Update settings. If no parameters are passed, the current value will be returned.

Supported:

- Windows Vista / Server 2008
- Windows 7 / Server 2008R2
- Windows 8 / Server 2012
- Windows 8.1 / Server 2012R2

Parameters

- **level** (*int*) -- Number from 1 to 4 indicating the update level:
  1. Never check for updates
  2. Check for updates but let me choose whether to download and install them
  3. Download updates but let me choose whether to install them
  4. Install updates automatically
- **recommended** (*bool*) -- Boolean value that indicates whether to include optional or recommended updates when a search for updates and installation of updates is performed.
- **featured** (*bool*) -- Boolean value that indicates whether to display notifications for featured updates.
- **elevated** (*bool*) -- Boolean value that indicates whether non-administrators can perform some update-related actions without administrator approval.
- **msupdate** (*bool*) -- Boolean value that indicates whether to turn on Microsoft Update for other Microsoft products
- **day** (*str*) -- Days of the week on which Automatic Updates installs or uninstalls

updates. Accepted values:

- Everyday
- Monday
- Tuesday
- Wednesday
- Thursday
- Friday
- Saturday
- **time** (*str*) -- Time at which Automatic Updates installs or uninstalls updates. Must be in the ##:## 24hr format, eg. 3:00 PM would be 15:00. Must be in 1 hour increments.

**Returns** Returns a dictionary containing the results.

**Return type** dict

CLI Examples:

```
salt '*' win_wua.set_wu_settings level=4 recommended=True featured=False
```

**salt.modules.win\_wua.uninstall**(*names*)

New in version 2017.7.0.

Uninstall updates.

**Parameters** **names** (*str*, *list*) -- A single update or a list of updates to uninstall. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.

**Returns** A dictionary containing the details about the uninstalled updates

**Return type** dict

CLI Examples:

```
# Normal Usage
salt '*' win_wua.uninstall KB3121212

# As a list
salt '*' win_wua.uninstall guid=['12345678-abcd-1234-abcd-1234567890ab',
↳ 'KB1231231']
```

#### 14.7.445 salt.modules.x509

Manage X509 certificates

New in version 2015.8.0.

**depends** M2Crypto

**salt.modules.x509.create\_certificate**(*path=None*, *text=False*, *overwrite=True*, *ca\_server=None*, *\*\*kwargs*)

Create an X509 certificate.

**path**: Path to write the certificate to.

**text**: If True, return the PEM text without writing to a file. Default False.

**overwrite**: If True(default), create\_certificate will overwrite the entire pem file. Set False to preserve existing private keys and dh params that may exist in the pem file.

**kwargs**: Any of the properties below can be included as additional keyword arguments.

**ca\_server**: Request a remotely signed certificate from ca\_server. For this to work, a signing\_policy must be specified, and that same policy must be configured on the ca\_server. See signing\_policy for details. Also the salt master must permit peers to call the sign\_remote\_certificate function.

Example:

```
/etc/salt/master.d/peer.conf
```

```
peer:  
  .*:  
    - x509.sign_remote_certificate
```

**subject properties:** Any of the values below can be included to set subject properties Any other subject properties supported by OpenSSL should also work.

**C:** 2 letter Country code

**CN:** Certificate common name, typically the FQDN.

**Email:** Email address

**GN:** Given Name

**L:** Locality

**O:** Organization

**OU:** Organization Unit

**SN:** SurName

**ST:** State or Province

**signing\_private\_key:** A path or string of the private key in PEM format that will be used to sign this certificate. If neither `signing_cert`, `public_key`, or `csr` are included, it will be assumed that this is a self-signed certificate, and the public key matching `signing_private_key` will be used to create the certificate.

**signing\_private\_key\_passphrase:** Passphrase used to decrypt the `signing_private_key`.

**signing\_cert:** A certificate matching the private key that will be used to sign this certificate. This is used to populate the issuer values in the resulting certificate. Do not include this value for self-signed certificates.

**public\_key:** The public key to be included in this certificate. This can be sourced from a public key, certificate, csr or private key. If a private key is used, the matching public key from the private key will be generated before any processing is done. This means you can request a certificate from a remote CA using a private key file as your `public_key` and only the public key will be sent across the network to the CA. If neither `public_key` or `csr` are specified, it will be assumed that this is a self-signed certificate, and the public key derived from `signing_private_key` will be used. Specify either `public_key` or `csr`, not both. Because you can input a CSR as a public key or as a CSR, it is important to understand the difference. If you import a CSR as a public key, only the public key will be added to the certificate, subject or extension information in the CSR will be lost.

**public\_key\_passphrase:** If the public key is supplied as a private key, this is the passphrase used to decrypt it.

**csr:** A file or PEM string containing a certificate signing request. This will be used to supply the subject, extensions and public key of a certificate. Any subject or extensions specified explicitly will overwrite any in the CSR.

**basicConstraints:** X509v3 Basic Constraints extension.

**extensions:** The following arguments set X509v3 Extension values. If the value starts with ``critical``, the extension will be marked as critical.

Some special extensions are `subjectKeyIdentifier` and `authorityKeyIdentifier`.

`subjectKeyIdentifier` can be an explicit value or it can be the special string `hash`. `hash` will set the `subjectKeyIdentifier` equal to the SHA1 hash of the modulus of the public key in this certificate. Note that this is not the exact same hashing method used by OpenSSL when using the `hash` value.

`authorityKeyIdentifier` Use values acceptable to the openssl CLI tools. This will automatically populate `authorityKeyIdentifier` with the `subjectKeyIdentifier` of `signing_cert`. If this is a self-signed cert these values will be the same.

**basicConstraints:** X509v3 Basic Constraints

**keyUsage:** X509v3 Key Usage

**extendedKeyUsage:** X509v3 Extended Key Usage

**subjectKeyIdentifier:** X509v3 Subject Key Identifier

**issuerAltName:** X509v3 Issuer Alternative Name

**subjectAltName:** X509v3 Subject Alternative Name

**crlDistributionPoints:** X509v3 CRL distribution points  
**issuingDistributionPoint:** X509v3 Issuing Distribution Point  
**certificatePolicies:** X509v3 Certificate Policies  
**policyConstraints:** X509v3 Policy Constraints  
**inhibitAnyPolicy:** X509v3 Inhibit Any Policy  
**nameConstraints:** X509v3 Name Constraints  
**noCheck:** X509v3 OCSP No Check  
**nsComment:** Netscape Comment  
**nsCertType:** Netscape Certificate Type  
**days\_valid:** The number of days this certificate should be valid. This sets the `notAfter` property of the certificate. Defaults to 365.  
**version:** The version of the X509 certificate. Defaults to 3. This is automatically converted to the version value, so `version=3` sets the certificate version field to 0x2.  
**serial\_number:** The serial number to assign to this certificate. If omitted a random serial number of size `serial_bits` is generated.  
**serial\_bits:** The number of bits to use when randomly generating a serial number. Defaults to 64.  
**algorithm:** The hashing algorithm to be used for signing this certificate. Defaults to sha256.  
**copypath:** An additional path to copy the resulting certificate to. Can be used to maintain a copy of all certificates issued for revocation purposes.  
**prepend\_cn:** If set to True, the CN and a dash will be prepended to the copypath's filename.  
**Example:** `/etc/pki/issued_certs/www.example.com-DE:CA:FB:AD:00:00:00:00.crt`  
**signing\_policy:** A signing policy that should be used to create this certificate. Signing policies should be defined in the minion configuration, or in a minion pillar. It should be a yaml formatted list of arguments which will override any arguments passed to this function. If the `minions` key is included in the signing policy, only minions matching that pattern will be permitted to remotely request certificates from that policy.

Example:

```
x509_signing_policies:
  www:
    - minions: 'www*'
    - signing_private_key: /etc/pki/ca.key
    - signing_cert: /etc/pki/ca.crt
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - basicConstraints: "critical CA:false"
    - keyUsage: "critical cRLSign, keyCertSign"
    - subjectKeyIdentifier: hash
    - authorityKeyIdentifier: keyid,issuer:always
    - days_valid: 90
    - copypath: /etc/pki/issued_certs/
```

The above signing policy can be invoked with `signing_policy=www`  
 CLI Example:

```
salt '*' x509.create_certificate path=/etc/pki/myca.crt \
  signing_private_key='/etc/pki/myca.key' csr='/etc/pki/myca.csr'}
```

```
salt.modules.x509.create_crl(path=None, text=False, signing_private_key=None, signing_private_key_passphrase=None, signing_cert=None, revoked=None, include_expired=False, days_valid=100, digest='')
```

Create a CRL

Depends

- PyOpenSSL Python module

**path:** Path to write the crl to.

**text:** If True, return the PEM text without writing to a file. Default False.

**signing\_private\_key:** A path or string of the private key in PEM format that will be used to sign this crl. This is required.

**signing\_private\_key\_passphrase:** Passphrase to decrypt the private key.

**signing\_cert:** A certificate matching the private key that will be used to sign this crl. This is required.

**revoked:** A list of dicts containing all the certificates to revoke. Each dict represents one certificate. A dict must contain either the key `serial_number` with the value of the serial number to revoke, or `certificate` with either the PEM encoded text of the certificate, or a path to the certificate to revoke.

The dict can optionally contain the `revocation_date` key. If this key is omitted the revocation date will be set to now. If should be a string in the format ```%Y-%m-%d %H:%M:%S```.

The dict can also optionally contain the `not_after` key. This is redundant if the `certificate` key is included. If the `Certificate` key is not included, this can be used for the logic behind the `include_expired` parameter. If should be a string in the format ```%Y-%m-%d %H:%M:%S```.

The dict can also optionally contain the `reason` key. This is the reason code for the revocation. Available choices are `unspecified`, `keyCompromise`, `CACompromise`, `affiliationChanged`, `superseded`, `cessationOfOperation` and `certificateHold`.

**include\_expired:** Include expired certificates in the CRL. Default is False.

**days\_valid:** The number of days that the CRL should be valid. This sets the Next Update field in the CRL.

**digest:** The digest to use for signing the CRL. This has no effect on versions of pyOpenSSL less than 0.14

CLI Example:

```
salt '*' x509.create_crl path=/etc/pki/mykey.key \
    signing_private_key=/etc/pki/ca.key \
    signing_cert=/etc/pki/ca.crt \
    revoked="{ 'compromized-web-key': \
    {'certificate': '/etc/pki/certs/www1.crt', \
    'revocation_date': '2015-03-01 00:00:00'} }"
```

`salt.modules.x509.create_csr` (*path=None, text=False, \*\*kwargs*)

Create a certificate signing request.

**path:** Path to write the certificate to.

**text:** If True, return the PEM text without writing to a file. Default False.

**algorithm:** The hashing algorithm to be used for signing this request. Defaults to sha256.

**kwargs:** The subject, extension and version arguments from `x509.create_certificate` can be used.

CLI Example:

```
salt '*' x509.create_csr path=/etc/pki/myca.csr \
    public_key='/etc/pki/myca.key' CN='My Cert'
```

`salt.modules.x509.create_private_key` (*path=None, text=False, bits=2048, passphrase=None, cipher='aes\_128\_cbc', verbose=True*)

Creates a private key in PEM format.

**path:** The path to write the file to, either `path` or `text` are required.

**text:** If True, return the PEM text without writing to a file. Default False.

**bits:** Length of the private key in bits. Default 2048

**passphrase:** Passphrase for encrypting the private key

**cipher:** Cipher for encrypting the private key. Has no effect if `passphrase` is None.

**verbose:** Provide visual feedback on stdout. Default True

New in version 2016.11.0.

CLI Example:

```
salt '*' x509.create_private_key path=/etc/pki/mykey.key
```

`salt.modules.x509.expired`(*certificate*)

Returns a dict containing limited details of a certificate and whether the certificate has expired.

New in version 2016.11.0.

**certificate**: The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.

CLI Example:

```
salt '*' x509.expired "/etc/pki/mycert.crt"
```

`salt.modules.x509.get_pem_entries`(*glob\_path*)

Returns a dict containing PEM entries in files matching a glob

**glob\_path**: A path to certificates to be read and returned.

CLI Example:

```
salt '*' x509.read_pem_entries "/etc/pki/*.crt"
```

`salt.modules.x509.get_pem_entry`(*text*, *pem\_type=None*)

Returns a properly formatted PEM string from the input text fixing any whitespace or line-break issues

**text**: Text containing the X509 PEM entry to be returned or path to a file containing the text.

**pem\_type**: If specified, this function will only return a pem of a certain type, for example `CERTIFICATE` or `CERTIFICATE REQUEST`.

CLI Example:

```
salt '*' x509.get_pem_entry "-----BEGIN CERTIFICATE REQUEST-----\nMIICyzCC Ar8CAQI...-----END CERTIFICATE REQUEST"
```

`salt.modules.x509.get_private_key_size`(*private\_key*, *passphrase=None*)

Returns the bit length of a private key in PEM format.

**private\_key**: A path or PEM encoded string containing a private key.

CLI Example:

```
salt '*' x509.get_private_key_size /etc/pki/mycert.key
```

`salt.modules.x509.get_public_key`(*key*, *passphrase=None*, *asObj=False*)

Returns a string containing the public key in PEM format.

**key**: A path or PEM encoded string containing a CSR, Certificate or Private Key from which a public key can be retrieved.

CLI Example:

```
salt '*' x509.get_public_key /etc/pki/mycert.cer
```

`salt.modules.x509.get_signing_policy`(*signing\_policy\_name*)

Returns the details of a names signing policy, including the text of the public key that will be used to sign it. Does not return the private key.

CLI Example:

```
salt '*' x509.get_signing_policy www
```

`salt.modules.x509.read_certificate`(*certificate*)

Returns a dict containing details of a certificate. Input can be a PEM string or file path.

**certificate**: The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.

CLI Example:

```
salt '*' x509.read_certificate /etc/pki/mycert.crt
```

`salt.modules.x509.read_certificates`(*glob\_path*)

Returns a dict containing details of a all certificates matching a glob

**glob\_path:** A path to certificates to be read and returned.

CLI Example:

```
salt '*' x509.read_certificates "/etc/pki/*.crt"
```

`salt.modules.x509.read_crl`(*crl*)

Returns a dict containing details of a certificate revocation list. Input can be a PEM string or file path.

**Depends**

- OpenSSL command line tool

**csl:** A path or PEM encoded string containing the CSL to read.

CLI Example:

```
salt '*' x509.read_crl /etc/pki/mycrl.crl
```

`salt.modules.x509.read_csr`(*csr*)

Returns a dict containing details of a certificate request.

**Depends**

- OpenSSL command line tool

**csr:** A path or PEM encoded string containing the CSR to read.

CLI Example:

```
salt '*' x509.read_csr /etc/pki/mycert.csr
```

`salt.modules.x509.sign_remote_certificate`(*argdic*, *\*\*kwargs*)

Request a certificate to be remotely signed according to a signing policy.

**argdic:** A dict containing all the arguments to be passed into the `create_certificate` function. This will become `kwargs` when passed to `create_certificate`.

**kwargs:** kwargs delivered from `publish.publish`

CLI Example:

```
salt '*' x509.sign_remote_certificate argdic="{ 'public_key': \
'/etc/pki/www.key', 'signing_policy': 'www' }" __pub_id='www1'
```

`salt.modules.x509.verify_crl`(*crl*, *cert*)

Validate a CRL against a certificate. Parses openssl command line output, this is a workaround for M2Crypto's inability to get them from CSR objects.

**crl:** The CRL to verify

**cert:** The certificate to verify the CRL against

CLI Example:

```
salt '*' x509.verify_crl crl=/etc/pki/myca.crl cert=/etc/pki/myca.crt
```

`salt.modules.x509.verify_private_key`(*private\_key*, *public\_key*, *passphrase=None*)

Verify that `'private_key'` matches `'public_key'`

**private\_key:** The private key to verify, can be a string or path to a private key in PEM format.

**public\_key:** The public key to verify, can be a string or path to a PEM formatted certificate, csr, or another private key.

**passphrase:** Passphrase to decrypt the private key.

CLI Example:

```
salt '*' x509.verify_private_key private_key=/etc/pki/myca.key \
    public_key=/etc/pki/myca.crt
```

**salt.modules.x509.verify\_signature**(*certificate*, *signing\_pub\_key=*None, *signing\_pub\_key\_passphrase=*None)

Verify that *certificate* has been signed by *signing\_pub\_key*

**certificate**: The certificate to verify. Can be a path or string containing a PEM formatted certificate.

**signing\_pub\_key**: The public key to verify, can be a string or path to a PEM formatted certificate, csr, or private key.

**signing\_pub\_key\_passphrase**: Passphrase to the *signing\_pub\_key* if it is an encrypted private key.

CLI Example:

```
salt '*' x509.verify_signature /etc/pki/mycert.pem \
    signing_pub_key=/etc/pki/myca.crt
```

**salt.modules.x509.will\_expire**(*certificate*, *days*)

Returns a dict containing details of a certificate and whether the certificate will expire in the specified number of days. Input can be a PEM string or file path.

New in version 2016.11.0.

**certificate**: The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.

CLI Example:

```
salt '*' x509.will_expire "/etc/pki/mycert.crt" days=30
```

**salt.modules.x509.write\_pem**(*text*, *path*, *overwrite=*True, *pem\_type=*None)

Writes out a PEM string fixing any formatting or whitespace issues before writing.

**text**: PEM string input to be written out.

**path**: Path of the file to write the pem out to.

**overwrite**: If True(default), *write\_pem* will overwrite the entire pem file. Set False to preserve existing private keys and dh params that may exist in the pem file.

**pem\_type**: The PEM type to be saved, for example CERTIFICATE or PUBLIC KEY. Adding this will allow the function to take input that may contain multiple pem types.

CLI Example:

```
salt '*' x509.write_pem \
    "-----BEGIN CERTIFICATE-----MIIGMzCCBugA..." \
    path=/etc/pki/mycert.crt
```

## 14.7.446 salt.modules.xapi

This module (mostly) uses the XenAPI to manage Xen virtual machines.

Big fat warning: the XenAPI used in this file is the one bundled with Xen Source, NOT XenServer nor Xen Cloud Platform. As a matter of fact it *will* fail under those platforms. From what I've read, little work is needed to adapt this code to XS/XCP, mostly playing with XenAPI version, but as XCP is not taking precedence on Xen Source on many platforms, please keep compatibility in mind.

Useful documentation:

. <http://downloads.xen.org/Wiki/XenAPI/xenapi-1.0.6.pdf> . [http://docs.vmd.citrix.com/XenServer/6.0.0/1.0/en\\_gb/api/](http://docs.vmd.citrix.com/XenServer/6.0.0/1.0/en_gb/api/) . <https://github.com/xapi-project/xen-api/tree/master/scripts/examples/python> . <http://xenbits.xen.org/gitweb/?p=xen.git;a=tree;f=tools/python/xen/xm;hb=HEAD>

`salt.modules.xapi.freecpu()`

Return an int representing the number of unallocated cpus on this hypervisor

CLI Example:

```
salt '*' virt.freecpu
```

`salt.modules.xapi.freemem()`

Return an int representing the amount of memory that has not been given to virtual machines on this node

CLI Example:

```
salt '*' virt.freemem
```

`salt.modules.xapi.full_info()`

Return the node\_info, vm\_info and freemem

CLI Example:

```
salt '*' virt.full_info
```

`salt.modules.xapi.get_disks(vm_)`

Return the disks of a named vm

CLI Example:

```
salt '*' virt.get_disks <vm name>
```

`salt.modules.xapi.get_macs(vm_)`

Return a list off MAC addresses from the named vm

CLI Example:

```
salt '*' virt.get_macs <vm name>
```

`salt.modules.xapi.get_nics(vm_)`

Return info about the network interfaces of a named vm

CLI Example:

```
salt '*' virt.get_nics <vm name>
```

`salt.modules.xapi.is_hyper()`

Returns a bool whether or not this node is a hypervisor of any kind

CLI Example:

```
salt '*' virt.is_hyper
```

`salt.modules.xapi.list_domains()`

Return a list of virtual machine names on the minion

CLI Example:

```
salt '*' virt.list_domains
```

`salt.modules.xapi.migrate(vm_, target, live=1, port=0, node=-1, ssl=None, change_home_server=0)`

Migrates the virtual machine to another hypervisor

CLI Example:

```
salt '*' virt.migrate <vm name> <target hypervisor> [live] [port] [node] [ssl]
↳ [change_home_server]
```

Optional values:

**live** Use live migration

**port** Use a specified port

**node** Use specified NUMA node on target

**ssl** use ssl connection for migration

**change\_home\_server** change home server for managed domains

`salt.modules.xapi.node_info()`

Return a dict with information about this node

CLI Example:

```
salt '*' virt.node_info
```

`salt.modules.xapi.pause(vm_)`

Pause the named vm

CLI Example:

```
salt '*' virt.pause <vm name>
```

`salt.modules.xapi.reboot(vm_)`

Reboot a domain via ACPI request

CLI Example:

```
salt '*' virt.reboot <vm name>
```

`salt.modules.xapi.reset(vm_)`

Reset a VM by emulating the reset button on a physical machine

CLI Example:

```
salt '*' virt.reset <vm name>
```

`salt.modules.xapi.resume(vm_)`

Resume the named vm

CLI Example:

```
salt '*' virt.resume <vm name>
```

`salt.modules.xapi.setmem(vm_, memory)`

Changes the amount of memory allocated to VM.

Memory is to be specified in MB

CLI Example:

```
salt '*' virt.setmem myvm 768
```

`salt.modules.xapi.setvcpus(vm_, vcpus)`

Changes the amount of vcpus allocated to VM.

vcpus is an int representing the number to be assigned

CLI Example:

```
salt '*' virt.setvcpus myvm 2
```

`salt.modules.xapi.shutdown(vm_)`  
Send a soft shutdown signal to the named vm

CLI Example:

```
salt '*' virt.shutdown <vm name>
```

`salt.modules.xapi.start(config_)`  
Start a defined domain

CLI Example:

```
salt '*' virt.start <path to Xen cfg file>
```

`salt.modules.xapi.stop(vm_)`  
Hard power down the virtual machine, this is equivalent to pulling the power

CLI Example:

```
salt '*' virt.stop <vm name>
```

`salt.modules.xapi.vcpu_pin(vm_, vcpu, cpus)`  
Set which CPUs a VCPU can use.

CLI Example:

```
salt 'foo' virt.vcpu_pin domU-id 2 1
salt 'foo' virt.vcpu_pin domU-id 2 2-6
```

`salt.modules.xapi.vm_cputime(vm_=None)`  
Return cputime used by the vms on this hyper in a list of dicts:

```
[
  'your-vm': {
    'cputime' <int>
    'cputime_percent' <int>
  },
  ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_cputime
```

`salt.modules.xapi.vm_diskstats(vm_=None)`  
Return disk usage counters used by the vms on this hyper in a list of dicts:

```
[
  'your-vm': {
    'io_read_kbs' : 0,
    'io_write_kbs' : 0
  },
  ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_diskstats
```

`salt.modules.xapi.vm_info`(*vm\_=None*)

Return detailed information about the vms.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_info
```

`salt.modules.xapi.vm_netstats`(*vm\_=None*)

Return combined network counters used by the vms on this hyper in a list of dicts:

```
[
  'your-vm': {
    'io_read_kbs'           : 0,
    'io_total_read_kbs'    : 0,
    'io_total_write_kbs'   : 0,
    'io_write_kbs'         : 0
  },
  ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_netstats
```

`salt.modules.xapi.vm_state`(*vm\_=None*)

Return list of all the vms and their state.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_state <vm name>
```

### 14.7.447 salt.modules.xbpspkg module

Package support for XBPS package manager (used by VoidLinux)

New in version 2016.11.0.

`salt.modules.xbpspkg.add_repo`(*repo*, *conffile*='/usr/share/xbps.d/15-saltstack.conf')

Add an XBPS repository to the system.

**repo** url of repo to add (persistent).

**conffile** path to xbps conf file to add this repo default: /usr/share/xbps.d/15-saltstack.conf

CLI Examples:

```
salt '*' pkg.add_repo <repo url> [conffile=/path/to/xbps/repo.conf]
```

`salt.modules.xbpspkg.available_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.xbpspkg.del_repo(repo)`

Remove an XBPS repository from the system.

**repo** url of repo to remove (persistent).

CLI Examples:

```
salt '*' pkg.del_repo <repo url>
```

`salt.modules.xbpspkg.get_repo(repo, **kwargs)`

Display information about the repo.

CLI Examples:

```
salt '*' pkg.get_repo 'repo-url'
```

`salt.modules.xbpspkg.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)`

Install the passed package

**name** The name of the package to be installed.

**refresh** Whether or not to refresh the package database before installing.

**fromrepo** Specify a package repository (url) to install from.

Multiple Package Installation Options:

**pkgs** A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo","bar"]'
```

**sources** A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources=[{"foo": "salt://foo.deb"}, {"bar": "salt://bar.
↳deb"}]
```

Return a dict containing the new package names and versions:

```
{<package>: {'old': '<old-version>',
             'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.install <package name>
```

`salt.modules.xbpspkg.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.xbpspkg.list_pkgs` (*versions\_as\_list=False, \*\*kwargs*)

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.xbpspkg.list_repos`()

List all repos known by XBPS

CLI Example:

```
salt '*' pkg.list_repos
```

`salt.modules.xbpspkg.list_upgrades` (*refresh=True*)

Check whether or not an upgrade is available for all packages

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.xbpspkg.refresh_db`()

Update list of available packages from installed repos

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.xbpspkg.remove` (*name=None, pkgs=None, recursive=True, \*\*kwargs*)

**name** The name of the package to be deleted.

**recursive** Also remove dependent packages (not required elsewhere). Default mode: enabled.

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.remove <package name> [recursive=False]
salt '*' pkg.remove <package1>,<package2>,<package3> [recursive=False]
salt '*' pkg.remove pkgs='["foo", "bar"]' [recursive=False]
```

`salt.modules.xbpspkg.upgrade` (*refresh=True*)

Run a full system upgrade

**refresh** Whether or not to refresh the package database before installing. Default is *True*.

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.xbpspkg.upgrade_available`(*name*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.xbpspkg.version`(*\*names, \*\*kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

#### 14.7.448 salt.modules.xfs

Module for managing XFS file systems.

`salt.modules.xfs.defragment`(*device*)

Defragment mounted XFS filesystem. In order to mount a filesystem, device should be properly mounted and writable.

CLI Example:

```
salt '*' xfs.defragment /dev/sda1
```

`salt.modules.xfs.devices`()

Get known XFS formatted devices on the system.

CLI Example:

```
salt '*' xfs.devices
```

`salt.modules.xfs.dump`(*device, destination, level=0, label=None, noerase=None*)

Dump filesystem device to the media (file, tape etc).

Required parameters:

- device**: XFS device, content of which to be dumped.
- destination**: Specifies a dump destination.

Valid options are:

- label**: Label of the dump. Otherwise automatically generated label is used.
- level**: Specifies a dump level of 0 to 9.
- noerase**: Pre-erase media.

Other options are not used in order to let `xfsdump` use its default values, as they are most optimal. See the `xfsdump(8)` manpage for a more complete description of these options.

CLI Example:

```
salt '*' xfs.dump /dev/sda1 /detination/on/the/client
salt '*' xfs.dump /dev/sda1 /detination/on/the/client label='Company accountancy'
salt '*' xfs.dump /dev/sda1 /detination/on/the/client noerase=True
```

`salt.modules.xfs.estimate`(*path*)

Estimate the space that an XFS filesystem will take. For each directory estimate the space that directory would take if it were copied to an XFS filesystem. Estimation does not cross mount points.

CLI Example:

```
salt '*' xfs.estimate /path/to/file
salt '*' xfs.estimate /path/to/dir/*
```

`salt.modules.xfs.info`(*device*)

Get filesystem geometry information.

CLI Example:

```
salt '*' xfs.info /dev/sda1
```

`salt.modules.xfs.inventory`()

Display XFS dump inventory without restoration.

CLI Example:

```
salt '*' xfs.inventory
```

`salt.modules.xfs.mkfs`(*device*, *label=None*, *ssize=None*, *noforce=None*, *bso=None*, *gmo=None*, *ino=None*, *lso=None*, *rso=None*, *nmo=None*, *dso=None*)

Create a file system on the specified device. By default wipes out with force.

General options:

- label**: Specify volume label.
- ssize**: Specify the fundamental sector size of the filesystem.
- noforce**: Do not force create filesystem, if disk is already formatted.

Filesystem geometry options:

- bso**: Block size options.
- gmo**: Global metadata options.
- dso**: **Data section options. These options specify the location, size, and other parameters of the data section of the filesystem.**
- ino**: Inode options to specify the inode size of the filesystem, and other inode allocation parameters.
- lso**: Log section options.
- nmo**: Naming options.
- rso**: Realtime section options.

See the `mkfs.xfs(8)` manpage for a more complete description of corresponding options description.

CLI Example:

```
salt '*' xfs.mkfs /dev/sda1
salt '*' xfs.mkfs /dev/sda1 dso='su=32k,sw=6' noforce=True
salt '*' xfs.mkfs /dev/sda1 dso='su=32k,sw=6' lso='logdev=/dev/sda2,size=10000b'
```

`salt.modules.xfs.modify`(*device*, *label=None*, *lazy\_counting=None*, *uuid=None*)

Modify parameters of an XFS filesystem.

CLI Example:

```
salt '*' xfs.modify /dev/sda1 label='My backup' lazy_counting=False
salt '*' xfs.modify /dev/sda1 uuid=False
salt '*' xfs.modify /dev/sda1 uuid=True
```

`salt.modules.xfs.prune_dump`(*sessionid*)

Prunes the dump session identified by the given session id.

CLI Example:

```
salt '*' xfs.prune_dump b74a3586-e52e-4a4a-8775-c3334fa8ea2c
```

### 14.7.449 salt.modules.xmpp

Module for Sending Messages via XMPP (a.k.a. Jabber)

New in version 2014.1.0.

#### depends

- sleekxmpp>=1.3.1
- pyasn1
- pyasn1-modules
- dnspython

**configuration** This module can be used by either passing a jid and password directly to `send_message`, or by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:

```
my-xmpp-login:
  xmpp.jid: myuser@jabber.example.org/resourcename
  xmpp.password: verybadpass
```

The `resourcename` refers to the resource that is using this account. It is user-definable, and optional. The following configurations are both valid:

```
my-xmpp-login:
  xmpp.jid: myuser@jabber.example.org/salt
  xmpp.password: verybadpass

my-xmpp-login:
  xmpp.jid: myuser@jabber.example.org
  xmpp.password: verybadpass
```

`salt.modules.xmpp.send_msg`(*recipient, message, jid=None, password=None, profile=None*)

Send a message to an XMPP recipient. Designed for use in states.

CLI Examples:

```
xmpp.send_msg 'admins@xmpp.example.com' 'This is a salt module test'
↳profile='my-xmpp-account'
xmpp.send_msg 'admins@xmpp.example.com' 'This is a salt module test'
↳jid='myuser@xmpp.example.com/salt' password='verybadpass'
```

`salt.modules.xmpp.send_msg_multi`(*message, recipients=None, rooms=None, jid=None, password=None, nick='SaltStack Bot', profile=None*)

Send a message to an XMPP recipient, support send message to multiple recipients or chat room.

CLI Examples:

```
xmpp.send_msg recipients=['admins@xmpp.example.com'] rooms=[
↳ 'secret@conference.xmpp.example.com'] 'This is a salt module test' ✖
↳ profile='my-xmpp-account'
xmpp.send_msg recipients=['admins@xmpp.example.com'] rooms=[
↳ 'secret@conference.xmpp.example.com'] 'This is a salt module test' ✖
↳ jid='myuser@xmpp.example.com/salt' password='verybadpass'
```

### 14.7.450 salt.modules.yumpkg

Support for YUM/DNF

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `pkg.install is not available`), see [here](#).

**Note:** DNF is fully supported as of version 2015.5.10 and 2015.8.4 (partial support for DNF was initially added in 2015.8.0), and DNF is used automatically in place of YUM in Fedora 22 and newer.

`salt.modules.yumpkg.clean_metadata(**kwargs)`

New in version 2014.1.0.

Cleans local yum metadata. Functionally identical to `refresh_db()`.

CLI Example:

```
salt '*' pkg.clean_metadata
```

`salt.modules.yumpkg.del_repo(repo, basedir=None, **kwargs)`

Delete a repo from <basedir> (default basedir: all dirs in `reposdir` yum option).

If the `.repo` file in which the repo exists does not contain any other repo configuration, the file itself will be deleted.

CLI Examples:

```
salt '*' pkg.del_repo myrepo
salt '*' pkg.del_repo myrepo basedir=/path/to/dir
salt '*' pkg.del_repo myrepo basedir=/path/to/dir,/path/to/another/dir
```

`salt.modules.yumpkg.diff(*paths)`

Return a formatted diff between current files and original in a package. NOTE: this function includes all files (configuration and not), but does not work on binary content.

**Parameters** `path` -- Full path to the installed file

**Returns** Difference string or raises an exception if examined file is binary.

CLI example:

```
salt '*' pkg.diff /etc/apache2/httpd.conf /etc/sudoers
```

`salt.modules.yumpkg.download(*packages)`

New in version 2015.5.0.

Download packages to the local disk. Requires `yumdownloader` from `yum-utils` package.

**Note:** yum-utils will already be installed on the minion if the package was installed from the Fedora / EPEL repositories.

---

CLI example:

```
salt '*' pkg.download httpd
salt '*' pkg.download httpd postfix
```

`salt.modules.yumpkg.file_dict(*packages)`

New in version 2014.1.0.

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of *every* file on the system's rpm database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.yumpkg.file_list(*packages)`

New in version 2014.1.0.

List the files that belong to a package. Not specifying any packages will return a list of *every* file on the system's rpm database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.yumpkg.get_repo(name, basedir=None, **kwargs)`

Display a repo from <basedir> (default basedir: all dirs in `reposdir` yum option).

CLI Examples:

```
salt '*' pkg.get_repo myrepo
salt '*' pkg.get_repo myrepo basedir=/path/to/dir
salt '*' pkg.get_repo myrepo basedir=/path/to/dir,/path/to/another/dir
```

`salt.modules.yumpkg.group_diff(name)`

New in version 2014.1.0.

Changed in version 2016.3.0,2015.8.4,2015.5.10: Environment groups are now supported. The key names have been renamed, similar to the changes made in [pkg.group\\_info](#).

Lists which of a group's packages are installed and which are not installed

CLI Example:

```
salt '*' pkg.group_diff 'Perl Support'
```

`salt.modules.yumpkg.group_info(name, expand=False)`

New in version 2014.1.0.

Changed in version 2016.3.0,2015.8.4,2015.5.10: The return data has changed. A new key type has been added to distinguish environment groups from package groups. Also, keys for the group name and group ID have been added. The mandatory `packages`, `optional` packages, and `default` packages keys have

been renamed to `mandatory`, `optional`, and `default` for accuracy, as environment groups include other groups, and not packages. Finally, this function now properly identifies conditional packages.

Lists packages belonging to a certain group

**name** Name of the group to query

**expand** [False] If the specified group is an environment group, then the group will be expanded and the return data will include package names instead of group names.

New in version 2016.3.0.

CLI Example:

```
salt '*' pkg.group_info 'Perl Support'
```

`salt.modules.yumpkg.group_install(name, skip=(), include=(), **kwargs)`

New in version 2014.1.0.

Install the passed package group(s). This is basically a wrapper around `pkg.install`, which performs package group resolution for the user. This function is currently considered experimental, and should be expected to undergo changes.

**name** Package group to install. To install more than one group, either use a comma-separated list or pass the value as a python list.

CLI Examples:

```
salt '*' pkg.group_install 'Group 1'
salt '*' pkg.group_install 'Group 1,Group 2'
salt '*' pkg.group_install ["Group 1", "Group 2"]'
```

**skip** Packages that would normally be installed by the package group (`default` packages), which should not be installed. Can be passed either as a comma-separated list or a python list.

CLI Examples:

```
salt '*' pkg.group_install 'My Group' skip='foo,bar'
salt '*' pkg.group_install 'My Group' skip=["foo", "bar"]'
```

**include** Packages which are included in a group, which would not normally be installed by a yum `groupinstall` (`optional` packages). Note that this will not enforce group membership; if you include packages which are not members of the specified groups, they will still be installed. Can be passed either as a comma-separated list or a python list.

CLI Examples:

```
salt '*' pkg.group_install 'My Group' include='foo,bar'
salt '*' pkg.group_install 'My Group' include=["foo", "bar"]'
```

---

**Note:** Because this is essentially a wrapper around `pkg.install`, any argument which can be passed to `pkg.install` may also be included here, and it will be passed along wholesale.

---

`salt.modules.yumpkg.group_list()`

New in version 2014.1.0.

Lists all groups known by yum on this system

CLI Example:

```
salt '*' pkg.group_list
```

`salt.modules.yumpkg.hold(name=None, pkgs=None, sources=None, normalize=True, **kwargs)`

New in version 2014.7.0.

Version-lock packages

---

**Note:** Requires the appropriate `versionlock` plugin package to be installed:

- On RHEL 5: `yum-versionlock`
  - On RHEL 6 & 7: `yum-plugin-versionlock`
  - On Fedora: `python-dnf-plugins-extras-versionlock`
- 

**name** The name of the package to be held.

Multiple Package Options:

**pkgs** A list of packages to hold. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.hold <package name>
salt '*' pkg.hold pkgs=['foo', 'bar']'
```

`salt.modules.yumpkg.info_installed(*names)`

New in version 2015.8.1.

Return the information of the named package(s), installed on the system.

CLI example:

```
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
```

`salt.modules.yumpkg.install(name=None, refresh=False, skip_verify=False, pkgs=None, sources=None, downloadonly=False, reinstall=False, normalize=True, update_holds=False, **kwargs)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd`  $\geq$  205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any `yum/dnf` commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Install the passed package(s), add `refresh=True` to clean the yum database before package is installed.

**name** The name of the package to be installed. Note that this parameter is ignored if either `pkgs` or `sources` is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the `sources` option.

32-bit packages can be installed on 64-bit systems by appending the architecture designation (`.i686`, `.i586`, etc.) to the end of the package name.

CLI Example:

```
salt '*' pkg.install <package name>
```

**refresh** Whether or not to update the yum database before executing.

**reinstall** Specifying `reinstall=True` will use `yum reinstall` rather than `yum install` for requested packages that are already installed.

If a version is specified with the requested package, then `yum reinstall` will only be used if the installed version matches the requested version.

Works with `sources` when the package header of the source can be matched to the name and version of an installed package.

New in version 2014.7.0.

**skip\_verify** Skip the GPG verification check (e.g., `--nogpgcheck`)

**downloadonly** Only download the packages, do not install.

**version** Install a specific version of the package, e.g. `1.2.3-4.el5`. Ignored if `pkgs` or `sources` is passed.

**update\_holds** [False] If True, and this function would update the package version, any packages held using the yum/dnf `versionlock` plugin will be unheld so that they can be updated. Otherwise, if this function attempts to update a held package, the held package(s) will be skipped and an error will be raised.

New in version 2016.11.0.

Repository Options:

**fromrepo** Specify a package repository (or repositories) from which to install. (e.g., `yum --disablerepo='*' --enablerepo='somerepo'`)

**enablerepo** (ignored if **fromrepo** is specified) Specify a disabled package repository (or repositories) to enable. (e.g., `yum --enablerepo='somerepo'`)

**disablerepo** (ignored if **fromrepo** is specified) Specify an enabled package repository (or repositories) to disable. (e.g., `yum --disablerepo='somerepo'`)

**disableexcludes** Disable exclude from main, for a repo or for everything. (e.g., `yum --disableexcludes='main'`)

New in version 2014.7.0.

Multiple Package Installation Options:

**pkgs** A list of packages to install from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version.

CLI Examples:

```
salt '*' pkg.install pkgs=['foo', 'bar']
salt '*' pkg.install pkgs=['foo', {'bar': "1.2.3-4.el5"}]
```

**sources** A list of RPM packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources=[{"foo": "salt://foo.rpm"}, {"bar": "salt://bar.
↳rpm"}]
```

**normalize** [True] Normalize the package name by removing the architecture. This is useful for poorly created packages which might include the architecture as an actual part of the name such as kernel modules which match a specific kernel version.

```
salt -G role:nsd pkg.install gpgfs.gplbin-2.6.32-279.31.1.el6.x86_64
↳normalize=False
```

New in version 2014.7.0.

Returns a dict containing the new package names and versions:

```
{'package': {'old': '<old-version>',
              'new': '<new-version>'}}
```

`salt.modules.yumpkg.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

A specific repo can be requested using the `fromrepo` keyword argument, and the `disableexcludes` option is also supported.

New in version 2014.7.0: Support for the `disableexcludes` option

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> fromrepo=epel-testing
salt '*' pkg.latest_version <package name> disableexcludes=main
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.yumpkg.list_downloaded()`

New in version 2017.7.0.

List prefetched packages downloaded by Yum in the local disk.

CLI example:

```
salt '*' pkg.list_downloaded
```

`salt.modules.yumpkg.list_holds(pattern='\\w+(?:[-][^~]+)*', full=True)`

Changed in version 2016.3.0,2015.8.4,2015.5.10: Function renamed from `pkg.get_locked_pkgs` to `pkg.list_holds`.

List information on locked packages

---

**Note:** Requires the appropriate `versionlock` plugin package to be installed:

- On RHEL 5: `yum-versionlock`
  - On RHEL 6 & 7: `yum-plugin-versionlock`
  - On Fedora: `python-dnf-plugins-extras-versionlock`
- 

**pattern** `[\\w+(?:[-][^~]+)*]` Regular expression used to match the package name

**full** `[True]` Show the full hold definition including version and epoch. Set to `False` to return just the name of the package(s) being held.

CLI Example:

```
salt '*' pkg.list_holds
salt '*' pkg.list_holds full=False
```

`salt.modules.yumpkg.list_installed_patches()`

New in version 2017.7.0.

List installed advisory patches on the system.

CLI Examples:

```
salt '*' pkg.list_installed_patches
```

`salt.modules.yumpkg.list_patches(refresh=False)`

New in version 2017.7.0.

List all known advisory patches from available repos.

**refresh** force a refresh if set to `True`. If set to `False` (default) it depends on yum if a refresh is executed.

CLI Examples:

```
salt '*' pkg.list_patches
```

`salt.modules.yumpkg.list_pkgs`(*versions\_as\_list=False*, *\*\*kwargs*)  
List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.yumpkg.list_repo_pkgs`(*\*args*, *\*\*kwargs*)  
New in version 2014.1.0.

Changed in version 2014.7.0: All available versions of each package are now returned. This required a slight modification to the structure of the return dict. The return data shown below reflects the updated return dict structure. Note that packages which are version-locked using `pkg.hold` will only show the currently installed version, as locking a package will make other versions appear unavailable to yum/dnf.

Changed in version 2017.7.0: By default, the versions for each package are no longer organized by repository. To get results organized by repository, use `byrepo=True`.

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names. This is recommended as it speeds up the function considerably.

**Warning:** Running this function on RHEL/CentOS 6 and earlier will be more resource-intensive, as the version of yum that ships with older RHEL/CentOS has no yum subcommand for listing packages from a repository. Thus, a `yum list installed` and `yum list available` are run, which generates a lot of output, which must then be analyzed to determine which package information to include in the return data.

This function can be helpful in discovering the version or repo to specify in a `pkg.installed` state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. If `byrepo` is set to `True`, then the return dictionary will contain repository names at the top level, and each repository will map packages to lists of version numbers. For example:

```
# With byrepo=False (default)
{
  'bash': ['4.1.2-15.el6_5.2',
          '4.1.2-15.el6_5.1',
          '4.1.2-15.el6_4'],
  'kernel': ['2.6.32-431.29.2.el6',
             '2.6.32-431.23.3.el6',
             '2.6.32-431.20.5.el6',
             '2.6.32-431.20.3.el6',
             '2.6.32-431.17.1.el6',
             '2.6.32-431.11.2.el6',
             '2.6.32-431.5.1.el6',
             '2.6.32-431.3.1.el6',
             '2.6.32-431.1.2.0.1.el6',
             '2.6.32-431.el6']
}
# With byrepo=True
{
  'base': {
    'bash': ['4.1.2-15.el6_4'],
    'kernel': ['2.6.32-431.el6']
  },
}
```

```

'updates': {
  'bash': ['4.1.2-15.el6_5.2', '4.1.2-15.el6_5.1'],
  'kernel': ['2.6.32-431.29.2.el6',
             '2.6.32-431.23.3.el6',
             '2.6.32-431.20.5.el6',
             '2.6.32-431.20.3.el6',
             '2.6.32-431.17.1.el6',
             '2.6.32-431.11.2.el6',
             '2.6.32-431.5.1.el6',
             '2.6.32-431.3.1.el6',
             '2.6.32-431.1.2.0.1.el6']
}

```

**fromrepo** [None] Only include results from the specified repo(s). Multiple repos can be specified, comma-separated.

**enablerepo** (ignored if **fromrepo** is specified) Specify a disabled package repository (or repositories) to enable. (e.g., yum --enablerepo='somerepo')

New in version 2017.7.0.

**disablerepo** (ignored if **fromrepo** is specified) Specify an enabled package repository (or repositories) to disable. (e.g., yum --disablerepo='somerepo')

New in version 2017.7.0.

**byrepo** [False] When True, the return data for each package will be organized by repository.

New in version 2017.7.0.

**cacheonly** [False] When True, the repo information will be retrieved from the cached repo metadata. This is equivalent to passing the -C option to yum/dnf.

New in version 2017.7.0.

CLI Examples:

```

salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
salt '*' pkg.list_repo_pkgs 'samba4*' fromrepo=base,updates
salt '*' pkg.list_repo_pkgs 'python2-*' byrepo=True

```

`salt.modules.yumpkg.list_repos` (*basedir=None*)

Lists all repos in <basedir> (default: all dirs in *reposdir* yum option).

CLI Example:

```

salt '*' pkg.list_repos
salt '*' pkg.list_repos basedir=/path/to/dir
salt '*' pkg.list_repos basedir=/path/to/dir,/path/to/another/dir

```

`salt.modules.yumpkg.list_upgrades` (*refresh=True, \*\*kwargs*)

Check whether or not an upgrade is available for all packages

The *fromrepo*, *enablerepo*, and *disablerepo* arguments are supported, as used in *pkg* states, and the *disableexcludes* option is also supported.

New in version 2014.7.0: Support for the *disableexcludes* option

CLI Example:

```

salt '*' pkg.list_upgrades

```

`salt.modules.yumpkg.mod_repo(repo, basedir=None, **kwargs)`

Modify one or more values for a repo. If the repo does not exist, it will be created, so long as the following values are specified:

**repo** name by which the yum refers to the repo

**name** a human-readable name for the repo

**baseurl** the URL for yum to reference

**mirrorlist** the URL for yum to reference

Key/Value pairs may also be removed from a repo's configuration by setting a key to a blank value. Bear in mind that a name cannot be deleted, and a baseurl can only be deleted if a mirrorlist is specified (or vice versa).

CLI Examples:

```
salt '*' pkg.mod_repo reponame enabled=1 gpgcheck=1
salt '*' pkg.mod_repo reponame basedir=/path/to/dir enabled=1
salt '*' pkg.mod_repo reponame baseurl= mirrorlist=http://host.com/
```

`salt.modules.yumpkg.modified(*packages, **flags)`

List the modified files that belong to a package. Not specifying any packages will return a list of `_all_` modified files on the system's RPM database.

New in version 2015.5.0.

Filtering by flags (True or False):

**size** Include only files where size changed.

**mode** Include only files which file's mode has been changed.

**checksum** Include only files which MD5 checksum has been changed.

**device** Include only files which major and minor numbers has been changed.

**symlink** Include only files which are symbolic link contents.

**owner** Include only files where owner has been changed.

**group** Include only files where group has been changed.

**time** Include only files where modification time of the file has been changed.

**capabilities** Include only files where capabilities differ or not. Note: supported only on newer RPM versions.

CLI Examples:

```
salt '*' pkg.modified
salt '*' pkg.modified httpd
salt '*' pkg.modified httpd postfix
salt '*' pkg.modified httpd owner=True group=False
```

`salt.modules.yumpkg.normalize_name(name)`

Strips the architecture from the specified package name, if necessary. Circumstances where this would be done include:

- If the arch is 32 bit and the package name ends in a 32-bit arch.
- If the arch matches the OS arch, or is noarch.

CLI Example:

```
salt '*' pkg.normalize_name zsh.x86_64
```

`salt.modules.yumpkg.owner(*paths)`

New in version 2014.7.0.

Return the name of the package that owns the file. Multiple file paths can be passed. Like `pkg.version` <`salt.modules.yumpkg.version`, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Examples:

```
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf
```

`salt.modules.yumpkg.purge` (*name=None, pkgs=None, \*\*kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd<=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any `yum/dnf` commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Package purges are not supported by yum, this function is identical to `pkg.remove`.

**name** The name of the package to be purged

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>, <package2>, <package3>
salt '*' pkg.purge pkgs=['foo', 'bar']
```

`salt.modules.yumpkg.refresh_db` (*\*\*kwargs*)

Check the yum repos for updated packages

Returns:

- True: Updates are available
- False: An error occurred
- None: No updates are available

**repo** Refresh just the specified repo

**disablerepo** Do not refresh the specified repo

**enablerepo** Refresh a disabled repo using this option

**branch** Add the specified branch when refreshing

**disableexcludes** Disable the excludes defined in your config files. Takes one of three options: - `all` - disable all excludes - `main` - disable excludes defined in `[main]` in `yum.conf` - `repo:d` - disable excludes defined for that repo

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.yumpkg.remove` (*name=None, pkgs=None, \*\*kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd<=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any `yum/dnf` commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Remove packages

**name** The name of the package to be removed

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs=['foo', 'bar']'
```

`salt.modules.yumpkg.unhold`(*name=None, pkgs=None, sources=None, \*\*kwargs*)

New in version 2014.7.0.

Remove version locks

**Note:** Requires the appropriate `versionlock` plugin package to be installed:

- On RHEL 5: `yum-versionlock`
- On RHEL 6 & 7: `yum-plugin-versionlock`
- On Fedora: `python-dnf-plugins-extras-versionlock`

**name** The name of the package to be unheld

Multiple Package Options:

**pkgs** A list of packages to unhold. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.unhold <package name>
salt '*' pkg.unhold pkgs=['foo', 'bar']'
```

`salt.modules.yumpkg.upgrade`(*name=None, pkgs=None, refresh=True, skip\_verify=False, normalize=True, \*\*kwargs*)

Run a full system upgrade (a `yum upgrade` or `dnf upgrade`), or upgrade specified packages. If the packages aren't installed, they will not be installed.

Changed in version 2014.7.0.

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd<=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any `yum/dnf` commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Run a full system upgrade, a yum upgrade

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
salt '*' pkg.upgrade name=openssl
```

Repository Options:

**fromrepo** Specify a package repository (or repositories) from which to install. (e.g., `yum --disablerepo='*' --enablerepo='somerepo'`)

**enablerepo** (ignored if **fromrepo** is specified) Specify a disabled package repository (or repositories) to enable. (e.g., `yum --enablerepo='somerepo'`)

**disablerepo** (ignored if **fromrepo** is specified) Specify an enabled package repository (or repositories) to disable. (e.g., `yum --disablerepo='somerepo'`)

**disableexcludes** Disable exclude from main, for a repo or for everything. (e.g., `yum --disableexcludes='main'`)

New in version 2014.7.

**name** The name of the package to be upgraded. Note that this parameter is ignored if ``pkgs`` is passed.

32-bit packages can be upgraded on 64-bit systems by appending the architecture designation (`.i686`, `.i586`, etc.) to the end of the package name.

Warning: if you forget `name=` and run `pkg.upgrade openssl`, ALL packages are upgraded. This will be addressed in next releases.

CLI Example:

```
salt '*' pkg.upgrade name=openssl
```

New in version 2016.3.0.

**pkgs** A list of packages to upgrade from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version. If the package was not already installed on the system, it will not be installed.

CLI Examples:

```
salt '*' pkg.upgrade pkgs=['foo', 'bar']
salt '*' pkg.upgrade pkgs=['foo', {'bar': '1.2.3-4.el5'}]
```

New in version 2016.3.0.

**normalize** [True] Normalize the package name by removing the architecture. This is useful for poorly created packages which might include the architecture as an actual part of the name such as kernel modules which match a specific kernel version.

```
salt -G role:nsd pkg.upgrade gpgfs.gplbin-2.6.32-279.31.1.el6.x86_64
↳normalize=False
```

New in version 2016.3.0.

---

**Note:** To add extra arguments to the `yum upgrade` command, pass them as key word arguments. For arguments without assignments, pass `True`

---

```
salt '*' pkg.upgrade security=True exclude='kernel*'
```

`salt.modules.yumpkg.upgrade_available(name)`

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.yumpkg.verify(*names, **kwargs)`

New in version 2014.1.0.

Runs an rpm -Va on a system, and returns the results in a dict

Pass options to modify rpm verify behavior using the `verify_options` keyword argument

Files with an attribute of config, doc, ghost, license or readme in the package header can be ignored using the `ignore_types` keyword argument

CLI Example:

```
salt '*' pkg.verify
salt '*' pkg.verify httpd
salt '*' pkg.verify 'httpd postfix'
salt '*' pkg.verify 'httpd postfix' ignore_types=['config','doc']
salt '*' pkg.verify 'httpd postfix' verify_options=['nodeps','nosize']
```

`salt.modules.yumpkg.version(*names, **kwargs)`

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

`salt.modules.yumpkg.version_cmp(pkg1, pkg2, ignore_epoch=False)`

New in version 2015.5.4.

Do a cmp-style comparison on two packages. Return -1 if `pkg1 < pkg2`, 0 if `pkg1 == pkg2`, and 1 if `pkg1 > pkg2`. Return None if there was a problem making the comparison.

`ignore_epoch` [False] Set to True to ignore the epoch when comparing versions

New in version 2015.8.10,2016.3.2.

CLI Example:

```
salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002'
```

## 14.7.451 salt.modules.zabbix module

Support for Zabbix

**optdepends**

- zabbix server

**configuration** This module is not usable until the zabbix user and zabbix password are specified either in a pillar or in the minion's config file. Zabbix url should be also specified.

```
zabbix.user: Admin
zabbix.password: mypassword
zabbix.url: http://127.0.0.1/zabbix/api_jsonrpc.php
```

Connection arguments from the minion config file can be overridden on the CLI by using arguments with `_connection_` prefix.

```
zabbix.apiinfo_version _connection_user=Admin _connection_
↳password=zabbix _connection_url=http://host/zabbix/
```

**codeauthor** Jiri Kotlin <jiri.kotlin@ultimum.io>

`salt.modules.zabbix.apiinfo_version(**connection_args)`

Retrieve the version of the Zabbix API.

New in version 2016.3.0.

**Parameters**

- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** On success string with Zabbix API version, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.apiinfo_version
```

`salt.modules.zabbix.host_create(host, groups, interfaces, **connection_args)`

Create new host. NOTE: This function accepts all standard host properties: keyword argument names differ depending on your zabbix version, see: <https://www.zabbix.com/documentation/2.4/manual/api/reference/host/object#host>

New in version 2016.3.0.

**Parameters**

- **host** -- technical name of the host
- **groups** -- groupids of host groups to add the host to
- **interfaces** -- interfaces to be created for the host
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)
- **visible\_name** -- string with visible name of the host, use `visible\_name` instead of `name` parameter

to not mess with value supplied from Salt sls file.

return: ID of the created host.

CLI Example:

```
salt '*' zabbix.host_create technicalname 4
interfaces='{type: 1, main: 1, useip: 1, ip: "192.168.3.1", dns: "", port: 10050}'
visible_name='Host Visible Name'
```

`salt.modules.zabbix.host_delete(hostids, **connection_args)`

Delete hosts.

New in version 2016.3.0.

**Parameters**

- **hostids** -- Hosts (hostids) to delete.
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** IDs of the deleted hosts.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.host_delete 10106
```

```
salt.modules.zabbix.host_exists(host=None, hostid=None, name=None, node=None,
                                nodeids=None, **connection_args)
```

Checks if at least one host that matches the given filter criteria exists.

New in version 2016.3.0.

#### Parameters

- **host** -- technical name of the host
- **hostids** -- Hosts (hostids) to delete.
- **name** -- visible name of the host
- **node** -- name of the node the hosts must belong to (zabbix API < 2.4)
- **nodeids** -- IDs of the node the hosts must belong to (zabbix API < 2.4)
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** IDs of the deleted hosts, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.host_exists `Zabbix server`
```

```
salt.modules.zabbix.host_get(host=None, name=None, hostids=None, **connection_args)
```

Retrieve hosts according to the given parameters. NOTE: This function accepts all optional host.get parameters: keyword argument names differ depending on your zabbix version, see: <https://www.zabbix.com/documentation/2.4/manual/api/reference/host/get>

New in version 2016.3.0.

#### Parameters

- **host** -- technical name of the host
- **name** -- visible name of the host
- **hostids** -- ids of the hosts
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** Array with convenient hosts details, False if no host found or on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.host_get `Zabbix server`
```

```
salt.modules.zabbix.host_list(**connection_args)
```

Retrieve all hosts.

New in version 2016.3.0.

#### Parameters

- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** Array with details about hosts, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.host_list
```

`salt.modules.zabbix.host_update` (*hostid*, *\*\*connection\_args*)

Update existing hosts. NOTE: This function accepts all standard host and host.update properties: keyword argument names differ depending on your zabbix version, see: <https://www.zabbix.com/documentation/2.4/manual/api/reference/host/update> <https://www.zabbix.com/documentation/2.4/manual/api/reference/host/object#host>

New in version 2016.3.0.

**Parameters**

- **hostid** -- ID of the host to update
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)
- **visible\_name** -- string with visible name of the host, use `visible\_name` instead of `name` parameter

to not mess with value supplied from Salt sls file.

**Returns** ID of the updated host.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.host_update 10084 name='Zabbix server2'
```

`salt.modules.zabbix.hostgroup_create` (*name*, *\*\*connection\_args*)

Create a host group. NOTE: This function accepts all standard host group properties: keyword argument names differ depending on your zabbix version, see: [https://www.zabbix.com/documentation/2.4/manual/api/reference/hostgroup/object#host\\_group](https://www.zabbix.com/documentation/2.4/manual/api/reference/hostgroup/object#host_group)

New in version 2016.3.0.

**Parameters**

- **name** -- name of the host group
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** ID of the created host group.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.hostgroup_create MyNewGroup
```

`salt.modules.zabbix.hostgroup_delete` (*hostgroupids*, *\*\*connection\_args*)

Delete the host group.

New in version 2016.3.0.

**Parameters**

- **hostgroupids** -- IDs of the host groups to delete
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** ID of the deleted host groups, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.hostgroup_delete 23
```

`salt.modules.zabbix.hostgroup_exists` (*name=None, groupid=None, node=None, nodeids=None, \*\*connection\_args*)

Checks if at least one host group that matches the given filter criteria exists.

New in version 2016.3.0.

#### Parameters

- **name** -- names of the host groups
- **groupid** -- host group IDs
- **node** -- name of the node the host groups must belong to (zabbix API < 2.4)
- **nodeids** -- IDs of the nodes the host groups must belong to (zabbix API < 2.4)
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** True if at least one host group exists, False if not or on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.hostgroup_exists MyNewGroup
```

`salt.modules.zabbix.hostgroup_get` (*name=None, groupids=None, hostids=None, \*\*connection\_args*)

Retrieve host groups according to the given parameters. NOTE: This function accepts all standard hostgroup.get properties: keyword argument names differ depending on your zabbix version, see: <https://www.zabbix.com/documentation/2.2/manual/api/reference/hostgroup/get>

New in version 2016.3.0.

#### Parameters

- **name** -- names of the host groups
- **groupid** -- host group IDs
- **node** -- name of the node the host groups must belong to
- **nodeids** -- IDs of the nodes the host groups must belong to
- **hostids** -- return only host groups that contain the given hosts
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** Array with host groups details, False if no convenient host group found or on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.hostgroup_get MyNewGroup
```

`salt.modules.zabbix.hostgroup_list` (*\*\*connection\_args*)

Retrieve all host groups.

New in version 2016.3.0.

#### Parameters

- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** Array with details about host groups, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.hostgroup_list
```

`salt.modules.zabbix.hostgroup_update`(*groupid*, *name=None*, *\*\*connection\_args*)

Update existing hosts group. NOTE: This function accepts all standard host group properties: keyword argument names differ depending on your zabbix version, see: [https://www.zabbix.com/documentation/2.4/manual/api/reference/hostgroup/object#host\\_group](https://www.zabbix.com/documentation/2.4/manual/api/reference/hostgroup/object#host_group)

New in version 2016.3.0.

#### Parameters

- **groupid** -- ID of the host group to update
- **name** -- name of the host group
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** IDs of updated host groups.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.hostgroup_update 24 name='Renamed Name'
```

`salt.modules.zabbix.hostinterface_create`(*hostid*, *ip*, *dns=''*, *main=1*, *type=1*, *useip=1*, *port=None*, *\*\*connection\_args*)

Create new host interface NOTE: This function accepts all standard host group interface: keyword argument names differ depending on your zabbix version, see: <https://www.zabbix.com/documentation/3.0/manual/api/reference/hostinterface/object>

New in version 2016.3.0.

#### Parameters

- **hostid** -- ID of the host the interface belongs to
- **ip** -- IP address used by the interface
- **dns** -- DNS name used by the interface
- **main** -- whether the interface is used as default on the host (0 - not default, 1 - default)
- **port** -- port number used by the interface
- **type** -- Interface type (1 - agent; 2 - SNMP; 3 - IPMI; 4 - JMX)
- **useip** -- Whether the connection should be made via IP (0 - connect using host DNS name; 1 - connect using

host IP address for this host interface) :param **\_connection\_user**: Optional - zabbix user (can also be set in opts or pillar, see module's docstring) :param **\_connection\_password**: Optional - zabbix password (can also be set in opts or pillar, see module's docstring) :param **\_connection\_url**: Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** ID of the created host interface, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.hostinterface_create 10105 192.193.194.197
```

`salt.modules.zabbix.hostinterface_delete`(*interfaceids*, *\*\*connection\_args*)

Delete host interface

New in version 2016.3.0.

#### Parameters

- **interfaceids** -- IDs of the host interfaces to delete
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** ID of deleted host interfaces, False on failure.

CLI Example: .. code-block:: bash  
 salt '\*' zabbix.hostinterface\_delete 50

`salt.modules.zabbix.hostinterface_get`(*hostids*, *\*\*connection\_args*)

Retrieve host groups according to the given parameters. NOTE: This function accepts all standard `hostinterface.get` properties: keyword argument names differ depending on your zabbix version, see: <https://www.zabbix.com/documentation/2.4/manual/api/reference/hostinterface/get>

New in version 2016.3.0.

#### Parameters

- **hostids** -- Return only host interfaces used by the given hosts.
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** Array with host interfaces details, False if no convenient host interfaces found or on failure.

CLI Example: .. code-block:: bash  
 salt '\*' zabbix.hostinterface\_get 101054

`salt.modules.zabbix.hostinterface_update`(*interfaceid*, *\*\*connection\_args*)

Update host interface NOTE: This function accepts all standard `hostinterface:` keyword argument names differ depending on your zabbix version, see: [https://www.zabbix.com/documentation/2.4/manual/api/reference/hostinterface/object#host\\_interface](https://www.zabbix.com/documentation/2.4/manual/api/reference/hostinterface/object#host_interface)

New in version 2016.3.0.

#### Parameters

- **interfaceid** -- ID of the hostinterface to update
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** ID of the updated host interface, False on failure.

CLI Example: .. code-block:: bash  
 salt '\*' zabbix.hostinterface\_update 6 ip=0.0.0.2

`salt.modules.zabbix.mediatype_create`(*name*, *mediatype*, *\*\*connection\_args*)

Create new mediatype. NOTE: This function accepts all standard `mediatype` properties: keyword argument names differ depending on your zabbix version, see: <https://www.zabbix.com/documentation/3.0/manual/api/reference/mediatype/object>

#### Parameters

- **mediatype** -- media type - 0: email, 1: script, 2: sms, 3: Jabber, 100: Ez Texting
- **exec\_path** -- exec path - Required for script and Ez Texting types, see Zabbix API docs
- **gsm\_modem** -- exec path - Required for sms type, see Zabbix API docs
- **smtp\_email** -- email address from which notifications will be sent, required for email type
- **smtp\_helo** -- SMTP HELO, required for email type
- **smtp\_server** -- SMTP server, required for email type
- **status** -- whether the media type is enabled - 0: enabled, 1: disabled
- **username** -- authentication user, required for Jabber and Ez Texting types
- **passwd** -- authentication password, required for Jabber and Ez Texting types

- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: ID of the created mediatype.

CLI Example:

```
salt '*' zabbix.mediatype_create 'Email' 0 smtp_email='noreply@example.com'
smtp_server='mailserver.example.com' smtp_helo='zabbix.example.com'
```

`salt.modules.zabbix.mediatype_delete`(*mediatypeids*, *\*\*connection\_args*)

Delete mediatype

Parameters

- **interfaceids** -- IDs of the mediatypes to delete
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns ID of deleted mediatype, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.mediatype_delete 3
```

`salt.modules.zabbix.mediatype_get`(*name=None*, *mediatypeids=None*, *\*\*connection\_args*)

Retrieve mediatypes according to the given parameters.

Parameters

- **name** -- Name or description of the mediatype
- **mediatypeids** -- ids of the mediatypes
- **connection\_args** (*optional*) -- `_connection_user`: zabbix user (can also be set in opts or pillar, see module's docstring) `_connection_password`: zabbix password (can also be set in opts or pillar, see module's docstring) `_connection_url`: url of zabbix frontend (can also be set in opts or pillar, see module's docstring)

all optional mediatype.get parameters: keyword argument names differ depending on your zabbix version, see:

<https://www.zabbix.com/documentation/2.2/manual/api/reference/mediatype/get>

Returns Array with mediatype details, False if no mediatype found or on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.mediatype_get name='Email' salt '*' zabbix.mediatype_get mediatypeids=["1", `2`, `3"]
```

`salt.modules.zabbix.mediatype_update`(*mediatypeid*, *name=False*, *mediatype=False*, *\*\*connection\_args*)

Update existing mediatype. NOTE: This function accepts all standard mediatype properties: keyword argument names differ depending on your zabbix version, see: <https://www.zabbix.com/documentation/3.0/manual/api/reference/mediatype/object>

Parameters

- **mediatypeid** -- ID of the mediatype to update
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)

- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** IDs of the updated mediatypes, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.usergroup_update 8 name="Email update"
```

`salt.modules.zabbix.run_query` (*method*, *params*, *\*\*connection\_args*)

Send Zabbix API call

**Parameters**

- **method** -- actual operation to perform via the API
- **params** -- parameters required for specific method
- **connection\_args** (*optional*) -- **\_connection\_user**: zabbix user (can also be set in opts or pillar, see module's docstring) **\_connection\_password**: zabbix password (can also be set in opts or pillar, see module's docstring) **\_connection\_url**: url of zabbix frontend (can also be set in opts or pillar, see module's docstring)

all optional `template.get` parameters: keyword argument names differ depending on your zabbix version, see:

<https://www.zabbix.com/documentation/2.4/manual/api/reference/>

**Returns** Response from Zabbix API

CLI Example: .. code-block:: bash

```
salt '*' zabbix.run_query proxy.create '{`host': `zabbixproxy.domain.com', `status': `5'}
```

`salt.modules.zabbix.template_get` (*name=None*, *host=None*, *templateids=None*, *\*\*connection\_args*)

Retrieve templates according to the given parameters.

**Parameters**

- **host** -- technical name of the template
- **name** -- visible name of the template
- **hostids** -- ids of the templates
- **connection\_args** (*optional*) -- **\_connection\_user**: zabbix user (can also be set in opts or pillar, see module's docstring) **\_connection\_password**: zabbix password (can also be set in opts or pillar, see module's docstring) **\_connection\_url**: url of zabbix frontend (can also be set in opts or pillar, see module's docstring)

all optional `template.get` parameters: keyword argument names differ depending on your zabbix version, see:

<https://www.zabbix.com/documentation/2.4/manual/api/reference/template/get>

**Returns** Array with convenient template details, False if no template found or on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.template_get name='Template OS Linux' salt '*' zabbix.template_get templateids="[`10050', `10001']"
```

`salt.modules.zabbix.user_addmedia` (*userid*, *active*, *mediatypeid*, *period*, *sendto*, *severity*, *\*\*connection\_args*)

Add new media to multiple users.

New in version 2016.3.0.

**Parameters**

- **userid** -- ID of the user that uses the media
- **active** -- Whether the media is enabled (0 enabled, 1 disabled)
- **mediatypeid** -- ID of the media type used by the media
- **period** -- Time when the notifications can be sent as a time period
- **sendto** -- Address, user name or other identifier of the recipient
- **severity** -- Trigger severities to send notifications about

- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** IDs of the created media.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.user_addmedia 4 active=0 mediatypeid=1 period='1-7,00:00-24:00'
sendto='support2@example.com' severity=63
```

`salt.modules.zabbix.user_create`(*alias*, *passwd*, *usrgrps*, *\*\*connection\_args*)

Create new zabbix user. NOTE: This function accepts all standard user properties: keyword argument names differ depending on your zabbix version, see: <https://www.zabbix.com/documentation/2.0/manual/appendix/api/user/definitions#user>

New in version 2016.3.0.

**Parameters**

- **alias** -- user alias
- **passwd** -- user's password
- **usrgrps** -- user groups to add the user to
- **\_connection\_user** -- zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- url of zabbix frontend (can also be set in opts or pillar, see module's docstring)
- **firstname** -- string with firstname of the user, use 'firstname' instead of 'name' parameter to not mess with value supplied from Salt sls file.

**Returns** On success string with id of the created user.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.user_create james password007 '[7, 12]' firstname='James Bond'
```

`salt.modules.zabbix.user_delete`(*users*, *\*\*connection\_args*)

Delete zabbix users.

New in version 2016.3.0.

**Parameters**

- **users** -- array of users (userids) to delete
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** On success array with userids of deleted users.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.user_delete 15
```

`salt.modules.zabbix.user_deletemedia`(*mediaids*, *\*\*connection\_args*)

Delete media by id.

New in version 2016.3.0.

**Parameters**

- **mediaids** -- IDs of the media to delete
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)

- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** IDs of the deleted media, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.user_deletemedia 27
```

`salt.modules.zabbix.user_exists` (*alias*, *\*\*connection\_args*)

Checks if user with given alias exists.

New in version 2016.3.0.

#### Parameters

- **alias** -- user alias
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** True if user exists, else False.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.user_exists james
```

`salt.modules.zabbix.user_get` (*alias=None*, *userids=None*, *\*\*connection\_args*)

Retrieve users according to the given parameters.

New in version 2016.3.0.

#### Parameters

- **alias** -- user alias
- **userids** -- return only users with the given IDs
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** Array with details of convenient users, False on failure of if no user found.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.user_get james
```

`salt.modules.zabbix.user_getmedia` (*userids=None*, *\*\*connection\_args*)

Retrieve media according to the given parameters NOTE: This function accepts all standard `usermedia.get` properties: keyword argument names differ depending on your zabbix version, see: <https://www.zabbix.com/documentation/3.2/manual/api/reference/usermedia/get>

New in version 2016.3.0.

#### Parameters

- **userids** -- return only media that are used by the given users
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** List of retrieved media, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.user_getmedia
```

```
salt.modules.zabbix.user_list(**connection_args)
```

Retrieve all of the configured users.

New in version 2016.3.0.

#### Parameters

- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** Array with user details.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.user_list
```

```
salt.modules.zabbix.user_update(userid, **connection_args)
```

Update existing users. NOTE: This function accepts all standard user properties: keyword argument names differ depending on your zabbix version, see: <https://www.zabbix.com/documentation/2.0/manual/appendix/api/user/definitions#user>

New in version 2016.3.0.

#### Parameters

- **userid** -- id of the user to update
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** Id of the updated user on success.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.user_update 16 visible_name='James Brown'
```

```
salt.modules.zabbix.usergroup_create(name, **connection_args)
```

Create new user group. NOTE: This function accepts all standard user group properties: keyword argument names differ depending on your zabbix version, see: [https://www.zabbix.com/documentation/2.0/manual/appendix/api/usergroup/definitions#user\\_group](https://www.zabbix.com/documentation/2.0/manual/appendix/api/usergroup/definitions#user_group)

New in version 2016.3.0.

#### Parameters

- **name** -- name of the user group
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** IDs of the created user groups.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.usergroup_create GroupName
```

```
salt.modules.zabbix.usergroup_delete(usergroupids, **connection_args)
```

New in version 2016.3.0.

#### Parameters

- **usergroupids** -- IDs of the user groups to delete

- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** IDs of the deleted user groups.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.usergroup_delete 28
```

`salt.modules.zabbix.usergroup_exists`(*name=None, node=None, nodeids=None, \*\*connection\_args*)

Checks if at least one user group that matches the given filter criteria exists

New in version 2016.3.0.

#### Parameters

- **name** -- names of the user groups
- **node** -- name of the node the user groups must belong to (This will override the nodeids parameter.)
- **nodeids** -- IDs of the nodes the user groups must belong to
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** True if at least one user group that matches the given filter criteria exists, else False.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.usergroup_exists Guests
```

`salt.modules.zabbix.usergroup_get`(*name=None, usrgpids=None, userids=None, \*\*connection\_args*)

Retrieve user groups according to the given parameters. NOTE: This function accepts all `usergroup_get` properties: keyword argument names differ depending on your zabbix version, see: <https://www.zabbix.com/documentation/2.4/manual/api/reference/usergroup/get>

New in version 2016.3.0.

#### Parameters

- **name** -- names of the user groups
- **usrgpids** -- return only user groups with the given IDs
- **userids** -- return only user groups that contain the given users
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** Array with convenient user groups details, False if no user group found or on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.usergroup_get Guests
```

`salt.modules.zabbix.usergroup_list`(*\*\*connection\_args*)

Retrieve all enabled user groups.

New in version 2016.3.0.

#### Parameters

- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see

- module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** Array with enabled user groups details, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.usergroup_list
```

`salt.modules.zabbix.usergroup_update`(*usrgrpid*, *\*\*connection\_args*)

Update existing user group. NOTE: This function accepts all standard user group properties: keyword argument names differ depending on your zabbix version, see: [https://www.zabbix.com/documentation/2.4/manual/api/reference/usergroup/object#user\\_group](https://www.zabbix.com/documentation/2.4/manual/api/reference/usergroup/object#user_group)

New in version 2016.3.0.

#### Parameters

- **usrgrpid** -- ID of the user group to update.
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** IDs of the updated user group, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.usergroup_update 8 name=guestsRenamed
```

## 14.7.452 salt.modules.zcbuildout

Management of zc.buildout

New in version 2014.1.0.

This module is inspired by [minitage's buildout maker](#)

---

**Note:** The zc.buildout integration is still in beta; the API is subject to change

---

### General notes

You have those following methods:

- `upgrade_bootstrap`
- `bootstrap`
- `run_buildout`
- `buildout`

`salt.modules.zcbuildout.bootstrap`(*\*a*, *\*\*kw*)

Run the buildout bootstrap dance (python bootstrap.py).

**directory** directory to execute in

**config** alternative buildout configuration file to use

**runas** User used to run buildout as

**env** environment variables to set when running

**buildout\_ver** force a specific buildout version (1 | 2)  
**test\_release** buildout accept test release  
**offline** are we executing buildout in offline mode  
**distribute** Forcing use of distribute  
**new\_st** Forcing use of setuptools >= 0.7  
**python** path to a python executable to use in place of default (salt one)  
**onlyif** Only execute cmd if statement on the host return 0  
**unless** Do not execute cmd if statement on the host return 0  
**use\_vt** Use the new salt VT to stream output [experimental]  
 CLI Example:

```
salt '*' buildout.bootstrap /srv/mybuildout
```

`salt.modules.zcbuildout.buildout(*a, **kw)`

Run buildout in a directory.  
**directory** directory to execute in  
**config** buildout config to use  
**parts** specific buildout parts to run  
**runas** user used to run buildout as  
**env** environment variables to set when running  
**buildout\_ver** force a specific buildout version (1 | 2)  
**test\_release** buildout accept test release  
**new\_st** Forcing use of setuptools >= 0.7  
**distribute** use distribute over setuptools if possible  
**offline** does buildout run offline  
**python** python to use  
**debug** run buildout with -D debug flag  
**onlyif** Only execute cmd if statement on the host return 0  
**unless** Do not execute cmd if statement on the host return 0  
**newest** run buildout in newest mode  
**verbose** run buildout in verbose mode (-vvvvv)  
**use\_vt** Use the new salt VT to stream output [experimental]  
 CLI Example:

```
salt '*' buildout.buildout /srv/mybuildout
```

`salt.modules.zcbuildout.run_buildout(*a, **kw)`

Run a buildout in a directory.  
**directory** directory to execute in  
**config** alternative buildout configuration file to use  
**offline** are we executing buildout in offline mode  
**runas** user used to run buildout as  
**env** environment variables to set when running  
**onlyif** Only execute cmd if statement on the host return 0  
**unless** Do not execute cmd if statement on the host return 0  
**newest** run buildout in newest mode  
**force** run buildout unconditionally  
**verbose** run buildout in verbose mode (-vvvvv)  
**use\_vt** Use the new salt VT to stream output [experimental]  
 CLI Example:

```
salt '*' buildout.run_buildout /srv/mybuildout
```

`salt.modules.zcbuildout.upgrade_bootstrap(*a, **kw)`

Upgrade current bootstrap.py with the last released one.

Indeed, when we first run a buildout, a common source of problem is to have a locally stale bootstrap, we just try to grab a new copy

**directory** directory to execute in

**offline** are we executing buildout in offline mode

**buildout\_ver** forcing to use a specific buildout version (1 | 2)

**onlyif** Only execute cmd if statement on the host return 0

**unless** Do not execute cmd if statement on the host return 0

CLI Example:

```
salt '*' buildout.upgrade_bootstrap /srv/mybuildout
```

### 14.7.453 salt.modules.zenoss

Module for working with the Zenoss API

New in version 2016.3.0.

**depends** requests

**configuration** This module requires a `zenoss` entry in the master/minion config.

For example:

```
zenoss:
  hostname: https://zenoss.example.com
  username: admin
  password: admin123
```

**salt.modules.zenoss.add\_device** (*device=None, device\_class=None, collector='localhost', prod\_state=1000*)

A function to connect to a zenoss server and add a new device entry.

**Parameters**

- **device** -- (Optional) Will use the grain `fqdn` by default.
- **device\_class** -- (Optional) The device class to use. If none, will determine based on kernel grain.
- **collector** -- (Optional) The collector to use for this device. Defaults to `localhost`.
- **prod\_state** -- (Optional) The prodState to set on the device. If none, defaults to 1000 ( production )

**CLI Example:** salt `\*` zenoss.add\_device

**salt.modules.zenoss.device\_exists** (*device=None*)

Check to see if a device already exists in Zenoss.

**Parameters** **device** -- (Optional) Will use the grain `fqdn` by default

**CLI Example:** salt `\*` zenoss.device\_exists

**salt.modules.zenoss.find\_device** (*device=None*)

Find a device in Zenoss. If device not found, returns None.

**Parameters** **device** -- (Optional) Will use the grain `fqdn` by default

**CLI Example:** salt `\*` zenoss.find\_device

**salt.modules.zenoss.set\_prod\_state** (*prod\_state, device=None*)

A function to set the prod\_state in zenoss.

**Parameters**

- **prod\_state** -- (Required) Integer value of the state
- **device** -- (Optional) Will use the grain `fqdn` by default.

CLI Example: salt zenoss.set\_prod\_state 1000 hostname

#### 14.7.454 salt.modules.zfs

Salt interface to ZFS commands

**codeauthor** Nitin Madhok <nmadhok@clemson.edu>

salt.modules.zfs.**bookmark**(*snapshot*, *bookmark*)

New in version 2016.3.0.

Creates a bookmark of the given snapshot

---

**Note:** Bookmarks mark the point in time when the snapshot was created, and can be used as the incremental source for a zfs send command.

This feature must be enabled to be used. See zpool-features(5) for details on ZFS feature flags and the bookmarks feature.

---

**snapshot** [string] name of snapshot to bookmark

**bookmark** [string] name of bookmark

CLI Example:

```
salt '*' zfs.bookmark myzpool/mydataset@yesterday myzpool/mydataset#complete
```

salt.modules.zfs.**clone**(*name\_a*, *name\_b*, *\*\*kwargs*)

New in version 2016.3.0.

Creates a clone of the given snapshot.

**name\_a** [string] name of snapshot

**name\_b** [string] name of filesystem or volume

**create\_parent** [boolean] creates all the non-existing parent datasets. any property specified on the command line using the -o option is ignored.

**properties** [dict] additional zfs properties (-o)

---

**Note:** ZFS properties can be specified at the time of creation of the filesystem by passing an additional argument called ``properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{ 'property1': 'value1', 'property2': 'value2' }"
```

---

CLI Example:

```
salt '*' zfs.clone myzpool/mydataset@yesterday myzpool/mydataset_yesterday
```

salt.modules.zfs.**create**(*name*, *\*\*kwargs*)

New in version 2015.5.0.

Changed in version 2016.3.0.

Create a ZFS File System.

**name** [string] name of dataset or volume

**volume\_size** [string] if specified, a zvol will be created instead of a dataset

**sparse** [boolean] create sparse volume

**create\_parent** [boolean] creates all the non-existing parent datasets. any property specified on the command line using the -o option is ignored.

**properties** [dict] additional zfs properties (-o)

**Note:** ZFS properties can be specified at the time of creation of the filesystem by passing an additional argument called ``properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{ 'property1': 'value1', 'property2': 'value2' }"
```

CLI Example:

```
salt '*' zfs.create myzpool/mydataset [create_parent=True|False]
salt '*' zfs.create myzpool/mydataset properties="{ 'mountpoint': '/export/zfs',
↳ 'sharenfs': 'on' }"
salt '*' zfs.create myzpool/volume volume_size=1G [sparse=True|False]`
salt '*' zfs.create myzpool/volume volume_size=1G properties="{ 'volblocksize':
↳ '512' }" [sparse=True|False]
```

**salt.modules.zfs.destroy**(*name*, *\*\*kwargs*)

New in version 2015.5.0.

Destroy a ZFS File System.

**name** [string] name of dataset, volume, or snapshot

**force** [boolean] force an unmount of any file systems using the unmount -f command.

**recursive** [boolean] recursively destroy all children. (-r)

**recursive\_all** [boolean] recursively destroy all dependents, including cloned file systems outside the target hierarchy. (-R)

**Warning:** watch out when using recursive and recursive\_all

CLI Example:

```
salt '*' zfs.destroy myzpool/mydataset [force=True|False]
```

**salt.modules.zfs.diff**(*name\_a*, *name\_b*, *\*\*kwargs*)

New in version 2016.3.0.

Display the difference between a snapshot of a given filesystem and another snapshot of that filesystem from a later time or the current contents of the filesystem.

**name\_a** [string] name of snapshot

**name\_b** [string] name of snapshot or filesystem

**show\_changetime** [boolean] display the path's inode change time as the first column of output. (default = False)

**show\_indication** [boolean] display an indication of the type of file. (default = True)

CLI Example:

```
salt '*' zfs.diff myzpool/mydataset@yesterday myzpool/mydataset
```

**salt.modules.zfs.exists**(*name*, *\*\*kwargs*)

New in version 2015.5.0.

Check if a ZFS filesystem or volume or snapshot exists.

**name** [string] name of dataset

**type** [string] also check if dataset is of a certain type, valid choices are: filesystem, snapshot, volume, bookmark, or all.

CLI Example:

```
salt '*' zfs.exists myzpool/mydataset
salt '*' zfs.exists myzpool/myvolume type=volume
```

`salt.modules.zfs.get(*dataset, **kwargs)`

New in version 2016.3.0.

Displays properties for the given datasets.

**\*dataset** [string] name of snapshot(s), filesystem(s), or volume(s)

**properties** [string] comma-separated list of properties to list, defaults to all

**recursive** [boolean] recursively list children

**depth** [int] recursively list children to depth

**fields** [string] comma-separated list of fields to include, the name and property field will always be added

**type** [string] comma-separated list of types to display, where type is one of filesystem, snapshot, volume, bookmark, or all.

**source** [string] comma-separated list of sources to display. Must be one of the following: local, default, inherited, temporary, and none. The default value is all sources.

---

**Note:** If no datasets are specified, then the command displays properties for all datasets on the system.

---

CLI Example:

```
salt '*' zfs.get
salt '*' zfs.get myzpool/mydataset [recursive=True|False]
salt '*' zfs.get myzpool/mydataset properties="sharenfs,mountpoint"
↳ [recursive=True|False]
salt '*' zfs.get myzpool/mydataset myzpool/myotherdataset properties=available
↳ fields=value depth=1
```

`salt.modules.zfs.hold(tag, *snapshot, **kwargs)`

New in version 2016.3.0.

Adds a single reference, named with the tag argument, to the specified snapshot or snapshots.

---

**Note:** Each snapshot has its own tag namespace, and tags must be unique within that space.

If a hold exists on a snapshot, attempts to destroy that snapshot by using the zfs destroy command return EBUSY.

---

**tag** [string] name of tag

**\*snapshot** [string] name of snapshot(s)

**recursive** [boolean] specifies that a hold with the given tag is applied recursively to the snapshots of all descendent file systems.

---

**Note:** A comma-separated list can be provided for the tag parameter to hold multiple tags.

---

CLI Example:

```
salt '*' zfs.hold mytag myzpool/mydataset@mysnapshot [recursive=True]
salt '*' zfs.hold mytag,myothertag myzpool/mydataset@mysnapshot
salt '*' zfs.hold mytag myzpool/mydataset@mysnapshot myzpool/
↳ mydataset@myothersnapshot
```

```
salt.modules.zfs.holds(snapshot, **kwargs)
```

New in version 2016.3.0.

Lists all existing user references for the given snapshot or snapshots.

**snapshot** [string] name of snapshot

**recursive** [boolean] lists the holds that are set on the named descendent snapshots also.

CLI Example:

```
salt '*' zfs.holds myzpool/mydataset@baseline
```

```
salt.modules.zfs.inherit(prop, name, **kwargs)
```

New in version 2016.3.0.

Clears the specified property

**prop** [string] name of property

**name** [string] name of the filesystem, volume, or snapshot

**recursive** [boolean] recursively inherit the given property for all children.

**revert** [boolean] revert the property to the received value if one exists; otherwise operate as if the -S option was not specified.

CLI Example:

```
salt '*' zfs.inherit canmount myzpool/mydataset [recursive=True|False]
```

```
salt.modules.zfs.list(name=None, **kwargs)
```

New in version 2015.5.0.

Changed in version 2016.3.0.

Return a list of all datasets or a specified dataset on the system and the values of their used, available, referenced, and mountpoint properties.

**name** [string] name of dataset, volume, or snapshot

**recursive** [boolean] recursively list children

**depth** [int] limit recursion to depth

**properties** [string] comma-separated list of properties to list, the name property will always be added

**type** [string] comma-separated list of types to display, where type is one of filesystem, snapshot, volume, bookmark, or all.

**sort** [string] property to sort on (default = name)

**order** [string [ascending|descending]] sort order (default = ascending)

CLI Example:

```
salt '*' zfs.list
salt '*' zfs.list myzpool/mydataset [recursive=True|False]
salt '*' zfs.list myzpool/mydataset properties="sharefs,mountpoint"
```

```
salt.modules.zfs.mount(name='-a', **kwargs)
```

New in version 2016.3.0.

Mounts ZFS file systems

**name** [string] name of the filesystem, you can use '-a' to mount all unmounted filesystems. (this is the default)

**overlay** [boolean] perform an overlay mount.

**options** [string] optional comma-separated list of mount options to use temporarily for the duration of the mount.

CLI Example:

```

salt '*' zfs.mount
salt '*' zfs.mount myzpool/mydataset
salt '*' zfs.mount myzpool/mydataset options=ro

```

`salt.modules.zfs.promote(name)`

New in version 2016.3.0.

Promotes a clone file system to no longer be dependent on its ``origin" snapshot.

---

**Note:** This makes it possible to destroy the file system that the clone was created from. The clone parent-child dependency relationship is reversed, so that the origin file system becomes a clone of the specified file system.

The snapshot that was cloned, and any snapshots previous to this snapshot, are now owned by the promoted clone. The space they use moves from the origin file system to the promoted clone, so enough space must be available to accommodate these snapshots. No new space is consumed by this operation, but the space accounting is adjusted. The promoted clone must not have any conflicting snapshot names of its own. The rename subcommand can be used to rename any conflicting snapshots.

---

**name** [string] name of clone-filesystem

CLI Example:

```

salt '*' zfs.promote myzpool/myclone

```

`salt.modules.zfs.release(tag, *snapshot, **kwargs)`

New in version 2016.3.0.

Removes a single reference, named with the tag argument, from the specified snapshot or snapshots.

---

**Note:** The tag must already exist for each snapshot. If a hold exists on a snapshot, attempts to destroy that snapshot by using the zfs destroy command return EBUSY.

---

**tag** [string] name of tag

**\*snapshot** [string] name of snapshot(s)

**recursive** [boolean] recursively releases a hold with the given tag on the snapshots of all descendent file systems.

---

**Note:** A comma-separated list can be provided for the tag parameter to release multiple tags.

---

CLI Example:

```

salt '*' zfs.release mytag myzpool/mydataset@mysnapshot [recursive=True]
salt '*' zfs.release mytag myzpool/mydataset@mysnapshot myzpool/
↳mydataset@myothersnapshot

```

`salt.modules.zfs.rename(name, new_name, **kwargs)`

New in version 2015.5.0.

Changed in version 2016.3.0.

Rename or Relocate a ZFS File System.

**name** [string] name of dataset, volume, or snapshot

**new\_name** [string] new name of dataset, volume, or snapshot

**force** [boolean] force unmount any filesystems that need to be unmounted in the process.  
**create\_parent** [boolean] creates all the nonexistent parent datasets. Datasets created in this manner are automatically mounted according to the mountpoint property inherited from their parent.  
**recursive** [boolean] recursively rename the snapshots of all descendent datasets. snapshots are the only dataset that can be renamed recursively.

CLI Example:

```
salt '*' zfs.rename myzpool/mydataset myzpool/renameddataset
```

`salt.modules.zfs.rollback`(*name*, *\*\*kwargs*)

New in version 2016.3.0.

Roll back the given dataset to a previous snapshot.

**Warning:** When a dataset is rolled back, all data that has changed since the snapshot is discarded, and the dataset reverts to the state at the time of the snapshot. By default, the command refuses to roll back to a snapshot other than the most recent one.

In order to do so, all intermediate snapshots and bookmarks must be destroyed by specifying the `-r` option.

**name** [string] name of snapshot

**recursive** [boolean] destroy any snapshots and bookmarks more recent than the one specified.

**recursive\_all** [boolean] destroy any more recent snapshots and bookmarks, as well as any clones of those snapshots.

**force** [boolean] used with the `-R` option to force an unmount of any clone file systems that are to be destroyed.

CLI Example:

```
salt '*' zfs.rollback myzpool/mydataset@yesterday
```

`salt.modules.zfs.set`(*\*dataset*, *\*\*kwargs*)

New in version 2016.3.0.

Sets the property or list of properties to the given value(s) for each dataset.

**\*dataset** [string] name of snapshot(s), filesystem(s), or volume(s)

**\*properties** [string] additional zfs properties pairs

**Note:** properties are passed as key-value pairs. e.g.  
 compression=off

**Note:** Only some properties can be edited.

See the Properties section for more information on what properties can be set and acceptable values.

Numeric values can be specified as exact values, or in a human-readable form with a suffix of B, K, M, G, T, P, E, Z (for bytes, kilobytes, megabytes, gigabytes, terabytes, petabytes, exabytes, or zettabytes, respectively).

CLI Example:

```
salt '*' zfs.set myzpool/mydataset compression=off
salt '*' zfs.set myzpool/mydataset myzpool/myotherdataset compression=off
salt '*' zfs.set myzpool/mydataset myzpool/myotherdataset compression=lz4
↪ canmount=off
```

`salt.modules.zfs.snapshot` (\**snapshot*, \*\**kwargs*)

New in version 2016.3.0.

Creates snapshots with the given names.

**\*snapshot** [string] name of snapshot(s)

**recursive** [boolean] recursively create snapshots of all descendent datasets.

**properties** [dict] additional zfs properties (-o)

**Note:** ZFS properties can be specified at the time of creation of the filesystem by passing an additional argument called ``properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{ 'property1': 'value1', 'property2': 'value2' }"
```

CLI Example:

```
salt '*' zfs.snapshot myzpool/mydataset@yesterday [recursive=True]
salt '*' zfs.snapshot myzpool/mydataset@yesterday myzpool/
↳myotherdataset@yesterday [recursive=True]
```

`salt.modules.zfs.unmount` (*name*, \*\**kwargs*)

New in version 2016.3.0.

Unmounts ZFS file systems

**name** [string] name of the filesystem, you can use '-a' to unmount all mounted filesystems.

**force** [boolean] forcefully unmount the file system, even if it is currently in use.

**Warning:** Using -a for the name parameter will probably break your system, unless your rootfs is not on zfs.

CLI Example:

```
salt '*' zfs.unmount myzpool/mydataset [force=True|False]
```

## 14.7.455 salt.modules.zk\_concurrency

### Concurrency controls in zookeeper

This module allows you to acquire and release a slot. This is primarily useful for ensuring that no more than N hosts take a specific action at once. This can also be used to coordinate between masters.

`salt.modules.zk_concurrency.lock` (*path*, *zk\_hosts*, *identifier=None*, *max\_concurrency=1*, *time-out=None*, *ephemeral\_lease=False*, *force=False*)

Get lock (with optional timeout)

**path** The path in zookeeper where the lock is

**zk\_hosts** zookeeper connect string

**identifier** Name to identify this minion, if unspecified defaults to the hostname

**max\_concurrency** Maximum number of lock holders

**timeout** timeout to wait for the lock. A None timeout will block forever

**ephemeral\_lease** Whether the locks in zookeeper should be ephemeral

**force** Forcibly acquire the lock regardless of available slots

Example:

... code-block: bash

```
salt minion zk_concurrency.lock /lock/path host1:1234,host2:1234
```

```
salt.modules.zk_concurrency.lock_holders(path, zk_hosts, identifier=None,  
                                           max_concurrency=1, timeout=None,  
                                           ephemeral_lease=False)
```

Return an un-ordered list of lock holders

**path** The path in zookeeper where the lock is

**zk\_hosts** zookeeper connect string

**identifier** Name to identify this minion, if unspecified defaults to hostname

**max\_concurrency** Maximum number of lock holders

**timeout** timeout to wait for the lock. A None timeout will block forever

**ephemeral\_lease** Whether the locks in zookeeper should be ephemeral

Example:

```
... code-block: bash
```

```
    salt minion zk_concurrency.lock_holders /lock/path host1:1234,host2:1234
```

```
salt.modules.zk_concurrency.party_members(path, zk_hosts, min_nodes=1, blocking=False)
```

Get the List of identifiers in a particular party, optionally waiting for the specified minimum number of nodes (min\_nodes) to appear

**path** The path in zookeeper where the lock is

**zk\_hosts** zookeeper connect string

**min\_nodes** The minimum number of nodes expected to be present in the party

**blocking** The boolean indicating if we need to block until min\_nodes are available

Example:

```
... code-block: bash
```

```
    salt minion zk_concurrency.party_members /lock/path host1:1234,host2:1234 salt minion  
    zk_concurrency.party_members /lock/path host1:1234,host2:1234 min_nodes=3 blocking=True
```

```
salt.modules.zk_concurrency.unlock(path, zk_hosts=None, identifier=None, max_concurrency=1,  
                                     ephemeral_lease=False)
```

Remove lease from semaphore

**path** The path in zookeeper where the lock is

**zk\_hosts** zookeeper connect string

**identifier** Name to identify this minion, if unspecified defaults to hostname

**max\_concurrency** Maximum number of lock holders

**timeout** timeout to wait for the lock. A None timeout will block forever

**ephemeral\_lease** Whether the locks in zookeeper should be ephemeral

Example:

```
... code-block: bash
```

```
    salt minion zk_concurrency.unlock /lock/path host1:1234,host2:1234
```

### 14.7.456 salt.modules.znc

znc - An advanced IRC bouncer

New in version 2014.7.0.

Provides an interface to basic ZNC functionality

```
salt.modules.znc.buildmod(*modules)
```

Build module using znc-buildmod

CLI Example:

```
salt '*' znc.buildmod module.cpp [...]
```

`salt.modules.znc.dumpconf()`

Write the active configuration state to config file

CLI Example:

```
salt '*' znc.dumpconf
```

`salt.modules.znc.rehashconf()`

Rehash the active configuration state from config file

CLI Example:

```
salt '*' znc.rehashconf
```

`salt.modules.znc.version()`

Return server version from `znc --version`

CLI Example:

```
salt '*' znc.version
```

#### 14.7.457 salt.modules.zoneadm

Module for Solaris 10's zoneadm

**maintainer** Jorge Schrauwen <[sjorge@blackdot.be](mailto:sjorge@blackdot.be)>

**maturity** new

**platform** OmniOS,OpenIndiana,SmartOS,OpenSolaris,Solaris 10

New in version 2017.7.0.

**Warning:** Oracle Solaris 11's zoneadm is not supported by this module!

`salt.modules.zoneadm.attach(zone, force=False, brand_opts=None)`

Attach the specified zone.

**zone** [string] name of the zone

**force** [boolean] force the zone into the ``installed'' state with no validation

**brand\_opts** [string] brand specific options to pass

CLI Example:

```
salt '*' zoneadm.attach lawrence
salt '*' zoneadm.attach lawrence True
```

`salt.modules.zoneadm.boot(zone, single=False, altinit=None, smf_options=None)`

Boot (or activate) the specified zone.

**zone** [string] name or uuid of the zone

**single** [boolean] boots only to milestone svc:/milestone/single-user:default.

**altinit** [string] valid path to an alternative executable to be the primordial process.

**smf\_options** [string] include two categories of options to control booting behavior of the service management facility: recovery options and messages options.

CLI Example:

```
salt '*' zoneadm.boot clementine
salt '*' zoneadm.boot maeve single=True
salt '*' zoneadm.boot teddy single=True smf_options=verbose
```

`salt.modules.zoneadm.clone`(*zone*, *source*, *snapshot=None*)

Install a zone by copying an existing installed zone.

**zone** [string] name of the zone

**source** [string] zone to clone from

**snapshot** [string] optional name of snapshot to use as source

CLI Example:

```
salt '*' zoneadm.clone clementine dolores
```

`salt.modules.zoneadm.detach`(*zone*)

Detach the specified zone.

**zone** [string] name or uuid of the zone

CLI Example:

```
salt '*' zoneadm.detach kissy
```

`salt.modules.zoneadm.halt`(*zone*)

Halt the specified zone.

**zone** [string] name or uuid of the zone

---

**Note:** To cleanly shutdown the zone use the shutdown function.

---

CLI Example:

```
salt '*' zoneadm.halt hector
```

`salt.modules.zoneadm.install`(*zone*, *nodataset=False*, *brand\_opts=None*)

Install the specified zone from the system.

**zone** [string] name of the zone

**nodataset** [boolean] do not create a ZFS file system

**brand\_opts** [string] brand specific options to pass

CLI Example:

```
salt '*' zoneadm.install dolores
salt '*' zoneadm.install teddy True
```

`salt.modules.zoneadm.list`(*verbose=True*, *installed=False*, *configured=False*, *hide\_global=True*)

List all zones

**verbose** [boolean] display additional zone information

**installed** [boolean] include installed zones in output

**configured** [boolean] include configured zones in output

**hide\_global** [boolean] do not include global zone

CLI Example:

```
salt '*' zoneadm.list
```

`salt.modules.zoneadm.move`(*zone*, *zonepath*)

Move zone to new zonepath.

**zone** [string] name or uuid of the zone

**zonepath** [string] new zonepath

CLI Example:

```
salt '*' zoneadm.move meave /sweetwater/meave
```

`salt.modules.zoneadm.ready(zone)`  
 Prepares a zone for running applications.  
**zone** [string] name or uuid of the zone  
 CLI Example:

```
salt '*' zoneadm.ready clementine
```

`salt.modules.zoneadm.reboot(zone, single=False, altinit=None, smf_options=None)`  
 Restart the zone. This is equivalent to a halt boot sequence.  
**zone** [string] name or uuid of the zone  
**single** [boolean] boots only to milestone svc:/milestone/single-user:default.  
**altinit** [string] valid path to an alternative executable to be the primordial process.  
**smf\_options** [string] include two categories of options to control booting behavior of the service management facility: recovery options and messages options.  
 CLI Example:

```
salt '*' zoneadm.reboot dolores
salt '*' zoneadm.reboot teddy single=True
```

`salt.modules.zoneadm.shutdown(zone, reboot=False, single=False, altinit=None, smf_options=None)`  
 Gracefully shutdown the specified zone.  
**zone** [string] name or uuid of the zone  
**reboot** [boolean] reboot zone after shutdown (equivalent of shutdown -i6 -g0 -y)  
**single** [boolean] boots only to milestone svc:/milestone/single-user:default.  
**altinit** [string] valid path to an alternative executable to be the primordial process.  
**smf\_options** [string] include two categories of options to control booting behavior of the service management facility: recovery options and messages options.  
 CLI Example:

```
salt '*' zoneadm.shutdown peter
salt '*' zoneadm.shutdown armistice reboot=True
```

`salt.modules.zoneadm.uninstall(zone)`  
 Uninstall the specified zone from the system.  
**zone** [string] name or uuid of the zone

**Warning:** The -F flag is always used to avoid the prompts when uninstalling.

CLI Example:

```
salt '*' zoneadm.uninstall teddy
```

`salt.modules.zoneadm.verify(zone)`  
 Check to make sure the configuration of the specified zone can safely be installed on the machine.  
**zone** [string] name of the zone  
 CLI Example:

```
salt '*' zoneadm.verify dolores
```

## 14.7.458 salt.modules.zonecfg

Module for Solaris 10's zonecfg

**maintainer** Jorge Schrauwen <sjorge@blackdot.be>  
**maturity** new  
**platform** OmniOS,OpenIndiana,SmartOS,OpenSolaris,Solaris 10  
**depend** salt.modules.file

New in version 2017.7.0.

**Warning:** Oracle Solaris 11's zonecfg is not supported by this module!

`salt.modules.zonecfg.add_resource(zone, resource_type, **kwargs)`

Add a resource

**zone** [string] name of zone  
**resource\_type** [string] type of resource  
**\*\*kwargs** [string|int|...] resource properties

CLI Example:

```
salt '*' zonecfg.add_resource tallgeese rctl name=zone.max-locked-memory value=
↳ '(priv=privileged,limit=33554432,action=deny)'
```

`salt.modules.zonecfg.clear_property(zone, key)`

Clear a property

**zone** [string] name of zone  
**key** [string] name of property

CLI Example:

```
salt '*' zonecfg.clear_property deathscythe cpu-shares
```

`salt.modules.zonecfg.create(zone, brand, zonpath, force=False)`

Create an in-memory configuration for the specified zone.

**zone** [string] name of zone  
**brand** [string] brand name  
**zonpath** [string] path of zone  
**force** [boolean] overwrite configuration

CLI Example:

```
salt '*' zonecfg.create deathscythe ipkg /zones/deathscythe
```

`salt.modules.zonecfg.create_from_template(zone, template)`

Create an in-memory configuration from a template for the specified zone.

**zone** [string] name of zone  
**template** [string] name of template

**Warning:** existing config will be overwritten!

CLI Example:

```
salt '*' zonecfg.create_from_template leo tallgeese
```

`salt.modules.zonecfg.delete(zone)`

Delete the specified configuration from memory and stable storage.

**zone** [string] name of zone

CLI Example:

```
salt '*' zonecfg.delete epyon
```

`salt.modules.zonecfg.export(zone, path=None)`

Export the configuration from memory to stable storage.

**zone** [string] name of zone

**path** [string] path of file to export to

CLI Example:

```
salt '*' zonecfg.export epyon
salt '*' zonecfg.export epyon /zones/epyon.cfg
```

`salt.modules.zonecfg.import(zone, path)`

Import the configuration to memory from stable storage.

**zone** [string] name of zone

**path** [string] path of file to export to

CLI Example:

```
salt '*' zonecfg.import epyon /zones/epyon.cfg
```

`salt.modules.zonecfg.info(zone, show_all=False)`

Display the configuration from memory

**zone** [string] name of zone

**show\_all** [boolean] also include calculated values like capped-cpu, cpu-shares, ...

CLI Example:

```
salt '*' zonecfg.info tallgeese
```

`salt.modules.zonecfg.remove_resource(zone, resource_type, resource_key, resource_value)`

Remove a resource

**zone** [string] name of zone

**resource\_type** [string] type of resource

**resource\_key** [string] key for resource selection

**resource\_value** [string] value for resource selection

---

**Note:** Set `resource_selector` to `None` for resource that do not require one.

---

CLI Example:

```
salt '*' zonecfg.remove_resource tallgeese rctl name zone.max-locked-memory
```

`salt.modules.zonecfg.set_property(zone, key, value)`

Set a property

**zone** [string] name of zone

**key** [string] name of property

**value** [string] value of property

CLI Example:

```
salt '*' zonecfg.set_property deathscythe cpu-shares 100
```

`salt.modules.zonecfg.update_resource(zone, resource_type, resource_selector, **kwargs)`

Add a resource

**zone** [string] name of zone  
**resource\_type** [string] type of resource  
**resource\_selector** [string] unique resource identifier  
**\*\*kwargs** [string|int|...] resource properties

---

**Note:** Set resource\_selector to None for resource that do not require one.

---

CLI Example:

```
salt '*' zonecfg.update_resource tallgeese rctl name name=zone.max-locked-memory
↳value='(priv=privileged,limit=33554432,action=deny)'
```

### 14.7.459 salt.modules.zpool

Module for running ZFS zpool command

**codeauthor** Nitin Madhok <nmadhok@clemson.edu>

**salt.modules.zpool.add**(zpool, \*vdevs, \*\*kwargs)

Changed in version 2016.3.0.

Add the specified vdev's to the given storage pool

**zpool** [string] name of storage pool

**\*vdevs** [string] one or more devices

**force** [boolean] forces use of device

CLI Example:

```
salt '*' zpool.add myzpool /path/to/vdev1 /path/to/vdev2 [...]
```

**salt.modules.zpool.attach**(zpool, device, new\_device, force=False)

Changed in version 2016.3.0.

Attach specified device to zpool

**zpool** [string] name of storage pool

**device** [string] device to attach too

**new\_device** [string] device to attach

**force** [boolean] forces use of device

CLI Example:

```
salt '*' zpool.attach myzpool /path/to/vdev1 /path/to/vdev2 [...]
```

**salt.modules.zpool.create**(zpool, \*vdevs, \*\*kwargs)

New in version 2015.5.0.

Changed in version 2016.3.0.

Create a simple zpool, a mirrored zpool, a zpool having nested VDEVs, a hybrid zpool with cache, spare and log drives or a zpool with RAIDZ-1, RAIDZ-2 or RAIDZ-3

**zpool** [string] name of storage pool

**\*vdevs** [string] one or move devices

**force** [boolean] forces use of vdevs, even if they appear in use or specify a conflicting replication level.

**mountpoint** [string] sets the mount point for the root dataset

**altroot** [string] equivalent to ``-o cachefile=none,altroot=root``

**properties** [dict] additional pool properties

**filesystem\_properties** [dict] additional filesystem properties

CLI Example:

```

salt '*' zpool.create myzpool /path/to/vdev1 [...] [force=True|False]
salt '*' zpool.create myzpool mirror /path/to/vdev1 /path/to/vdev2 [...]
↳ [force=True|False]
salt '*' zpool.create myzpool raidz1 /path/to/vdev1 /path/to/vdev2 raidz2 /path/
↳ to/vdev3 /path/to/vdev4 /path/to/vdev5 [...] [force=True|False]
salt '*' zpool.create myzpool mirror /path/to/vdev1 [...] mirror /path/to/vdev2 /
↳ path/to/vdev3 [...] [force=True|False]
salt '*' zpool.create myhybridzpool mirror /tmp/file1 [...] log mirror /path/to/
↳ vdev1 [...] cache /path/to/vdev2 [...] spare /path/to/vdev3 [...]
↳ [force=True|False]

```

**Note:** Zpool properties can be specified at the time of creation of the pool by passing an additional argument called ``properties`` and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{ 'property1': 'value1', 'property2': 'value2' }"
```

Filesystem properties can be specified at the time of creation of the pool by passing an additional argument called ``filesystem\_properties`` and specifying the properties with their respective values in the form of a python dictionary:

```
filesystem_properties="{ 'property1': 'value1', 'property2': 'value2' }"
```

Example:

```

salt '*' zpool.create myzpool /path/to/vdev1 [...] properties="{ 'property1':
↳ 'value1', 'property2': 'value2' }"

```

**salt.modules.zpool.create\_file\_vdev**(*size*, \**vdevs*)

Changed in version 2016.3.0.

Creates file based virtual devices for a zpool

\**vdevs* is a list of full paths for mkfile to create

CLI Example:

```

salt '*' zpool.create_file_vdev 7g /path/to/vdev1 [/path/to/vdev2] [...]

```

**Note:** Depending on file size, the above command may take a while to return.

**salt.modules.zpool.destroy**(*zpool*, *force=False*)

Changed in version 2016.3.0.

Destroys a storage pool

**zpool** [string] name of storage pool

**force** [boolean] force destroy of pool

CLI Example:

```

salt '*' zpool.destroy myzpool

```

**salt.modules.zpool.detach**(*zpool*, *device*)

Changed in version 2016.3.0.

Detach specified device to zpool

**zpool** [string] name of storage pool  
**device** [string] device to detach  
CLI Example:

```
salt '*' zpool.detach myzpool /path/to/vdev1
```

**salt.modules.zpool.exists**(*zpool*)  
Check if a ZFS storage pool is active  
**zpool** [string] name of storage pool  
CLI Example:

```
salt '*' zpool.exists myzpool
```

**salt.modules.zpool.export**(*\*pools, \*\*kwargs*)  
New in version 2015.5.0.  
Changed in version 2016.3.0.

Export storage pools  
**\*pools** [string] one or more storage pools to export  
**force** [boolean] force export of storage pools  
CLI Example:

```
salt '*' zpool.export myzpool ... [force=True|False]  
salt '*' zpool.export myzpool2 myzpool2 ... [force=True|False]
```

**salt.modules.zpool.get**(*zpool, prop=None, show\_source=False*)  
New in version 2016.3.0.

Retrieves the given list of properties  
**zpool** [string] name of storage pool  
**prop** [string] optional name of property to retrieve  
**show\_source** [boolean] show source of property  
CLI Example:

```
salt '*' zpool.get myzpool
```

**salt.modules.zpool.healthy**()  
New in version 2016.3.0.

Check if all zpools are healthy  
CLI Example:

```
salt '*' zpool.healthy
```

**salt.modules.zpool.history**(*zpool=None, internal=False, verbose=False*)  
New in version 2016.3.0.

Displays the command history of the specified pools or all pools if no pool is specified  
**zpool** [string] optional storage pool  
**internal** [boolean] toggle display of internally logged ZFS events  
**verbose** [boolean] toggle display of the user name, the hostname, and the zone in which the operation was performed  
CLI Example:

```
salt '*' zpool.upgrade myzpool
```

`salt.modules.zpool.import` (*zpool=None, new\_name=None, \*\*kwargs*)

New in version 2015.5.0.

Changed in version 2016.3.0.

Import storage pools or list pools available for import

**zpool** [string] optional name of storage pool

**new\_name** [string] optional new name for the storage pool

**mntopts** [string] comma-separated list of mount options to use when mounting datasets within the pool.

**force** [boolean] forces import, even if the pool appears to be potentially active.

**altroot** [string] equivalent to ``-o cachefile=none,altroot=root``

**dir** [string] searches for devices or files in dir, multiple dirs can be specified as follows:: `dir="dir1,dir2"`

**no\_mount** [boolean] import the pool without mounting any file systems.

**only\_destroyed** [boolean] imports destroyed pools only. this also sets `force=True`.

**properties** [dict] additional pool properties

---

**Note:** Zpool properties can be specified at the time of creation of the pool by passing an additional argument called ``properties`` and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{ 'property1': 'value1', 'property2': 'value2' }"
```

---

CLI Example:

```
salt '*' zpool.import [force=True|False]
salt '*' zpool.import myzpool [mynewzpool] [force=True|False]
salt '*' zpool.import myzpool dir='/tmp'
```

`salt.modules.zpool.iostat` (*zpool=None, sample\_time=0*)

Changed in version 2016.3.0.

Display I/O statistics for the given pools

**zpool** [string] optional name of storage pool

**sample\_time** [int] seconds to capture data before output

CLI Example:

```
salt '*' zpool.iostat myzpool
```

`salt.modules.zpool.list` (*properties='size, alloc, free, cap, frag, health', zpool=None*)

New in version 2015.5.0.

Changed in version 2016.3.0.

Return information about (all) storage pools

**zpool** [string] optional name of storage pool

**properties** [string] comma-separated list of properties to list

---

**Note:** the ``name`` property will always be included, the ``frag`` property will get removed if not available

---

**zpool** [string] optional zpool

---

**Note:** multiple storage pool can be provided as a space separated list

---

CLI Example:

```
salt '*' zpool.list
```

`salt.modules.zpool.offline`(*zpool*, \**vdevs*, \*\**kwargs*)

New in version 2015.5.0.

Changed in version 2016.3.0.

Ensure that the specified devices are offline

**Warning:** By default, the OFFLINE state is persistent. The device remains offline when the system is rebooted. To temporarily take a device offline, use `temporary=True`.

**zpool** [string] name of storage pool

\***vdevs** [string] one or more devices

**temporary** [boolean] enable temporarily offline

CLI Example:

```
salt '*' zpool.offline myzpool /path/to/vdev1 [...] [temporary=True|False]
```

`salt.modules.zpool.online`(*zpool*, \**vdevs*, \*\**kwargs*)

New in version 2015.5.0.

Changed in version 2016.3.0.

Ensure that the specified devices are online

**zpool** [string] name of storage pool

\***vdevs** [string] one or more devices

**expand** [boolean] Expand the device to use all available space.

---

**Note:** If the device is part of a mirror or raidz then all devices must be expanded before the new space will become available to the pool.

---

CLI Example:

```
salt '*' zpool.online myzpool /path/to/vdev1 [...]
```

`salt.modules.zpool.reguid`(*zpool*)

New in version 2016.3.0.

Generates a new unique identifier for the pool

**Warning:** You must ensure that all devices in this pool are online and healthy before performing this action.

**zpool** [string] name of storage pool

CLI Example:

```
salt '*' zpool.reguid myzpool
```

`salt.modules.zpool.reopen`(*zpool*)

New in version 2016.3.0.

Reopen all the vdevs associated with the pool

**zpool** [string] name of storage pool

CLI Example:

```
salt '*' zpool.reopen myzpool
```

`salt.modules.zpool.replace`(*zpool*, *old\_device*, *new\_device=None*, *force=False*)

Changed in version 2016.3.0.

Replaces *old\_device* with *new\_device*.

---

**Note:** This is equivalent to attaching *new\_device*, waiting for it to resilver, and then detaching *old\_device*.

The size of *new\_device* must be greater than or equal to the minimum size of all the devices in a mirror or raidz configuration.

---

**zpool** [string] name of storage pool  
**old\_device** [string] old device to replace  
**new\_device** [string] optional new device  
**force** [boolean] Forces use of *new\_device*, even if its appears to be in use.

CLI Example:

```
salt '*' zpool.replace myzpool /path/to/vdev1 /path/to/vdev2
```

`salt.modules.zpool.scrub`(*zpool*, *stop=False*)

Changed in version 2016.3.0.

Scrub a storage pool

**zpool** [string] name of storage pool  
**stop** [boolean] if true, cancel ongoing scrub

CLI Example:

```
salt '*' zpool.scrub myzpool
```

`salt.modules.zpool.set`(*zpool*, *prop*, *value*)

New in version 2016.3.0.

Sets the given property on the specified pool

**zpool** [string] name of storage pool  
**prop** [string] name of property  
**value** [string] value to set property to

CLI Example:

```
salt '*' zpool.set myzpool readonly yes
```

`salt.modules.zpool.status`(*zpool=None*)

Changed in version 2016.3.0.

Return the status of the named zpool

**zpool** [string] optional name of storage pool

CLI Example:

```
salt '*' zpool.status myzpool
```

`salt.modules.zpool.upgrade`(*zpool=None*, *version=None*)

New in version 2016.3.0.

Enables all supported features on the given pool

**Warning:** Once this is done, the pool will no longer be accessible on systems that do not support feature flags. See `zpool-features(5)` for details on compatibility with systems that support feature flags, but do not support all features enabled on the pool.

**zpool** [string] optional storage pool, applies to all otherwise  
**version** [int] version to upgrade to, if unspecified upgrade to the highest possible

CLI Example:

```
salt '*' zpool.upgrade myzpool
```

## 14.7.460 salt.modules.zypper

Package support for openSUSE via the zypper package manager

**depends**

- rpm Python module. Install with `zypper install rpm-python`

---

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `'pkg.install' is not available`), see [here](#).

---

**class** `salt.modules.zypper.Wildcard(zypper)`

New in version 2017.7.0.

Converts string wildcard to a zypper query. .. rubric:: Example

``1.2.3.4*` is `1.2.3.4.whatever.is.here` and is equal to: `1.2.3.4 >= and < 1.2.3.5``

**Parameters** `ptn` -- Pattern

**Returns** Query range

**salt.modules.zypper.add\_lock**(*packages*, *\*\*kwargs*)

Add a package lock. Specify packages to lock by exact name.

CLI Example:

```
salt '*' pkg.add_lock <package name>
salt '*' pkg.add_lock <package1>, <package2>, <package3>
salt '*' pkg.add_lock pkgs=['foo', 'bar']
```

**salt.modules.zypper.clean\_locks**()

Remove unused locks that do not currently (with regard to repositories used) lock any package.

CLI Example:

```
salt '*' pkg.clean_locks
```

**salt.modules.zypper.del\_repo**(*repo*)

Delete a repo.

CLI Examples:

```
salt '*' pkg.del_repo alias
```

**salt.modules.zypper.diff**(\**paths*)

Return a formatted diff between current files and original in a package. NOTE: this function includes all files (configuration and not), but does not work on binary content.

**Parameters** **path** -- Full path to the installed file

**Returns** Difference string or raises an exception if examined file is binary.

CLI example:

```
salt '*' pkg.diff /etc/apache2/httpd.conf /etc/sudoers
```

`salt.modules.zypper.download(*packages, **kwargs)`

Download packages to the local disk.

**refresh** force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

CLI example:

```
salt '*' pkg.download httpd
salt '*' pkg.download httpd postfix
```

`salt.modules.zypper.file_dict(*packages)`

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of every file on the system's rpm database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.zypper.file_list(*packages)`

List the files that belong to a package. Not specifying any packages will return a list of every file on the system's rpm database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.zypper.get_repo(repo, **kwargs)`

Display a repo.

CLI Example:

```
salt '*' pkg.get_repo alias
```

`salt.modules.zypper.info_available(*names, **kwargs)`

Return the information of the named package available for the system.

**refresh** force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed or not.

CLI example:

```
salt '*' pkg.info_available <package1>
salt '*' pkg.info_available <package1> <package2> <package3> ...
```

`salt.modules.zypper.info_installed(*names, **kwargs)`

Return the information of the named package(s), installed on the system.

**Parameters**

- **names** -- Names of the packages to get information about.
- **attr** -- Comma-separated package attributes. If no `attr` is specified, all available attributes returned.

**Valid attributes are:** version, vendor, release, build\_date, build\_date\_time\_t, install\_date, install\_date\_time\_t, build\_host, group, source\_rpm, arch, epoch, size, license, signature, packager, url, summary, description.

- **errors** -- Handle RPM field errors. If 'ignore' is chosen, then various mistakes are simply ignored and omitted from the texts or strings. If 'report' is chosen, then a field with a mistake is not returned, instead a 'N/A (broken)' (not available, broken) text is placed.

**Valid attributes are:** ignore, report

CLI example:

```
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
salt '*' pkg.info_installed <package1> attr=version,vendor
salt '*' pkg.info_installed <package1> <package2> <package3> ... ❌
↳attr=version,vendor
salt '*' pkg.info_installed <package1> <package2> <package3> ... ❌
↳attr=version,vendor errors=ignore
salt '*' pkg.info_installed <package1> <package2> <package3> ... ❌
↳attr=version,vendor errors=report
```

`salt.modules.zypper.install`(*name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, downloadonly=None, skip\_verify=False, version=None, ignore\_repo\_failure=False, \*\*kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd<=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any zypper commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Install the passed package(s), add `refresh=True` to force a 'zypper refresh' before package is installed.

**name** The name of the package to be installed. Note that this parameter is ignored if either `pkgs` or `sources` is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the `sources` option.

CLI Example:

```
salt '*' pkg.install <package name>
```

**refresh** force a refresh if set to `True`. If set to `False` (default) it depends on zypper if a refresh is executed.

**fromrepo** Specify a package repository to install from.

**downloadonly** Only download the packages, do not install.

**skip\_verify** Skip the GPG verification check (e.g., `--no-gpg-checks`)

**version** Can be either a version number, or the combination of a comparison operator (<, >, <=, >=, =) and a version number (ex. '>1.2.3-4'). This parameter is ignored if `pkgs` or `sources` is passed.

Multiple Package Installation Options:

**pkgs** A list of packages to install from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version. As with the `version` parameter above, comparison operators can be used to target a specific version of a package.

CLI Examples:

```
salt '*' pkg.install pkgs=['foo', 'bar']
salt '*' pkg.install pkgs=['foo', {'bar': '1.2.3-4'}]
salt '*' pkg.install pkgs=['foo', {'bar': '<1.2.3-4'}]
```

**sources** A list of RPM packages to install. Must be passed as a list of dicts, with the keys being package

names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.rpm"}, {"bar": "salt://bar.
↳rpm"}]'
```

**ignore\_repo\_failure** Zypper returns error code 106 if one of the repositories are not available for various reasons. In case to set strict check, this parameter needs to be set to True. Default: False.

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

**salt.modules.zypper.latest\_version(\*names, \*\*kwargs)**

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty dict will be returned for that package.

**refresh** force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed or not.

CLI example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

**salt.modules.zypper.list\_downloaded()**

New in version 2017.7.0.

List prefetched packages downloaded by Zypper in the local disk.

CLI example:

```
salt '*' pkg.list_downloaded
```

**salt.modules.zypper.list\_installed\_patches()**

New in version 2017.7.0.

List installed advisory patches on the system.

CLI Examples:

```
salt '*' pkg.list_installed_patches
```

**salt.modules.zypper.list\_installed\_patterns()**

List installed patterns on the system.

CLI Examples:

```
salt '*' pkg.list_installed_patterns
```

**salt.modules.zypper.list\_locks()**

List current package locks.

Return a dict containing the locked package with attributes:

```
{'<package>': {'case_sensitive': '<case_sensitive>',
               'match_type': '<match_type>'
               'type': '<type>'}}
```

CLI Example:

```
salt '*' pkg.list_locks
```

`salt.modules.zypper.list_patches` (*refresh=False*)

New in version 2017.7.0.

List all known advisory patches from available repos.

**refresh** force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

CLI Examples:

```
salt '*' pkg.list_patches
```

`salt.modules.zypper.list_patterns` (*refresh=False*)

List all known patterns from available repos.

**refresh** force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

CLI Examples:

```
salt '*' pkg.list_patterns
```

`salt.modules.zypper.list_pkgs` (*versions\_as\_list=False, \*\*kwargs*)

List the packages currently installed as a dict with versions as a comma separated string:

```
{'<package_name>': '<version>[,<version>...']}
```

**versions\_as\_list**: If set to true, the versions are provided as a list

```
{'<package_name>': ['<version>', '<version>']}
```

**removed**: not supported

**purge\_desired**: not supported

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.zypper.list_products` (*all=False, refresh=False*)

List all available or installed SUSE products.

**all** List all products available or only installed. Default is False.

**refresh** force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

Includes handling for OEM products, which read the OEM productline file and overwrite the release value.

CLI Examples:

```
salt '*' pkg.list_products
salt '*' pkg.list_products all=True
```

`salt.modules.zypper.list_repos` ()

Lists all repos.

CLI Example:

```
salt '*' pkg.list_repos
```

`salt.modules.zypper.list_upgrades` (*refresh=True, \*\*kwargs*)

List all available package upgrades on this system

**refresh** force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed.

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.zypper.mod_repo(repo, **kwargs)`

Modify one or more values for a repo. If the repo does not exist, it will be created, so long as the following values are specified:

**repo** or **alias** alias by which the zypper refers to the repo

**url**, **mirrorlist** or **baseurl** the URL for zypper to reference

**enabled** enable or disable (True or False) repository, but do not remove if disabled.

**refresh** enable or disable (True or False) auto-refresh of the repository.

**cache** Enable or disable (True or False) RPM files caching.

**gpgcheck** Enable or disable (True or False) GPG check for this repository.

**gpgautoimport** Automatically trust and import new repository.

Key/Value pairs may also be removed from a repo's configuration by setting a key to a blank value. Bear in mind that a name cannot be deleted, and a url can only be deleted if a mirrorlist is specified (or vice versa).

CLI Examples:

```
salt '*' pkg.mod_repo alias alias=new_alias
salt '*' pkg.mod_repo alias url=mirrorlist=http://host.com/
```

`salt.modules.zypper.modified(*packages, **flags)`

List the modified files that belong to a package. Not specifying any packages will return a list of `_all_` modified files on the system's RPM database.

New in version 2015.5.0.

Filtering by flags (True or False):

**size** Include only files where size changed.

**mode** Include only files which file's mode has been changed.

**checksum** Include only files which MD5 checksum has been changed.

**device** Include only files which major and minor numbers has been changed.

**symlink** Include only files which are symbolic link contents.

**owner** Include only files where owner has been changed.

**group** Include only files where group has been changed.

**time** Include only files where modification time of the file has been changed.

**capabilities** Include only files where capabilities differ or not. Note: supported only on newer RPM versions.

CLI Examples:

```
salt '*' pkg.modified
salt '*' pkg.modified httpd
salt '*' pkg.modified httpd postfix
salt '*' pkg.modified httpd owner=True group=False
```

`salt.modules.zypper.owner(*paths)`

Return the name of the package that owns the file. Multiple file paths can be passed. If a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Examples:

```
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf
```

`salt.modules.zypper.purge(name=None, pkgs=None, **kwargs)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd<=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any zypper commands spawned by Salt when the `salt-minion`

service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Recursively remove a package and all dependencies which were installed with it, this will call a `zypper -n remove -u`

**name** The name of the package to be deleted.

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs=['foo', 'bar']
```

`salt.modules.zypper.refresh_db()`

Force a repository refresh by calling `zypper refresh --force`, return a dict:

```
{'<database name>': Bool}
```

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.zypper.remove(name=None, pkgs=None, **kwargs)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any `zypper` commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Remove packages with `zypper -n remove`

**name** The name of the package to be deleted.

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs=['foo', 'bar']
```

`salt.modules.zypper.remove_lock(packages, **kwargs)`

Remove specified package lock.

CLI Example:

```
salt '*' pkg.remove_lock <package name>
salt '*' pkg.remove_lock <package1>, <package2>, <package3>
salt '*' pkg.remove_lock pkgs='["foo", "bar"]'
```

`salt.modules.zypper.search(criteria, refresh=False)`

List known packages, available to the system.

**refresh** force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

CLI Examples:

```
salt '*' pkg.search <criteria>
```

`salt.modules.zypper.upgrade(refresh=True, dryrun=False, dist_upgrade=False, fromrepo=None, novendorchange=False, skip_verify=False, **kwargs)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd<=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any zypper commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Run a full system upgrade, a zypper upgrade

**refresh** force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed.

**dryrun** If set to True, it creates a debug solver log file and then perform a dry-run upgrade (no changes are made). Default: False

**dist\_upgrade** Perform a system dist-upgrade. Default: False

**fromrepo** Specify a list of package repositories to upgrade from. Default: None

**novendorchange** If set to True, no allow vendor changes. Default: False

**skip\_verify** Skip the GPG verification check (e.g., `--no-gpg-checks`)

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
                'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
salt '*' pkg.upgrade dist-upgrade=True fromrepo='["MyRepoName"]'
↳ novendorchange=True
salt '*' pkg.upgrade dist-upgrade=True dryrun=True
```

`salt.modules.zypper.upgrade_available(name, **kwargs)`

Check whether or not an upgrade is available for a given package

**refresh** force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed or not.

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.zypper.verify(*names, **kwargs)`

Runs an `rpm -Va` on a system, and returns the results in a dict

Files with an attribute of `config`, `doc`, `ghost`, `license` or `readme` in the package header can be ignored using the `ignore_types` keyword argument

CLI Example:

```
salt '*' pkg.verify
salt '*' pkg.verify httpd
salt '*' pkg.verify 'httpd postfix'
salt '*' pkg.verify 'httpd postfix' ignore_types=['config','doc']
```

`salt.modules.zypper.version(*names, **kwargs)`

Returns a string representing the package version or an empty dict if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

`salt.modules.zypper.version_cmp(ver1, ver2, ignore_epoch=False)`

New in version 2015.5.4.

Do a cmp-style comparison on two packages. Return -1 if `ver1 < ver2`, 0 if `ver1 == ver2`, and 1 if `ver1 > ver2`. Return None if there was a problem making the comparison.

`ignore_epoch` [False] Set to True to ignore the epoch when comparing versions

New in version 2015.8.10,2016.3.2.

CLI Example:

```
salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002'
```

## 14.8 netapi modules

### 14.8.1 rest\_cherrypy

#### A REST API for Salt

New in version 2014.7.0.

##### depends

- CherryPy Python module. Version 3.2.3 is currently recommended when SSL is enabled, since this version worked the best with SSL in internal testing. Versions 3.2.3 - 4.x can be used if SSL is not enabled. Be aware that there is a known [SSL error](#) introduced in version 3.2.5. The issue was reportedly resolved with CherryPy milestone 3.3, but the patch was committed for version 3.6.1.

##### optdepends

- ws4py Python module for websockets support.

##### client\_libraries

- Java: <https://github.com/SUSE/salt-netapi-client>
- Python: <https://github.com/saltstack/pepper>

**setup** All steps below are performed on the machine running the Salt Master daemon. Configuration goes into the Master configuration file.

1. Install `salt-api`. (This step varies between OS and Linux distros. Some package systems have a split package, others include `salt-api` in the main Salt package. Ensure the `salt-api --version` output matches the `salt --version` output.)

2. Install CherryPy. (Read the version caveat in the section above.)
3. Optional: generate self-signed SSL certificates.

Using a secure HTTPS connection is strongly recommended since Salt eauth authentication credentials will be sent over the wire.

- (a) Install the PyOpenSSL package.
- (b) Generate a self-signed certificate using the `create_self_signed_cert()` execution function.

```
salt-call --local tls.create_self_signed_cert
```

4. Edit the master config to create at least one external auth user or group following the [full external auth instructions](#).
5. Edit the master config with the following production-ready example to enable the `rest_cherrypy` module. (Adjust cert paths as needed, or disable SSL (not recommended!))

```
rest_cherrypy:
  port: 8000
  ssl_cert: /etc/pki/tls/certs/localhost.crt
  ssl_key: /etc/pki/tls/certs/localhost.key
```

6. Restart the `salt-master` daemon.
7. Start the `salt-api` daemon.

**configuration** All available configuration options are detailed below. These settings configure the CherryPy HTTP server and do not apply when using an external server such as Apache or Nginx.

#### port Required

The port for the webserver to listen on.

**host** [0.0.0.0] The socket interface for the HTTP server to listen on.

**debug** [False] Starts the web server in development mode. It will reload itself when the underlying code is changed and will output more debugging info.

**log\_access\_file** Path to a file to write HTTP access logs.

**log\_error\_file** Path to a file to write HTTP error logs.

**ssl\_cert** The path to a SSL certificate. (See below)

**ssl\_key** The path to the private key for your SSL certificate. (See below)

**ssl\_chain** (Optional when using PyOpenSSL) the certificate chain to pass to `Context.load_verify_locations`.

**disable\_ssl** A flag to disable SSL. Warning: your Salt authentication credentials will be sent in the clear!

**webhook\_disable\_auth** [False] The *Webhook* URL requires authentication by default but external services cannot always be configured to send authentication. See the Webhook documentation for suggestions on securing this interface.

**webhook\_url** [/hook] Configure the URL endpoint for the *Webhook* entry point.

**thread\_pool** [100] The number of worker threads to start up in the pool.

**socket\_queue\_size** [30] Specify the maximum number of HTTP connections to queue.

**expire\_responses** [True] Whether to check for and kill HTTP responses that have exceeded the default timeout.

**max\_request\_body\_size** [1048576] Maximum size for the HTTP request body.

**collect\_stats** [False] Collect and report statistics about the CherryPy server

Reports are available via the *Stats* URL.

**static** A filesystem path to static HTML/JavaScript/CSS/image assets.

**static\_path** [/static] The URL prefix to use when serving static assets out of the directory specified in the *static* setting.

**enable\_sessions** [True] Enable or disable all endpoints that rely on session cookies. This can be useful to enforce only header-based authentication.

New in version 2017.7.0.

**app** [index.html] A filesystem path to an HTML file that will be served as a static file. This is useful for bootstrapping a single-page JavaScript app.

Warning! If you set this option to a custom web application, anything that uses cookie-based authentication is vulnerable to XSRF attacks. Send the custom *X-Auth-Token* header instead and consider disabling the *enable\_sessions* setting.

Changed in version 2017.7.0: Add a proof-of-concept JavaScript single-page app.

**app\_path** [/app] The URL prefix to use for serving the HTML file specified in the *app* setting. This should be a simple name containing no slashes.

Any path information after the specified path is ignored; this is useful for apps that utilize the HTML5 history API.

**root\_prefix** [/] A URL path to the main entry point for the application. This is useful for serving multiple applications from the same URL.

## Authentication

Authentication is performed by passing a session token with each request. Tokens are generated via the *Login* URL.

The token may be sent in one of two ways: as a custom header or as a session cookie. The latter is far more convenient for clients that support cookies.

- Include a custom header named *X-Auth-Token*.

For example, using curl:

```
curl -sSk https://localhost:8000/login \  
-H 'Accept: application/x-yaml' \  
-d username=saltdev \  
-d password=saltdev \  
-d eauth=auto
```

Copy the token value from the output and include it in subsequent requests:

```
curl -sSk https://localhost:8000 \  
-H 'Accept: application/x-yaml' \  
-H 'X-Auth-Token: 697adbdc8fe971d09ae4c2a3add7248859c87079' \  
-d client=local \  

```

```
-d tgt='*' \
-d fun=test.ping
```

- Sent via a cookie. This option is a convenience for HTTP clients that automatically handle cookie support (such as browsers).

For example, using curl:

```
# Write the cookie file:
curl -sSk https://localhost:8000/login \
  -c ~/cookies.txt \
  -H 'Accept: application/x-yaml' \
  -d username=saltdev \
  -d password=saltdev \
  -d eauth=auto

# Read the cookie file:
curl -sSk https://localhost:8000 \
  -b ~/cookies.txt \
  -H 'Accept: application/x-yaml' \
  -d client=local \
  -d tgt='*' \
  -d fun=test.ping
```

Another example using the **requests** library in Python:

```
>>> import requests
>>> session = requests.Session()
>>> session.post('http://localhost:8000/login', json={
    'username': 'saltdev',
    'password': 'saltdev',
    'eauth': 'auto',
})
<Response [200]>
>>> resp = session.post('http://localhost:8000', json=[{
    'client': 'local',
    'tgt': '*',
    'fun': 'test.arg',
    'arg': ['foo', 'bar'],
    'kwarg': {'baz': 'Baz!'},
}])
>>> resp.json()
{'return': [{
    ...snip...
}]}
```

### See also:

You can bypass the session handling via the [Run](#) URL.

### Usage

This interface directly exposes Salt's *Python API*. Everything possible at the CLI is possible through the Python API. Commands are executed on the Salt Master.

The root URL (/) is RPC-like in that it accepts instructions in the request body for what Salt functions to execute, and the response contains the result of those function calls.

For example:

```
% curl -sSi https://localhost:8000 -H 'Content-type: application/json' -
→d '[{
    "client": "local",
    "tgt": "*",
    "fun": "test.ping"
}]'
HTTP/1.1 200 OK
Content-Type: application/json
[...snip...]
{"return": [{"jerry": true}]}
```

The request body must be an array of commands. Use this workflow to build a command:

1. Choose a client interface.
2. Choose a function.
3. Fill out the remaining parameters needed for the chosen client.

The `client` field is a reference to the main Python classes used in Salt's Python API. Read the full client interfaces documentation, but in short:

- `local` uses *LocalClient* which sends commands to Minions. Equivalent to the `salt` CLI command.
- `runner` uses *RunnerClient* which invokes runner modules on the Master. Equivalent to the `salt-run` CLI command.
- `wheel` uses *WheelClient* which invokes wheel modules on the Master. Wheel modules do not have a direct CLI equivalent but they typically manage Master-side resources such as state files, pillar files, the Salt config files, and the *key wheel module* exposes similar functionality as the `salt-key` CLI command.

Most clients have variants like synchronous or asynchronous execution as well as others like batch execution. See the full list of client interfaces.

Each client requires different arguments and sometimes has different syntax. For example, *LocalClient* requires the `tgt` argument because it forwards the command to Minions and the other client interfaces do not. *LocalClient* also takes `arg` (array) and `kwarg` (dictionary) arguments because these values are sent to the Minions and used to execute the requested function there. *RunnerClient* and *WheelClient* are executed directly on the Master and thus do not need or accept those arguments.

Read the method signatures in the client documentation linked above, but hopefully an example will help illustrate the concept. This example causes Salt to execute two functions -- the *test.arg execution function* using *LocalClient* and the *test.arg runner function* using *RunnerClient*; note the different structure for each command. The results for both are combined and returned as one response.

```
% curl -b ~/cookies.txt -sSi localhost:8000 -H 'Content-type: application/json'
→' -d '
[
  {
    "client": "local",
    "tgt": "*",
    "fun": "test.arg",
    "arg": ["positional arg one", "positional arg two"],
    "kwarg": {
      "keyword arg one": "Hello from a minion",
      "keyword arg two": "Hello again from a minion"
    }
  },
]
```

```

    {
      "client": "runner",
      "fun": "test.arg",
      "keyword arg one": "Hello from a master",
      "keyword arg two": "Runners do not support positional args"
    }
  ]
  ,
HTTP/1.1 200 OK
[...snip...]
{
  "return": [
    {
      "jerry": {
        "args": [
          "positional arg one",
          "positional arg two"
        ],
        "kwargs": {
          "keyword arg one": "Hello from a minion",
          "keyword arg two": "Hello again from a minion",
          [...snip...]
        }
      },
      [...snip; other minion returns here...]
    },
    {
      "args": [],
      "kwargs": {
        "keyword arg two": "Runners do not support positional args",
        "keyword arg one": "Hello from a master"
      }
    }
  ]
}

```

One more example, this time with more commonly used functions:

```

curl -b /tmp/cookies.txt -sSi localhost:8000 -H 'Content-type: application/json
→' -d '
[
  {
    "client": "local",
    "tgt": "*",
    "fun": "state.sls",
    "kwarg": {
      "mods": "apache",
      "pillar": {
        "lookup": {
          "wwwdir": "/srv/httpd/htdocs"
        }
      }
    }
  },
  {
    "client": "runner",
    "fun": "cloud.create",
    "provider": "my-ec2-provider",

```

```
        "instances": "my-centos-6",
        "image": "ami-1624987f",
        "delvol_on_destroy": true
    }
]
'
HTTP/1.1 200 OK
[...snip...]
{
  "return": [
    {
      "jerry": {
        "pkg_|-install_apache_|-httpd_|-installed": {
          [...snip full state return here...]
        }
      }
    }
    [...snip other minion returns here...]
  ],
  {
    [...snip full salt-cloud output here...]
  }
]
}
```

## Content negotiation

This REST interface is flexible in what data formats it will accept as well as what formats it will return (e.g., JSON, YAML, urlencoded).

- Specify the format of data in the request body by including the *Content-Type* header.
- Specify the desired data format for the response body with the *Accept* header.

We recommend the JSON format for most HTTP requests. urlencoded data is simple and cannot express complex data structures -- and that is often required for some Salt commands, such as starting a state run that uses Pillar data. Salt's CLI tool can reformat strings passed in at the CLI into complex data structures, and that behavior also works via salt-api, but that can be brittle and since salt-api can accept JSON it is best just to send JSON.

Here is an example of sending urlencoded data:

```
curl -sSik https://localhost:8000 \  
  -b ~/cookies.txt \  
  -d client=runner \  
  -d fun='jobs.lookup_jid' \  
  -d jid='20150129182456704682'
```

---

## urlencoded data caveats

- Only a single command may be sent per HTTP request.
- Repeating the `arg` parameter multiple times will cause those parameters to be combined into a single list.

Note, some popular frameworks and languages (notably jQuery, PHP, and Ruby on Rails) will automatically append empty brackets onto repeated query string parameters. E.g., `?foo[]=fooone&foo[]=footwo`. This is **not** supported; send `?foo=fooone&foo=footwo` instead, or send JSON or YAML.

A note about `curl`

The `-d` flag to `curl` does *not* automatically urlencode data which can affect passwords and other data that contains characters that must be encoded. Use the `--data-urlencode` flag instead. E.g.:

```
curl -ksi http://localhost:8000/login \
-H "Accept: application/json" \
-d username='myapiuser' \
--data-urlencode password='1234+' \
-d eauth='pam'
```

## Deployment

The `rest_cherry.py` netapi module is a standard Python WSGI app. It can be deployed one of two ways.

### `salt-api` using the CherryPy server

The default configuration is to run this module using `salt-api` to start the Python-based CherryPy server. This server is lightweight, multi-threaded, encrypted with SSL, and should be considered production-ready.

### Using a WSGI-compliant web server

This module may be deployed on any WSGI-compliant server such as Apache with `mod_wsgi` or Nginx with `FastCGI`, to name just two (there are many).

Note, external WSGI servers handle URLs, paths, and SSL certs directly. The `rest_cherry.py` configuration options are ignored and the `salt-api` daemon does not need to be running at all. Remember Salt authentication credentials are sent in the clear unless SSL is being enforced!

An example Apache virtual host configuration:

```
<VirtualHost *:80>
    ServerName example.com
    ServerAlias *.example.com

    ServerAdmin webmaster@example.com

    LogLevel warn
    ErrorLog /var/www/example.com/logs/error.log
    CustomLog /var/www/example.com/logs/access.log combined

    DocumentRoot /var/www/example.com/htdocs

    WSGIScriptAlias / /path/to/salt/netapi/rest_cherrypy/wsgi.py
</VirtualHost>
```

## REST URI Reference

- /
- /login

- `/logout`

`class salt.netapi.rest_cherry.py.app.LowDataAdapter`

The primary entry point to Salt's REST API

**GET()**

An explanation of the API with links of where to go next

**GET /**

Request Headers

- **Accept** -- the desired response format.

Status Codes

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

**Example request:**

```
curl -i localhost:8000
```

```
GET / HTTP/1.1
Host: localhost:8000
Accept: application/json
```

**Example response:**

```
HTTP/1.1 200 OK
Content-Type: application/json
```

**/login**

`class salt.netapi.rest_cherry.py.app.Login(*args, **kwargs)`

Log in to receive a session token

*Authentication information.*

**GET()**

Present the login interface

**GET /login**

An explanation of how to log in.

**Status Codes**

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

**Example request:**

```
curl -i localhost:8000/login
```

```
GET /login HTTP/1.1
Host: localhost:8000
Accept: text/html
```

**Example response:**

```
HTTP/1.1 200 OK
Content-Type: text/html
```

**POST ( *\*\*kwargs* )**

*Authenticate* against Salt's eauth system

**POST /login****Request Headers**

- **X-Auth-Token** -- a session token from *Login*.
- **Accept** -- the desired response format.
- **Content-Type** -- the format of the request body.

**Form Parameters**

- **eauth** -- the eauth backend configured for the user
- **username** -- username
- **password** -- password

**Status Codes**

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

**Example request:**

```
curl -si localhost:8000/login \
  -c ~/cookies.txt \
  -H "Accept: application/json" \
  -H "Content-type: application/json" \
  -d '{
    "username": "saltuser",
    "password": "saltuser",
    "eauth": "auto"
  }'
```

```
POST / HTTP/1.1
Host: localhost:8000
Content-Length: 42
Content-Type: application/json
Accept: application/json

{"username": "saltuser", "password": "saltuser", "eauth": "auto"}
```

**Example response:**

```
HTTP/1.1 200 OK
Content-Type: application/json
Content-Length: 206
X-Auth-Token: 6d1b722e
Set-Cookie: session_id=6d1b722e; expires=Sat, 17 Nov 2012 03:23:52 GMT; Path=/

{"return": {
  "token": "6d1b722e",
  "start": 1363805943.776223,
  "expire": 1363849143.776224,
  "user": "saltuser",
  "eauth": "pam",
  "perms": [
    "grains.*",
    "status.*",
    "sys.*",
    "test.*"
  ]
}}
```

**/logout****class salt.netapi.rest\_cherry.py.app.Logout**

Class to remove or invalidate sessions

**POST()**

Destroy the currently active session and expire the session cookie

**/minions****class salt.netapi.rest\_cherry.py.app.Minions**

Convenience URLs for working with minions

**GET** (*mid=None*)

A convenience URL for getting lists of minions or getting minion details

**GET** **/minions/** (*mid*)

## Request Headers

- **X-Auth-Token** -- a session token from [Login](#).
- **Accept** -- the desired response format.

## Status Codes

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

**Example request:**

```
curl -i localhost:8000/minions/ms-3
```

```
GET /minions/ms-3 HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

**Example response:**

```

HTTP/1.1 200 OK
Content-Length: 129005
Content-Type: application/x-yaml

return:
- ms-3:
  grains.items:
    ...

```

**POST** (*\*\*kwargs*)

Start an execution command and immediately return the job id

**POST** /minions

## Request Headers

- **X-Auth-Token** -- a session token from *Login*.
- **Accept** -- the desired response format.
- **Content-Type** -- the format of the request body.

## Response Headers

- **Content-Type** -- the format of the response body; depends on the *Accept* request header.

## Status Codes

- **200** -- success
- **400** -- bad or malformed request
- **401** -- authentication required
- **406** -- requested Content-Type not available

lowstate data describing Salt commands must be sent in the request body. The `client` option will be set to `local_async()`.

**Example request:**

```

curl -sSi localhost:8000/minions \
  -b ~/cookies.txt \
  -H "Accept: application/x-yaml" \
  -d '{"tgt": "*", "fun": "status.diskusage"}'

```

```

POST /minions HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
Content-Type: application/json

tgt=*&fun=status.diskusage

```

**Example response:**

```

HTTP/1.1 202 Accepted
Content-Length: 86
Content-Type: application/x-yaml

return:
- jid: '20130603122505459265'
  minions: [ms-4, ms-3, ms-2, ms-1, ms-0]
  _links:
    jobs:
      - href: /jobs/20130603122505459265

```

## /jobs

class salt.netapi.rest\_cherry.py.app.**Jobs**

**GET** (*jid=None, timeout=''*)

A convenience URL for getting lists of previously run jobs or getting the return from a single job

**GET** **/jobs/**(*jid*)

List jobs or show a single job from the job cache.

### Request Headers

- **X-Auth-Token** -- a session token from [Login](#).
- **Accept** -- the desired response format.

### Status Codes

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

### Example request:

```
curl -i localhost:8000/jobs
```

```
GET /jobs HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

### Example response:

```
HTTP/1.1 200 OK
Content-Length: 165
Content-Type: application/x-yaml

return:
- '20121130104633606931':
  Arguments:
  - '3'
  Function: test.fib
  Start Time: 2012, Nov 30 10:46:33.606931
  Target: jerry
  Target-type: glob
```

### Example request:

```
curl -i localhost:8000/jobs/20121130104633606931
```

```
GET /jobs/20121130104633606931 HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

### Example response:

```
HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

info:
- Arguments:
```

```

- '3'
  Function: test.fib
  Minions:
  - jerry
  Start Time: 2012, Nov 30 10:46:33.606931
  Target: '*'
  Target-type: glob
  User: saltdev
  jid: '20121130104633606931'
return:
- jerry:
  - - 0
  - 1
  - 1
  - 2
  - 6.9141387939453125e-06

```

## /run

### class salt.netapi.rest\_cherry.py.app.Run

Run commands bypassing the *normal session handling*

salt-api does not enforce authorization, Salt's eauth system does that. Local/Runner/WheelClient all accept username/password/eauth **or** token kwargs that are then checked by the eauth system. The session mechanism in rest\_cherry simply pairs a session with a Salt eauth token and then passes the token kwarg in automatically.

If you already have a Salt eauth token, perhaps generated by the *mk\_token* function in the Auth Runner module, then there is no reason to use sessions.

This endpoint accepts either a username, password, eauth trio, **or** a token kwarg and does not make use of sessions at all.

#### POST ( *\*\*kwargs* )

Run commands bypassing the *normal session handling* Other than that this URL is identical to the root URL (/).

#### POST /run

An array of lowstate data describing Salt commands must be sent in the request body.

##### Status Codes

- **200** -- success
- **400** -- bad or malformed request
- **401** -- authentication required
- **406** -- requested Content-Type not available

#### Example request:

```

curl -sS localhost:8000/run \
-H 'Accept: application/x-yaml' \
-H 'Content-type: application/json' \
-d '[{
  "client": "local",
  "tgt": "*",
  "fun": "test.ping",
  "username": "saltdev",
  "password": "saltdev",

```

```
"eauth": "auto"
}]'
```

Or using a Salt Eauth token:

```
curl -sS localhost:8000/run \
-H 'Accept: application/x-yaml' \
-H 'Content-type: application/json' \
-d '[{
  "client": "local",
  "tgt": "*",
  "fun": "test.ping",
  "token": "<salt eauth token here>"
}]'
```

```
POST /run HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
Content-Length: 75
Content-Type: application/json

[{"client": "local", "tgt": "*", "fun": "test.ping", "username": "saltdev",
  "password": "saltdev", "eauth": "auto"}]
```

**Example response:**

```
HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

return:
- ms-0: true
  ms-1: true
  ms-2: true
  ms-3: true
  ms-4: true
```

The /run endpoint can also be used to issue commands using the salt-ssh subsystem.

When using salt-ssh, eauth credentials should not be supplied. Instead, authentication should be handled by the SSH layer itself. The use of the salt-ssh client does not require a salt master to be running. Instead, only a roster file must be present in the salt configuration directory.

All SSH client requests are synchronous.

**Example SSH client request:**

```
curl -sS localhost:8000/run \
-H 'Accept: application/x-yaml' \
-d client='ssh' \
-d tgt='*' \
-d fun='test.ping'
```

```
POST /run HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
Content-Length: 75
Content-Type: application/x-www-form-urlencoded
```

```
client=ssh&tgt=*&fun=test.ping
```

**Example SSH response:**

```
return:
- silver:
  fun: test.ping
  fun_args: []
  id: silver
  jid: '20141203103525666185'
  retcode: 0
  return: true
  success: true
```

**/events****class salt.netapi.rest\_cherry.py.app.Events**

Expose the Salt event bus

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure.

**See also:**

[Events & Reactor](#)

**GET** (*token=None, salt\_token=None*)

An HTTP stream of the Salt master event bus

This stream is formatted per the Server Sent Events (SSE) spec. Each event is formatted as JSON.

**GET /events**

## Status Codes

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

## Query Parameters

- **token** -- **optional** parameter containing the token ordinarily supplied via the X-Auth-Token header in order to allow cross-domain requests in browsers that do not include CORS support in the EventSource API. E.g., `curl -NsS localhost:8000/events?token=308650d`
- **salt\_token** -- **optional** parameter containing a raw Salt *eauth token* (not to be confused with the token returned from the /login URL). E.g., `curl -NsS localhost:8000/events?salt_token=30742765`

**Example request:**

```
curl -NsS localhost:8000/events
```

```
GET /events HTTP/1.1
Host: localhost:8000
```

**Example response:**

Note, the `tag` field is not part of the spec. SSE compliant clients should ignore unknown fields. This addition allows non-compliant clients to only watch for certain tags without having to deserialize the JSON object each time.

```
HTTP/1.1 200 OK
Connection: keep-alive
Cache-Control: no-cache
Content-Type: text/event-stream;charset=utf-8

retry: 400

tag: salt/job/20130802115730568475/new
data: {'tag': 'salt/job/20130802115730568475/new', 'data': {'minions': ['ms-4
↳', 'ms-3', 'ms-2', 'ms-1', 'ms-0']}}

tag: salt/job/20130802115730568475/ret/jerry
data: {'tag': 'salt/job/20130802115730568475/ret/jerry', 'data': {'jid':
↳ '20130802115730568475', 'return': True, 'retcode': 0, 'success': True, 'cmd
↳ ': '_return', 'fun': 'test.ping', 'id': 'ms-1'}}
```

The event stream can be easily consumed via JavaScript:

```
var source = new EventSource('/events');
source.onopen = function() { console.info('Listening ...') };
source.onerror = function(err) { console.error(err) };
source.onmessage = function(message) {
    var saltEvent = JSON.parse(message.data);
    console.log(saltEvent.tag, saltEvent.data);
};
```

Note, the SSE stream is fast and completely asynchronous and Salt is very fast. If a job is created using a regular POST request, it is possible that the job return will be available on the SSE stream before the response for the POST request arrives. It is important to take that asynchrony into account when designing an application. Below are some general guidelines.

- Subscribe to the SSE stream *before* creating any events.
- Process SSE events directly as they arrive and don't wait for any other process to "complete" first (like an ajax request).
- Keep a buffer of events if the event stream must be used for synchronous lookups.
- Be cautious in writing Salt's event stream directly to the DOM. It is very busy and can quickly overwhelm the memory allocated to a browser tab.

A full, working proof-of-concept JavaScript application is available [adjacent to this file](#). It can be viewed by pointing a browser at the `/app` endpoint in a running `rest_cherry.py` instance.

Or using CORS:

```
var source = new EventSource('/events?
↳ token=ecd589e4e01912cf3c4035afad73426dbb8dba75', {withCredentials: true});
```

It is also possible to consume the stream via the shell.

Records are separated by blank lines; the `data:` and `tag:` prefixes will need to be removed manually before attempting to unserialize the JSON.

`curl`'s `-N` flag turns off input buffering which is required to process the stream incrementally.

Here is a basic example of printing each event as it comes in:

```
curl -NsS localhost:8000/events | \
    while IFS= read -r line ; do
```

```
echo $line
done
```

Here is an example of using `awk` to filter events based on tag:

```
curl -NsS localhost:8000/events |\
    awk '
        BEGIN { RS=""; FS="\n" }
        $1 ~ /^tag: salt\/job\/[0-9]+\\/new$/ { print $0 }
    '
tag: salt/job/20140112010149808995/new
data: {"tag": "salt/job/20140112010149808995/new", "data": {"tgt_type": "glob
↳", "jid": "20140112010149808995", "tgt": "jerry", "_stamp": "2014-01-12_01:
↳01:49.809617", "user": "shouse", "arg": [], "fun": "test.ping", "minions":
↳["jerry"]}}
tag: 20140112010149808995
data: {"tag": "20140112010149808995", "data": {"fun_args": [], "jid":
↳"20140112010149808995", "return": true, "retcode": 0, "success": true, "cmd
↳": "_return", "_stamp": "2014-01-12_01:01:49.819316", "fun": "test.ping",
↳"id": "jerry"}}
```

## /hook

### class salt.netapi.rest\_cherry.py.app.Webhook

A generic web hook entry point that fires an event on Salt's event bus

External services can POST data to this URL to trigger an event in Salt. For example, Amazon SNS, Jenkins-CI or Travis-CI, or GitHub web hooks.

---

**Note:** Be mindful of security

Salt's Reactor can run any code. A Reactor SLS that responds to a hook event is responsible for validating that the event came from a trusted source and contains valid data.

#### This is a generic interface and securing it is up to you!

This URL requires authentication however not all external services can be configured to authenticate. For this reason authentication can be selectively disabled for this URL. Follow best practices -- always use SSL, pass a secret key, configure the firewall to only allow traffic from a known source, etc.

---

The event data is taken from the request body. The *Content-Type* header is respected for the payload.

The event tag is prefixed with `salt/netapi/hook` and the URL path is appended to the end. For example, a POST request sent to `/hook/mycompany/myapp/mydata` will produce a Salt event with the tag `salt/netapi/hook/mycompany/myapp/mydata`.

The following is an example `.travis.yml` file to send notifications to Salt of successful test runs:

```
language: python
script: python -m unittest tests
after_success:
  - |
      curl -sSk https://saltapi-url.example.com:8000/hook/travis/build/success
↳      -d branch="${TRAVIS_BRANCH}" -d
↳commit="${TRAVIS_COMMIT}"
```

**See also:***Events & Reactor*, reactor**POST** (*\*args*, *\*\*kwargs*)

Fire an event in Salt with a custom event tag and data

**POST /hook**

## Status Codes

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available
- **413** -- request body is too large

**Example request:**

```
curl -sS localhost:8000/hook \
  -H 'Content-type: application/json' \
  -d '{"foo": "Foo!", "bar": "Bar!"}'
```

```
POST /hook HTTP/1.1
Host: localhost:8000
Content-Length: 16
Content-Type: application/json

{"foo": "Foo!", "bar": "Bar!"}
```

**Example response:**

```
HTTP/1.1 200 OK
Content-Length: 14
Content-Type: application/json

{"success": true}
```

As a practical example, an internal continuous-integration build server could send an HTTP POST request to the URL `https://localhost:8000/hook/mycompany/build/success` which contains the result of a build and the SHA of the version that was built as JSON. That would then produce the following event in Salt that could be used to kick off a deployment via Salt's Reactor:

```
Event fired at Fri Feb 14 17:40:11 2014
*****
Tag: salt/netapi/hook/mycompany/build/success
Data:
{'_stamp': '2014-02-14_17:40:11.440996',
  'headers': {
    'X-My-Secret-Key': 'F0fAgoQjIT@W',
    'Content-Length': '37',
    'Content-Type': 'application/json',
    'Host': 'localhost:8000',
    'Remote-Addr': '127.0.0.1'},
  'post': {'revision': 'aa22a3c4b2e7', 'result': True}}
```

Salt's Reactor could listen for the event:

```
reactor:
- 'salt/netapi/hook/mycompany/build/*':
- /srv/reactor/react_ci_builds.sls
```

And finally deploy the new build:

```
{% set secret_key = data.get('headers', {}).get('X-My-Secret-Key') %}
{% set build = data.get('post', {}) %}

{% if secret_key == 'F0fAgoQjIT@W' and build.result == True %}
deploy_my_app:
  cmd.state.sls:
    - tgt: 'application*'
    - arg:
      - myapp.deploy
    - kwarg:
      pillar:
        revision: {{ revision }}
{% endif %}
```

## /keys

### class salt.netapi.rest\_cherrypy.app.Keys

Convenience URLs for working with minion keys

New in version 2014.7.0.

These URLs wrap the functionality provided by the *key wheel module* functions.

#### GET (*mid=None*)

Show the list of minion keys or detail on a specific key

New in version 2014.7.0.

#### GET /keys/ (*mid*)

List all keys or show a specific key

##### Status Codes

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

#### Example request:

```
curl -i localhost:8000/keys
```

```
GET /keys HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

#### Example response:

```
HTTP/1.1 200 OK
Content-Length: 165
Content-Type: application/x-yaml
```

```
return:
  local:
    - master.pem
    - master.pub
  minions:
    - jerry
```

```
minions_pre: []
minions_rejected: []
```

**Example request:**

```
curl -i localhost:8000/keys/jerry
```

```
GET /keys/jerry HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

**Example response:**

```
HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

return:
  minions:
    jerry: 51:93:b3:d0:9f:3a:6d:e5:28:67:c2:4b:27:d6:cd:2b
```

**POST** (*\*\*kwargs*)

Easily generate keys for a minion and auto-accept the new key

Accepts all the same parameters as the *key.gen\_accept*.

---

**Note:** A note about `curl` Avoid using the `-i` flag or HTTP headers will be written and produce an invalid tar file.

---

Example partial kickstart script to bootstrap a new minion:

```
%post
mkdir -p /etc/salt/pki/minion
curl -sSk https://localhost:8000/keys \
    -d mid=jerry \
    -d username=kickstart \
    -d password=kickstart \
    -d eauth=pam \
    | tar -C /etc/salt/pki/minion -xf -

mkdir -p /etc/salt/minion.d
printf 'master: 10.0.0.5\nid: jerry' > /etc/salt/minion.d/id.conf
%end
```

**POST** **/keys**

Generate a public and private key and return both as a tarball

Authentication credentials must be passed in the request.

**Status Codes**

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

**Example request:**

```
curl -sSk https://localhost:8000/keys \
-d mid=jerry \
-d username=kickstart \
-d password=kickstart \
-d eauth=pam \
-o jerry-salt-keys.tar
```

```
POST /keys HTTP/1.1
Host: localhost:8000
```

**Example response:**

```
HTTP/1.1 200 OK
Content-Length: 10240
Content-Disposition: attachment; filename="saltkeys-jerry.tar"
Content-Type: application/x-tar

jerry.pub000006440000000000000000000000000070300000000000010730 0ustar ☒
↵0000000000000000
```

**/ws****class salt.netapi.rest\_cherry.py.app.WebsocketEndpoint**

Open a WebSocket connection to Salt's event bus

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure. Uses websocket as the transport mechanism.

**See also:**

[Events & Reactor](#)

**GET** (*token=None, \*\*kwargs*)

Return a websocket connection of Salt's event stream

**GET** */ws/* (*token*)

Query format\_events The event stream will undergo server-side formatting if the `format_events` URL parameter is included in the request. This can be useful to avoid formatting on the client-side:

```
curl -NsS <...snip...> localhost:8000/ws?format_events
```

**Reqheader X-Auth-Token** an authentication token from [Login](#).

**Status 101** switching to the websockets protocol

**Status 401** authentication required

**Status 406** requested Content-Type not available

**Example request:**

```
curl -NsSk \
-H 'X-Auth-Token: ffedf49d' \
-H 'Host: localhost:8000' \
-H 'Connection: Upgrade' \
-H 'Upgrade: websocket' \
-H 'Origin: https://localhost:8000' \
-H 'Sec-WebSocket-Version: 13' \
```

```
-H 'Sec-WebSocket-Key: '"$(echo -n $RANDOM | base64)"' \
localhost:8000/ws
```

```
GET /ws HTTP/1.1
Connection: Upgrade
Upgrade: websocket
Host: localhost:8000
Origin: https://localhost:8000
Sec-WebSocket-Version: 13
Sec-WebSocket-Key: s65VsgHigh7v/Jcf4nXHnA==
X-Auth-Token: ffedf49d
```

**Example response:**

```
HTTP/1.1 101 Switching Protocols
Upgrade: websocket
Connection: Upgrade
Sec-WebSocket-Accept: mWZjBV9FCglzn1rIKJAxrTFlnJE=
Sec-WebSocket-Version: 13
```

An authentication token **may optionally** be passed as part of the URL for browsers that cannot be configured to send the authentication header or cookie:

```
curl -NsS <...snip...> localhost:8000/ws/ffedf49d
```

The event stream can be easily consumed via JavaScript:

```
// Note, you must be authenticated!
var source = new WebSocket('ws://localhost:8000/ws/d0ce6c1a');
source.onerror = function(e) { console.debug('error!', e); };
source.onmessage = function(e) { console.debug(e.data); };

source.send('websocket client ready')

source.close();
```

Or via Python, using the Python module `websocket-client` for example.

```
# Note, you must be authenticated!

from websocket import create_connection

ws = create_connection('ws://localhost:8000/ws/d0ce6c1a')
ws.send('websocket client ready')

# Look at https://pypi.python.org/pypi/websocket-client/ for more
# examples.
while listening_to_events:
    print ws.recv()

ws.close()
```

Above examples show how to establish a websocket connection to Salt and activating real time updates from Salt's event stream by signaling `websocket client ready`.

## /stats

`class salt.netapi.rest_cherrypy.app.Stats`

Expose statistics on the running CherryPy server

### GET()

Return a dump of statistics collected from the CherryPy server

### GET /stats

#### Request Headers

- **X-Auth-Token** -- a session token from *Login*.
- **Accept** -- the desired response format.

#### Response Headers

- **Content-Type** -- the format of the response body; depends on the *Accept* request header.

#### Status Codes

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

## 14.8.2 rest\_tornado

### REST URI Reference

- /
- /login
- /minions
- /jobs
- /run
- /events
- /hook

/

**/login**

**/minions**

**/jobs**

**/run**

**/events**

**/hook**

### 14.8.3 rest\_wsgi

#### A minimalist REST API for Salt

This `rest_wsgi` module provides a no-frills REST interface for sending commands to the Salt master. There are no dependencies.

Extra care must be taken when deploying this module into production. Please read this documentation in entirety.

All authentication is done through Salt's *external auth* system.

#### Usage

- All requests must be sent to the root URL (/).
- All requests must be sent as a POST request with JSON content in the request body.
- All responses are in JSON.

#### See also:

*rest\_cherrypy*

The *rest\_cherrypy* module is more full-featured, production-ready, and has builtin security features.

#### Deployment

The `rest_wsgi` netapi module is a standard Python WSGI app. It can be deployed one of two ways.

#### Using a WSGI-compliant web server

This module may be run via any WSGI-compliant production server such as Apache with `mod_wsgi` or Nginx with `FastCGI`.

It is strongly recommended that this app be used with a server that supports HTTPS encryption since raw Salt authentication credentials must be sent with every request. Any apps that access Salt through this interface will need to manually manage authentication credentials (either username and password or a Salt token). Tread carefully.

## salt-api using a development-only server

If run directly via the salt-api daemon it uses the `wsgiref.simple_server()` that ships in the Python standard library. This is a single-threaded server that is intended for testing and development. **This server does not use encryption;** please note that raw Salt authentication credentials must be sent with every HTTP request.

### Running this module via salt-api is not recommended!

In order to start this module via the salt-api daemon the following must be put into the Salt master config:

```
rest_wsgi:
  port: 8001
```

## Usage examples

### POST /

**Example request** for a basic `test.ping`:

```
% curl -sS -i \
  -H 'Content-Type: application/json' \
  -d '[{"eauth":"pam","username":"saltdev","password":"saltdev","client":
  ↪"local","tgt":"*","fun":"test.ping"}]' localhost:8001
```

**Example response:**

```
HTTP/1.0 200 OK
Content-Length: 89
Content-Type: application/json

{"return": [{"ms--4": true, "ms--3": true, "ms--2": true, "ms--1": true, "ms--0":
  ↪true}]}
```

**Example request** for an asynchronous `test.ping`:

```
% curl -sS -i \
  -H 'Content-Type: application/json' \
  -d '[{"eauth":"pam","username":"saltdev","password":"saltdev","client":
  ↪"local_async","tgt":"*","fun":"test.ping"}]' localhost:8001
```

**Example response:**

```
HTTP/1.0 200 OK
Content-Length: 103
Content-Type: application/json

{"return": [{"jid": "20130412192112593739", "minions": ["ms--4", "ms--3", "ms--2
  ↪", "ms--1", "ms--0"]}]}
```

**Example request** for looking up a job ID:

```
% curl -sS -i \
  -H 'Content-Type: application/json' \
  -d '[{"eauth":"pam","username":"saltdev","password":"saltdev","client":
  ↪"runner","fun":"jobs.lookup_jid","jid":"20130412192112593739"}]' localhost:8001
```

**Example response:**

```

HTTP/1.0 200 OK
Content-Length: 89
Content-Type: application/json

{"return": [{"ms--4": true, "ms--3": true, "ms--2": true, "ms--1": true, "ms--0": true}]}

```

**form lowstate** A list of lowstate data appropriate for the *client* interface you are calling.

**status 200** success

**status 401** authentication required

## 14.9 output modules

Follow one of the below links for further information and examples

<a href="#"><i>highstate</i></a>	Outputter for displaying results of state runs
<a href="#"><i>json_out</i></a>	Display return data in JSON format
<a href="#"><i>key</i></a>	Display salt-key output
<a href="#"><i>nested</i></a>	Recursively display nested data
<a href="#"><i>newline_values_only</i></a>	Display values only, separated by newlines
<a href="#"><i>no_out</i></a>	Display no output
<a href="#"><i>no_return</i></a>	Display output for minions that did not return
<a href="#"><i>overstatestage</i></a>	Display clean output of an overstate stage
<a href="#"><i>pony</i></a>	Display Pony output data structure
<a href="#"><i>pprint_out</i></a>	Python pretty-print (pprint)
<a href="#"><i>progress</i></a>	Display return data as a progress bar
<a href="#"><i>raw</i></a>	Display raw output data structure
<a href="#"><i>table_out</i></a>	Display output in a table format
<a href="#"><i>txt</i></a>	Simple text outputter
<a href="#"><i>virt_query</i></a>	virt.query outputter
<a href="#"><i>yaml_out</i></a>	Display return data in YAML format

### 14.9.1 salt.output.highstate

#### Outputter for displaying results of state runs

The return data from the Highstate command is a standard data structure which is parsed by the highstate outputter to deliver a clean and readable set of information about the HighState run on minions.

Two configurations can be set to modify the highstate outputter. These values can be set in the master config to change the output of the `salt` command or set in the minion config to change the output of the `salt-call` command.

**state\_verbose:** By default *state\_verbose* is set to *True*, setting this to *False* will instruct the highstate outputter to omit displaying anything in green, this means that nothing with a result of True and no changes will not be printed

**state\_output:** The highstate outputter has six output modes, `full`, `terse`, `mixed`, `mixed_id`, `changes` and `filter`.

- The default is set to `full`, which will display many lines of detailed information for each executed chunk.
- If `terse` is used, then the output is greatly simplified and shown in only one line.
- If `mixed` is used, then terse output will be used unless a state failed, in which case full output will be used.
- If `mixed_id` is used, then the mixed form will be used, but the value for `name` will be drawn from the state ID. This is useful for cases where the name value might be very long and hard to read.
- If `changes` is used, then terse output will be used if there was no error and no changes, otherwise full output will be used.
- If `filter` is used, then either or both of two different filters can be used: `exclude` or `terse`. \* for `exclude`, `state.highstate` expects a list of states to be excluded

(or `None`) followed by `True` for terse output or `False` for regular output. Because of parsing nuances, if only one of these is used, it must still contain a comma. For instance:  
`exclude=True,`

- for `terse`, `state.highstate` expects simply `True` or `False`.

These can be set as such from the command line, or in the Salt config as `state_output_exclude` or `state_output_terse`, respectively.

**state\_tabular:** If `state_output` uses the terse output, set this to `True` for an aligned output format. If you wish to use a custom format, this can be set to a string.

Example usage:

If `state_output: filter` is set in the configuration file:

```
salt '*' state.highstate exclude=None,True
```

means to exclude no states from the highstate and turn on terse output.

```
salt twd state.highstate exclude=problemstate1,problemstate2,False
```

means to exclude states `problemstate1` and `problemstate2` from the highstate, and use regular output.

Example output for the above highstate call when `top.sls` defines only one other state to apply to minion `twd`:

```
twd:
Summary for twd
-----
Succeeded: 1 (changed=1)
Failed:    0
-----
Total states run:    1
```

Example output with no special settings in configuration files:

```
myminion:
-----
      ID: test.ping
Function: module.run
      Result: True
Comment: Module function test.ping executed
Changes:
-----
```

```

ret:
  True

Summary for myminion
-----
Succeeded: 1
Failed:    0
-----
Total:    0

```

`salt.output.highstate.output`(*data*, *\*\*kwargs*)

The HighState Outputter is only meant to be used with the `state.highstate` function, or a function that returns highstate return data.

## 14.9.2 salt.output.json\_out

### Display return data in JSON format

**configuration** The output format can be configured in two ways: Using the `--out-indent` CLI flag and specifying a positive integer or a negative integer to group JSON from each minion to a single line.

Or setting the `output_indent` setting in the Master or Minion configuration file with one of the following values:

- `Null`: put each minion return on a single line.
- `pretty`: use four-space indents and sort the keys.
- An integer: specify the indentation level.

Salt's outputters operate on a per-minion basis. Each minion return will be output as a single JSON object once it comes in to the master.

Some JSON parsers can guess when an object ends and a new one begins but many can not. A good way to differentiate between each minion return is to use the single-line output format and to parse each line individually. Example output (truncated):

```

{"dave": {"en0": {"hwaddr": "02:b0:26:32:4c:69", ...}}}
{"jerry": {"en0": {"hwaddr": "02:26:ab:0d:b9:0d", ...}}}
{"kevin": {"en0": {"hwaddr": "02:6d:7f:ce:9f:ee", ...}}}
{"mike": {"en0": {"hwaddr": "02:48:a2:4b:70:a0", ...}}}
{"phill": {"en0": {"hwaddr": "02:1d:cc:a2:33:55", ...}}}
{"stuart": {"en0": {"hwaddr": "02:9a:e0:ea:9e:3c", ...}}}

```

`salt.output.json_out.output`(*data*, *\*\*kwargs*)

Print the output data in JSON

## 14.9.3 salt.output.key

### Display salt-key output

The `salt-key` command makes use of this outputter to format its output.

`salt.output.key.output`(*data*, *\*\*kwargs*)

Read in the dict structure generated by the salt key API methods and print the structure.

## 14.9.4 salt.output.nested

### Recursively display nested data

This is the default outputter for most execution functions.

Example output:

```

myminion:
  -----
  foo:
    -----
    bar:
      baz
    dictionary:
      -----
      abc:
        123
      def:
        456
    list:
      - Hello
      - World

```

#### class salt.output.nested.NestDisplay

Manage the nested display contents

**display**(*ret*, *indent*, *prefix*, *out*)

Recursively iterate down through data structures to determine output

salt.output.nested.**output**(*ret*, *\*\*kwargs*)

Display ret data

## 14.9.5 salt.output.newline\_values\_only

### Display values only, separated by newlines

New in version 2015.5.0.

This outputter is designed for Salt CLI return data. It will do the following to the return dict:

1. Get just the values (ignoring the minion IDs).
2. Each value, if it is iterable, is split a separate line.
3. Each minion's values are separated by newlines.

This results in a single string of return data containing all the values from the various minions.

**Warning:** As noted above, this outputter will discard the minion ID. If the minion ID is important, then an outputter that returns the full return dictionary in a parsable format (such as `json`, `pprint`, or `yaml`) may be more suitable.

### Example 1

#### Input

```
{
  'myminion': ['127.0.0.1', '10.0.0.1'],
  'second-minion': ['127.0.0.1', '10.0.0.2']
}
```

#### Output

```
127.0.0.1
10.0.0.1
127.0.0.1
10.0.0.2
```

### Example 2

#### Input

```
{
  'myminion': 8,
  'second-minion': 10
}
```

#### Output

```
8
10
```

`salt.output.newline_values_only.output(data, **kwargs)`  
Display modified ret data

### 14.9.6 salt.output.no\_out

#### Display no output

No output is produced when this outputter is selected

`salt.output.no_out.output(ret, **kwargs)`  
Don't display data. Used when you only are interested in the return.

`salt.output.pony.output(data, **kwargs)`  
 Mane function

### 14.9.10 salt.output.pprint\_out

#### Python pretty-print (pprint)

The python pretty-print system was once the default outputter. It simply passes the return data through to `pprint.pformat` and prints the results.

Example output:

```
{'saltmine': {'foo': {'bar': 'baz',
                      'dictionary': {'abc': 123, 'def': 456},
                      'list': ['Hello', 'World']}}}
```

`salt.output.pprint_out.output(data, **kwargs)`  
 Print out via pretty print

### 14.9.11 salt.output.progress

Display return data as a progress bar

`salt.output.progress.output(ret, bar, **kwargs)`  
 Update the progress bar

`salt.output.progress.progress_iter(progress)`  
 Initialize and return a progress bar iter

### 14.9.12 salt.output.raw

#### Display raw output data structure

This outputter simply displays the output as a python data structure, by printing a string representation of it. It is similar to the `pprint` outputter, only the data is not nicely formatted/indented.

This was the original outputter used by Salt before the outputter system was developed.

Example output:

```
{'myminion': {'foo': {'list': ['Hello', 'World'], 'bar': 'baz', 'dictionary': {'abc': ↵
↵123, 'def': 456}}}}
```

`salt.output.raw.output(data, **kwargs)`  
Rather basic....

### 14.9.13 salt.output.table\_out

#### Display output in a table format

New in version 2017.7.0.

This outputter displays a sequence of rows as table.

Example output:

```
edge01.bjm01:
-----
comment:
-----
out:
-----
| Active | Interface | Last Move |           Mac           | Moves | Static | Vlan |
-----
|  True  | ae1.900   |  0.0     | 40:A6:77:5A:50:01 |    0  | False  | 111 |
-----
|  True  | ae1.111   |  0.0     | 64:16:8D:32:26:58 |    0  | False  | 111 |
-----
|  True  | ae1.111   |  0.0     | 8C:60:4F:73:2D:57 |    0  | False  | 111 |
-----
|  True  | ae1.111   |  0.0     | 8C:60:4F:73:2D:7C |    0  | False  | 111 |
-----
|  True  | ae1.222   |  0.0     | 8C:60:4F:73:2D:57 |    0  | False  | 222 |
-----
|  True  | ae1.222   |  0.0     | F4:0F:1B:76:9D:97 |    0  | False  | 222 |
-----
result:
-----
```

```
class salt.output.table_out.TableDisplay(has_header=True, row_delimiter='-`', delim='| `', justify='center', separate_rows=True, prefix='| `', suffix='| `', width=50, wrapfunc=None)
```

Manage the table display content.

**display**(*ret, indent, out, rows\_key=None, labels\_key=None*)  
Display table(s).

**display\_rows**(*rows, labels, indent*)  
Prepares row content and displays.

**prepare\_rows**(*rows, indent, has\_header*)  
Prepare rows content to be displayed.

**ustring**(*indent, color, msg, prefix='`', suffix='`', endc=None*)  
Build the unicode string to be displayed.

**wrap\_onspace**(*text*)  
When the text inside the column is longer then the width, will split by space and continue on the next line.

`salt.output.table_out.output`(*ret*, *\*\*kwargs*)

Display the output as table.

Parameters

- **nested\_indent** (\*) -- integer, specify the left alignment.
- **has\_header** (\*) -- boolean specifying if header should be displayed. Default: True.
- **row\_delimiter** (\*) -- character to separate rows. Default: `_`.
- **delim** (\*) -- character to separate columns. Default: ``|``.
- **justify** (\*) -- text alignment. Default: center.
- **separate\_rows** (\*) -- boolean specifying if row separator will be displayed between consecutive rows. Default: True.
- **prefix** (\*) -- character at the beginning of the row. Default: ```|```.
- **suffix** (\*) -- character at the end of the row. Default: ```|```.
- **width** (\*) -- column max width. Default: 50.
- **rows\_key** (\*) -- display the rows under a specific key.
- **labels\_key** (\*) -- use the labels under a certain key. Otherwise will try to use the dictionary keys (if any).
- **title** (\*) -- display title when only one table is selected (using the `rows_key` argument).

#### 14.9.14 salt.output.txt

##### Simple text outputter

The txt outputter has been developed to make the output from shell commands on minions appear as they do when the command is executed on the minion.

`salt.output.txt.output`(*data*, *\*\*kwargs*)

Output the data in lines, very nice for running commands

#### 14.9.15 salt.output.virt\_query

##### virt.query outputter

Used to display the output from the `virt.query` runner.

`salt.output.virt_query.output`(*data*, *\*\*kwargs*)

Display output for the salt-run virt.query function

#### 14.9.16 salt.output.yaml\_out

##### Display return data in YAML format

This outputter defaults to printing in YAML block mode for better readability.

Example output:

```
saltmine:
  foo:
    bar: baz
    dictionary:
      abc: 123
      def: 456
    list:
```

```
- Hello
- World
```

```
salt.output.yaml_out.output(data, **kwargs)
    Print out YAML using the block mode
```

## 14.10 pillar modules

<i>cmd_json</i>	Execute a command and read the output as JSON.
<i>cmd_yaml</i>	Execute a command and read the output as YAML.
<i>cmd_yamllex</i>	Execute a command and read the output as YAMLEX.
<i>cobbler</i>	A module to pull data from Cobbler via its API into the Pillar dictionary
<i>confidant</i>	An external pillar module for getting credentials from confidant.
<i>consul_pillar</i>	Use Consul K/V as a Pillar source with values parsed as YAML
<i>csvpillar</i>	Store key/value pairs in a CSV file
<i>digicert</i>	Digicert Pillar Certificates
<i>django_orm</i>	Generate Pillar data from Django models through the Django ORM
<i>ec2_pillar</i>	Retrieve EC2 instance data for minions.
<i>etcd_pillar</i>	Use etcd data as a Pillar source
<i>file_tree</i>	<i>File_tree</i> is an external pillar that allows
<i>foreman</i>	A module to pull data from Foreman via its API into the Pillar dictionary
<i>git_pillar</i>	Use a git repository as a Pillar source
<i>gpg</i>	Decrypt pillar data through the builtin GPG renderer
<i>hg_pillar</i>	Use remote Mercurial repository as a Pillar source.
<i>hiera</i>	Use hiera data as a Pillar source
<i>http_json</i>	A module that adds data to the Pillar structure retrieved by an http request
<i>http_yaml</i>	A module that adds data to the Pillar structure retrieved by an http request
<i>libvirt</i>	Load up the libvirt keys into Pillar for a given minion if said keys have been
<i>makostack</i>	Simple and flexible YAML ext_pillar which can read pillar from within pillar.
<i>mongo</i>	Read Pillar data from a mongodb collection
<i>mysql</i>	Retrieve Pillar data by doing a MySQL query
<i>neutron</i>	Use Openstack Neutron data as a Pillar source.
<i>nodegroups</i>	
<i>pepa</i>	Pepa
<i>pillar_ldap</i>	Use LDAP data as a Pillar source
<i>postgres</i>	Retrieve Pillar data by doing a postgres query
<i>puppet</i>	Execute an unmodified puppet_node_classifier and read the output as YAML.
<i>reclass_adapter</i>	Use the ``reclass`` database as a Pillar source
<i>redismod</i>	Read pillar data from a Redis backend

Continued on next page

Table 14.10 -- continued from previous page

<code>s3</code>	Copy pillar data from a bucket in Amazon S3
<code>sql_base</code>	Retrieve Pillar data by doing a SQL query
<code>sqlcipher</code>	Retrieve Pillar data by running a SQLCipher query
<code>sqlite3</code>	Retrieve Pillar data by doing a SQLite3 query
<code>stack</code>	Simple and flexible YAML <code>ext_pillar</code> which can read pillar from within pillar.
<code>svn_pillar</code>	Clone a remote SVN repository and use the filesystem as a Pillar source
<code>varstack_pillar</code>	Use <code>Varstack</code> data as a Pillar source
<code>vault</code>	Vault Pillar Module
<code>venafi</code>	Venafi Pillar Certificates
<code>virtkey</code>	Accept a key from a hypervisor if the virt runner has already submitted an authorization request
<code>vmware_pillar</code>	Pillar data from vCenter or an ESXi host

### 14.10.1 salt.pillar.cmd\_json

Execute a command and read the output as JSON. The JSON data is then directly overlaid onto the minion's Pillar data.

`salt.pillar.cmd_json.ext_pillar` (*minion\_id*, *pillar*, *command*)

Execute a command and read the output as JSON

### 14.10.2 salt.pillar.cmd\_yaml

Execute a command and read the output as YAML. The YAML data is then directly overlaid onto the minion's Pillar data

`salt.pillar.cmd_yaml.ext_pillar` (*minion\_id*, *pillar*, *command*)

Execute a command and read the output as YAML

### 14.10.3 salt.pillar.cmd\_yamllex

Execute a command and read the output as YAMLEX. The YAMLEX data is then directly overlaid onto the minion's Pillar data

`salt.pillar.cmd_yamllex.ext_pillar` (*minion\_id*, *pillar*, *command*)

Execute a command and read the output as YAMLEX

### 14.10.4 salt.pillar.cobbler

A module to pull data from Cobbler via its API into the Pillar dictionary

#### Configuring the Cobbler `ext_pillar`

The same `cobbler.*` parameters are used for both the Cobbler tops and Cobbler pillar modules.

```
ext_pillar:
- cobbler:
    key: cobbler # Nest results within this key. By default, values are not nested.
```

```

only: [parameters] # Add only these keys to pillar.

cobbler.url: https://example.com/cobbler_api #default is http://localhost/cobbler_api
cobbler.user: username # default is no username
cobbler.password: password # default is no password

```

## Module Documentation

`salt.pillar.cobbler.ext_pillar` (*minion\_id*, *pillar*, *key=None*, *only=()*)  
 Read pillar data from Cobbler via its API.

### 14.10.5 salt.pillar.confidant

An external pillar module for getting credentials from confidant.

#### Configuring the Confidant module

The module can be configured via `ext_pillar` in the minion config:

`ext_pillar:`

- `confidant:`

```

profile: # The URL of the confidant web service url: `https://confidant-production.example.com`
# The context to use for KMS authentication auth_context: from: example-production-
iad to: confidant-production-iad user_type: service # The KMS master key to use for au-
thentication auth_key: ``alias/authnz" # Cache file for KMS auth token token_cache_file:
/run/confidant/confidant_token # The duration of the validity of a token, in minutes to-
ken_duration: 60 # key, keyid and region can be defined in the profile, but it's # generally
best to use IAM roles or environment variables for AWS # auth. keyid: 98nh9h9h908h09kjjk
key: jhf908gyeghehe0he0g8h9u0j0n0n09hj09h0 region: us-east-1

```

`depends` confidant-common, confidant-client

## Module Documentation

`salt.pillar.confidant.ext_pillar` (*minion\_id*, *pillar*, *profile=None*)  
 Read pillar data from Confidant via its API.

### 14.10.6 salt.pillar.consul\_pillar module

Use Consul K/V as a Pillar source with values parsed as YAML

`depends`

- `python-consul`

In order to use an consul server, a profile must be created in the master configuration file:

```
my_consul_config:
  consul.host: 127.0.0.1
  consul.port: 8500
  consul.token: b6376760-a8bb-edd5-fcda-33bc13bfc556
  consul.scheme: http
  consul.consistency: default
  consul.dc: dev
  consul.verify: True
```

All parameters are optional.

The `consul.token` requires `python-consul >= 0.4.7`.

If you have a multi-datacenter Consul cluster you can map your pillarenv`s to your data centers by providing a dictionary of mappings in `consul.dc` field:

```
my_consul_config:
  consul.dc:
    dev: us-east-1
    prod: us-west-1
```

In the example above we specifying static mapping between Pillar environments and data centers: the data for `dev` and `prod` Pillar environments will be fetched from `us-east-1` and `us-west-1` datacenter respectively.

In fact when `consul.dc` is set to dictionary keys are processed as regular expressions (that can capture named parameters) and values are processed as string templates as per PEP 3101.

```
my_consul_config:
  consul.dc:
    ^dev-.*$: dev-datacenter
    ^(?P<region>.*)-prod$: prod-datacenter-{region}
```

This example maps all Pillar environments starting with `dev-` to `dev-datacenter` whereas Pillar environment like `eu-prod` will be mapped to `prod-datacenter-eu`.

Before evaluation patterns are sorted by length in descending order.

If Pillar environment names correspond to data center names a single pattern can be used:

```
my_consul_config:
  consul.dc:
    ^(?P<env>.*): '{env}'
```

After the profile is created, configure the external pillar system to use it. Optionally, a root may be specified.

```
ext_pillar:
  - consul: my_consul_config

ext_pillar:
  - consul: my_consul_config root=salt
```

Using these configuration profiles, multiple consul sources may also be used:

```
ext_pillar:
  - consul: my_consul_config
  - consul: my_other_consul_config
```

Either the `minion_id`, or the `role`, or the `environment` grain may be used in the `root` path to expose minion-specific information stored in consul.

```

ext_pillar:
  - consul: my_consul_config root=salt/%(minion_id)s
  - consul: my_consul_config root=salt/%(role)s
  - consul: my_consul_config root=salt/%(environment)s

```

Minion-specific values may override shared values when the minion-specific root appears after the shared root:

```

ext_pillar:
  - consul: my_consul_config root=salt-shared
  - consul: my_other_consul_config root=salt-private/%(minion_id)s

```

If using the `role` or `environment` grain in the consul key path, be sure to define it using `/etc/salt/grains`, or similar:

```

role: my-minion-role
environment: dev

```

It's possible to lock down where the pillar values are shared through minion targeting. Note that double quotes `"` are required around the target value and cannot be used inside the matching statement. See the section on Compound Matchers for more examples.

```

ext_pillar:
  - consul: my_consul_config root=salt target="L@salt.example.com and G@osarch:x86_64"

```

`salt.pillar.consul_pillar.consul_fetch(client, path)`

Query consul for all keys/values within base path

`salt.pillar.consul_pillar.ext_pillar(minion_id, pillar, conf)`

Check consul for all data

`salt.pillar.consul_pillar.fetch_tree(client, path)`

Grab data from consul, trim base path and remove any keys which are folders. Take the remaining data and send it to be formatted in such a way as to be used as pillar data.

`salt.pillar.consul_pillar.get_conn(opts, profile)`

Return a client object for accessing consul

`salt.pillar.consul_pillar.pillar_format(ret, keys, value)`

Perform data formatting to be used as pillar data and merge it with the current pillar data

### 14.10.7 salt.pillar.csvpillar module

Store key/value pairs in a CSV file

Example configuration:

```

ext_pillar:
  - csv: /path/to/file.csv

# or

ext_pillar:
  - csv:
      path: /path/to/file.csv
      namespace: 'subkey'
      fieldnames:
        - col1

```

```
- col2
- col2
```

The first column must be minion IDs and the first row must be dictionary keys. E.g.:

id	role	env
jerry	web	prod
stuart	web	stage
dave	web	qa
phil	db	prod
kevin	db	stage
mike	db	qa

Will produce the following Pillar values for a minion named ``jerry``:

```
{
  'role': 'web',
  'env': 'prod',
}
```

`salt.pillar.csvpillar.ext_pillar`(*mid*, *pillar*, *path*, *idkey*='id', *namespace*=None, *fieldnames*=None, *restkey*=None, *restval*=None, *dialect*='excel')

Read a CSV into Pillar

#### Parameters

- **path** (*str*) -- Absolute path to a CSV file.
- **idkey** (*str*) -- (Optional) The column name of minion IDs.
- **namespace** (*str*) -- (Optional) A pillar key to namespace the values under.
- **fieldnames** (*list*) -- (Optional) if the first row of the CSV is not column names they may be specified here instead.

## 14.10.8 salt.pillar.digicert module

Digicert Pillar Certificates

This module will only return pillar data if the `digicert` runner module has already been used to create certificates.

To configure this module, set `digicert` to `True` in the `ext_pillar` section of your master configuration file:

```
ext_pillar:
- digicert: True
```

`salt.pillar.digicert.ext_pillar`(*minion\_id*, *pillar*, *conf*)  
Return an existing set of certificates

## 14.10.9 salt.pillar.django\_orm

Generate Pillar data from Django models through the Django ORM

**maintainer** Micah Hausler <micah.hausler@gmail.com>

**maturity** new

## Configuring the `django_orm` ext\_pillar

To use this module, your Django project must be on the salt master server with database access. This assumes you are using virtualenv with all the project's requirements installed.

```
ext_pillar:
- django_orm:
  pillar_name: my_application
  project_path: /path/to/project/
  settings_module: my_application.settings
  env_file: /path/to/env/file.sh
  # Optional: If your project is not using the system python,
  # add your virtualenv path below.
  env: /path/to/virtualenv/

  django_app:

    # Required: the app that is included in INSTALLED_APPS
    my_application.clients:

      # Required: the model name
      Client:

        # Required: model field to use as the key in the rendered
        # Pillar. Must be unique; must also be included in the
        # ``fields`` list below.
        name: shortname

        # Optional:
        # See Django's QuerySet documentation for how to use .filter()
        filter: {'kw': 'args'}

        # Required: a list of field names
        # List items will be used as arguments to the .values() method.
        # See Django's QuerySet documentation for how to use .values()
        fields:
          - field_1
          - field_2
```

This would return pillar data that would look like

```
my_application:
  my_application.clients:
    Client:
      client_1:
        field_1: data_from_field_1
        field_2: data_from_field_2
      client_2:
        field_1: data_from_field_1
        field_2: data_from_field_2
```

As another example, data from multiple database tables can be fetched using Django's regular lookup syntax. Note, using ManyToManyFields will not currently work since the return from values() changes if a ManyToMany is present.

```
ext_pillar:
- django_orm:
  pillar_name:.djangotutorial
```

```
project_path: /path/to/mysite
settings_module: mysite.settings

django_app:
  mysite.polls:
    Choices:
      name: poll__question
      fields:
        - poll__question
        - poll__id
        - choice_text
        - votes
```

## Module Documentation

`salt.pillar.django_orm.ext_pillar` (*minion\_id*, *pillar*, *pillar\_name*, *project\_path*, *settings\_module*, *django\_app*, *env=None*, *env\_file=None*, *\*args*, *\*\*kwargs*)

Connect to a Django database through the ORM and retrieve model fields

### Parameters

- **pillar\_name** (*str*) -- The name of the pillar to be returned
- **project\_path** (*str*) -- The full path to your Django project (the directory `manage.py` is in)
- **settings\_module** (*str*) -- The settings module for your project. This can be found in your `manage.py` file
- **django\_app** (*str*) -- A dictionary containing your apps, models, and fields
- **env** (*str*) -- The full path to the virtualenv for your Django project
- **env\_file** (*str*) -- An optional bash file that sets up your environment. The file is run in a subprocess and the changed variables are then added

### 14.10.10 salt.pillar.ec2\_pillar

Retrieve EC2 instance data for minions.

The minion id must be the instance-id retrieved from AWS. As an option, `use_grain` can be set to `True`. This allows the use of an instance-id grain instead of the minion-id. Since this is a potential security risk, the configuration can be further expanded to include a list of minions that are trusted to only allow the alternate id of the instances to specific hosts. There is no glob matching at this time.

```
ext_pillar:
  - ec2_pillar:
      use_grain: True
      minion_ids:
        - trusted-minion-1
        - trusted-minion-2
        - trusted-minion-3
```

This is a very simple pillar that simply retrieves the instance data from AWS. Currently the only portion implemented are EC2 tags, which returns a list of key/value pairs for all of the EC2 tags assigned to the instance.

`salt.pillar.ec2_pillar.ext_pillar` (*minion\_id*, *pillar*, *use\_grain=False*, *minion\_ids=None*)

Execute a command and read the output as YAML

### 14.10.11 salt.pillar.etcd\_pillar

Use etcd data as a Pillar source

New in version 2014.7.0.

#### depends

- python-etcd

In order to use an etcd server, a profile must be created in the master configuration file:

```
my_etcd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

After the profile is created, configure the external pillar system to use it. Optionally, a root may be specified.

```
ext_pillar:
  - etcd: my_etcd_config

ext_pillar:
  - etcd: my_etcd_config root=/salt
```

Using these configuration profiles, multiple etcd sources may also be used:

```
ext_pillar:
  - etcd: my_etcd_config
  - etcd: my_other_etcd_config
```

The `minion_id` may be used in the root path to expose minion-specific information stored in etcd.

```
ext_pillar:
  - etcd: my_etcd_config root=/salt/%(minion_id)s
```

Minion-specific values may override shared values when the minion-specific root appears after the shared root:

```
ext_pillar:
  - etcd: my_etcd_config root=/salt-shared
  - etcd: my_other_etcd_config root=/salt-private/%(minion_id)s
```

Using the configuration above, the following commands could be used to share a key with all minions but override its value for a specific minion:

```
etcdctl set /salt-shared/mykey my_value
etcdctl set /salt-private/special_minion_id/mykey my_other_value
```

`salt.pillar.etcd_pillar.ext_pillar(minion_id, pillar, conf)`  
Check etcd for all data

### 14.10.12 salt.pillar.file\_tree

`File_tree` is an external pillar that allows values from all files in a directory tree to be imported as Pillar data.

Note this is an external pillar, and is subject to the rules and constraints governing external pillars detailed here: [External Pillars](#).

New in version 2015.5.0.

## Example Configuration

```
ext_pillar:  
  - file_tree:  
      root_dir: /path/to/root/directory  
      follow_dir_links: False  
      keep_newline: True
```

The `root_dir` parameter is required and points to the directory where files for each host are stored. The `follow_dir_links` parameter is optional and defaults to `False`. If `follow_dir_links` is set to `True`, this external pillar will follow symbolic links to other directories.

**Warning:** Be careful when using `follow_dir_links`, as a recursive symlink chain will result in unexpected results.

If `keep_newline` is set to `True`, then the pillar values for files ending in newlines will keep that newline. The default behavior is to remove the end-of-file newline. `keep_newline` should be turned on if the pillar data is intended to be used to deploy a file using `contents_pillar` with a *file.managed* state.

Changed in version 2015.8.4: The `raw_data` parameter has been renamed to `keep_newline`. In earlier releases, `raw_data` must be used. Also, this parameter can now be a list of globs, allowing for more granular control over which pillar values keep their end-of-file newline. The globs match paths relative to the directories named for minion IDs and nodegroups underneath the `root_dir` (see the layout examples in the below sections).

```
ext_pillar:  
  - file_tree:  
      root_dir: /path/to/root/directory  
      keep_newline:  
        - files/testdir/*
```

**Note:** In earlier releases, this documentation incorrectly stated that binary files would not be affected by the `keep_newline` configuration. However, this module does not actually distinguish between binary and text files.

Changed in version 2017.7.0: Templating/rendering has been added. You can now specify a default render pipeline and a black- and whitelist of (dis)allowed renderers.

`template` must be set to `True` for templating to happen.

```
ext_pillar:  
  - file_tree:  
      root_dir: /path/to/root/directory  
      render_default: jinja|yaml  
      renderer_blacklist:  
        - gpg  
      renderer_whitelist:  
        - jinja  
        - yaml  
      template: True
```

## Assigning Pillar Data to Individual Hosts

To configure pillar data for each host, this external pillar will recursively iterate over `root_dir/hosts/id` (where `id` is a minion ID), and compile pillar data with each subdirectory as a dictionary key and each file as a value.

For example, the following `root_dir` tree:

```
./hosts/
./hosts/test-host/
./hosts/test-host/files/
./hosts/test-host/files/testdir/
./hosts/test-host/files/testdir/file1.txt
./hosts/test-host/files/testdir/file2.txt
./hosts/test-host/files/another-testdir/
./hosts/test-host/files/another-testdir/symlink-to-file1.txt
```

will result in the following pillar tree for minion with ID `test-host`:

```
test-host:
  -----
  files:
    -----
    another-testdir:
      -----
      symlink-to-file1.txt:
        Contents of file #1.

    testdir:
      -----
      file1.txt:
        Contents of file #1.

      file2.txt:
        Contents of file #2.
```

---

**Note:** Subdirectories underneath `root_dir/hosts/id` become nested dictionaries, as shown above.

---

### Assigning Pillar Data to Entire Nodegroups

To assign Pillar data to all minions in a given nodegroup, this external pillar recursively iterates over `root_dir/nodegroups/nodegroup` (where `nodegroup` is the name of a nodegroup), and like for individual hosts, compiles pillar data with each subdirectory as a dictionary key and each file as a value.

---

**Important:** If the same Pillar key is set for a minion both by nodegroup and by individual host, then the value set for the individual host will take precedence.

---

For example, the following `root_dir` tree:

```
./nodegroups/
./nodegroups/test-group/
./nodegroups/test-group/files/
./nodegroups/test-group/files/testdir/
./nodegroups/test-group/files/testdir/file1.txt
./nodegroups/test-group/files/testdir/file2.txt
./nodegroups/test-group/files/another-testdir/
./nodegroups/test-group/files/another-testdir/symlink-to-file1.txt
```

will result in the following pillar data for minions in the node group `test-group`:

```
test-host:
  -----
  files:
    -----
    another-testdir:
      -----
      symlink-to-file1.txt:
        Contents of file #1.

    testdir:
      -----
      file1.txt:
        Contents of file #1.

      file2.txt:
        Contents of file #2.
```

`salt.pillar.file_tree.ext_pillar` (*minion\_id*, *pillar*, *root\_dir=None*, *follow\_dir\_links=False*, *debug=False*, *keep\_newline=False*, *render\_default=None*, *renderer\_blacklist=None*, *renderer\_whitelist=None*, *template=False*)

Compile pillar data for the specified minion ID

### 14.10.13 salt.pillar.foreman

A module to pull data from Foreman via its API into the Pillar dictionary

#### Configuring the Foreman ext\_pillar

Set the following Salt config to setup Foreman as external pillar source:

```
ext_pillar:
  - foreman:
      key: foreman # Nest results within this key
      only: ['hostgroup_name', 'parameters'] # Add only these keys to pillar

foreman.url: https://example.com/foreman_api
foreman.user: username # default is admin
foreman.password: password # default is changeme
```

The following options are optional:

```
foreman.api: apiversion # default is 2 (1 is not supported yet)
foreman.verifyssl: False # default is True
foreman.certfile: /etc/ssl/certs/mycert.pem # default is None
foreman.keyfile: /etc/ssl/private/mykey.pem # default is None
foreman.cafile: /etc/ssl/certs/mycert.ca.pem # default is None
foreman.lookup_parameters: True # default is True
```

An alternative would be to use the Foreman modules integrating Salt features in the Smart Proxy and the webinterface.

Further information can be found on [GitHub](#).

## Module Documentation

`salt.pillar.foreman.ext_pillar` (*minion\_id, pillar, key=None, only=()*)  
 Read pillar data from Foreman via its API.

### 14.10.14 salt.pillar.git\_pillar

#### Use a git repository as a Pillar source

---

**Note:** This external pillar has been rewritten for the *2015.8.0* release. The old method of configuring this external pillar will be maintained for a couple releases, allowing time for configurations to be updated to reflect the new usage.

---

This external pillar allows for a Pillar top file and Pillar SLS files to be sourced from a git repository.

However, since `git_pillar` does not have an equivalent to the `pillar_roots` parameter, configuration is slightly different. A Pillar top file is required to be in the git repository and must still contain the relevant environment, like so:

```
base:
  '*':
    - foo
```

The branch/tag which maps to that environment must then be specified along with the repo's URL. Configuration details can be found below.

---

**Important:** Each branch/tag used for `git_pillar` must have its own top file. This is different from how the top file works when configuring `States`. The reason for this is that each `git_pillar` branch/tag is processed separately from the rest. Therefore, if the `qa` branch is to be used for `git_pillar`, it would need to have its own top file, with the `qa` environment defined within it, like this:

```
qa:
  'dev-*':
    - bar
```

Additionally, while `git_pillar` allows for the branch/tag to be overridden (see [here](#), or [here](#) for Salt releases before 2015.8.0), keep in mind that the top file must reference the actual environment name. It is common practice to make the environment in a `git_pillar` top file match the branch/tag name, but when remapping, the environment of course no longer matches the branch/tag, and the top file needs to be adjusted accordingly. When expected Pillar values configured in `git_pillar` are missing, this is a common misconfiguration that may be to blame, and is a good first step in troubleshooting.

---

#### Configuring git\_pillar for Salt releases before 2015.8.0

---

**Note:** This legacy configuration for `git_pillar` will no longer be supported as of the **Oxygen** release of Salt.

---

For Salt releases earlier than *2015.8.0*, GitPython is the only supported provider for `git_pillar`. Individual repositories can be configured under the `ext_pillar` configuration parameter like so:

```
ext_pillar:
- git: master https://gitserver/git-pillar.git root=subdirectory
```

The repository is specified in the format `<branch> <repo_url>`, with an optional `root` parameter (added in the 2014.7.0 release) which allows the pillar SLS files to be served up from a subdirectory (similar to `gitfs_root` in `gitfs`).

To use more than one branch from the same repo, multiple lines must be specified under `ext_pillar`:

```
ext_pillar:
- git: master https://gitserver/git-pillar.git
- git: dev https://gitserver/git-pillar.git
```

To remap a specific branch to a specific Pillar environment, use the format `<branch>:<env>`:

```
ext_pillar:
- git: develop:dev https://gitserver/git-pillar.git
- git: master:prod https://gitserver/git-pillar.git
```

In this case, the `develop` branch would need its own `top.sls` with a `dev` section in it, like this:

```
dev:
  '*':
    - bar
```

The `master` branch would need its own `top.sls` with a `prod` section in it:

```
prod:
  '*':
    - bar
```

If `__env__` is specified as the branch name, then `git_pillar` will first look at the minion's `environment` option. If unset, it will fall back to using branch specified by the master's `gitfs_base`:

```
ext_pillar:
- git: __env__ https://gitserver/git-pillar.git root=pillar
```

The corresponding Pillar top file would look like this:

```
{{saltenv}}:
  '*':
    - bar
```

---

**Note:** This feature was unintentionally omitted when `git_pillar` was rewritten for the 2015.8.0 release. It was added again in the 2016.3.4 release, but it has changed slightly in that release. On Salt masters running 2015.8.0 through 2016.3.3, this feature can only be accessed using the legacy config described above. For 2016.3.4 and later, refer to explanation of the `__env__` parameter in the below section.

Versions 2016.3.0 through 2016.3.4 incorrectly check the *master's* `environment` config option (instead of the minion's) before falling back to `gitfs_base`. This has been fixed in the 2016.3.5 and 2016.11.1 releases (2016.11.0 contains the incorrect behavior).

Additionally, in releases before 2016.11.0, both `{{env}}` and `{{saltenv}}` could be used as a placeholder for the environment. Starting in 2016.11.0, `{{env}}` is no longer supported.

---

## Configuring `git_pillar` for Salt releases 2015.8.0 and later

**Note:** In version 2015.8.0, the method of configuring git external pillars has changed, and now more closely resembles that of the *Git Fileserver Backend*. If Salt detects the old configuration schema, it will use the pre-2015.8.0 code to compile the external pillar. A warning will also be logged.

Beginning with Salt version 2015.8.0, `pygit2` is now supported in addition to `GitPython`. The requirements for `GitPython` and `pygit2` are the same as for `GitFS`, as described [here](#).

**Important:** `git_pillar` has its own set of global configuration parameters. While it may seem intuitive to use the global `gitfs` configuration parameters (`gitfs_base`, etc.) to manage `git_pillar`, this will not work. The main difference for this is the fact that the different components which use Salt's git backend code do not all function identically. For instance, in `git_pillar` it is necessary to specify which branch/tag to be used for `git_pillar` remotes. This is the reverse behavior from `gitfs`, where branches/tags make up your environments.

See [here](#) for documentation on the `git_pillar` configuration options and their usage.

Here is an example `git_pillar` configuration:

```
ext_pillar:
- git:
  # Use 'prod' instead of the branch name 'production' as the environment
  - production https://gitserver/git-pillar.git:
    - env: prod
  # Use 'dev' instead of the branch name 'develop' as the environment
  - develop https://gitserver/git-pillar.git:
    - env: dev
  # No per-remote config parameters (and no trailing colon), 'qa' will
  # be used as the environment
  - qa https://gitserver/git-pillar.git
  # SSH key authentication
  - master git@other-git-server:pillardata-ssh.git:
    # Pillar SLS files will be read from the 'pillar' subdirectory in
    # this repository
    - root: pillar
    - privkey: /path/to/key
    - pubkey: /path/to/key.pub
    - passphrase: CorrectHorseBatteryStaple
  # HTTPS authentication
  - master https://other-git-server/pillardata-https.git:
    - user: git
    - password: CorrectHorseBatteryStaple
```

The main difference between this and the old way of configuring `git_pillar` is that multiple remotes can be configured under one `git` section under `ext_pillar`. More than one `git` section can be used, but it is not necessary. Remotes will be evaluated sequentially.

Per-remote configuration parameters are supported (similar to `gitfs`), and global versions of the `git_pillar` configuration parameters can also be set. To remap a specific branch to a specific Pillar environment, use the `env` per-remote parameter:

```
ext_pillar:
- git:
  - production https://gitserver/git-pillar.git:
    - env: prod
```

If `__env__` is specified as the branch name, then `git_pillar` will decide which branch to use based on the following criteria:

- If the minion has a `pillarenv` configured, it will use that pillar environment. (2016.11.2 and later)
- Otherwise, if the minion has an `environment` configured, it will use that environment.
- Otherwise, the master's `git_pillar_base` will be used.

---

**Note:** The use of `environment` to choose the pillar environment dates from a time before the `pillarenv` parameter was added. In a future release, it will be ignored and either the minion's `pillarenv` or the master's `git_pillar_base` will be used.

---

Here's an example of using `__env__` as the `git_pillar` environment:

```
ext_pillar:
- git:
  - __env__ https://gitserver/git-pillar.git:
    - root: pillar
```

The corresponding Pillar top file would look like this:

```
{{saltenv}}:
  '*':
    - bar
```

---

**Note:** This feature was unintentionally omitted when `git_pillar` was rewritten for the 2015.8.0 release. It was added again in the 2016.3.4 release, but it has changed slightly in that release. The fallback value replaced by `{{env}}` is `:conf_master:` is `git_pillar_base`, while the legacy config's version of this feature replaces `{{env}}` with `gitfs_base`.

On Salt masters running 2015.8.0 through 2016.3.3, this feature can only be accessed using the legacy config in the previous section of this page.

The same issue which affected the behavior of the minion's `environment` config value using the legacy configuration syntax (see the documentation in the pre-2015.8.0 section above for the legacy support of this feature) also affects the new-style `git_pillar` syntax in version 2016.3.4. This has been corrected in version 2016.3.5 and 2016.11.1 (2016.11.0 contains the incorrect behavior).

2016.3.4 incorrectly checks the *master's* `environment` config option (instead of the minion's) before falling back to the master's `git_pillar_base`.

Additionally, in releases before 2016.11.0, both `{{env}}` and `{{saltenv}}` could be used as a placeholder for the environment. Starting in 2016.11.0, `{{env}}` is no longer supported.

---

With the addition of `pygit2` support, `git_pillar` can now interact with authenticated remotes. Authentication works just like in `gitfs` (as outlined in the [Git Fileserver Backend Walkthrough](#)), only with the global authentication parameter names prefixed with `git_pillar` instead of `gitfs` (e.g. `git_pillar_pubkey`, `git_pillar_privkey`, `git_pillar_passphrase`, etc.).

---

**Note:** The `name` parameter can be used to further differentiate between two remotes with the same URL and branch. When using two remotes with the same URL, the `name` option is required.

---

## How Multiple Remotes Are Handled

As noted above, multiple remotes can be included in the same `git` `ext_pillar` configuration. Consider the following:

```
my_etcd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001

ext_pillar:
  - etcd: my_etcd_config
  - git:
    - master https://mydomain.tld/foo.git:
      - root: pillar
    - master https://mydomain.tld/bar.git
    - master https://mydomain.tld/baz.git
    - dev https://mydomain.tld/qux.git
  - git:
    - master https://mydomain.tld/abc.git
    - dev https://mydomain.tld/123.git
```

To understand how pillar data from these repos will be compiled, it's important to know how Salt will process them. The following points should be kept in mind:

1. Each `ext_pillar` is called separately from the others. So, in the above example, the `etcd` `ext_pillar` will be evaluated first, with the first group of `git_pillar` remotes evaluated next (and merged into the `etcd` pillar data). Lastly, the second group of `git_pillar` remotes will be evaluated, and then merged into the `ext_pillar` data evaluated before it.
2. Within a single group of `git_pillar` remotes, each remote will be evaluated in order, with results merged together as each remote is evaluated.

---

**Note:** Prior to the 2017.7.0 release, remotes would be evaluated in a non-deterministic order.

---

3. By default, when a repo is evaluated, other remotes' which share its pillar environment will have their files made available to the remote being processed.

The first point should be straightforward enough, but the second and third could use some additional clarification.

First, point #2. In the first group of `git_pillar` remotes, the top file and pillar SLS files in the `foo` remote will be evaluated first. The `bar` remote will be evaluated next, and its results will be merged into the pillar data compiled when the `foo` remote was evaluated. As the subsequent remotes are evaluated, their data will be merged in the same fashion.

But wait, don't these repositories belong to more than one pillar environments? Well, yes. The default method of generating pillar data compiles pillar data from all environments. This behavior can be overridden using a `pillarenv`. Setting a `pillarenv` in the minion config file will make that minion tell the master to ignore any pillar data from environments which don't match that `pillarenv`. A `pillarenv` can also be specified for a given minion or set of minions when *running states*, by using the `pillarenv` argument. The CLI `pillarenv` will override one set in the minion config file. So, assuming that a `pillarenv` of `base` was set for a minion, it would not get any of the pillar variables configured in the `qux` remote, since that remote is assigned to the `dev` environment. The only way to get its pillar data would be to specify a `pillarenv` of `dev`, which would mean that it would then ignore any items from the `base` `pillarenv`. A more detailed explanation of pillar environments can be found [here](#).

Moving on to point #3, and looking at the example `ext_pillar` configuration, as the `foo` remote is evaluated, it will also have access to the files from the `bar` and `baz` remotes, since all three are assigned to the `base` pillar environment. So, if an SLS file referenced by the `foo` remotes's top file does not exist in the `foo` remote, it will be searched for in the `bar` remote, followed by the `baz` remote. When it comes time to evaluate the `bar` remote,

SLS files referenced by the bar remote's top file will first be looked for in the bar remote, followed by foo, and baz, and when the baz remote is processed, SLS files will be looked for in baz, followed by foo and bar. This "failover" logic is called a *directory overlay*, and it is also used by *file\_roots* and `:conf_minion`pillar_roots``. The ordering of which remote is checked for SLS files is determined by the order they are listed. First the remote being processed is checked, then the others that share the same environment are checked. However, before the 2017.7.0 release, since evaluation was unordered, the remote being processed would be checked, followed in no specific order by the other repos which share the same environment.

Beginning with the 2017.7.0 release, this behavior of `git_pillar` remotes having access to files in other repos which share the same environment can be disabled by setting `git_pillar_includes` to `False`. If this is done, then all `git_pillar` remotes will only have access to their own SLS files. Another way of ensuring that a `git_pillar` remote will not have access to SLS files from other `git_pillar` remotes which share the same pillar environment is to put them in a separate `git` section under `ext_pillar`. Look again at the example configuration above. In the second group of `git_pillar` remotes, the abc remote would not have access to the SLS files from the foo, bar, and baz remotes, and vice-versa.

### Mountpoints

New in version 2017.7.0.

Assume the following pillar top file:

```
base:
  'web*':
    - common
    - web.server.nginx
    - web.server.appdata
```

Now, assume that you would like to configure the `web.server.nginx` and `web.server.appdata` SLS files in separate repos. This could be done using the following `ext_pillar` configuration (assuming that `git_pillar_includes` has not been set to `False`):

```
ext_pillar:
  - git:
    - master https://mydomain.tld/pillar-common.git
    - master https://mydomain.tld/pillar-nginx.git
    - master https://mydomain.tld/pillar-appdata.git
```

However, in order to get the files in the second and third `git_pillar` remotes to work, you would need to first create the directory structure underneath it (i.e. place them underneath `web/server/` in the repository). This also makes it tedious to reorganize the configuration, as changing `web.server.nginx` to `web.nginx` in the top file would require you to also move the SLS files in the `pillar-nginx` up a directory level.

For these reasons, much like `gitfs`, `git_pillar` now supports a "mountpoint" feature. Using the following `ext_pillar` configuration, the SLS files in the second and third `git_pillar` remotes can be placed in the root of the git repository:

```
ext_pillar:
  - git:
    - master https://mydomain.tld/pillar-common.git
    - master https://mydomain.tld/pillar-nginx.git:
      - mountpoint: web/server/
    - master https://mydomain.tld/pillar-appdata.git:
      - mountpoint: web/server/
```

Now, if the top file changed the SLS target from `web.server.nginx`, instead of reorganizing the git repository, you would just need to adjust the mountpoint to `web/` (and restart the `salt-master` daemon).

**Note:**

- Leading and trailing slashes on the mountpoints are optional.
- Use of the mountpoint feature requires that `git_pillar_includes` is not disabled.
- Content from mounted git\_pillar repos can only be referenced by a top file in the same pillar environment.

`salt.pillar.git_pillar.ext_pillar` (*minion\_id, repo, pillar\_dirs*)  
Checkout the ext\_pillar sources and compile the resulting pillar SLS

**14.10.15 salt.pillar.gpg module**

Decrypt pillar data through the builtin GPG renderer

In most cases, you'll want to make this the last external pillar used. For example, to pair with the builtin stack pillar you could do something like this:

```
ext_pillar:
  - stack: /path/to/stack.cfg
  - gpg: {}
```

Set `gpg_keydir` in your config to adjust the homedir the renderer uses.

`salt.pillar.gpg.ext_pillar` (*minion\_id, pillar, \*args, \*\*kwargs*)

**14.10.16 salt.pillar.hg\_pillar**

Use remote Mercurial repository as a Pillar source.

New in version 2015.8.0.

The module depends on the `hglib` python module being available. This is the same requirement as for `hgfs_` so should not pose any extra hurdles.

This external Pillar source can be configured in the master config file as such:

```
ext_pillar:
  - hg: ssh://hg@example.co/user/repo
```

**class** `salt.pillar.hg_pillar.Repo` (*repo\_uri*)  
Deal with remote hg (mercurial) repository for Pillar

**close** ()  
Cleanup mercurial command server

**update** (*branch='default'*)  
Ensure we are using the latest revision in the hg repository

`salt.pillar.hg_pillar.ext_pillar` (*minion\_id, pillar, repo, branch='default', root=None*)  
Extract pillar from an hg repository

`salt.pillar.hg_pillar.update` (*repo\_uri*)  
Execute an hg pull on all the repos

### 14.10.17 salt.pillar.hiera

Use hiera data as a Pillar source

`salt.pillar.hiera.ext_pillar` (*minion\_id, pillar, conf*)  
Execute hiera and return the data

### 14.10.18 salt.pillar.http\_json module

A module that adds data to the Pillar structure retrieved by an http request

#### Configuring the HTTP\_JSON ext\_pillar

Set the following Salt config to setup Foreman as external pillar source:

```
ext_pillar:
- http_json:
  url: http://example.com/api/minion_id
  ::TODO::
  username: username
  password: password
```

#### Module Documentation

`salt.pillar.http_json.ext_pillar` (*minion\_id, pillar, url=None*)  
Read pillar data from HTTP response.

:param url String to make request :returns dict with pillar data to add :returns empty if error

### 14.10.19 salt.pillar.http\_yaml module

A module that adds data to the Pillar structure retrieved by an http request

#### Configuring the HTTP\_YAML ext\_pillar

Set the following Salt config to setup an http endpoint as the external pillar source:

```
ext_pillar:
- http_yaml:
  url: http://example.com/api/minion_id
  ::TODO::
  username: username
  password: password
```

#### Module Documentation

`salt.pillar.http_yaml.ext_pillar` (*minion\_id, pillar, url*)  
Read pillar data from HTTP response.

:param url String to make request :returns dict with pillar data to add :returns empty if error

### 14.10.20 salt.pillar.libvirt

Load up the libvirt keys into Pillar for a given minion if said keys have been generated using the libvirt key runner

`depends certtool`

`salt.pillar.libvirt.ext_pillar(minion_id, pillar, command)`

Read in the generated libvirt keys

`salt.pillar.libvirt.gen_hyper_keys(minion_id, country='US', state='Utah', locality='Salt Lake City', organization='Salted')`

Generate the keys to be used by libvirt hypervisors, this routine gens the keys and applies them to the pillar for the hypervisor minions

### 14.10.21 salt.pillar.makostack module

Simple and flexible YAML ext\_pillar which can read pillar from within pillar.

New in version 2016.3.0.

This custom saltstack ext\_pillar is a direct ripoff of the 'stack' ext\_pillar, simply ported to use mako instead of jinja2 for templating.

It supports the following features:

- multiple config files that are mako templates with support for pillar, \_\_grains\_\_, \_\_salt\_\_, \_\_opts\_\_ objects.
- a config file renders as an ordered list of files. Unless absolute, the paths of these files are relative to the current config file - if absolute, they will be treated literally.
- this list of files are read in order as mako templates with support for stack, pillar, \_\_grains\_\_, \_\_salt\_\_, \_\_opts\_\_ objects.
- all these rendered files are then parsed as yaml.
- then all yaml dicts are merged in order, with support for the following. merging strategies: merge-first, merge-last, remove, and overwrite.
- stack config files can be matched based on pillar, grains, or opts values, which make it possible to support kind of self-contained environments.

#### Configuration in Salt

Like any other external pillar, its configuration takes place through the ext\_pillar key in the master config file.

However, you can configure MakoStack in 3 different ways:

#### Single config file

This is the simplest option, you just need to set the path to your single MakoStack config file like below:

```
ext_pillar:
  - makostack: /path/to/stack.cfg
```

## List of config files

You can also provide a list of config files:

```
ext_pillar:
  - makostack:
    - /path/to/stack1.cfg
    - /path/to/stack2.cfg
```

## Select config files through grains|pillar|opts matching

You can also opt for a much more flexible configuration: MakoStack allows one to select the config files for the current minion based on matching values from either grains, or pillar, or opts objects.

Here is an example of such a configuration, which should speak by itself:

```
ext_pillar:
  - makostack:
    pillar:environment:
      dev: /path/to/dev/stack.cfg
      prod: /path/to/prod/stack.cfg
    grains:custom:grain:
      value:
        - /path/to/stack1.cfg
        - /path/to/stack2.cfg
    opts:custom:opt:
      value: /path/to/stack0.cfg
```

## Grafting data from files to arbitrary namespaces

An extended syntax for config files permits defining ``graft points" on a per-config-file basis. As an example, if the file foo.cfg would produce the following:

```
foo:
  - bar
  - baz
```

and you specified the cfg file as /path/to/foo.cfg:yummy:fur, the following would actually end up in pillar after all merging was complete:

```
yummy:
  fur:
    foo:
      - bar
      - baz
```

## MakoStack configuration files

The config files that are referenced in the above `ext_pillar` configuration are mako templates which must render as a simple ordered list of `yaml` files that will then be merged to build pillar data.

Unless an absolute path name is specified, the path of these `yaml` files is assumed to be relative to the directory containing the MakoStack config file. If a path begins with `/'`, however, it will be treated literally and can be anywhere on the filesystem.

The following variables are available in mako templating of makostack configuration files:

- `pillar`: the pillar data (as passed by Salt to our `ext_pillar` function)
- `minion_id`: the minion id ;-)
- `__opts__`: a dictionary of mostly Salt configuration options
- `__grains__`: a dictionary of the grains of the minion making this pillar call
- `__salt__`: a dictionary of Salt module functions, useful so you don't have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of mako to build your list of `yaml` files that will be merged in pillar data.

For example, you could have a MakoStack config file which looks like:

```
$ cat /path/to/stack/config.cfg
core.yml
osarchs/%{ __grains__['osarch'] }.yml
oscodenames/%{ __grains__['oscodename'] }.yml
% for role in pillar.get('roles', []):
roles/%{ role }.yml
% endfor
minions/%{ minion_id }.yml
```

And the whole directory structure could look like:

```
$ tree /path/to/stack/
/path/to/stack/
|-- config.cfg
|-- core.yml
|-- osarchs/
|   |-- amd64.yml
|   |-- armhf.yml
|-- oscodenames/
|   |-- wheezy.yml
|   |-- jessie.yml
|-- roles/
|   |-- web.yml
|   |-- db.yml
|-- minions/
|   |-- test-1-dev.yml
|   |-- test-2-dev.yml
```

## Overall process

In the above MakoStack configuration, given that `test-1-dev` minion is an `amd64` platform running Debian Jessie, and which pillar `roles` is `["db"]`, the following `yaml` files would be merged in order:

- `core.yml`
- `osarchs/amd64.yml`
- `oscodenames/jessie.yml`
- `roles/db.yml`
- `minions/test-1-dev.yml`

Before merging, every files above will be preprocessed as mako templates. The following variables are available in mako templating of `yaml` files:

- `stack`: the MakoStack pillar data object that has currently been merged (data from previous `yaml` files in MakoStack configuration)
- `pillar`: the pillar data (as passed by Salt to our `ext_pillar` function)
- `minion_id`: the minion id ;-)
- `__opts__`: a dictionary of mostly Salt configuration options
- `__grains__`: a dictionary of the grains of the minion making this pillar call
- `__salt__`: a dictionary of Salt module functions, useful so you don't have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of mako to build your pillar data, and even use other pillar values that has already been merged by MakoStack (from previous `yaml` files in MakoStack configuration) through the `stack` variable.

Once a `yaml` file has been preprocessed by mako, we obtain a Python dict - let's call it `yaml_data` - then, MakoStack will merge this `yaml_data` dict in the main `stack` dict (which contains already merged MakoStack pillar data). By default, MakoStack will deeply merge `yaml_data` in `stack` (similarly to the `recurse salt pillar_source_merging_strategy`), but 3 merging strategies are currently available for you to choose (see next section).

Once every `yaml` files have been processed, the `stack` dict will contain your whole own pillar data, merged in order by MakoStack. So MakoStack `ext_pillar` returns the `stack` dict, the contents of which Salt takes care to merge in with all of the other pillars and finally return the whole pillar to the minion.

### Merging strategies

The way the data from a new `yaml_data` dict is merged with the existing `stack` data can be controlled by specifying a merging strategy. Right now this strategy can either be `merge-last` (the default), `merge-first`, `remove`, or `overwrite`.

Note that scalar values like strings, integers, booleans, etc. are always evaluated using the `overwrite` strategy (other strategies don't make sense in that case).

The merging strategy can be set by including a dict in the form of:

```
__: <merging strategy>
```

as the first item of the dict or list. This allows fine grained control over the merging process.

#### **merge-last** (default) strategy

If the `merge-last` strategy is selected (the default), then content of dict or list variables is merged recursively with previous definitions of this variable (similarly to the `recurse salt pillar_source_merging_strategy`). This allows for extending previously defined data.

#### **merge-first** strategy

If the `merge-first` strategy is selected, then the content of dict or list variables are swapped between the `yaml_data` and `stack` objects before being merged recursively with the `merge-last` previous strategy.

### remove strategy

If the `remove` strategy is selected, then content of dict or list variables in `stack` are removed only if the corresponding item is present in the `yaml_data` dict. This allows for removing items from previously defined data.

### overwrite strategy

If the `overwrite` strategy is selected, then the content of dict or list variables in `stack` is overwritten by the content of `yaml_data` dict. So this allows one to overwrite variables from previous definitions.

### Merging examples

Let's go through small examples that should clarify what's going on when a `yaml_data` dict is merged in the `stack` dict.

When you don't specify any strategy, the default `merge-last` strategy is selected:

stack	yaml_data	stack (after merge)
<pre>users:   tom:     uid: 500     roles:       - sysadmin   root:     uid: 0</pre>	<pre>users:   tom:     uid: 1000     roles:       - developer   mat:     uid: 1001</pre>	<pre>users:   tom:     uid: 1000     roles:       - sysadmin       - developer   mat:     uid: 1001   root:     uid: 0</pre>

Then you can select a custom merging strategy using the `__` key in a dict:

stack	yaml_data	stack (after merge)
<pre>users:   tom:     uid: 500     roles:       - sysadmin   root:     uid: 0</pre>	<pre>users:   __: merge-last   tom:     uid: 1000     roles:       - developer   mat:     uid: 1001</pre>	<pre>users:   tom:     uid: 1000     roles:       - sysadmin       - developer   mat:     uid: 1001   root:     uid: 0</pre>
<pre>users:   tom:     uid: 500     roles:       - sysadmin   root:     uid: 0</pre>	<pre>users:   __: merge-first   tom:     uid: 1000     roles:       - developer   mat:     uid: 1001</pre>	<pre>users:   tom:     uid: 500     roles:       - developer       - sysadmin   mat:     uid: 1001   root:     uid: 0</pre>
<pre>users:   tom:     uid: 500     roles:       - sysadmin   root:     uid: 0</pre>	<pre>users:   __: remove   tom:   mat:</pre>	<pre>users:   root:     uid: 0</pre>
<pre>users:   tom:     uid: 500     roles:       - sysadmin   root:     uid: 0</pre>	<pre>users:   __: overwrite   tom:     uid: 1000     roles:       - developer   mat:     uid: 1001</pre>	<pre>users:   tom:     uid: 1000     roles:       - developer   mat:     uid: 1001</pre>

You can also select a custom merging strategy using a `__` object in a list:

stack	yaml_data	stack (after merge)
<pre>users: - tom - root</pre>	<pre>users: - __: merge-last - mat</pre>	<pre>users: - tom - root - mat</pre>
<pre>users: - tom - root</pre>	<pre>users: - __: merge-first - mat</pre>	<pre>users: - mat - tom - root</pre>
<pre>users: - tom - root</pre>	<pre>users: - __: remove - mat - tom</pre>	<pre>users: - root</pre>
<pre>users: - tom - root</pre>	<pre>users: - __: overwrite - mat</pre>	<pre>users: - mat</pre>

`salt.pillar.makostack.ext_pillar` (*minion\_id*, *pillar*, *\*args*, *\*\*kwargs*)

### 14.10.22 salt.pillar.mongo

Read Pillar data from a mongodb collection

**depends** pymongo (for salt-master)

This module will load a node-specific pillar dictionary from a mongo collection. It uses the node's id for lookups and can load either the whole document, or just a specific field from that document as the pillar dictionary.

#### Salt Master Mongo Configuration

The module shares the same base mongo connection variables as `salt.returners.mongo_return`. These variables go in your master config file.

- `mongo.db` - The mongo database to connect to. Defaults to 'salt'.
- `mongo.host` - The mongo host to connect to. Supports replica sets by specifying all hosts in the set, comma-delimited. Defaults to 'salt'.
- `mongo.port` - The port that the mongo database is running on. Defaults to 27017.
- `mongo.user` - The username for connecting to mongo. Only required if you are using mongo authentication. Defaults to ''.
- `mongo.password` - The password for connecting to mongo. Only required if you are using mongo authentication. Defaults to ''.

#### Configuring the Mongo ext\_pillar

The Mongo `ext_pillar` takes advantage of the fact that the Salt Master configuration file is yaml. It uses a sub-dictionary of values to adjust specific features of the pillar. This is the explicit single-line dictionary notation for

yaml. One may be able to get the easier-to-read multi-line dict to work correctly with some experimentation.

```
ext_pillar:
  - mongo: {collection: vm, id_field: name, re_pattern: \.example\.com, fields:
    → [customer_id, software, apache_vhosts]}
```

In the example above, we've decided to use the `vm` collection in the database to store the data. Minion ids are stored in the `name` field on documents in that collection. And, since minion ids are FQDNs in most cases, we'll need to trim the domain name in order to find the minion by hostname in the collection. When we find a minion, return only the `customer_id`, `software`, and `apache_vhosts` fields, as that will contain the data we want for a given node. They will be available directly inside the `pillar` dict in your SLS templates.

## Module Documentation

`salt.pillar.mongo.ext_pillar` (*minion\_id*, *pillar*, *collection='pillar'*, *id\_field='\_id'*, *re\_pattern=None*, *re\_replace=''*, *fields=None*)

Connect to a mongo database and read per-node pillar information.

### Parameters

- **collection** (\*) -- The mongodb collection to read data from. Defaults to 'pillar'.
- **id\_field** (\*) -- The field in the collection that represents an individual minion id. Defaults to '\_id'.
- **re\_pattern** (\*) -- If your naming convention in the collection is shorter than the minion id, you can use this to trim the name. *re\_pattern* will be used to match the name, and *re\_replace* will be used to replace it. Backrefs are supported as they are in the Python standard library. If `None`, no mangling of the name will be performed - the collection will be searched with the entire minion id. Defaults to `None`.
- **re\_replace** (\*) -- Use as the replacement value in node ids matched with *re\_pattern*. Defaults to `''`. Feel free to use backreferences here.
- **fields** (\*) -- The specific fields in the document to use for the pillar data. If `None`, will use the entire document. If using the entire document, the `_id` field will be converted to string. Be careful with other fields in the document as they must be string serializable. Defaults to `None`.

### 14.10.23 salt.pillar.mysql

Retrieve Pillar data by doing a MySQL query

MariaDB provides Python support through the MySQL Python package. Therefore, you may use this module with both MySQL or MariaDB.

This module is a concrete implementation of the `sql_base` `ext_pillar` for MySQL.

**maturity** new

**depends** python-mysqldb

**platform** all

### Configuring the mysql ext\_pillar

Use the ``mysql`` key under `ext_pillar` for configuration of queries.

MySQL configuration of the MySQL returner is being used (`mysql.db`, `mysql.user`, `mysql.pass`, `mysql.port`, `mysql.host`) for database connection info.

Required python modules: MySQLdb

### Complete example

```
mysql:
  user: 'salt'
  pass: 'super_secret_password'
  db: 'salt_db'
  port: 3306
  ssl:
    cert: /etc/mysql/client-cert.pem
    key: /etc/mysql/client-key.pem

ext_pillar:
  - mysql:
      fromdb:
        query: 'SELECT col1,col2,col3,col4,col5,col6,col7
                FROM some_random_table
                WHERE minion_pattern LIKE %s'
        depth: 5
        as_list: True
        with_lists: [1,3]
```

#### class salt.pillar.mysql.MySQLExtPillar

This class receives and processes the database rows from MySQL.

#### **extract\_queries** (*args, kwargs*)

This function normalizes the config block into a set of queries we can use. The return is a list of consistently laid out dicts.

`salt.pillar.mysql.ext_pillar` (*minion\_id, pillar, \*args, \*\*kwargs*)

Execute queries against MySQL, merge and return as a dict

### 14.10.24 salt.pillar.neutron module

Use Openstack Neutron data as a Pillar source. Will list all networks listed inside of Neutron, to all minions.

New in version 2015.5.1.

#### **depends**

- python-neutronclient

A keystone profile must be used for the pillar to work (no generic keystone configuration here). For example:

```
my_openstack_config:
  keystone.user: 'admin'
  keystone.password: 'password'
  keystone.tenant: 'admin'
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
  keystone.region_name: 'RegionOne'
  keystone.service_type: 'network'
```

After the profile is created, configure the external pillar system to use it.

```
ext_pillar:
  - neutron: my_openstack_config
```

Using these configuration profiles, multiple neutron sources may also be used:

```
ext_pillar:
  - neutron: my_openstack_config
  - neutron: my_other_openstack_config
```

By default, these networks will be returned as a pillar item called `networks`. In order to have them returned under a different name, add the name after the Keystone profile name:

```
ext_pillar:
  • neutron: my_openstack_config neutron_networks
```

`salt.pillar.neutron.ext_pillar` (*minion\_id, pillar, conf*)  
Check neutron for all data

### 14.10.25 salt.pillar.nodegroups

#### Nodegroups Pillar

Introspection: to which nodegroups does my minion belong? Provides a pillar with the default name of *nodegroups* which contains a list of nodegroups which match for a given minion.

New in version 2016.11.0.

#### Command Line

#### Configuring Nodegroups Pillar

```
extension_modules: /srv/salt/ext
ext_pillar:
  - nodegroups:
      pillar_name: 'nodegroups'
```

`salt.pillar.nodegroups.ext_pillar` (*minion\_id, pillar, pillar\_name=None*)

A salt external pillar which provides the list of nodegroups of which the minion is a member.

#### Parameters

- **minion\_id** -- used for compound matching nodegroups
- **pillar** -- provided by salt, but not used by nodegroups `ext_pillar`
- **pillar\_name** -- optional name to use for the pillar, defaults to `'nodegroups'`

**Returns** a dictionary which is included by the salt master in the pillars returned to the minion

### 14.10.26 salt.pillar.pepa

#### Pepa

Configuration templating for SaltStack using Hierarchical substitution and Jinja.

#### Configuring Pepa

```

extension_modules: /srv/salt/ext

ext_pillar:
  - pepa:
      resource: host           # Name of resource directory and sub-key in pillars
      sequence:                # Sequence used for hierarchical substitution
      - hostname:              # Name of key
          name: input          # Alias used for template directory
          base_only: True      # Only use templates from Base environment, i.e. no
→staging
      - default:
      - environment:
      - location..region:
          name: region
      - location..country:
          name: country
      - location..datacenter:
          name: datacenter
      - roles:
      - osfinger:
          name: os
      - hostname:
          name: override
          base_only: True
      subkey: True             # Create a sub-key in pillars, named after the
→resource in this case [host]
      subkey_only: True       # Only create a sub-key, and leave the top level
→untouched

pepa_roots:                    # Base directory for each environment
  base: /srv/pepa/base         # Path for base environment
  dev: /srv/pepa/base          # Associate dev with base
  qa: /srv/pepa/qa
  prod: /srv/pepa/prod

# Use a different delimiter for nested dictionaries, defaults to '..' since some keys
→may use '.' in the name
#pepa_delimiter: ..

# Supply Grains for Pepa, this should **ONLY** be used for testing or validation
#pepa_grains:
#  environment: dev

# Supply Pillar for Pepa, this should **ONLY** be used for testing or validation
#pepa_pillars:
#  saltversion: 0.17.4

# Enable debug for Pepa, and keep Salt on warning
#log_level: debug

#log_granular_levels:
#  salt: warning
#  salt.loaded.ext.pillar.pepa: debug

```

Pepa can also be used in Master-less SaltStack setup.

## Command line

```
usage: pepa.py [-h] [-c CONFIG] [-d] [-g GRAINS] [-p PILLAR] [-n] [-v]
              hostname

positional arguments:
  hostname              Hostname

optional arguments:
  -h, --help            show this help message and exit
  -c CONFIG, --config CONFIG
                        Configuration file
  -d, --debug           Print debug info
  -g GRAINS, --grains GRAINS
                        Input Grains as YAML
  -p PILLAR, --pillar PILLAR
                        Input Pillar as YAML
  -n, --no-color       No color output
  -v, --validate       Validate output
```

## Templates

Templates is configuration for a host or software, that can use information from Grains or Pillars. These can then be used for hierarchically substitution.

**Example File:** host/input/test\_example\_com.yaml

```
location..region: emea
location..country: nl
location..datacenter: foobar
environment: dev
roles:
  - salt.master
network..gateway: 10.0.0.254
network..interfaces..eth0..hwaddr: 00:20:26:a1:12:12
network..interfaces..eth0..dhcp: False
network..interfaces..eth0..ipv4: 10.0.0.3
network..interfaces..eth0..netmask: 255.255.255.0
network..interfaces..eth0..fqdn: {{ hostname }}
cobbler..profile: fedora-19-x86_64
```

As you see in this example you can use Jinja directly inside the template.

**Example File:** host/region/amer.yaml

```
network..dns..servers:
  - 10.0.0.1
  - 10.0.0.2
time..ntp..servers:
  - ntp1.amer.example.com
  - ntp2.amer.example.com
  - ntp3.amer.example.com
time..timezone: America/Chihuahua
yum..mirror: yum.amer.example.com
```

Each template is named after the value of the key using lowercase and all extended characters are replaced with underscore.

**Example:**

```
osfinger: Fedora-19
```

**Would become:**

```
fedora_19.yaml
```

**Nested dictionaries**

In order to create nested dictionaries as output you can use double dot "." as a delimiter. You can change this using ``pepa\_delimiter`` we choose double dot since single dot is already used by key names in some modules, and using ":" requires quoting in the YAML.

**Example:**

```
network..dns..servers:
  - 10.0.0.1
  - 10.0.0.2
network..dns..options:
  - timeout:2
  - attempts:1
  - ndots:1
network..dns..search:
  - example.com
```

**Would become:**

```
network:
  dns:
    servers:
      - 10.0.0.1
      - 10.0.0.2
    options:
      - timeout:2
      - attempts:1
      - ndots:1
    search:
      - example.com
```

**Operators**

Operators can be used to merge/unset a list/hash or set the key as immutable, so it can't be changed.

Operator	Description
merge()	Merge list or hash
unset()	Unset key
immutable()	Set the key as immutable, so it can't be changed
imerge()	Set immutable and merge
iunset()	Set immutable and unset

**Example:**

```
network..dns..search..merge():
  - foobar.com
  - dummy.nl
```

```
owner..immutable(): Operations
host..printers..unset():
```

## Validation

Since it's very hard to test Jinja as is, the best approach is to run all the permutations of input and validate the output, i.e. Unit Testing.

To facilitate this in Pepa we use YAML, Jinja and Cerberus <<https://github.com/nicolaiarocci/cerberus>>.

## Schema

So this is a validation schema for network configuration, as you see it can be customized with Jinja just as Pepa templates.

This was designed to be run as a build job in Jenkins or similar tool. You can provide Grains/Pillar input using either the config file or command line arguments.

### File Example: host/validation/network.yaml

```
network..dns..search:
  type: list
  allowed:
    - example.com

network..dns..options:
  type: list
  allowed: ['timeout:2', 'attempts:1', 'ndots:1']

network..dns..servers:
  type: list
  schema:
    regex: ^([0-9]{1,3}\.){3}[0-9]{1,3}$

network..gateway:
  type: string
  regex: ^([0-9]{1,3}\.){3}[0-9]{1,3}$

{% if network.interfaces is defined %}
{% for interface in network.interfaces %}

network..interfaces..{{ interface }}..dhcp:
  type: boolean

network..interfaces..{{ interface }}..fqdn:
  type: string
  regex: ^([a-z0-9]([a-z0-9-]{0,61}[a-z0-9])?\.)+[a-zA-Z]{2,6}$

network..interfaces..{{ interface }}..hwaddr:
  type: string
  regex: ^([0-9a-f]{1,2}\:){5}[0-9a-f]{1,2}$

network..interfaces..{{ interface }}..ipv4:
  type: string
  regex: ^([0-9]{1,3}\.){3}[0-9]{1,3}$
```

```

network..interfaces..{{ interface }}..netmask:
  type: string
  regex: ^([0-9]{1,3}\.){3}[0-9]{1,3}$

{% endfor %}
{% endif %}

```

### 14.10.27 salt.pillar.pillar\_ldap

Use LDAP data as a Pillar source

This pillar module executes a series of LDAP searches. Data returned by these searches are aggregated, whereby data returned by later searches override data by previous searches with the same key.

The final result is merged with existing pillar data.

The configuration of this external pillar module is done via an external file which provides the actual configuration for the LDAP searches.

#### Configuring the LDAP ext\_pillar

The basic configuration is part of the master configuration.

```

ext_pillar:
  - pillar_ldap: /etc/salt/master.d/pillar_ldap.yaml

```

**Note:** When placing the file in the `master.d` directory, make sure its name doesn't end in `.conf`, otherwise the salt-master process will attempt to parse its content.

**Warning:** Make sure this file has very restrictive permissions, as it will contain possibly sensitive LDAP credentials!

The only required key in the master configuration is `pillar_ldap` pointing to a file containing the actual configuration.

## Configuring the LDAP searches

The file is processed using *Salt's Renderers* <renderers> which makes it possible to reference grains within the configuration.

**Warning:** When using Jinja in this file, make sure to do it in a way which prevents leaking sensitive information. A rogue minion could send arbitrary grains to trick the master into returning secret data. Use only the `id` grain which is verified through the minion's key/cert.

## Map Mode

The `it-admins` configuration below returns the Pillar `it-admins` by:

- **filtering for:**
  - members of the group `it-admins`
  - objects with `objectclass=user`
- returning the data of users (`mode: map`), where each user is a dictionary containing the configured string or list attributes.

### Configuration:

```
salt-users:
  server: ldap.company.tld
  port: 389
  tls: true
  dn: 'dc=company,dc=tld'
  binddn: 'cn=salt-pillars,ou=users,dc=company,dc=tld'
  bindpw: bi7ieBai5Ano
  referrals: false
  anonymous: false
  mode: map
  dn: 'ou=users,dc=company,dc=tld'
  filter: '(&(memberof=cn=it-
→admins,ou=groups,dc=company,dc=tld)(objectclass=user))'
  attrs:
    - cn
    - displayName
    - givenName
    - sn
  lists:
    - memberOf

**Result:**
```

```
salt-users:
  - cn: cn=johndoe,ou=users,dc=company,dc=tld
    displayName: John Doe
    givenName: John
    sn: Doe
    memberOf:
      - cn=it-admins,ou=groups,dc=company,dc=tld
      - cn=team01,ou=groups,dc=company
  - cn: cn=janedoe,ou=users,dc=company,dc=tld
```

```

displayName: Jane Doe
givenName: Jane
sn: Doe
memberOf:
  - cn=it-admins,ou=groups,dc=company,dc=tld
  - cn=team02,ou=groups,dc=company

```

### List Mode

TODO: see also `_result_to_dict()` documentation

`salt.pillar.pillar_ldap.ext_pillar(minion_id, pillar, config_file)`  
Execute LDAP searches and return the aggregated data

### 14.10.28 salt.pillar.postgres module

Retrieve Pillar data by doing a postgres query

New in version 2017.7.0.

```

maturity new
depends psycpg2
platform all

```

### Complete example

```

postgres:
  user: 'salt'
  pass: 'super_secret_password'
  db: 'salt_db'

ext_pillar:
  - postgres:
      fromdb:
        query: 'SELECT col1,col2,col3,col4,col5,col6,col7
                FROM some_random_table
                WHERE minion_pattern LIKE %s'
      depth: 5
      as_list: True
      with_lists: [1,3]

```

### class salt.pillar.postgres.POSTGRESExtPillar

This class receives and processes the database rows from POSTGRES.

#### extract\_queries(args, kwargs)

This function normalizes the config block into a set of queries we can use. The return is a list of consistently laid out dicts.

`salt.pillar.postgres.ext_pillar(minion_id, pillar, *args, **kwargs)`

Execute queries against POSTGRES, merge and return as a dict

### 14.10.29 salt.pillar.puppet

Execute an unmodified puppet\_node\_classifier and read the output as YAML. The YAML data is then directly overlaid onto the minion's Pillar data.

`salt.pillar.puppet.ext_pillar(minion_id, pillar, command)`  
Execute an unmodified puppet\_node\_classifier and read the output as YAML

### 14.10.30 salt.pillar.reclass\_adapter

Use the ``reclass`` database as a Pillar source

This ext\_pillar plugin provides access to the **reclass** database, such that Pillar data for a specific minion are fetched using **reclass**.

You can find more information about **reclass** at <http://reclass.pantsfullofunix.net>.

To use the plugin, add it to the ext\_pillar list in the Salt master config and tell **reclass** by way of a few options how and where to find the inventory:

```
ext_pillar:
  - reclass:
      storage_type: yaml_fs
      inventory_base_uri: /srv/salt
```

This would cause **reclass** to read the inventory from YAML files in `/srv/salt/nodes` and `/srv/salt/classes`.

If you are also using **reclass** as master\_tops plugin, and you want to avoid having to specify the same information for both, use YAML anchors (take note of the differing data types for ext\_pillar and master\_tops):

```
reclass: &reclass
  storage_type: yaml_fs
  inventory_base_uri: /srv/salt
  reclass_source_path: ~/code/reclass

ext_pillar:
  - reclass: *reclass

master_tops:
  reclass: *reclass
```

If you want to run reclass from source, rather than installing it, you can either let the master know via the PYTHONPATH environment variable, or by setting the configuration option, like in the example above.

`salt.pillar.reclass_adapter.ext_pillar(minion_id, pillar, **kwargs)`  
Obtain the Pillar data from **reclass** for the given minion\_id.

### 14.10.31 salt.pillar.redismod

#### Read pillar data from a Redis backend

New in version 2014.7.0.

#### depends

- redis Python module (on master)

## Salt Master Redis Configuration

The module shares the same base Redis connection variables as `salt.returners.redis_return`. These variables go in your master config file.

- `redis.db` - The Redis database to use. Defaults to 0.
- `redis.host` - The Redis host to connect to. Defaults to 'salt'.
- `redis.port` - The port that the Redis database is listening on. Defaults to 6379.
- `redis.password` - The password for authenticating with Redis. Only required if you are using master auth. Defaults to None.

## Configuring the Redis ext\_pillar

```
ext_pillar:
  - redis: {function: key_value}
```

`salt.pillar.redismod.ext_pillar` (*minion\_id, pillar, function, \*\*kwargs*)  
Grabs external pillar data based on configured function

`salt.pillar.redismod.key_json` (*minion\_id, pillar, pillar\_key=None*)  
Pulls a string from redis and deserializes it from json. Deserialized dictionary data loaded directly into top level if `pillar_key` is not set.  
**pillar\_key** Pillar key to return data into

`salt.pillar.redismod.key_value` (*minion\_id, pillar, pillar\_key='redis\_pillar'*)  
Looks for key in redis matching `minion_id`, returns a structure based on the data type of the redis key. String for string type, dict for hash type and lists for lists, sets and sorted sets.  
**pillar\_key** Pillar key to return data into

### 14.10.32 salt.pillar.s3

Copy pillar data from a bucket in Amazon S3

The S3 pillar can be configured in the master config file with the following options

```
ext_pillar:
  - s3:
      bucket: my.fancy.pillar.bucket
      keyid: KASKFJWAKJASJKDAJKSD
      key: ksladfdLKDALSFKSD93q032sdDasdfasdflsadkf
      multiple_env: False
      environment: base
      prefix: somewhere/overthere
      verify_ssl: True
      service_url: s3.amazonaws.com
      kms_keyid: 01234567-89ab-cdef-0123-4567890abcde
      s3_cache_expire: 30
      s3_sync_on_update: True
      path_style: False
      https_enable: True
```

The `bucket` parameter specifies the target S3 bucket. It is required.

The `keyid` parameter specifies the key id to use when access the S3 bucket. If it is not provided, an attempt to fetch it from EC2 instance meta-data will be made.

The `key` parameter specifies the key to use when access the S3 bucket. If it is not provided, an attempt to fetch it from EC2 instance meta-data will be made.

The `multiple_env` defaults to `False`. It specifies whether the pillar should interpret top level folders as pillar environments (see mode section below).

The `environment` defaults to `'base'`. It specifies which environment the bucket represents when in single environments mode (see mode section below). It is ignored if `multiple_env` is `True`.

The `prefix` defaults to `''`. It specifies a key prefix to use when searching for data in the bucket for the pillar. It works when `multiple_env` is `True` or `False`. Essentially it tells `ext_pillar` to look for your pillar data in a `'subdirectory'` of your S3 bucket

The `verify_ssl` parameter defaults to `True`. It specifies whether to check for valid S3 SSL certificates. *NOTE* If you use bucket names with periods, this must be set to `False` else an invalid certificate error will be thrown (issue #12200).

The `service_url` parameter defaults to `'s3.amazonaws.com'`. It specifies the base url to use for accessing S3.

The `kms_keyid` parameter is optional. It specifies the ID of the Key Management Service (KMS) master key that was used to encrypt the object.

The `s3_cache_expire` parameter defaults to 30s. It specifies expiration time of S3 metadata cache file.

The `s3_sync_on_update` parameter defaults to `True`. It specifies if cache is synced on update rather than jit.

The `path_style` parameter defaults to `False`. It specifies whether to use path style requests or dns style requests

The `https_enable` parameter defaults to `True`. It specifies whether to use https protocol or http protocol

This pillar can operate in two modes, single environment per bucket or multiple environments per bucket.

Single environment mode must have this bucket structure:

```
s3://<bucket name>/<prefix>/<files>
```

Multiple environment mode must have this bucket structure:

```
s3://<bucket name>/<prefix>/<environment>/<files>
```

If you wish to define your pillar data entirely within S3 it's recommended that you use the `prefix=` parameter and specify one entry in `ext_pillar` for each environment rather than specifying `multiple_env`. This is due to issue #22471 (<https://github.com/saltstack/salt/issues/22471>)

```
salt.pillar.s3.ext_pillar(minion_id, pillar, bucket, key=None, keyid=None, verify_ssl=True,
                          location=None, multiple_env=False, environment='base', pre-
                          fix='', service_url=None, kms_keyid=None, s3_cache_expire=30,
                          s3_sync_on_update=True, path_style=False, https_enable=True)
```

Execute a command and read the output as YAML

### 14.10.33 salt.pillar.sql\_base module

Retrieve Pillar data by doing a SQL query

This module is not meant to be used directly as an `ext_pillar`. It is a place to put code common to PEP 249 compliant SQL database adapters. It exposes a python ABC that can be subclassed for new database providers.

**maturity** new

**platform** all

## Theory of `sql_base ext_pillar`

Ok, here's the theory for how this works...

- First, any non-keyword args are processed in order.
- Then, remaining keywords are processed.

We do this so that it's backward compatible with older configs. Keyword arguments are sorted before being appended, so that they're predictable, but they will always be applied last so overall it's moot.

For each of those items we process, it depends on the object type:

- Strings are executed as is and the pillar depth is determined by the number of fields returned.
- A list has the first entry used as the query, the second as the pillar depth.
- A mapping uses the keys ```query``` and ```depth``` as the tuple

You can retrieve as many fields as you like, how they get used depends on the exact settings.

## Configuring a `sql_base ext_pillar`

The `sql_base ext_pillar` cannot be used directly, but shares query configuration with its implementations. These examples use a fake `sql_base` adapter, which should be replaced with the name of the adapter you are using.

A list of queries can be passed in

```
ext_pillar:
- sql_base:
  - "SELECT pillar,value FROM pillars WHERE minion_id = %s"
  - "SELECT pillar,value FROM more_pillars WHERE minion_id = %s"
```

Or you can pass in a mapping

```
ext_pillar:
- sql_base:
  main: "SELECT pillar,value FROM pillars WHERE minion_id = %s"
  extras: "SELECT pillar,value FROM more_pillars WHERE minion_id = %s"
```

The query can be provided as a string as we have just shown, but they can be provided as lists

```
ext_pillar:
- sql_base:
  - "SELECT pillar,value FROM pillars WHERE minion_id = %s"
  2
```

Or as a mapping

```
ext_pillar:
- sql_base:
  - query: "SELECT pillar,value FROM pillars WHERE minion_id = %s"
  depth: 2
```

The depth defines how the dicts are constructed. Essentially if you query for fields a,b,c,d for each row you'll get:

- With depth 1: {a: {`b`: b, `c`: c, `d`: d}}
- With depth 2: {a: {b: {`c`: c, `d`: d}}}
- With depth 3: {a: {b: {c: d}}}

Depth greater than 3 wouldn't be different from 3 itself. Depth of 0 translates to the largest depth needed, so 3 in this case. (max depth == key count - 1)

Then they are merged in a similar way to plain pillar data, in the order returned by the SQL database.

Thus subsequent results overwrite previous ones when they collide.

The `ignore_null` option can be used to change the overwrite behavior so that only non-NULL values in subsequent results will overwrite. This can be used to selectively overwrite default values.

```
ext_pillar:
  - sql_base:
    - query: "SELECT pillar,value FROM pillars WHERE minion_id = 'default' and
->minion_id != %s"
      depth: 2
    - query: "SELECT pillar,value FROM pillars WHERE minion_id = %s"
      depth: 2
      ignore_null: True
```

If you specify `as_list: True` in the mapping expression it will convert collisions to lists.

If you specify `with_lists: `..`` in the mapping expression it will convert the specified depths to list. The string provided is a sequence numbers that are comma separated. The string ``1,3`` will result in:

```
a,b,c,d,e,1 # field 1 same, field 3 differs
a,b,c,f,g,2 # ^^^^
a,z,h,y,j,3 # field 1 same, field 3 same
a,z,h,y,k,4 # ^^^^
  ^      ^
```

These columns define list grouping

```
{a: [
  {c: [
    {e: 1},
    {g: 2}
  ]},
  {h: [
    {j: 3, k: 4 }
  ]}
]}
```

The range for `with_lists` is 1 to `number_of_fields`, inclusive. Numbers outside this range are ignored.

Finally, if you pass the queries in via a mapping, the key will be the first level name where as passing them in as a list will place them in the root. This isolates the query results into their own subtrees. This may be a help or hindrance to your aims and can be used as such.

You can basically use any SELECT query that gets you the information, you could even do joins or subqueries in case your `minion_id` is stored elsewhere. It is capable of handling single rows or multiple rows per minion.

Configuration of the connection depends on the adapter in use.

### More complete example for MySQL (to also show configuration)

```
mysql:
  user: 'salt'
```

```

pass: 'super_secret_password'
db: 'salt_db'

ext_pillar:
  - mysql:
      fromdb:
        query: 'SELECT col1,col2,col3,col4,col5,col6,col7
                FROM some_random_table
                WHERE minion_pattern LIKE %s'
      depth: 5
      as_list: True
      with_lists: [1,3]

```

### class salt.pillar.sql\_base.SqlBaseExtPillar

This class receives and processes the database rows in a database agnostic way.

#### **enter\_root** (*root*)

Set self.focus for kwarg queries

#### **extract\_queries** (*args, kwargs*)

This function normalizes the config block into a set of queries we can use. The return is a list of consistently laid out dicts.

#### **fetch** (*minion\_id, pillar, \*args, \*\*kwargs*)

Execute queries, merge and return as a dict.

#### **process\_fields** (*field\_names, depth*)

The primary purpose of this function is to store the sql field list and the depth to which we process.

#### **process\_results** (*rows*)

This function takes a list of database results and iterates over, merging them into a dict form.

## 14.10.34 salt.pillar.sqlcipher module

Retrieve Pillar data by running a SQLCipher query

New in version 2016.3.0.

Python SQLCipher support is provided by the pysqlcipher Python package. You need this module installed to query Pillar data from a SQLCipher database.

This module is a concrete implementation of the sql\_base ext\_pillar for SQLCipher.

**maturity** new

**depends** pysqlcipher (for py2) or pysqlcipher3 (for py3)

**platform** all

### Configuring the sqlcipher ext\_pillar

Use the `sqlcipher` key under ext\_pillar for configuration of queries.

SQLCipher database connection configuration requires the following values configured in the master config:

- `sqlcipher.database` - The SQLCipher database to connect to. Defaults to `'/var/lib/salt/pillar-sqlcipher.db'`.
- `sqlcipher.pass` - The SQLCipher database decryption password.

- `sqlcipher.timeout` - The connection timeout in seconds.

Example configuration

```
sqlcipher:
  database: /var/lib/salt/pillar-sqlcipher.db
  pass: strong_pass_phrase
  timeout: 5.0
```

### Complete example

```
sqlcipher:
  database: '/var/lib/salt/pillar-sqlcipher.db'
  pass: strong_pass_phrase
  timeout: 5.0

ext_pillar:
  - sqlcipher:
      fromdb:
        query: 'SELECT col1,col2,col3,col4,col5,col6,col7
                FROM some_random_table
                WHERE minion_pattern LIKE ?'
      depth: 5
      as_list: True
      with_lists: [1,3]
```

#### `class salt.pillar.sqlcipher.SQLCipherExtPillar`

This class receives and processes the database rows from SQLCipher.

`salt.pillar.sqlcipher.ext_pillar(minion_id, pillar, *args, **kwargs)`

Execute queries against SQLCipher, merge and return as a dict

### 14.10.35 `salt.pillar.sqlite3` module

Retrieve Pillar data by doing a SQLite3 query

New in version 2015.8.0.

`sqlite3` is included in the `stdlib` since Python 2.5.

This module is a concrete implementation of the `sql_base` `ext_pillar` for SQLite3.

`platform` all

#### Configuring the `sqlite3` `ext_pillar`

Use the `'sqlite3'` key under `ext_pillar` for configuration of queries.

SQLite3 database connection configuration requires the following values configured in the master config:

Note, timeout is in seconds.

```
sqlite3.database: /var/lib/salt/pillar.db
sqlite3.timeout: 5.0
```

## Complete Example

```

sqlite3:
  database: '/var/lib/salt/pillar.db'
  timeout: 5.0

ext_pillar:
  - sqlite3:
      fromdb:
        query: 'SELECT col1,col2,col3,col4,col5,col6,col7
                FROM some_random_table
                WHERE minion_pattern LIKE ?'
      depth: 5
      as_list: True
      with_lists: [1,3]

```

### class salt.pillar.sqlite3.SQLite3ExtPillar

This class receives and processes the database rows from SQLite3.

`salt.pillar.sqlite3.ext_pillar(minion_id, pillar, *args, **kwargs)`

Execute queries against SQLite3, merge and return as a dict

## 14.10.36 salt.pillar.stack

Simple and flexible YAML ext\_pillar which can read pillar from within pillar.

New in version 2016.3.0.

`PillarStack` is a custom saltstack ext\_pillar which was inspired by `varstack` but is heavily based on Jinja2 for maximum flexibility.

Any issue should be reported to the upstream project at: <https://github.com/bbnet/pillarstack/issues>

It supports the following features:

- multiple config files that are jinja2 templates with support for `pillar`, `__grains__`, `__salt__`, `__opts__` objects
- a config file renders as an ordered list of files (paths of these files are relative to the current config file)
- this list of files are read in ordered as jinja2 templates with support for `stack`, `pillar`, `__grains__`, `__salt__`, `__opts__` objects
- all these rendered files are then parsed as `yaml`
- then all `yaml` dicts are merged in order with support for the following merging strategies: `merge-first`, `merge-last`, `remove`, and `overwrite`
- stack config files can be matched based on `pillar`, `grains`, or `opts` values, which make it possible to support kind of self-contained environments

### Installation

`PillarStack` is already bundled with Salt since 2016.3.0 version so there is nothing to install from version 2016.3.0.

If you use an older Salt version or you want to override `PillarStack` with a more recent one, follow the installation procedure below.

Installing the `PillarStack` ext\_pillar is as simple as dropping the `stack.py` file in the `<extension_modules>/pillar` directory (no external python module required), given that `extension_modules`

is set in your salt-master configuration, see: <http://docs.saltstack.com/en/latest/ref/configuration/master.html#extension-modules>

## Configuration in Salt

Like any other external pillar, its configuration takes place through the `ext_pillar` key in the master config file. However, you can configure PillarStack in 3 different ways:

### Single config file

This is the simplest option, you just need to set the path to your single PillarStack config file like below:

```
ext_pillar:
  - stack: /path/to/stack.cfg
```

### List of config files

You can also provide a list of config files:

```
ext_pillar:
  - stack:
    - /path/to/stack1.cfg
    - /path/to/stack2.cfg
```

### Select config files through grains|pillar|opts matching

You can also opt for a much more flexible configuration: PillarStack allows one to select the config files for the current minion based on matching values from either grains, or pillar, or opts objects.

Here is an example of such a configuration, which should speak by itself:

```
ext_pillar:
  - stack:
    pillar:environment:
      dev: /path/to/dev/stack.cfg
      prod: /path/to/prod/stack.cfg
    grains:custom:grain:
      value:
        - /path/to/stack1.cfg
        - /path/to/stack2.cfg
    opts:custom:opt:
      value: /path/to/stack0.cfg
```

### PillarStack configuration files

The config files that are referenced in the above `ext_pillar` configuration are jinja2 templates which must render as a simple ordered list of `yam` files that will then be merged to build pillar data.

The path of these `yam` files must be relative to the directory of the PillarStack config file. These paths support unix style pathname pattern expansion through the *Python glob module* <<https://docs.python.org/2/library/glob.html>>.

The following variables are available in jinja2 templating of PillarStack configuration files:

- `pillar`: the pillar data (as passed by Salt to our `ext_pillar` function)
- `minion_id`: the minion id ;-)
- `__opts__`: a dictionary of mostly Salt configuration options
- `__grains__`: a dictionary of the grains of the minion making this pillar call
- `__salt__`: a dictionary of Salt module functions, useful so you don't have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of jinja2 to build your list of `yaml` files that will be merged in pillar data.

For example, you could have a PillarStack config file which looks like:

```
$ cat /path/to/stack/config.cfg
core.yml
common/*.yml
osarchs/{{ __grains__['osarch'] }}.yml
oscodenames/{{ __grains__['oscodename'] }}.yml
{%- for role in pillar.get('roles', []) %}
roles/{{ role }}.yml
{%- endfor %}
minions/{{ minion_id }}.yml
```

And the whole directory structure could look like:

```
$ tree /path/to/stack/
/path/to/stack/
|-- config.cfg
|-- core.yml
|-- common/
|   |-- xxx.yml
|   |-- yyy.yml
|-- osarchs/
|   |-- amd64.yml
|   |-- armhf.yml
|-- oscodenames/
|   |-- wheezy.yml
|   |-- jessie.yml
|-- roles/
|   |-- web.yml
|   |-- db.yml
|-- minions/
|   |-- test-1-dev.yml
|   |-- test-2-dev.yml
```

## Overall process

In the above PillarStack configuration, given that `test-1-dev` minion is an `amd64` platform running Debian Jessie, and which pillar `roles` is `["db"]`, the following `yaml` files would be merged in order:

- `core.yml`
- `common/xxx.yml`

- `common/yyy.yml`
- `osarchs/amd64.yml`
- `oscodenames/jessie.yml`
- `roles/db.yml`
- `minions/test-1-dev.yml`

Before merging, every files above will be preprocessed as Jinja2 templates. The following variables are available in Jinja2 templating of `yml` files:

- `stack`: the PillarStack pillar data object that has currently been merged (data from previous `yml` files in PillarStack configuration)
- `pillar`: the pillar data (as passed by Salt to our `ext_pillar` function)
- `minion_id`: the minion id ;-)
- `__opts__`: a dictionary of mostly Salt configuration options
- `__grains__`: a dictionary of the grains of the minion making this pillar call
- `__salt__`: a dictionary of Salt module functions, useful so you don't have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of `jinja2` to build your pillar data, and even use other pillar values that has already been merged by PillarStack (from previous `yml` files in PillarStack configuration) through the `stack` variable.

Once a `yml` file has been preprocessed by Jinja2, we obtain a Python dict - let's call it `yml_data` - then, PillarStack will merge this `yml_data` dict in the main `stack` dict (which contains already merged PillarStack pillar data). By default, PillarStack will deeply merge `yml_data` in `stack` (similarly to the recurse salt `pillar_source_merging_strategy`), but 3 merging strategies are currently available for you to choose (see next section).

Once every `yml` files have been processed, the `stack` dict will contain your whole own pillar data, merged in order by PillarStack. So PillarStack `ext_pillar` returns the `stack` dict, the contents of which Salt takes care to merge in with all of the other pillars and finally return the whole pillar to the minion.

### Merging strategies

The way the data from a new `yml_data` dict is merged with the existing `stack` data can be controlled by specifying a merging strategy. Right now this strategy can either be `merge-last` (the default), `merge-first`, `remove`, or `overwrite`.

Note that scalar values like strings, integers, booleans, etc. are always evaluated using the `overwrite` strategy (other strategies don't make sense in that case).

The merging strategy can be set by including a dict in the form of:

```
__: <merging strategy>
```

as the first item of the dict or list. This allows fine grained control over the merging process.

### `merge-last` (default) strategy

If the `merge-last` strategy is selected (the default), then content of dict or list variables is merged recursively with previous definitions of this variable (similarly to the recurse salt `pillar_source_merging_strategy`). This allows for extending previously defined data.

### merge-first strategy

If the `merge-first` strategy is selected, then the content of dict or list variables are swapped between the `yaml_data` and `stack` objects before being merged recursively with the `merge-last` previous strategy.

### remove strategy

If the `remove` strategy is selected, then content of dict or list variables in `stack` are removed only if the corresponding item is present in the `yaml_data` dict. This allows for removing items from previously defined data.

### overwrite strategy

If the `overwrite` strategy is selected, then the content of dict or list variables in `stack` is overwritten by the content of `yaml_data` dict. So this allows one to overwrite variables from previous definitions.

### Merging examples

Let's go through small examples that should clarify what's going on when a `yaml_data` dict is merged in the `stack` dict.

When you don't specify any strategy, the default `merge-last` strategy is selected:

stack	yaml_data	stack (after merge)
<pre>users:   tom:     uid: 500     roles:       - sysadmin   root:     uid: 0</pre>	<pre>users:   tom:     uid: 1000     roles:       - developer   mat:     uid: 1001</pre>	<pre>users:   tom:     uid: 1000     roles:       - sysadmin       - developer   mat:     uid: 1001   root:     uid: 0</pre>

Then you can select a custom merging strategy using the `__` key in a dict:

stack	yaml_data	stack (after merge)
<pre>users:   tom:     uid: 500     roles:       - sysadmin   root:     uid: 0</pre>	<pre>users:   __: merge-last   tom:     uid: 1000     roles:       - developer   mat:     uid: 1001</pre>	<pre>users:   tom:     uid: 1000     roles:       - sysadmin       - developer   mat:     uid: 1001   root:     uid: 0</pre>
<pre>users:   tom:     uid: 500     roles:       - sysadmin   root:     uid: 0</pre>	<pre>users:   __: merge-first   tom:     uid: 1000     roles:       - developer   mat:     uid: 1001</pre>	<pre>users:   tom:     uid: 500     roles:       - developer       - sysadmin   mat:     uid: 1001   root:     uid: 0</pre>
<pre>users:   tom:     uid: 500     roles:       - sysadmin   root:     uid: 0</pre>	<pre>users:   __: remove   tom:   mat:</pre>	<pre>users:   root:     uid: 0</pre>
<pre>users:   tom:     uid: 500     roles:       - sysadmin   root:     uid: 0</pre>	<pre>users:   __: overwrite   tom:     uid: 1000     roles:       - developer   mat:     uid: 1001</pre>	<pre>users:   tom:     uid: 1000     roles:       - developer   mat:     uid: 1001</pre>

You can also select a custom merging strategy using a `__` object in a list:

stack	yaml_data	stack (after merge)
<pre>users: - tom - root</pre>	<pre>users: - __: merge-last - mat</pre>	<pre>users: - tom - root - mat</pre>
<pre>users: - tom - root</pre>	<pre>users: - __: merge-first - mat</pre>	<pre>users: - mat - tom - root</pre>
<pre>users: - tom - root</pre>	<pre>users: - __: remove - mat - tom</pre>	<pre>users: - root</pre>
<pre>users: - tom - root</pre>	<pre>users: - __: overwrite - mat</pre>	<pre>users: - mat</pre>

### 14.10.37 salt.pillar.svn\_pillar

Clone a remote SVN repository and use the filesystem as a Pillar source

This external Pillar source can be configured in the master config file like so:

```
ext_pillar:
- svn: trunk svn://svnserver/repo root=subdirectory
```

The `root=` parameter is optional and used to set the subdirectory from where to look for Pillar files (such as `top.sls`).

Changed in version 2014.7.0: The optional `root` parameter will be added.

Note that this is not the same thing as configuring pillar data using the `pillar_roots` parameter. The branch referenced in the `ext_pillar` entry above (`master`), would evaluate to the `base` environment, so this branch needs to contain a `top.sls` with a `base` section in it, like this:

```
base:
  '*':
    - foo
```

To use other environments from the same SVN repo as `svn_pillar` sources, just add additional lines, like so:

```
ext_pillar:
- svn: trunk svn://svnserver/repo
- svn: dev svn://svnserver/repo
```

In this case, the `dev` branch would need its own `top.sls` with a `dev` section in it, like this:

```
dev:
  '*':
    - bar
```

**class** salt.pillar.svn\_pillar.**SvnPillar**(*branch, repo\_location, root, opts*)

Deal with the remote SVN repository for Pillar

**pillar\_dir**()

Returns the directory of the pillars (repo cache + branch + root)

salt.pillar.svn\_pillar.**ext\_pillar**(*minion\_id, pillar, repo\_string*)

Execute a command and read the output as YAML

### 14.10.38 salt.pillar.varstack\_pillar

Use [Varstack](#) data as a Pillar source

#### Configuring Varstack

Using varstack in Salt is fairly simple. Just put the following into the config file of your master:

```
ext_pillar:  
- varstack: /etc/varstack.yaml
```

Varstack will then use `/etc/varstack.yaml` to determine which configuration data to return as pillar information. From there you can take a look at the [README](#) of varstack on how this file is evaluated.

salt.pillar.varstack\_pillar.**ext\_pillar**(*minion\_id, pillar, conf*)

Parse varstack data and return the result

### 14.10.39 salt.pillar.vault module

Vault Pillar Module

**maintainer** SaltStack

**maturity** New

**platform** all

New in version 2016.11.0.

This module allows pillar data to be stored in Hashicorp Vault.

Base configuration instructions are documented in the execution module docs. Below are noted extra configuration required for the pillar module, but the base configuration must also be completed.

After the base Vault configuration is created, add the configuration below to the `ext_pillar` section in the Salt master configuration.

```
ext_pillar:  
- vault: path=secret/salt
```

Each key needs to have all the key-value pairs with the names you require. Avoid naming every key `'password'` as you they will collide:

```
$ vault write secret/salt auth=my_password master=127.0.0.1
```

The above will result in two pillars being available, `auth` and `master`.

You can then use normal pillar requests to get each key pair directly from pillar root. Example:

```
$ salt-ssh '*' pillar.get auth
```

Multiple Vault sources may also be used:

```
ext_pillar:
- vault: path=secret/salt
- vault: path=secret/root
```

`salt.pillar.vault.ext_pillar` (*minion\_id, pillar, conf*)  
Get pillar data from Vault for the configuration conf.

#### 14.10.40 salt.pillar.venafi module

Venafi Pillar Certificates

This module will only return pillar data if the `venafi` runner module has already been used to create certificates. To configure this module, set `venafi` to `True` in the `ext_pillar` section of your master configuration file:

```
ext_pillar:
- venafi: True
```

`salt.pillar.venafi.ext_pillar` (*minion\_id, pillar, conf*)  
Return an existing set of certificates

#### 14.10.41 salt.pillar.virtkey

Accept a key from a hypervisor if the virt runner has already submitted an authorization request

`salt.pillar.virtkey.ext_pillar` (*hyper\_id, pillar, name, key*)  
Accept the key for the VM on the hyper, if authorized.

#### 14.10.42 salt.pillar.vmware\_pillar module

Pillar data from vCenter or an ESXi host

New in version 2017.7.0.

**depends**

- pyVmomi

This external pillar can pull attributes from objects in vCenter or an ESXi host and provide those attributes as pillar data to minions. This can allow for pillar based targeting of minions on ESXi host, Datastore, VM configuration, etc. This setup requires only the salt master have access to the vCenter server/ESXi hosts.

The pillar will return an empty dict if the ``os`` or ``virtual`` grain are not ``VMWare``, ``ESXi``, or ``VMWare ESXi``.

#### Defaults

The external pillar will search for Virtual Machines with the VM name matching the minion id. Data will be returned into the ``vmware`` pillar key. The external pillar has a default set of properties to return for both `VirtualMachine` and `HostSystem` types.

## Configuring the VMWare pillar

The required minimal configuration in the salt master ext\_pillar setup:

```
ext_pillar:
  - vmware:
      host: <vcenter/esx host>
      username: <user to connect with>
      password: <password>
```

Optionally, the following keyword arguments can be passed to the ext\_pillar for customized configuration:

**pillar\_key** Optionally set the pillar key to return the data into. Default is vmware.

**protocol** Optionally set to alternate protocol if the vCenter server or ESX/ESXi host is not using the default protocol. Default protocol is https.

**port** Optionally set to alternate port if the vCenter server or ESX/ESXi host is not using the default port. Default port is 443.

**property\_name** Property name to match the minion id against. Defaults to name.

**property\_types** Optionally specify a list of pyVmomi vim types to search for the minion id in 'property\_name'. Default is ['VirtualMachine'].

For example, to search both vim.VirtualMachine and vim.HostSystem object types:

```
ext_pillar:
  - vmware:
      host: myesx
      username: root
      password: complex_password
      property_types:
        - VirtualMachine
        - HostSystem
```

Additionally, the list of property types can be dicts, the item of the dict being a list specifying the attribute to return for that vim object type.

The pillar will attempt to recurse the attribute and return all child attributes.

To explicitly specify deeper attributes without attempting to recurse an attribute, convert the list item to a dict with the item of the dict being the child attributes to return. Follow this pattern to return attributes as deep within the object as necessary.

---

**Note:** Be careful when specifying custom attributes! Many attributes have objects as attributes which have the parent object as an attribute and which will cause the pillar to fail due to the attempt to convert all sub-objects recursively (i.e. infinite attribute loops). Specifying only the sub-attributes you would like returned will keep the infinite recursion from occurring.

A maximum recursion exception will occur in this case and the pillar will not return as desired.

---

```
ext_pillar:
  - vmware:
      host: myvcenter
      username: my_user
      password: my_pass
      replace_default_attributes: True
      property_types:
```

```

- VirtualMachine:
  - config:
    - bootOptions:
      - bootDelay
      - bootRetryDelay
- HostSystem:
  - datastore:
    - name

```

The above `ext_pillar` example would return a pillar like the following for a `VirtualMachine` object that's name matched the minion id:

```

vmware:
  config:
    bootOptions:
      bootDelay: 1000
      bootRetryDelay: 1000

```

If you were to retrieve these virtual machine attributes via `pyVmomi` directly, this would be the same as

```

vmObject.config.bootOptions.bootDelay
vmObject.config.bootOptions.bootRetryDelay

```

The above `ext_pillar` example would return a pillar like the following for a `HostSystem` object that's name matched the minion id:

```

vmware:
  datastore:
    - name: Datastore1
    - name: Datastore2

```

The `'datastore'` property of a `HostSystem` object is a list of datastores, thus a list is returned.

**replace\_default\_attributes** If custom attributes are specified by the `property_types` parameter, `replace_default_attributes` determines if those will be added to default attributes (`False`) or replace the default attributes completely (`True`). The default setting is `'False'`.

---

**Note:** vCenter ``Custom Attributes'' (i.e. Annotations) will always be returned if it exists on the object as part of the pillar regardless of this setting.

---

`salt.pillar.vmware_pillar.ext_pillar` (*minion\_id*, *pillar*, *\*\*kwargs*)  
 Check vmware/vcenter for all data

## 14.11 proxy modules

<i>chronos</i>	Chronos
<i>cisconso</i>	Proxy Minion interface module for managing (practically) any network device with Cisco Network Services Orchestrator (Cisco NSO).
<i>dummy</i>	This is a dummy proxy-minion designed for testing the proxy minion subsystem.

Continued on next page

Table 14.11 -- continued from previous page

<i>esxi</i>	Proxy Minion interface module for managing VMware ESXi hosts.
<i>fx2</i>	Dell FX2 chassis
<i>junos</i>	Interface with a Junos device via proxy-minion.
<i>marathon</i>	Marathon
<i>napalm</i>	NAPALM: Network Automation and Programmability Abstraction Layer with Multivendor support
<i>nxos</i>	Proxy Minion for Cisco NX OS Switches
<i>philips_hue</i>	Philips HUE lamps module for proxy.
<i>rest_sample</i>	This is a simple proxy-minion designed to connect to and communicate with
<i>ssh_sample</i>	This is a simple proxy-minion designed to connect to and communicate with a server that exposes functionality via SSH.

### 14.11.1 salt.proxy.chronos module

#### Chronos

Proxy minion for managing a Chronos cluster.

#### Dependencies

- *chronos execution module (salt.modules.chronos)*

#### Pillar

The chronos proxy configuration requires a `base_url` property that points to the chronos endpoint:

```
proxy:
  proxytype: chronos
  base_url: http://my-chronos-master.mydomain.com:4400
```

New in version 2015.8.2.

`salt.proxy.chronos.init(opts)`  
Perform any needed setup.

`salt.proxy.chronos.ping()`  
Is the chronos api responding?

`salt.proxy.chronos.shutdown(opts)`  
For this proxy shutdown is a no-op

### 14.11.2 salt.proxy.cisconso

Proxy Minion interface module for managing (practically) any network device with Cisco Network Services Orchestrator (Cisco NSO). Cisco NSO uses a series of remote polling agents, APIs and SSH commands to fetch network configuration and represent it in a data model. PyNSO, the Python module used by this proxy minion does the task of converting native Python dictionaries into NETCONF/YANG syntax that the REST API for Cisco NSO can then use to set the configuration of the target network device.

**Supported devices:**

- A10 AX Series
- Arista 7150 Series
- Ciena 3000, 5000, ESM
- H3c S5800 Series
- Overture 1400, 2200, 5000, 5100, 6000
- Accedian MetroNID
- Avaya ERS 4000, SR8000, VSP 9000
- Cisco: APIC-DC, ASA, IOS, IOS XE, IOS XR, er, ME-4600, NX OS, Prime Network Registrar, Quantum, StarOS, UCS ManagWSA

New in version 2016.11.0.

**codeauthor** *Anthony Shaw* <[anthony.shaw@dimensiondata.com](mailto:anthony.shaw@dimensiondata.com)>

This proxy minion enables a consistent interface to fetch, control and maintain the configuration of network devices via a NETCONF-compliant control plane. Cisco Network Services Orchestrator.

More in-depth conceptual reading on Proxy Minions can be found in the [Proxy Minion](#) section of Salt's documentation.

### Dependencies

- pynso Python module

### PyNSO

PyNSO can be installed via pip:

```
pip install pynso
```

### Configuration

To use this integration proxy module, please configure the following:

### Pillar

Proxy minions get their configuration from Salt's Pillar. Every proxy must have a stanza in Pillar and a reference in the Pillar top-file that matches the ID. At a minimum for communication with the NSO host, the pillar should look like this:

```
proxy:
  proxytype: cisco_nso
  host: <ip or dns name of host>
  port: 8080
  use_ssl: false
  username: <username>
  password: password
```

### proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the proxy directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this Cisco NSO Proxy Module, set this to `cisco_nso`.

### host

The location, or IP/dns, of the Cisco NSO API host. Required.

### username

The username used to login to the Cisco NSO host, such as `admin`. Required.

## passwords

The password for the given user. Required.

## use\_ssl

Whether to use HTTPS messaging to speak to the API.

## port

The port that the Cisco NSO API is running on, 8080 by default

## Salt Proxy

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your Salt Master and to the Cisco NSO host in question. SaltStack recommends that the machine running the salt-proxy process also run a regular minion, though it is not strictly necessary.

On the machine that will run the proxy, make sure there is an `/etc/salt/proxy` file with at least the following in it:

```
master: <ip or hostname of salt-master>
```

You can then start the salt-proxy process with:

```
salt-proxy --proxyid <id you want to give the host>
```

You may want to add `-l debug` to run the above in the foreground in debug mode just to make sure everything is OK.

Next, accept the key for the proxy on your salt-master, just like you would for a regular minion:

```
salt-key -a <id you gave the cisco host>
```

You can confirm that the pillar data is in place for the proxy:

```
salt <id> pillar.items
```

And now you should be able to ping the Cisco NSO host to make sure it is responding:

```
salt <id> test.ping
```

`salt.proxy.cisconso.apply_rollback`(*datastore*, *name*)

Apply a system rollback

### Parameters

- **datastore** (DatastoreType (str enum).) -- The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **name** (str) -- an ID of the rollback to restore

`salt.proxy.cisconso.get_data`(*datastore*, *path*)

Get the configuration of the device tree at the given path

### Parameters

- **datastore** (DatastoreType (str enum).) -- The datastore, e.g. running, operational. One of the NETCONF store IETF types

- **path** (list of str OR tuple) -- The device path, a list of element names in order, comma separated

**Returns** The network configuration at that tree

**Return type** dict

```
salt cisco-nso cisco.get_data devices
```

**salt.proxy.cisco.get\_rollback**(*name*)

Get the backup of stored a configuration rollback

**Parameters** **name** (str) -- Typically an ID of the backup

**Return type** str

**Returns** the contents of the rollback snapshot

**salt.proxy.cisco.get\_rollbacks**()

Get a list of stored configuration rollbacks

**salt.proxy.cisco.grains**()

Get the grains from the proxy device.

**salt.proxy.cisco.ping**()

Check to see if the host is responding. Returns False if the host didn't respond, True otherwise.

CLI Example:

```
salt cisco-nso test.ping
```

**salt.proxy.cisco.set\_data\_value**(*datastore, path, data*)

Get a data entry in a datastore

**Parameters**

- **datastore** (DatastoreType (str enum).) -- The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **path** (list of str OR tuple) -- The device path to set the value at, a list of element names in order, comma separated
- **data** (dict) -- The new value at the given path

**Return type** bool

**Returns** True if successful, otherwise error.

**salt.proxy.cisco.shutdown**()

Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

### 14.11.3 salt.proxy.dummy module

This is a dummy proxy-minion designed for testing the proxy minion subsystem.

**salt.proxy.dummy.fns**()

**salt.proxy.dummy.grains**()

Make up some grains

**salt.proxy.dummy.grains\_refresh**()

Refresh the grains

**salt.proxy.dummy.init**(*opts*)

**salt.proxy.dummy.initialized**()

Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our init() function has been called

---

```

salt.proxy.dummy.package_install(name, **kwargs)
    Install a ``package`` on the REST server

salt.proxy.dummy.package_list()
    List ``packages`` installed on the REST server

salt.proxy.dummy.package_remove(name)
    Remove a ``package`` on the REST server

salt.proxy.dummy.package_status(name)
    Check the installation status of a package on the REST server

salt.proxy.dummy.ping()
    Degenerate ping

salt.proxy.dummy.service_list()
    List ``services`` on the REST server

salt.proxy.dummy.service_restart(name)
    Restart a ``service`` on the REST server

salt.proxy.dummy.service_start(name)
    Start a ``service`` on the dummy server

salt.proxy.dummy.service_status(name)
    Check if a service is running on the REST server

salt.proxy.dummy.service_stop(name)
    Stop a ``service`` on the dummy server

salt.proxy.dummy.shutdown(opts)
    For this proxy shutdown is a no-op

salt.proxy.dummy.test_from_state()
    Test function so we have something to call from a state :return:

salt.proxy.dummy.upgrade()
    ``Upgrade`` packages

salt.proxy.dummy.uptodate()
    Call the REST endpoint to see if the packages on the ``server`` are up to date.

```

#### 14.11.4 salt.proxy.esxi

Proxy Minion interface module for managing VMware ESXi hosts.

New in version 2015.8.4.

**Special Note:** SaltStack thanks [Adobe Corporation](#) for their support in creating this Proxy Minion integration.

This proxy minion enables VMware ESXi (hereafter referred to as simply `ESXi`) hosts to be treated individually like a Salt Minion.

Since the ESXi host may not necessarily run on an OS capable of hosting a Python stack, the ESXi host can't run a Salt Minion directly. Salt's ``Proxy Minion`` functionality enables you to designate another machine to host a minion process that ``proxies`` communication from the Salt Master. The master does not know nor care that the target is not a ``real`` Salt Minion.

More in-depth conceptual reading on Proxy Minions can be found in the [Proxy Minion](#) section of Salt's documentation.

## Dependencies

- pyVmomi Python Module
- ESXCLI

## pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

---

**Note:** Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.6, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See [Issue #29537](#) for more information.

---

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original ESXi State Module was developed against.

## ESXCLI

Currently, about a third of the functions used in the vSphere Execution Module require the ESXCLI package be installed on the machine running the Proxy Minion process.

The ESXCLI package is also referred to as the VMware vSphere CLI, or vCLI. VMware provides vCLI package installation instructions for [vSphere 5.5](#) and [vSphere 6.0](#).

Once all of the required dependencies are in place and the vCLI package is installed, you can check to see if you can connect to your ESXi host or vCenter server by running the following command:

```
esxcli -s <host-location> -u <username> -p <password> system syslog config get
```

If the connection was successful, ESXCLI was successfully installed on your system. You should see output related to the ESXi host's syslog configuration.

## Configuration

To use this integration proxy module, please configure the following:

## Pillar

Proxy minions get their configuration from Salt's Pillar. Every proxy must have a stanza in Pillar and a reference in the Pillar top-file that matches the ID. At a minimum for communication with the ESXi host, the pillar should look like this:

```
proxy:
  proxytype: esxi
  host: <ip or dns name of esxi host>
  username: <ESXi username>
  passwords:
    - first_password
    - second_password
    - third_password
  credstore: <path to credential store>
```

### proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the proxy directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this ESXi Proxy Module, set this to `esxi`.

### host

The location, or ip/dns, of the ESXi host. Required.

### username

The username used to login to the ESXi host, such as `root`. Required.

### passwords

A list of passwords to be used to try and login to the ESXi host. At least one password in this list is required.

The proxy integration will try the passwords listed in order. It is configured this way so you can have a regular password and the password you may be updating for an ESXi host either via the `vsphere.update_host_password` execution module function or via the `esxi.password_present` state function. This way, after the password is changed, you should not need to restart the proxy minion--it should just pick up the the new password provided in the list. You can then change pillar at will to move that password to the front and retire the unused ones.

This also allows you to use any number of potential fallback passwords.

---

**Note:** When a password is changed on the host to one in the list of possible passwords, the further down on the list the password is, the longer individual commands will take to return. This is due to the nature of pyVmomi's login system. We have to wait for the first attempt to fail before trying the next password on the list.

This scenario is especially true, and even slower, when the proxy minion first starts. If the correct password is not the first password on the list, it may take up to a minute for `test.ping` to respond with a `True` result. Once the initial authorization is complete, the responses for commands will be a little faster.

To avoid these longer waiting periods, SaltStack recommends moving the correct password to the top of the list and restarting the proxy minion at your earliest convenience.

---

### protocol

If the ESXi host is not using the default protocol, set this value to an alternate protocol. Default is `https`.

### port

If the ESXi host is not using the default port, set this value to an alternate port. Default is 443.

### credstore

If the ESXi host is using an untrusted SSL certificate, set this value to the file path where the credential store is located. This file is passed to `esxcli`. Default is `<HOME>/vmware/credstore/vicredentials.xml` on Linux and `<APPDATA>/VMware/credstore/vicredentials.xml` on Windows.

---

**Note:** HOME variable is sometimes not set for processes running as system services. If you want to rely on the default credential store location, make sure HOME is set for the proxy process.

---

## Salt Proxy

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your Salt Master and to the ESXi host in question. SaltStack recommends that the machine running the salt-proxy process also run a regular minion, though it is not strictly necessary.

On the machine that will run the proxy, make sure there is an `/etc/salt/proxy` file with at least the following in it:

```
master: <ip or hostname of salt-master>
```

You can then start the salt-proxy process with:

```
salt-proxy --proxyid <id you want to give the host>
```

You may want to add `-l debug` to run the above in the foreground in debug mode just to make sure everything is OK.

Next, accept the key for the proxy on your salt-master, just like you would for a regular minion:

```
salt-key -a <id you gave the esxi host>
```

You can confirm that the pillar data is in place for the proxy:

```
salt <id> pillar.items
```

And now you should be able to ping the ESXi host to make sure it is responding:

```
salt <id> test.ping
```

At this point you can execute one-off commands against the host. For example, you can get the ESXi host's system information:

```
salt <id> esxi.cmd system_info
```

Note that you don't need to provide credentials or an ip/hostname. Salt knows to use the credentials you stored in Pillar.

It's important to understand how this particular proxy works. `salt.modules.vsphere` is a standard Salt execution module. If you pull up the docs for it you'll see that almost every function in the module takes credentials and a target host. When credentials and a host aren't passed, Salt runs commands through `pyVmomi` against the local machine. If you wanted, you could run functions from this module on any host where an appropriate version of `pyVmomi` is installed, and that host would reach out over the network and communicate with the ESXi host.

`esxi.cmd` acts as a "shim" between the execution module and the proxy. Its first parameter is always the function from `salt.modules.vsphere`. If the function takes more positional or keyword arguments you can append them to the call. It's this shim that speaks to the ESXi host through the proxy, arranging for the credentials and hostname to be pulled from the Pillar section for this Proxy Minion.

Because of the presence of the shim, to lookup documentation for what functions you can use to interface with the ESXi host, you'll want to look in `salt.modules.vsphere` instead of `salt.modules.esxi`.

## States

Associated states are thoroughly documented in `salt.states.esxi`. Look there to find an example structure for Pillar as well as an example `.sls` file for standing up an ESXi host from scratch.

`salt.proxy.esxi.ch_config(cmd, *args, **kwargs)`

This function is called by the `salt.modules.esxi.cmd` shim. It then calls whatever is passed in `cmd` inside the `salt.modules.vsphere` module. Passes the return through from the `vsphere` module.

**cmd** The command to call inside `salt.modules.vsphere`

**args** Arguments that need to be passed to that command.

**kwargs** Keyword arguments that need to be passed to that command.

`salt.proxy.esxi.find_credentials(host)`

Cycle through all the possible credentials and return the first one that works.

`salt.proxy.esxi.grains()`

Get the grains from the proxy device.

`salt.proxy.esxi.grains_refresh()`

Refresh the grains from the proxy device.

`salt.proxy.esxi.init(opts)`

This function gets called when the proxy starts up. For ESXi devices, the host, login credentials, and, if configured, the protocol and port are cached.

`salt.proxy.esxi.ping()`

Check to see if the host is responding. Returns False if the host didn't respond, True otherwise.

CLI Example:

```
salt esxi-host test.ping
```

`salt.proxy.esxi.shutdown()`

Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

### 14.11.5 salt.proxy.fx2

#### Dell FX2 chassis

New in version 2015.8.2.

Proxy minion interface module for managing Dell FX2 chassis (Dell Chassis Management Controller version 1.2 and above, iDRAC8 version 2.00 and above)

## Dependencies

- *iDRAC Remote execution module (salt.modules.dracr)*
- *Chassis command shim (salt.modules.chassis)*
- *Dell Chassis States (salt.states.dellchassis)*
- Dell's racadm command line interface to CMC and iDRAC devices.

**Special Note: SaltStack thanks Adobe Corporation for their support in creating this proxy minion integration.**

This proxy minion enables Dell FX2 and FX2s (hereafter referred to as simply ``chassis'', ``CMC'', or ``FX2'') chassis to be treated individually like a salt-minion.

Since the CMC embedded in the chassis does not run an OS capable of hosting a Python stack, the chassis can't run a minion directly. Salt's ``Proxy Minion'' functionality enables you to designate another machine to host a minion process that ``proxies'' communication from the salt-master. The master does not know nor care that the target is not a real minion.

More in-depth conceptual reading on Proxy Minions can be found *in the Proxy Minion section* of Salt's documentation.

To configure this integration, follow these steps:

## Pillar

Proxy minions get their configuration from Salt's Pillar. Every proxy must have a stanza in Pillar, and a reference in the Pillar topfile that matches the ID. At a minimum for communication with the chassis the pillar should look like this:

```
proxy:
  host: <ip or dns name of chassis controller>
  admin_username: <iDRAC username for the CMC, usually 'root'>
  fallback_admin_username: <username to try if the first fails>
  passwords:
    - first_password
    - second_password
    - third_password
  proxytype: fx2
```

The `proxytype` line above is critical, it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the salt-master (if you have created your own proxy module, for example).

The proxy integration will try the passwords listed in order. It is configured this way so you can have a regular password, a potential fallback password, and the third password can be the one you intend to change the chassis to use. This way, after it is changed, you should not need to restart the proxy minion--it should just pick up the third password in the list. You can then change pillar at will to move that password to the front and retire the unused ones.

Beware, many Dell CMC and iDRAC units are configured to lockout IP addresses or users after too many failed password attempts. This can generate user panic in the form of ``I no longer know what the password is!!!''. To

mitigate panic try the web interface from a different IP, or setup a emergency administrator user in the CMC before doing a wholesale password rotation.

The automatic lockout can be disabled via Salt with the following:

```
salt <cmc> chassis.cmd set_general cfgRacTuning cfgRacTuneIpBlkEnable 0
```

and then verified with

```
salt <cmc> chassis.cmd get_general cfgRacTuning cfgRacTuneIpBlkEnable
```

### salt-proxy

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your salt-master and to the chassis in question. SaltStack recommends that this machine also run a regular minion, though it is not strictly necessary.

On the machine that will run the proxy, make sure there is an `/etc/salt/proxy` file with at least the following in it:

```
master: <ip or hostname of salt-master>
```

You can start the proxy with

```
salt-proxy --proxyid <id you want to give the chassis>
```

You may want to add `-l debug` to run the above in the foreground in debug mode just to make sure everything is OK.

Next, accept the key for the proxy on your salt-master, just like you would for a regular minion:

```
salt-key -a <id you want to give the chassis>
```

You can confirm that the pillar data is in place for the proxy:

```
salt <id> pillar.items
```

And now you should be able to ping the chassis to make sure it is responding:

```
salt <id> test.ping
```

At this point you can execute one-off commands against the chassis. For example, you can get the chassis inventory:

```
salt <id> chassis.cmd inventory
```

Note that you don't need to provide credentials or an ip/hostname. Salt knows to use the credentials you stored in Pillar.

It's important to understand how this particular proxy works. `Salt.modules.dracr` is a standard Salt execution module. If you pull up the docs for it you'll see that almost every function in the module takes credentials and a target host. When credentials and a host aren't passed, Salt runs `racadm` against the local machine. If you wanted you could run functions from this module on any host where an appropriate version of `racadm` is installed, and that host would reach out over the network and communicate with the chassis.

`Chassis.cmd` acts as a ``shim'' between the execution module and the proxy. It's first parameter is always the function from `salt.modules.dracr` to execute. If the function takes more positional or keyword arguments you can

append them to the call. It's this shim that speaks to the chassis through the proxy, arranging for the credentials and hostname to be pulled from the pillar section for this proxy minion.

Because of the presence of the shim, to lookup documentation for what functions you can use to interface with the chassis, you'll want to look in `salt.modules.dracr` instead of `salt.modules.chassis`.

## States

Associated states are thoroughly documented in `salt.states.dellchassis`. Look there to find an example structure for pillar as well as an example `.sls` file for standing up a Dell Chassis from scratch.

`salt.proxy.fx2.admin_password()`

Return the `admin_password` in the `DETAILS` dictionary, or `'calvin'` (the Dell default) if there is none present

`salt.proxy.fx2.admin_username()`

Return the `admin_username` in the `DETAILS` dictionary, or `root` if there is none present

`salt.proxy.fx2.chconfig(cmd, *args, **kwargs)`

This function is called by the `salt.modules.chassis.cmd` shim. It then calls whatever is passed in `cmd` inside the `salt.modules.dracr` module.

### Parameters

- **cmd** -- The command to call inside `salt.modules.dracr`
- **args** -- Arguments that need to be passed to that command
- **kwargs** -- Keyword arguments that need to be passed to that command

**Returns** Passthrough the return from the `dracr` module.

`salt.proxy.fx2.find_credentials()`

Cycle through all the possible credentials and return the first one that works

`salt.proxy.fx2.grains()`

Get the grains from the proxied device

`salt.proxy.fx2.grains_refresh()`

Refresh the grains from the proxied device

`salt.proxy.fx2.init(opts)`

This function gets called when the proxy starts up. We check `opts` to see if a fallback user and password are supplied. If they are present, and the primary credentials don't work, then we try the backup before failing.

Whichever set of credentials works is placed in the persistent `DETAILS` dictionary and will be used for further communication with the chassis.

`salt.proxy.fx2.ping()`

Is the chassis responding?

**Returns** Returns `False` if the chassis didn't respond, `True` otherwise.

`salt.proxy.fx2.shutdown(opts)`

Shutdown the connection to the proxied device. For this proxy shutdown is a no-op.

### 14.11.6 salt.proxy.junos

Interface with a Junos device via proxy-minion. To connect to a junos device via junos proxy, specify the host information in the pillar in ``/srv/pillar/details.sls'`

```
proxy:
  proxytype: junos
  host: <ip or dns name of host>
  username: <username>
```

```
port: 830
password: <secret>
```

In ``/srv/pillar/top.sls'` map the device details with the proxy name.

```
base:
  'vmx':
    - details
```

After storing the device information in the pillar, configure the proxy in ``/etc/salt/proxy'`

```
master: <ip or hostname of salt-master>
```

Run the salt proxy via the following command:

```
salt-proxy --proxyid=vmx
```

`salt.proxy.junos.init(opts)`

Open the connection to the Junos device, login, and bind to the Resource class

`salt.proxy.junos.ping()`

Ping? Pong!

`salt.proxy.junos.proxytype()`

Returns the name of this proxy

`salt.proxy.junos.shutdown(opts)`

This is called when the proxy-minion is exiting to make sure the connection to the device is closed cleanly.

### 14.11.7 salt.proxy.marathon module

#### Marathon

Proxy minion for managing a Marathon cluster.

#### Dependencies

- *marathon execution module (salt.modules.marathon)*

#### Pillar

The marathon proxy configuration requires a ``base_url'` property that points to the marathon endpoint:

```
proxy:
  proxytype: marathon
  base_url: http://my-marathon-master.mydomain.com:8080
```

New in version 2015.8.2.

`salt.proxy.marathon.init(opts)`

Perform any needed setup.

`salt.proxy.marathon.ping()`

Is the marathon api responding?

`salt.proxy.marathon.shutdown(opts)`  
For this proxy shutdown is a no-op

### 14.11.8 salt.proxy.napalm

#### NAPALM: Network Automation and Programmability Abstraction Layer with Multivendor support

Proxy minion for managing network devices via [NAPALM](#) library.

**codeauthor** Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>

**maturity** new

**depends** napalm

**platform** unix

#### Dependencies

The `napalm` proxy module requires [NAPALM](#) library to be installed: `pip install napalm` Please check [Installation](#) for complete details.

#### Pillar

The `napalm` proxy configuration requires the following parameters in order to connect to the network device:

**driver** Specifies the network device operating system. For a complete list of the supported operating systems please refer to the [NAPALM Read the Docs page](#).

**host** The IP Address or FQDN to use when connecting to the device. Alternatively, the following field names can be used instead: `hostname`, `fqdn`, `ip`.

**username** The username to be used when connecting to the device.

**passwd** The password needed to establish the connection.

---

**Note:** This field may not be mandatory when working with SSH-based drivers, and the username has a SSH key properly configured on the device targeted to be managed.

---

**optional\_args** Dictionary with the optional arguments. Check the complete list of supported [optional arguments](#).

**always\_alive: True** In certain less dynamic environments, maintaining the remote connection permanently open with the network device is not always beneficial. In that case, the user can select to initialize the connection only when needed, by specifying this field to `false`. Default: `true` (maintains the connection with the remote network device).

New in version 2017.7.0.

**provider: napalm\_base** The module that provides the `get_network_device` function. This option is useful when the user has more specific needs and requires to extend the [NAPALM](#) capabilities using a private library implementation. The only constraint is that the alternative library needs to have the `get_network_device` function available.

New in version 2017.7.1.

**multiprocessing: False** Overrides the *multiprocessing* option, per proxy minion. The `multiprocessing` option must be turned off for SSH-based proxies. However, some NAPALM drivers (e.g. Arista, NX-OS) are not SSH-based. As multiple proxy minions may share the same configuration file, this option permits the configuration of the `multiprocessing` option more specifically, for some proxy minions.

New in version 2017.7.2.

Proxy pillar file example:

```
proxy:
  proxytype: napalm
  driver: junos
  host: core05.nrt02
  username: my_username
  passwd: my_password
  optional_args:
    port: 12201
```

Example using a user-specific library, extending NAPALM's capabilities, e.g. `custom_napalm_base`:

```
proxy:
  proxytype: napalm
  driver: ios
  fqdn: cr1.th2.par.as1234.net
  username: salt
  password: ''
  provider: custom_napalm_base
```

**See also:**

- *NAPALM grains: select network devices based on their characteristics*
- *NET module: network basic features*
- *Network config state: Manage the configuration using arbitrary templates*
- *NAPALM YANG state: Manage the configuration according to the YANG models (OpenConfig/IETF)*
- *Network ACL module: Generate and load ACL (firewall) configuration*
- *Network ACL state: Manage the firewall configuration*
- *NTP operational and configuration management module*
- *BGP operational and configuration management module*
- *Routes details*
- *SNMP configuration module*
- *Users configuration management*

New in version 2016.11.0.

`salt.proxy.napalm.alive`(*opts*)

Return the connection status with the remote device.

New in version 2017.7.0.

`salt.proxy.napalm.call`(*method*, *\*args*, *\*\*kwargs*)

Calls a specific method from the network driver instance. Please check the `readthedocs` page for the updated list of getters.

**Parameters**

- **method** -- specifies the name of the method to be called
- **params** -- contains the mapping between the name and the values of the parameters needed to call the method

#### Returns

A dictionary with three keys:

- **result** (True/False): if the operation succeeded
- **out** (object): returns the object as-is from the call
- **comment** (string): provides more details in case the call failed
- **traceback** (string): complete traceback in case of exception. Please submit an issue including this traceback

on the [correct driver repo](#) and make sure to read the [FAQ](#)

Example:

```
__proxy__['napalm.call']('cli'
                        **{
                            'commands': [
                                'show version',
                                'show chassis fan'
                            ]
                        })
```

`salt.proxy.napalm.fns()`

Method called by NAPALM grains module.

`salt.proxy.napalm.get_device()`

Returns the network device object.

`salt.proxy.napalm.get_grains()`

Retrieve facts from the network device.

`salt.proxy.napalm.grains_refresh()`

Refresh the grains.

`salt.proxy.napalm.init(opts)`

Opens the connection with the network device.

`salt.proxy.napalm.initialized()`

Connection finished initializing?

`salt.proxy.napalm.ping()`

Connection open successfully?

`salt.proxy.napalm.shutdown(opts)`

Closes connection with the device.

### 14.11.9 salt.proxy.nxos module

Proxy Minion for Cisco NX OS Switches

The Cisco NX OS Proxy Minion uses the built in SSHConnection module in `salt.utils.vt_helper`

To configure the proxy minion:

```
proxy:
  proxytype: nxos
  host: 192.168.187.100
  username: admin
  password: admin
```

```
prompt_name: switch
ssh_args: '-o PubkeyAuthentication=no'
key_accept: True
```

**proxytype** (REQUIRED) Use this proxy minion *nxos*

**host** (REQUIRED) ip address or hostname to connect to

**username** (REQUIRED) username to login with

**password** (REQUIRED) password to use to login with

**prompt\_name** (REQUIRED) The name in the prompt on the switch. By default, use your devices hostname.

**ssh\_args** Any extra args to use to connect to the switch.

**key\_accept** Whether or not to accept a the host key of the switch on initial login. Defaults to False.

The functions from the proxy minion can be run from the salt commandline using the *salt.modules.nxos* execution module.

**salt.proxy.nxos.add\_config**(*lines*)

Add one or more config lines to the switch running config

```
salt '*' nxos.cmd add_config 'snmp-server community TESTSTRINGHERE group network-
↳operator'
```

---

**Note:** For more than one config added per command, lines should be a list.

---

**salt.proxy.nxos.check\_password**(*username, password, encrypted=False*)

Check if passed password is the one assigned to user

**salt.proxy.nxos.check\_role**(*username, role*)

Check if user is assigned a specific role on switch

```
salt '*' nxos.cmd check_role username=admin role=network-admin
```

**salt.proxy.nxos.delete\_config**(*lines*)

Delete one or more config lines to the switch running config

```
salt '*' nxos.cmd delete_config 'snmp-server community TESTSTRINGHERE group
↳network-operator'
```

---

**Note:** For more than one config deleted per command, lines should be a list.

---

**salt.proxy.nxos.find**(*pattern*)

Find all instances where the pattern is in the running command

```
salt '*' nxos.cmd find '^snmp-server.*$'
```

---

**Note:** This uses the *re.MULTILINE* regex format for python, and runs the regex against the whole `show_run` output.

---

**salt.proxy.nxos.get\_roles**(*username*)

Get roles that the username is assigned from switch

**salt.proxy.nxos.get\_user**(*username*)  
Get username line from switch

**salt.proxy.nxos.grains**()  
Get grains for proxy minion

**salt.proxy.nxos.grains\_refresh**()  
Refresh the grains from the proxy device.

**salt.proxy.nxos.init**(*opts=None*)  
Required. Can be used to initialize the server connection.

**salt.proxy.nxos.ping**()  
Ping the device on the other end of the connection

**salt.proxy.nxos.remove\_user**(*username*)  
Remove user from switch

```
salt '*' nxos.cmd remove_user username=daniel
```

**salt.proxy.nxos.replace**(*old\_value, new\_value, full\_match=False*)  
Replace string or full line matches in switch's running config  
If *full\_match* is set to True, then the whole line will need to be matched as part of the old value.

```
salt '*' nxos.cmd replace 'TESTSTRINGHERE' 'NEWTTESTSTRINGHERE'
```

**salt.proxy.nxos.sendline**(*command*)  
Run command through switch's cli

**salt.proxy.nxos.set\_password**(*username, password, encrypted=False, role=None, crypt\_salt=None, algorithm='sha256'*)  
Set users password on switch

```
salt '*' nxos.cmd set_password admin TestPass
salt '*' nxos.cmd set_password admin \
    password='$5$2fWw02vK$S7.Hr3YltMNHuhywQQ3nf0d.gAPHgs3S0BYyGT3E.A' \
    encrypted=True
```

**salt.proxy.nxos.set\_role**(*username, role*)  
Assign role to username

```
salt '*' nxos.cmd set_role username=daniel role=vdc-admin
```

**salt.proxy.nxos.show\_run**()  
Shortcut to run *show run* on switch

```
salt '*' nxos.cmd show_run
```

**salt.proxy.nxos.show\_ver**()  
Shortcut to run *show ver* on switch

```
salt '*' nxos.cmd show_ver
```

**salt.proxy.nxos.shutdown**(*opts*)  
Disconnect

**salt.proxy.nxos.system\_info**()  
Return system information for grains of the NX OS proxy minion

```
salt '*' nxos.system_info
```

`salt.proxy.nxos.unset_role`(*username*, *role*)

Remove role from username

```
salt '*' nxos.cmd unset_role username=daniel role=vdc-admin
```

### 14.11.10 salt.proxy.philips\_hue module

Philips HUE lamps module for proxy.

New in version 2015.8.3.

**class** `salt.proxy.philips_hue.Const`

Constants for the lamp operations.

`salt.proxy.philips_hue.call_alert`(\*args, \*\*kwargs)

Lamp alert

Options:

- id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- on**: Turns on or off an alert. Default is True.

CLI Example:

```
salt '*' hue.alert
salt '*' hue.alert id=1
salt '*' hue.alert id=1,2,3 on=false
```

`salt.proxy.philips_hue.call_blink`(\*args, \*\*kwargs)

Blink a lamp. If lamp is ON, then blink ON-OFF-ON, otherwise OFF-ON-OFF.

Options:

- id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- pause**: Time in seconds. Can be less than 1, i.e. 0.7, 0.5 sec.

CLI Example:

```
salt '*' hue.blink id=1
salt '*' hue.blink id=1,2,3
```

`salt.proxy.philips_hue.call_brightness`(\*args, \*\*kwargs)

Set an effect to the lamp.

Arguments:

- value**: 0~255 brightness of the lamp.

Options:

- id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- transition**: Transition 0~200. Default 0.

CLI Example:

```
salt '*' hue.brightness value=100
salt '*' hue.brightness id=1 value=150
salt '*' hue.brightness id=1,2,3 value=255
```

`salt.proxy.philips_hue.call_color`(\*args, \*\*kwargs)

Set a color to the lamp.

Options:

- id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- color**: Fixed color. Values are: red, green, blue, orange, pink, white, yellow, daylight, purple. Default white.
- transition**: Transition 0~200.

Advanced:

- gamut**: XY coordinates. Use gamut according to the Philips HUE devices documentation. More: <http://www.developers.meethue.com/documentation/hue-xy-values>

CLI Example:

```
salt '*' hue.color
salt '*' hue.color id=1
salt '*' hue.color id=1,2,3 ocolor=red transition=30
salt '*' hue.color id=1 gamut=0.3,0.5
```

`salt.proxy.philips_hue.call_effect(*args, **kwargs)`

Set an effect to the lamp.

Options:

- id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- type**: Type of the effect. Possible values are ``none`` or ``colorloop``. Default ``none``.

CLI Example:

```
salt '*' hue.effect
salt '*' hue.effect id=1
salt '*' hue.effect id=1,2,3 type=colorloop
```

`salt.proxy.philips_hue.call_lights(*args, **kwargs)`

Get info about all available lamps.

Options:

- id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.

CLI Example:

```
salt '*' hue.lights
salt '*' hue.lights id=1
salt '*' hue.lights id=1,2,3
```

`salt.proxy.philips_hue.call_ping(*args, **kwargs)`

Ping the lamps by issuing a short inversion blink to all available devices.

CLI Example:

```
salt '*' hue.ping
```

`salt.proxy.philips_hue.call_rename(*args, **kwargs)`

Rename a device.

Options:

- id**: Specifies a device ID. Only one device at a time.
- title**: Title of the device.

CLI Example:

```
salt '*' hue.rename id=1 title='WC for cats'
```

`salt.proxy.philips_hue.call_status(*args, **kwargs)`

Return the status of the lamps.

Options:

- id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.

CLI Example:

```
salt '*' hue.status
salt '*' hue.status id=1
salt '*' hue.status id=1,2,3
```

`salt.proxy.philips_hue.call_switch(*args, **kwargs)`

Switch lamp ON/OFF.

If no particular state is passed, then lamp will be switched to the opposite state.

Options:

- id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- on**: True or False. Inverted current, if omitted

CLI Example:

```
salt '*' hue.switch
salt '*' hue.switch id=1
salt '*' hue.switch id=1,2,3 on=True
```

`salt.proxy.philips_hue.call_temperature(*args, **kwargs)`

Set the mired color temperature. More: <http://en.wikipedia.org/wiki/Mired>

Arguments:

- value**: 150-500.

Options:

- id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.

CLI Example:

```
salt '*' hue.temperature value=150
salt '*' hue.temperature value=150 id=1
salt '*' hue.temperature value=150 id=1,2,3
```

`salt.proxy.philips_hue.init(cnf)`

Initialize the module.

`salt.proxy.philips_hue.ping(*args, **kw)`

Ping the lamps.

`salt.proxy.philips_hue.shutdown(opts, *args, **kw)`

Shuts down the service.

### 14.11.11 salt.proxy.rest\_sample

This is a simple proxy-minion designed to connect to and communicate with the bottle-based web service contained in [https://github.com/saltstack/salt-contrib/tree/master/proxyminion\\_rest\\_example](https://github.com/saltstack/salt-contrib/tree/master/proxyminion_rest_example)

`salt.proxy.rest_sample.grains()`

Get the grains from the proxied device

`salt.proxy.rest_sample.grains_refresh()`

Refresh the grains from the proxied device

`salt.proxy.rest_sample.id(opts)`

Return a unique ID for this proxy minion. This ID MUST NOT CHANGE. If it changes while the proxy is running the salt-master will get really confused and may stop talking to this minion

`salt.proxy.rest_sample.initialized()`

Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our `init()` function has been called

`salt.proxy.rest_sample.package_install(name, **kwargs)`

Install a ``package" on the REST server

`salt.proxy.rest_sample.package_list()`

List ``packages" installed on the REST server

`salt.proxy.rest_sample.package_remove(name)`

Remove a ``package" on the REST server

`salt.proxy.rest_sample.package_status(name)`

Check the installation status of a package on the REST server

`salt.proxy.rest_sample.ping()`

Is the REST server up?

`salt.proxy.rest_sample.service_list()`

List ``services" on the REST server

`salt.proxy.rest_sample.service_restart(name)`

Restart a ``service" on the REST server

`salt.proxy.rest_sample.service_start(name)`

Start a ``service" on the REST server

`salt.proxy.rest_sample.service_status(name)`

Check if a service is running on the REST server

`salt.proxy.rest_sample.service_stop(name)`

Stop a ``service" on the REST server

`salt.proxy.rest_sample.shutdown(opts)`

For this proxy shutdown is a no-op

`salt.proxy.rest_sample.test_from_state()`

Test function so we have something to call from a state :return:

`salt.proxy.rest_sample.uptodate(name)`

Call the REST endpoint to see if the packages on the ``server" are up to date.

### 14.11.12 salt.proxy.ssh\_sample

This is a simple proxy-minion designed to connect to and communicate with a server that exposes functionality via SSH. This can be used as an option when the device does not provide an api over HTTP and doesn't have the python stack to run a minion.

`salt.proxy.ssh_sample.grains()`

Get the grains from the proxied device

`salt.proxy.ssh_sample.grains_refresh()`

Refresh the grains from the proxied device

`salt.proxy.ssh_sample.init(opts)`

Required. Can be used to initialize the server connection.

`salt.proxy.ssh_sample.initialized()`

Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our `init()` function has been called

`salt.proxy.ssh_sample.package_install(name, **kwargs)`  
Install a ``package`` on the ssh server

`salt.proxy.ssh_sample.package_list()`  
List ``packages`` by executing a command via ssh This function is called in response to the salt command  
..code-block::bash salt target\_minion pkg.list\_pkgs

`salt.proxy.ssh_sample.package_remove(name)`  
Remove a ``package`` on the ssh server

`salt.proxy.ssh_sample.parse(out)`  
Extract json from out.  
**Parameter** out: Type string. The data returned by the ssh command.

`salt.proxy.ssh_sample.ping()`  
Required. Ping the device on the other end of the connection

`salt.proxy.ssh_sample.service_list()`  
Start a ``service`` on the ssh server  
  
New in version 2015.8.2.

`salt.proxy.ssh_sample.service_restart(name)`  
Restart a ``service`` on the ssh server  
  
New in version 2015.8.2.

`salt.proxy.ssh_sample.service_start(name)`  
Start a ``service`` on the ssh server  
  
New in version 2015.8.2.

`salt.proxy.ssh_sample.service_stop(name)`  
Stop a ``service`` on the ssh server  
  
New in version 2015.8.2.

`salt.proxy.ssh_sample.shutdown(opts)`  
Disconnect

## 14.12 queue modules

---

<code>pgjsonb_queue</code>	New in version 2016.3.0.
<code>sqlite_queue</code>	New in version 2014.7.0.

---

### 14.12.1 salt.queues.pgjsonb\_queue module

New in version 2016.3.0.

This is a queue with postgres as the backend. It uses the jsonb store to store information for queues.

**depends** python-psycpg2

To enable this queue, the following needs to be configured in your master config. These are the defaults:

```
queue.pgjsonb.host: 'salt'
queue.pgjsonb.user: 'salt'
```

```
queue.pgjsonb.pass: 'salt'  
queue.pgjsonb.db: 'salt'  
queue.pgjsonb.port: 5432
```

Use the following Pg database schema:

```
CREATE DATABASE salt WITH ENCODING 'utf-8';  
  
--  
-- Table structure for table `salt`  
--  
DROP TABLE IF EXISTS salt;  
CREATE OR REPLACE TABLE salt(  
    id SERIAL PRIMARY KEY,  
    data jsonb NOT NULL  
);
```

```
salt-run queue.insert test '{"name": "redis", "host": "172.16.0.8", "port": 6379}'  
↳ backend=pgjsonb  
salt-run queue.process_queue test all backend=pgjsonb
```

`salt.queues.pgjsonb_queue.delete(queue, items)`  
Delete an item or items from a queue

`salt.queues.pgjsonb_queue.insert(queue, items)`  
Add an item or items to a queue

`salt.queues.pgjsonb_queue.list_items(queue)`  
List contents of a queue

`salt.queues.pgjsonb_queue.list_length(queue)`  
Provide the number of items in a queue

`salt.queues.pgjsonb_queue.list_queues()`  
Return a list of Salt Queues on the Salt Master

`salt.queues.pgjsonb_queue.pop(queue, quantity=1)`  
Pop one or more or all items from the queue return them.

## 14.12.2 salt.queues.sqlite\_queue module

New in version 2014.7.0.

This is the default local master event queue built on sqlite. By default, an sqlite3 database file is created in the `sqlite_queue_dir` which is found at:

```
/var/cache/salt/master/queues
```

It's possible to store the sqlite3 database files by setting `sqlite_queue_dir` to another location:

```
sqlite_queue_dir: /home/myuser/salt/master/queues
```

`salt.queues.sqlite_queue.delete(queue, items)`  
Delete an item or items from a queue

`salt.queues.sqlite_queue.insert(queue, items)`  
Add an item or items to a queue

`salt.queues.sqlite_queue.list_items(queue)`  
List contents of a queue

`salt.queues.sqlite_queue.list_length(queue)`  
Provide the number of items in a queue

`salt.queues.sqlite_queue.list_queues()`  
Return a list of Salt Queues on the Salt Master

`salt.queues.sqlite_queue.pop(queue, quantity=1)`  
Pop one or more or all items from the queue return them.

## 14.13 roster modules

<i>ansible</i>	Read in an Ansible inventory file or script
<i>cache</i>	The <i>cache</i> roster provides a flexible interface to the Salt Masters' minion cache to access regular minions over <code>salt-ssh</code> .
<i>cloud</i>	Use the cloud cache on the master to derive IPv4 addresses based on minion ID.
<i>clustershell</i>	This roster resolves hostname in a <code>pdsh/clustershell</code> style.
<i>flat</i>	Read in the roster from a flat file using the render system
<i>range</i>	This roster resolves targets from a range server.
<i>scan</i>	Scan a netmask or <code>ipaddr</code> for open ssh ports

### 14.13.1 salt.roster.ansible

Read in an Ansible inventory file or script

Flat inventory files should be in the regular ansible inventory format.

```
[servers]
salt.gtmanfred.com ansible_ssh_user=gtmanfred ansible_ssh_host=127.0.0.1 ansible_ssh_
→port=22 ansible_ssh_pass='password'

[desktop]
home ansible_ssh_user=gtmanfred ansible_ssh_host=12.34.56.78 ansible_ssh_port=23
→ansible_ssh_pass='password'

[computers:children]
desktop
servers

[names:vars]
http_port=80
```

then `salt-ssh` can be used to hit any of them

```
[~]# salt-ssh all test.ping
salt.gtmanfred.com:
  True
home:
  True
```

```
[~]# salt-ssh desktop test.ping
home:
  True
[~]# salt-ssh computers test.ping
salt.gtmanfred.com:
  True
home:
  True
[~]# salt-ssh salt.gtmanfred.com test.ping
salt.gtmanfred.com:
  True
```

There is also the option of specifying a dynamic inventory, and generating it on the fly

```
#!/bin/bash
echo '{
  "servers": [
    "salt.gtmanfred.com"
  ],
  "desktop": [
    "home"
  ],
  "computers": {
    "hosts": [],
    "children": [
      "desktop",
      "servers"
    ]
  },
  "_meta": {
    "hostvars": {
      "salt.gtmanfred.com": {
        "ansible_ssh_user": "gtmanfred",
        "ansible_ssh_host": "127.0.0.1",
        "ansible_sudo_pass": "password",
        "ansible_ssh_port": 22
      },
      "home": {
        "ansible_ssh_user": "gtmanfred",
        "ansible_ssh_host": "12.34.56.78",
        "ansible_sudo_pass": "password",
        "ansible_ssh_port": 23
      }
    }
  }
}'
```

This is the format that an inventory script needs to output to work with ansible, and thus here.

```
[~]# salt-ssh --roster-file /etc/salt/hosts salt.gtmanfred.com test.ping
salt.gtmanfred.com:
  True
```

Any of the [groups] or direct hostnames will return. The `all` is special, and returns everything.

**class salt.roster.ansible.Inventory** (*tgt, tgt\_type='glob', inventory\_file='/etc/salt/roster'*)  
 Matcher for static inventory files

**class salt.roster.ansible.Script** (*tgt, tgt\_type='glob', inventory\_file='/etc/salt/roster'*)

Matcher for Inventory scripts

```
salt.roster.ansible.targets(tgt, tgt_type='glob', **kwargs)
Return the targets from the ansible inventory_file Default: /etc/salt/roster
```

### 14.13.2 salt.roster.cache

The *cache* roster provides a flexible interface to the Salt Masters' minion cache to access regular minions over `salt-ssh`.

New in version 2017.7.0: grains, pillar, mine data matching SDB URLs IPv6 support roster\_order per config key default order changed to industry-wide best practices CIDR range selection

#### Targeting

This roster supports all matching and targeting of the Salt Master. The matching will be done using only the Salt Master's cache.

#### The Roster Order

The roster's composition can be configured using `roster_order`. In the `roster_order` you can define *any* roster key and fill it with a parameter overriding the one in `roster_defaults`:

- 

`roster_order: host: id # use the minion id as hostname`

You can define lists of parameters as well, the first result from the list will become the value.

#### Selecting a host

- 

# default roster\_order:

**host:**

- ipv6-private # IPv6 addresses in private ranges
- ipv6-global # IPv6 addresses in global ranges
- ipv4-private # IPv4 addresses in private ranges
- ipv4-public # IPv4 addresses in public ranges
- ipv4-local # loopback addresses

This is the default `roster_order`. It prefers IPv6 over IPv4 addresses and private addresses over public ones. The relevant data will be fetched from the cache in-order, and the first match will fill the `host` key.

Other address selection parameters are also possible:

- 

`roster_order:`

**host:**

- global|public|private|local # Both IPv6 and IPv4 addresses in that range
- 2000::/3 # CIDR networks, both IPv4 and IPv6 are supported

### Using cached data

Several cached libraries can be selected using the `library: ``` prefix, followed by the library key. This can be referenced using the same ````: syntax as e.g. `pillar.get`. Lists of references are also supported during the lookup, as are Salt SDB URLs.

This should be especially useful for the other roster keys:

#### roster\_order:

##### host:

- grain: fqdn\_ip4 # Lookup this grain
- mine: network.ip\_addrs # Mine data lookup works the same

password: sdb://vault/ssh\_pass # Salt SDB URLs are also supported

##### user:

- pillar: ssh:auth:user # Lookup this pillar key
- sdb://osenv/USER # Lookup this env var through sdb

##### priv:

- pillar: # Lists are also supported
  - salt:ssh:private\_key
  - ssh:auth:private\_key

`salt.roster.cache.targets` (*tgt*, *tgt\_type='glob'*, *\*\*kwargs*)

Return the targets from the Salt Masters' minion cache. All targets and matchers are supported.

The resulting roster can be configured using `roster_order` and `roster_default`.

### 14.13.3 salt.roster.cloud

Use the cloud cache on the master to derive IPv4 addresses based on minion ID.

This roster requires that the minion in question was created using at least the 2015.5.0 version of Salt Cloud. Starting with the 2015.5.0 release, Salt Cloud maintains an index of minions that it creates and deletes. This index tracks the provider and profile configuration used to provision the minion, including authentication information. So long as this configuration remains current, it can be used by Salt SSH to log into any minion in the index.

To connect as a user other than root, modify the cloud configuration file usually located at `/etc/salt/cloud`. For example, add the following:

```
ssh_username: my_user
sudo: True
```

`salt.roster.cloud.extract_ipv4` (*roster\_order*, *ipv4*)

Extract the preferred IP address from the `ipv4` grain

`salt.roster.cloud.targets` (*tgt*, *tgt\_type='glob'*, *\*\*kwargs*)  
Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster

#### 14.13.4 salt.roster.clustershell

This roster resolves hostname in a pdsh/clustershell style.

**depends** clustershell, <https://github.com/cea-hpc/clustershell>

When you want to use host globs for target matching, use `--roster clustershell`. For example:

```
salt-ssh --roster clustershell 'server_[1-10,21-30],test_server[5,7,9]' test.ping
```

`salt.roster.clustershell.targets` (*tgt*, *tgt\_type='glob'*, *\*\*kwargs*)  
Return the targets

#### 14.13.5 salt.roster.flat

Read in the roster from a flat file using the renderer system

**class** `salt.roster.flat.RosterMatcher` (*raw*, *tgt*, *tgt\_type*, *ipv='ipv4'*)  
Matcher for the roster data structure

**get\_data** (*minion*)  
Return the configured ip

**ret\_glob\_minions** ()  
Return minions that match via glob

**ret\_list\_minions** ()  
Return minions that match via list

**ret\_nodegroup\_minions** ()  
Return minions which match the special list-only groups defined by `ssh_list_nodegroups`

**ret\_pcre\_minions** ()  
Return minions that match via pcre

**ret\_range\_minions** ()  
Return minions that are returned by a range query

**targets** ()  
Execute the correct *tgt\_type* routine and return

`salt.roster.flat.targets` (*tgt*, *tgt\_type='glob'*, *\*\*kwargs*)  
Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster

#### 14.13.6 salt.roster.range module

This roster resolves targets from a range server.

**depends** seco.range, <https://github.com/ytoolshed/range>

When you want to use a range query for target matching, use `--roster range`. For example:

```
salt-ssh --roster range '%%example.range.cluster' test.ping
```

`salt.roster.range.targets` (*tgt*, *tgt\_type='range'*, *\*\*kwargs*)  
Return the targets from a range query

### 14.13.7 salt.roster.scan

Scan a netmask or ipaddr for open ssh ports

`class salt.roster.scan.RosterMatcher` (*tgt*, *tgt\_type*)  
Matcher for the roster data structure

`targets` ()

Return ip addrs based on netmask, sitting in the ``glob" spot because it is the default

`salt.roster.scan.targets` (*tgt*, *tgt\_type='glob'*, *\*\*kwargs*)

Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster

## 14.14 runner modules

<i>asam</i>	Novell ASAM Runner
<i>auth</i>	Authentication runner for creating, deleting, and managing eauth tokens.
<i>bgp</i>	BGP Finder
<i>cache</i>	Return cached data from minions
<i>cloud</i>	The Salt Cloud Runner
<i>ddns</i>	Dynamic DNS Runner
<i>digicertapi</i>	Support for Digicert.
<i>doc</i>	A runner module to collect and display the inline documentation from the
<i>drac</i>	Manage Dell DRAC from the Master
<i>error</i>	Error generator to enable integration testing of salt runner error handling
<i>event</i>	Module for sending events using the runner system.
<i>f5</i>	Runner to provide F5 Load Balancer functionality
<i>fileservers</i>	Directly manage the Salt fileservers plugins
<i>git_pillar</i>	Runner module to directly manage the git external pillar
<i>http</i>	Module for making various web calls.
<i>jobs</i>	A convenience system to manage jobs, both active and already run
<i>launchd</i>	Manage launchd plist files
<i>lxc</i>	Control Linux Containers via Salt
<i>manage</i>	General management functions for salt, tools like seeing what hosts are up
<i>mattermost</i>	Module for sending messages to Mattermost
<i>mine</i>	A runner to access data from the salt mine
<i>nacl</i>	This runner helps create encrypted passwords that can be included in pillars.
<i>net</i>	NET Finder
<i>network</i>	Network tools to run from the Master
<i>pagerduty</i>	Runner Module for Firing Events via PagerDuty

Continued on next page

Table 14.14 -- continued from previous page

<i>pillar</i>	Functions to interact with the pillar compiler on the master
<i>pkg</i>	Package helper functions using <code>salt.modules.pkg</code>
<i>queue</i>	General management and processing of queues.
<i>reactor</i>	A convenience system to manage reactors
<i>salt</i>	This runner makes Salt's execution modules available on the salt master.
<i>saltutil</i>	Sync custom types to the Master
<i>sdb</i>	Runner for setting and querying data via the sdb API on the master
<i>smartos_vmadm</i>	Runner for SmartOS minions control vmadm
<i>search</i>	Runner frontend to search system
<i>spacewalk</i>	Spacewalk Runner
<i>ssh</i>	A Runner module interface on top of the salt-ssh Python API.
<i>state</i>	Execute orchestration functions
<i>survey</i>	A general map/reduce style salt runner for aggregating results returned by several different minions.
<i>test</i>	This runner is used only for test purposes and servers no production purpose
<i>thin</i>	The thin runner is used to manage the salt thin systems.
<i>vault</i>	
	<b>maintainer</b> SaltStack
<i>venafiapi</i>	Support for Venafi
<i>virt</i>	Control virtual machines via Salt
<i>vistara</i>	Vistara Runner
<i>winrepo</i>	Runner to manage Windows software repo

### 14.14.1 salt.runners.asam

#### Novell ASAM Runner

New in version Beryllium.

Runner to interact with Novell ASAM Fan-Out Driver

**codeauthor** Nitin Madhok <nmadhok@clemson.edu>

To use this runner, set up the Novell Fan-Out Driver URL, username and password in the master configuration at `/etc/salt/master` or `/etc/salt/master.d/asam.conf`:

```
asam:
  prov1.domain.com
    username: "testuser"
    password: "verybadpass"
  prov2.domain.com
    username: "testuser"
    password: "verybadpass"
```

**Note:** Optionally, `protocol` and `port` can be specified if the Fan-Out Driver server is not using the defaults. Default is `protocol: https` and `port: 3451`.

`salt.runners.asam.add_platform`(*name*, *platform\_set*, *server\_url*)

To add an ASAM platform using the specified ASAM platform set on the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.add_platform my-test-vm test-platform-set prov1.domain.com
```

`salt.runners.asam.list_platform_sets`(*server\_url*)

To list all ASAM platform sets present on the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.list_platform_sets prov1.domain.com
```

`salt.runners.asam.list_platforms`(*server\_url*)

To list all ASAM platforms present on the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.list_platforms prov1.domain.com
```

`salt.runners.asam.remove_platform`(*name*, *server\_url*)

To remove specified ASAM platform from the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.remove_platform my-test-vm prov1.domain.com
```

## 14.14.2 salt.runners.auth

Authentication runner for creating, deleting, and managing eauth tokens.

New in version 2016.11.0.

`salt.runners.auth.del_token`(*token*)

Delete an eauth token by name

CLI Example:

```
salt-run auth.del_token 6556760736e4077daa601baec2b67c24
```

`salt.runners.auth.mk_token`(*\*\*load*)

Create an eauth token using provided credentials

Non-root users may specify an expiration date -- if allowed via the `token_expire_user_override` setting -- by passing an additional `token_expire` param. This overrides the `token_expire` setting of the same name in the Master config and is how long a token should live in seconds.

CLI Example:

```
salt-run auth.mk_token username=saltdev password=saltdev eauth=auto

# Create a token valid for three years.
salt-run auth.mk_token username=saltdev password=saltdev eauth=auto \
    token_expire=94670856

# Calculate the number of seconds using expr.
salt-run auth.mk_token username=saltdev password=saltdev eauth=auto \
    token_expire=$(expr \( 365 \* 24 \* 60 \* 60 \) \* 3)
```

### 14.14.3 salt.runners.bgp

#### BGP Finder

New in version 2017.7.0.

Runner to search BGP neighbors details.

#### Configuration

- Minion (proxy) config

The `bgp.neighbors` function must be appended in the list of `mine_functions`:

```
mine_functions:
  bgp.neighbors: []
```

Which instructs Salt to cache the data returned by the `neighbors` function from the *NAPALM BGP module*.

How often the mines are refreshed, can be specified using:

```
mine_interval: <X minutes>
```

- Master config

By default the following options can be configured on the master. They are not mandatory, but available in case the user has different requirements.

**tgt:** \* From what minions will collect the mine data. Default: \* (collect mine data from all minions)

**tgt\_type:** **glob** Minion matching expression form. Default: `glob`.

**return\_fields** What fields to return in the output. It can display all the fields from the `neighbors` function from the *NAPALM BGP module*.

Some fields cannot be removed:

- `as_number`: the AS number of the neighbor
- `device`: the minion ID
- `neighbor_address`: the neighbor remote IP address

By default, the following extra fields are returned (displayed):

- `connection_stats`: connection stats, as described below
- `import_policy`: the name of the import policy
- `export_policy`: the name of the export policy

Special fields:

- `vrf`: return the name of the VRF.
- `connection_stats`: returning an output of the form

<State> <Active>/<Received>/<Accepted>/<Damped>, e.g. Established 398/399/399/0 similar to the usual output from network devices. - `interface_description`: matches the neighbor details with the corresponding interface and returns its description. This will reuse functionality from the *net runner*, so the

user needs to enable the mines as specified in the documentation. - `interface_name`: matches the neighbor details with the corresponding interface and returns the name. Similar to `interface_description`, this will reuse functionality from the `net runner`, so the user needs to enable the mines as specified in the documentation.

**display: True** Display on the screen or return structured object? Default: True (return on the CLI).

**outputter: table** Specify the outputter name when displaying on the CLI. Default: `table`.

Configuration example:

```
runners:
  bgp:
    tgt: 'edge*'
    tgt_type: 'glob'
    return_fields:
      - up
      - connection_state
      - previous_connection_state
      - suppress_4byte_as
      - holdtime
      - flap_count
    outputter: yaml
```

`salt.runners.bgp.neighbors(*asns, **kwargs)`

Search for BGP neighbors details in the mines of the `bgp.neighbors` function.

Arguments:

**\*asns** A list of AS numbers to search for. The runner will return only the neighbors of these AS numbers.

**device** Filter by device name (minion ID).

**ip** Search BGP neighbor using the IP address. In multi-VRF environments, the same IP address could be used by more than one neighbors, in different routing tables.

**network** Search neighbors within a certain IP network.

**title** Custom title.

**display: True** Display on the screen or return structured object? Default: True (return on the CLI).

**outputter: table** Specify the outputter name when displaying on the CLI. Default: `table`.

In addition, any field from the output of the `neighbors` function from the `NAPALM BGP module` can be used as a filter.

CLI Example:

```
salt-run bgp.neighbors 13335 15169
salt-run bgp.neighbors 13335 ip=172.17.19.1
salt-run bgp.neighbors multipath=True
salt-run bgp.neighbors up=False export_policy=my-export-policy multihop=False
salt-run bgp.neighbors network=192.168.0.0/16
```

Output example:

```
BGP Neighbors for 13335, 15169
-----
↪ | Device | AS Number | Neighbor Address | State|#Active/ |
↪ |-----|-----|-----|-----|-----|
↪ | edge01.bjm01 | 13335 | 172.17.109.11 | Established 0/ |
↪ | 398/398/0 | | import-policy | export-policy |
```

↩	-----							
↩	edge01.bjm01	13335		172.17.109.12		Established	↩	
	↩397/398/398/0			import-policy		export-policy		
↩	-----							
↩	edge01.flw01	13335		192.168.172.11		Established 1/		
	↩398/398/0			import-policy		export-policy		
↩	-----							
↩	edge01.oua01	13335		172.17.109.17		Established	↩	
	↩0/0/0/0			import-policy		export-policy		
↩	-----							
↩	edge01.bjm01	15169		2001::1		Established	↩	
	↩102/102/102/0			import-policy		export-policy		
↩	-----							
↩	edge01.bjm01	15169		2001::2		Established	↩	
	↩102/102/102/0			import-policy		export-policy		
↩	-----							
↩	edge01.tbg01	13335		192.168.172.17		Established	↩	
	↩0/1/1/0			import-policy		export-policy		
↩	-----							
↩	-----							

#### 14.14.4 salt.runners.cache

Return cached data from minions

`salt.runners.cache.clear_all` (*tgt=None, tgt\_type='glob', expr\_form=None*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached pillar, grains, and mine data of the targeted minions

CLI Example:

```
salt-run cache.clear_all
```

`salt.runners.cache.clear_git_lock` (*role, remote=None, \*\*kwargs*)

New in version 2015.8.2.

Remove the update locks for Salt components (`gitfs`, `git_pillar`, `winrepo`) which use `gitfs` backend code from `salt.utils.gitfs`.

**Note:** Running `cache.clear_all` will not include this function as it does for pillar, grains, and mine.

Additionally, executing this function with a role of `gitfs` is equivalent to running `salt-run file-server.clear_lock backend=git`.

**role** Which type of lock to remove (`gitfs`, `git_pillar`, or `winrepo`)

**remote** If specified, then any remotes which contain the passed string will have their lock cleared. For example, a `remote` value of `github` will remove the lock from all `github.com` remotes.

**type** [`update,checkout`] The types of lock to clear. Can be `update`, `checkout`, or both of

et (either comma-separated or as a Python list).

New in version 2015.8.8.

CLI Example:

```
salt-run cache.clear_git_lock git_pillar
```

`salt.runners.cache.clear_grains` (*tgt=None, tgt\_type='glob', expr\_form=None*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached grains data of the targeted minions

CLI Example:

```
salt-run cache.clear_grains
```

`salt.runners.cache.clear_mine` (*tgt=None, tgt\_type='glob', expr\_form=None*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached mine data of the targeted minions

CLI Example:

```
salt-run cache.clear_mine
```

`salt.runners.cache.clear_mine_func` (*tgt=None, tgt\_type='glob', clear\_mine\_func\_flag=None, expr\_form=None*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached mine function data of the targeted minions

CLI Example:

```
salt-run cache.clear_mine_func tgt='*' clear_mine_func_flag='network.interfaces'
```

`salt.runners.cache.clear_pillar` (*tgt=None, tgt\_type='glob', expr\_form=None*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached pillar data of the targeted minions

CLI Example:

```
salt-run cache.clear_pillar
```

`salt.runners.cache.cloud` (*tgt, provider=None*)

Return cloud cache data for target.

---

**Note:** Only works with glob matching

---

**tgt** Glob Target to match minion ids

**provider** Cloud Provider

CLI Example:

```
salt-run cache.cloud 'salt*'
salt-run cache.cloud glance.example.org provider=openstack
```

`salt.runners.cache.fetch`(*bank, key, cachedir=None*)

Fetch data from a salt.cache bank.

CLI Example:

```
salt-run cache.fetch cloud/active/ec2/myec2 myminion cachedir=/var/cache/salt/
```

`salt.runners.cache.flush`(*bank, key=None, cachedir=None*)

Remove the key from the cache bank with all the key content. If no key is specified remove the entire bank with all keys and sub-banks inside.

CLI Examples:

```
salt-run cache.flush cloud/active/ec2/myec2 cachedir=/var/cache/salt/
salt-run cache.flush cloud/active/ec2/myec2 myminion cachedir=/var/cache/salt/
```

`salt.runners.cache.grains`(*tgt=None, tgt\_type='glob', \*\*kwargs*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Return cached grains of the targeted minions

CLI Example:

```
salt-run cache.grains
```

`salt.runners.cache.list`(*bank, cachedir=None*)

Lists entries stored in the specified bank.

CLI Example:

```
salt-run cache.list cloud/active/ec2/myec2 cachedir=/var/cache/salt/
```

`salt.runners.cache.mine`(*tgt=None, tgt\_type='glob', \*\*kwargs*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Return cached mine data of the targeted minions

CLI Example:

```
salt-run cache.mine
```

`salt.runners.cache.pillar`(*tgt=None, tgt\_type='glob', \*\*kwargs*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Return cached pillars of the targeted minions

CLI Example:

```
salt-run cache.pillar
```

`salt.runners.cache.store`(*bank, key, data, cachedir=None*)

Lists entries stored in the specified bank.

CLI Example:

```
salt-run cache.store mycache mykey 'The time has come the walrus said'
```

## 14.14.5 salt.runners.cloud

### The Salt Cloud Runner

This runner wraps the functionality of salt cloud making salt cloud routines available to all internal apis via the runner system

**salt.runners.cloud.action**(*func=None, cloudmap=None, instances=None, provider=None, instance=None, \*\*kwargs*)  
Execute a single action on the given map/provider/instance

CLI Example:

```
salt-run cloud.action start my-salt-vm
```

**salt.runners.cloud.create**(*provider, instances, opts=None, \*\*kwargs*)  
Create an instance using Salt Cloud

CLI Example:

```
salt-run cloud.create my-ec2-config myinstance image=ami-1624987f size=  
↳ 't1.micro' ssh_username=ec2-user securitygroup=default delvol_on_  
↳ destroy=True
```

**salt.runners.cloud.destroy**(*instances*)  
Destroy the named vm(s)

**salt.runners.cloud.full\_query**(*query\_type='list\_nodes\_full'*)  
List all available cloud provider data

**salt.runners.cloud.list\_images**(*provider='all'*)  
List cloud provider images for the given providers

**salt.runners.cloud.list\_locations**(*provider='all'*)  
List cloud provider sizes for the given providers

**salt.runners.cloud.list\_sizes**(*provider='all'*)  
List cloud provider sizes for the given providers

**salt.runners.cloud.map\_run**(*path=None, \*\*kwargs*)  
Execute a salt cloud map file

**salt.runners.cloud.profile**(*prof=None, instances=None, opts=None, \*\*kwargs*)  
Create a cloud vm with the given profile and instances, instances can be a list or comma-delimited string

CLI Example:

```
salt-run cloud.profile prof=my-ec2 instances=node1,node2,node3
```

**salt.runners.cloud.query**(*query\_type='list\_nodes'*)  
List cloud provider data for all providers

**salt.runners.cloud.select\_query**(*query\_type='list\_nodes\_select'*)  
List selected nodes

## 14.14.6 salt.runners.ddns

### Dynamic DNS Runner

New in version Beryllium.

Runner to interact with DNS server and create/delete/update DNS records

**codeauthor** Nitin Madhok <nmadhok@clemsn.edu>

**salt.runners.ddns.add\_host**(*zone, name, ttl, ip, keyname, keyfile, nameserver, timeout, port=53, keyalgorithm='hmac-md5'*)

Create both A and PTR (reverse) records for a host.

CLI Example:

```
salt-run ddns.add_host domain.com my-test-vm 3600 10.20.30.40 my-tsig-key /etc/
↳salt/tsig.keyring 10.0.0.1 5
```

**salt.runners.ddns.create**(*zone, name, ttl, rdtype, data, keyname, keyfile, nameserver, timeout, port=53, keyalgorithm='hmac-md5'*)

Create a DNS record. The nameserver must be an IP address and the master running this runner must have create privileges on that server.

CLI Example:

```
salt-run ddns.create domain.com my-test-vm 3600 A 10.20.30.40 my-tsig-key /etc/
↳salt/tsig.keyring 10.0.0.1 5
```

**salt.runners.ddns.delete**(*zone, name, keyname, keyfile, nameserver, timeout, rdtype=None, data=None, port=53, keyalgorithm='hmac-md5'*)

Delete a DNS record.

CLI Example:

```
salt-run ddns.delete domain.com my-test-vm my-tsig-key /etc/salt/tsig.keyring 10.
↳0.0.1 5 A
```

**salt.runners.ddns.delete\_host**(*zone, name, keyname, keyfile, nameserver, timeout, port=53, keyalgorithm='hmac-md5'*)

Delete both forward (A) and reverse (PTR) records for a host only if the forward (A) record exists.

CLI Example:

```
salt-run ddns.delete_host domain.com my-test-vm my-tsig-key /etc/salt/tsig.
↳keyring 10.0.0.1 5
```

**salt.runners.ddns.update**(*zone, name, ttl, rdtype, data, keyname, keyfile, nameserver, timeout, replace=False, port=53, keyalgorithm='hmac-md5'*)

Replace, or update a DNS record. The nameserver must be an IP address and the master running this runner must have update privileges on that server.

---

**Note:** If `replace` is set to `True`, all records for this name and type will first be deleted and then recreated. Default is `replace=False`.

---

CLI Example:

```
salt-run ddns.update domain.com my-test-vm 3600 A 10.20.30.40 my-tsig-key /etc/
↳salt/tsig.keyring 10.0.0.1 5
```

### 14.14.7 salt.runners.digicertapi

Support for Digicert. Heavily based on the Venafi runner by Joseph Hall ([jphall@saltstack.com](mailto:jphall@saltstack.com)).

Before using this module you need to register an account with Digicert's CertCentral.

Login to CertCentral, ensure you have a payment method configured and/or there are adequate funds attached to your account. Click the Account item in the left sidebar, and select Account Access. The right hand pane should show "Account Access" and a link to create an API key. Create a new API key and assign it to the user that should be attached to requests coming from Salt.

NOTE CertCentral will not show the API key again after revealing it the first time. Make sure you copy it right away or you will have to revoke it and generate a new one.

Now open `/etc/salt/master` and add the API key as shown below.

```
digicert:
  api_key: [REDACTED]
  → ABCDEFGHIJKLMNOPQRSTUVWXYZABCDEFGHIJKLMN...QRSTUVWXYZABC
```

Restart your Salt Master.

You can also include default values of the following variables to help with creating CSRs:

```
digicert:
  api_key: [REDACTED]
  → ABCDEFGHIJKLMNOPQRSTUVWXYZABCDEFGHIJKLMN...QRSTUVWXYZABC
  shatype: sha256
```

This API currently only supports RSA key types. Support for other key types will be added if interest warrants.

`salt.runners.digicertapi.del_cached_domain(domains)`

Delete cached domains from the master

CLI Example:

```
salt-run digicert.del_cached_domain domain1.example.com, domain2.example.com
```

`salt.runners.digicertapi.gen_csr(minion_id, dns_name, organization_id, ou_name=None, key_len=2048, shatype='sha256', password=None)`

CLI Example:

```
salt-run digicert.gen_csr <minion_id> <dns_name>
```

`salt.runners.digicertapi.gen_key(minion_id, dns_name=None, password=None, key_len=2048)`

Generate and return a private\_key. If a `dns_name` is passed in, the private\_key will be cached under that name.

CLI Example:

```
salt-run digicert.gen_key <minion_id> [dns_name] [password]
```

`salt.runners.digicertapi.get_certificate(order_id=None, certificate_id=None, minion_id=None, cert_format='pem_all', filename=None)`

Retrieve a certificate by `order_id` or `certificate_id` and write it to stdout or a filename.

A list of permissible `cert_formats` is here: <https://www.digicert.com/services/v2/documentation/appendix-certificate-formats>

CLI Example:

```
salt-run digicert.get_certificate order_id=48929454 cert_format=apache
```

Including a `'filename'` will write the certificate to the desired file. Note that some cert formats are zipped files, and some are binary.

If the certificate has not been issued, this function will return the order details inside of which will be a status (one of pending, rejected, processing, issued, revoked, canceled, needs\_csr, and needs\_approval)

If for some reason you want to pipe the output of this command to a file or other command you will want to leave off the `filename` argument and make sure to include `--no-color` so there will be no terminal ANSI escape sequences.

`salt.runners.digicertapi.get_org_details(organization_id)`  
Return the details for an organization

CLI Example:

```
salt-run digicert.get_org_details 34
```

Returns a dictionary with the org details, or with ``error'` and ``status'` keys.

`salt.runners.digicertapi.list_domain_cache()`  
List domains that have been cached

CLI Example:

```
salt-run digicert.list_domain_cache
```

`salt.runners.digicertapi.list_domains(container_id=None)`  
List domains that CertCentral knows about. You can filter by `container_id` (also known as ```Division''`) by passing a `container_id`.

CLI Example:

```
salt-run digicert.list_domains
```

`salt.runners.digicertapi.list_orders(status=None)`  
List certificate orders made to CertCentral.

CLI Example:

```
salt-run digicert.list_orders
```

`salt.runners.digicertapi.list_organizations(container_id=None, include_validation=True)`  
List organizations that CertCentral knows about. You can filter by `container_id` (also known as ```Division''`) by passing a `container_id`. This function returns validation information by default; pass `include_validation=False` to turn it off.

CLI Example:

```
salt-run digicert.list_organizations
```

`salt.runners.digicertapi.list_requests(status=None)`  
List certificate requests made to CertCentral. You can filter by status: pending, approved, rejected

CLI Example:

```
salt-run digicert.list_requests pending
```

`salt.runners.digicertapi.order_certificate`(*minion\_id*, *common\_name*, *organization\_id*, *validity\_years*, *cert\_key\_passphrase*=None, *signature\_hash*=None, *key\_len*=2048, *dns\_names*=None, *organization\_units*=None, *server\_platform*=None, *custom\_expiration\_date*=None, *comments*=None, *disable\_renewal\_notifications*=False, *product\_type\_hint*=None, *renewal\_of\_order\_id*=None)

Order a certificate. Requires that an Organization has been created inside Digicert's CertCentral.

See here for API documentation: <https://www.digicert.com/services/v2/documentation/order/order-ssl-determinator>

CLI Example:

```
salt-run digicert.order_certificate my_minionid my.domain.com 10 3
→signature_hash=sha256 dns_names=['this.domain.com', 'that.domain.com
→'] organization_units='My Domain Org Unit' comments=
→'Comment goes here for the approver'
```

This runner can also be used to renew a certificate by passing *renewal\_of\_order\_id*. Previous order details can be retrieved with `digicertapi.list_orders`.

`salt.runners.digicertapi.show_csrs`()

Show certificate requests for this API key

CLI Example:

```
salt-run digicert.show_csrs
```

`salt.runners.digicertapi.show_organization`(*domain*)

Show organization information, especially the company id

CLI Example:

```
salt-run digicert.show_company example.com
```

`salt.runners.digicertapi.show_rsa`(*minion\_id*, *dns\_name*)

Show a private RSA key

CLI Example:

```
salt-run digicert.show_rsa myminion domain.example.com
```

### 14.14.8 salt.runners.doc

A runner module to collect and display the inline documentation from the various module types

`salt.runners.doc.execution`()

Collect all the `sys.doc` output from each minion and return the aggregate

CLI Example:

```
salt-run doc.execution
```

`salt.runners.doc.runner`()

Return all inline documentation for runner modules

CLI Example:

```
salt-run doc.runner
```

`salt.runners.doc.wheel()`

Return all inline documentation for wheel modules

CLI Example:

```
salt-run doc.wheel
```

### 14.14.9 salt.runners.drac

Manage Dell DRAC from the Master

The login credentials need to be configured in the Salt master configuration file.

`salt.runners.drac.poweroff` (*hostname*, *timeout=20*, *username=None*, *password=None*)

Power server off

CLI Example:

```
salt-run drac.poweroff example.com
```

`salt.runners.drac.poweron` (*hostname*, *timeout=20*, *username=None*, *password=None*)

Power server on

CLI Example:

```
salt-run drac.poweron example.com
```

`salt.runners.drac.pxe` (*hostname*, *timeout=20*, *username=None*, *password=None*)

Connect to the Dell DRAC and have the boot order set to PXE and power cycle the system to PXE boot

CLI Example:

```
salt-run drac.pxe example.com
```

`salt.runners.drac.reboot` (*hostname*, *timeout=20*, *username=None*, *password=None*)

Reboot a server using the Dell DRAC

CLI Example:

```
salt-run drac.reboot example.com
```

`salt.runners.drac.version` (*hostname*, *timeout=20*, *username=None*, *password=None*)

Display the version of DRAC

CLI Example:

```
salt-run drac.version example.com
```

### 14.14.10 salt.runners.error

Error generator to enable integration testing of salt runner error handling

`salt.runners.error.error` (*name=None, message=''*)

If name is None Then return empty dict

Otherwise raise an exception with `__name__` from name, message from message

CLI Example:

```
salt-run error
salt-run error.error name="Exception" message="This is an error."
```

### 14.14.11 salt.runners.event

Module for sending events using the runner system.

New in version 2016.11.0.

`salt.runners.event.send` (*tag, data=None*)

Send an event with the given tag and data.

This is useful for sending events directly to the master from the shell with salt-run. It is also quite useful for sending events in orchestration states where the `fire_event` requisite isn't sufficient because it does not support sending custom data with the event.

Note that event tags will *not* be namespaced like events sent with the `fire_event` requisite! Whereas events produced from `fire_event` are prefixed with `salt/state_result/<jid>/<minion_id>/<name>`, events sent using this runner module will have no such prefix. Make sure your reactors don't expect a prefix!

#### Parameters

- **tag** -- the tag to send with the event
- **data** -- an optional dictionary of data to send with the event

CLI Example:

```
salt-run event.send my/custom/event '{"foo": "bar"}'
```

Orchestration Example:

```
# orch/command.sls

run_a_command:
  salt.function:
    - name: cmd.run
    - tgt: my_minion
    - arg:
      - exit {{ pillar['exit_code'] }}

send_success_event:
  salt.runner:
    - name: event.send
    - tag: my_event/success
    - data:
      foo: bar
    - require:
      - salt: run_a_command

send_failure_event:
  salt.runner:
    - name: event.send
    - tag: my_event/failure
```

```
- data:
  baz: qux
- onfail:
  - salt: run_a_command
```

```
salt-run state.orchestrate orch.command pillar='{"exit_code": 0}'
salt-run state.orchestrate orch.command pillar='{"exit_code": 1}'
```

### 14.14.12 salt.runners.f5

Runner to provide F5 Load Balancer functionality

#### depends

- pycontrol Python module

**configuration** In order to connect to a F5 Load Balancer, you must specify in the Salt master configuration the currently available load balancers

```
load_balancers:
  bigip1.example.com
    username: admin
    password: secret
  bigip2.example.com:
    username: admin
    password: secret
```

**salt.runners.f5.add\_pool\_member** (*lb, name, port, pool\_name*)

Add a node to a pool

CLI Examples:

```
salt-run f5.add_pool_member load_balancer 10.0.0.1 80 my_pool
```

**salt.runners.f5.check\_member\_pool** (*lb, member, pool\_name*)

Check a pool member exists in a specific pool

CLI Examples:

```
salt-run f5.check_member_pool load_balancer 10.0.0.1 my_pool
```

**salt.runners.f5.check\_pool** (*lb, name*)

Check to see if a pool exists

CLI Examples:

```
salt-run f5.check_pool load_balancer pool_name
```

**salt.runners.f5.check\_virtualserver** (*lb, name*)

Check to see if a virtual server exists

CLI Examples:

```
salt-run f5.check_virtualserver load_balancer virtual_server
```

**salt.runners.f5.create\_pool** (*lb, name, method='ROUND\_ROBIN'*)

Create a pool on the F5 load balancer

CLI Examples:

```
salt-run f5.create_pool load_balancer pool_name loadbalance_method
salt-run f5.create_pool load_balancer my_pool ROUND_ROBIN
```

`salt.runners.f5.create_vs`(*lb, name, ip, port, protocol, profile, pool\_name*)

Create a virtual server

CLI Examples:

```
salt-run f5.create_vs lbalancer vs_name 10.0.0.1 80 tcp http poolname
```

### 14.14.13 salt.runners.fileserver

Directly manage the Salt fileserver plugins

`salt.runners.fileserver.clear_cache`(*backend=None*)

New in version 2015.5.0.

Clear the fileserver cache from VCS fileserver backends (*git, hg, svn*). Executing this runner with no arguments will clear the cache for all enabled VCS fileserver backends, but this can be narrowed using the `backend` argument.

**backend** Only clear the update lock for the specified backend(s). If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

CLI Example:

```
salt-run fileserver.clear_cache
salt-run fileserver.clear_cache backend=git,hg
salt-run fileserver.clear_cache hg
salt-run fileserver.clear_cache -roots
```

`salt.runners.fileserver.clear_file_list_cache`(*saltenv=None, backend=None*)

New in version 2016.11.0.

The Salt fileserver caches the files/directories/symlinks for each fileserver backend and environment as they are requested. This is done to help the fileserver scale better. Without this caching, when hundreds/thousands of minions simultaneously ask the master what files are available, this would cause the master's CPU load to spike as it obtains the same information separately for each minion.

**saltenv** By default, this runner will clear the file list caches for all environments. This argument allows for a list of environments to be passed, to clear more selectively. This list can be passed either as a comma-separated string, or a Python list.

**backend** Similar to the `saltenv` parameter, this argument will restrict the cache clearing to specific fileserver backends (the default behavior is to clear from all enabled fileserver backends). This list can be passed either as a comma-separated string, or a Python list.

Since the ability to clear these caches is often required by users writing custom runners which add/remove files, this runner can easily be called from within a custom runner using any of the following examples:

```
# Clear all file list caches
__salt__['fileserver.clear_file_list_cache']()
# Clear just the 'base' saltenv file list caches
__salt__['fileserver.clear_file_list_cache'](saltenv='base')
# Clear just the 'base' saltenv file list caches from just the 'roots'
# fileserver backend
__salt__['fileserver.clear_file_list_cache'](saltenv='base', backend='roots')
```

```
# Clear all file list caches from the 'roots' fileserver backend
__salt__['fileserver.clear_file_list_cache'](backend='roots')
```

**Note:** In runners, the `__salt__` dictionary will likely be renamed to `__runner__` in a future Salt release to distinguish runner functions from remote execution functions. See [this GitHub issue](#) for discussion/updates on this.

If using Salt's Python API (not a runner), the following examples are equivalent to the ones above:

```
import salt.config
import salt.runner

opts = salt.config.master_config('/etc/salt/master')
opts['fun'] = 'fileserver.clear_file_list_cache'

# Clear all file list caches
opts['arg'] = [] # No arguments
runner = salt.runner.Runner(opts)
cleared = runner.run()

# Clear just the 'base' saltenv file list caches
opts['arg'] = ['base', None]
runner = salt.runner.Runner(opts)
cleared = runner.run()

# Clear just the 'base' saltenv file list caches from just the 'roots'
# fileserver backend
opts['arg'] = ['base', 'roots']
runner = salt.runner.Runner(opts)
cleared = runner.run()

# Clear all file list caches from the 'roots' fileserver backend
opts['arg'] = [None, 'roots']
runner = salt.runner.Runner(opts)
cleared = runner.run()
```

This function will return a dictionary showing a list of environments which were cleared for each backend. An empty return dictionary means that no changes were made.

CLI Examples:

```
# Clear all file list caches
salt-run fileserver.clear_file_list_cache
# Clear just the 'base' saltenv file list caches
salt-run fileserver.clear_file_list_cache saltenv=base
# Clear just the 'base' saltenv file list caches from just the 'roots'
# fileserver backend
salt-run fileserver.clear_file_list_cache saltenv=base backend=roots
# Clear all file list caches from the 'roots' fileserver backend
salt-run fileserver.clear_file_list_cache backend=roots
```

`salt.runners.fileserver.clear_lock(backend=None, remote=None)`

New in version 2015.5.0.

Clear the fileserver update lock from VCS fileserver backends (*git*, *hg*, *svn*). This should only need to be done if a fileserver update was interrupted and a remote is not updating (generating a warning in the Master's

log file). Executing this runner with no arguments will remove all update locks from all enabled VCS fileserver backends, but this can be narrowed by using the following arguments:

**backend** Only clear the update lock for the specified backend(s).

**remote** If specified, then any remotes which contain the passed string will have their lock cleared. For example, a remote value of **github** will remove the lock from all github.com remotes.

CLI Example:

```
salt-run fileserver.clear_lock
salt-run fileserver.clear_lock backend=git,hg
salt-run fileserver.clear_lock backend=git remote=github
salt-run fileserver.clear_lock remote=bitbucket
```

`salt.runners.fileserver.dir_list` (*saltenv='base', backend=None*)

Return a list of directories in the given environment

**saltenv** [base] The salt fileserver environment to be listed

**backend** Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

New in version 2015.5.0.

CLI Example:

```
salt-run fileserver.dir_list
salt-run fileserver.dir_list saltenv=prod
salt-run fileserver.dir_list saltenv=dev backend=git
salt-run fileserver.dir_list base hg,roots
salt-run fileserver.dir_list -git
```

`salt.runners.fileserver.empty_dir_list` (*saltenv='base', backend=None*)

New in version 2015.5.0.

Return a list of empty directories in the given environment

**saltenv** [base] The salt fileserver environment to be listed

**backend** Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

---

**Note:** Some backends (such as `git` and `hg`) do not support empty directories. So, passing `backend=git` or `backend=hg` will result in an empty list being returned.

---

CLI Example:

```
salt-run fileserver.empty_dir_list
salt-run fileserver.empty_dir_list saltenv=prod
salt-run fileserver.empty_dir_list backend=roots
```

`salt.runners.fileserver.envs` (*backend=None, sources=False*)

Return the available fileserver environments. If no backend is provided, then the environments for all configured backends will be returned.

**backend** Narrow fileserver backends to a subset of the enabled ones.

Changed in version 2015.5.0: If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

Additionally, fileserver backends can now be passed as a comma-separated list. In earlier versions, they needed to be passed as a python list (ex: backend=["'roots', 'git']")

CLI Example:

```
salt-run fileserver.envs
salt-run fileserver.envs backend=roots,git
salt-run fileserver.envs git
```

`salt.runners.fileserver.file_list` (*saltenv='base', backend=None*)

Return a list of files from the salt fileserver

**saltenv** [base] The salt fileserver environment to be listed

**backend** Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: backend=-roots,git) then the ones starting with a minus sign will be disregarded.

New in version 2015.5.0.

CLI Examples:

```
salt-run fileserver.file_list
salt-run fileserver.file_list saltenv=prod
salt-run fileserver.file_list saltenv=dev backend=git
salt-run fileserver.file_list base hg,roots
salt-run fileserver.file_list -git
```

`salt.runners.fileserver.lock` (*backend=None, remote=None*)

New in version 2015.5.0.

Set a fileserver update lock for VCS fileserver backends (*git, hg, svn*).

---

**Note:** This will only operate on enabled backends (those configured in *fileserver\_backend*).

---

**backend** Only set the update lock for the specified backend(s).

**remote** If not None, then any remotes which contain the passed string will have their lock cleared. For example, a remote value of *\*github.com\** will remove the lock from all github.com remotes.

CLI Example:

```
salt-run fileserver.lock
salt-run fileserver.lock backend=git,hg
salt-run fileserver.lock backend=git remote='*github.com*'
salt-run fileserver.lock remote=bitbucket
```

`salt.runners.fileserver.symlink_list` (*saltenv='base', backend=None*)

Return a list of symlinked files and dirs

**saltenv** [base] The salt fileserver environment to be listed

**backend** Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: backend=-roots,git) then the ones starting with a minus sign will be disregarded.

New in version 2015.5.0.

CLI Example:

```
salt-run fileserver.symlink_list
salt-run fileserver.symlink_list saltenv=prod
salt-run fileserver.symlink_list saltenv=dev backend=git
```

```
salt-run fileserver.symlink_list base hg,roots
salt-run fileserver.symlink_list -git
```

`salt.runners.fileserver.update` (*backend=None*)

Update the fileserver cache. If no backend is provided, then the cache for all configured backends will be updated.

**backend** Narrow fileserver backends to a subset of the enabled ones.

Changed in version 2015.5.0: If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

Additionally, fileserver backends can now be passed as a comma-separated list. In earlier versions, they needed to be passed as a python list (ex: `backend=["roots','git']`)

CLI Example:

```
salt-run fileserver.update
salt-run fileserver.update backend=roots,git
```

#### 14.14.14 salt.runners.git\_pillar

Runner module to directly manage the git external pillar

`salt.runners.git_pillar.update` (*branch=None, repo=None*)

New in version 2014.1.0.

Changed in version 2015.8.4: This runner function now supports the *new git\_pillar configuration schema* introduced in 2015.8.0. Additionally, the branch and repo can now be omitted to update all git\_pillar remotes. The return data has also changed. For releases 2015.8.3 and earlier, there is no value returned. Starting with 2015.8.4, the return data is a dictionary. If using the *old git\_pillar configuration schema*, then the dictionary values will be True if the update completed without error, and False if an error occurred. If using the *new git\_pillar configuration schema*, the values will be True only if new commits were fetched, and False if there were errors or no new commits were fetched.

Fetch one or all configured git\_pillar remotes.

---

**Note:** This will *not* fast-forward the git\_pillar cachedir on the master. All it does is perform a `git fetch`. If this runner is executed with `-l debug`, you may see a log message that says that the repo is up-to-date. Keep in mind that Salt automatically fetches git\_pillar repos roughly every 60 seconds (or whatever *loop\_interval* is set to). So, it is possible that the repo was fetched automatically in the time between when changes were pushed to the repo, and when this runner was executed. When in doubt, simply refresh pillar data using *saltutil.refresh\_pillar* and then use *pillar.item* to check if the pillar data has changed as expected.

---

CLI Example:

```
# Update specific branch and repo
salt-run git_pillar.update branch='branch' repo='https://foo.com/bar.git'
# Update all repos (2015.8.4 and later)
salt-run git_pillar.update
# Run with debug logging
salt-run git_pillar.update -l debug
```

### 14.14.15 salt.runners.http

Module for making various web calls. Primarily designed for webhooks and the like, but also useful for basic http testing.

New in version 2015.5.0.

`salt.runners.http.query` (*url*, *output=True*, *\*\*kwargs*)

Query a resource, and decode the return data

New in version 2015.5.0.

CLI Example:

```
salt-run http.query http://somelink.com/
salt-run http.query http://somelink.com/ method=POST           params='key1=val1&
↳key2=val2'
salt-run http.query http://somelink.com/ method=POST           data='<xml>
↳somecontent</xml>'
```

`salt.runners.http.update_ca_bundle` (*target=None*, *source=None*, *merge\_files=None*)

Update the local CA bundle file from a URL

New in version 2015.5.0.

CLI Example:

```
salt-run http.update_ca_bundle
salt-run http.update_ca_bundle target=/path/to/cacerts.pem
salt-run http.update_ca_bundle source=https://example.com/cacerts.pem
```

If the `target` is not specified, it will be pulled from the `ca_cert` configuration variable available to the master. If it cannot be found there, it will be placed at `<<FILE_ROOTS>>/cacerts.pem`.

If the `source` is not specified, it will be pulled from the `ca_cert_url` configuration variable available to the master. If it cannot be found, it will be downloaded from the cURL website, using an http (not https) URL. USING THE DEFAULT URL SHOULD BE AVOIDED!

`merge_files` may also be specified, which includes a string or list of strings representing a file or files to be appended to the end of the CA bundle, once it is downloaded.

CLI Example:

```
salt-run http.update_ca_bundle merge_files=/path/to/mycert.pem
```

### 14.14.16 salt.runners.jobs

A convenience system to manage jobs, both active and already run

`salt.runners.jobs.active` (*display\_progress=False*)

Return a report on all actively running jobs from a job id centric perspective

CLI Example:

```
salt-run jobs.active
```

`salt.runners.jobs.exit_success` (*jid*, *ext\_source=None*)

Check if a job has been executed and exit successfully

`jid` The jid to look up.

`ext_source` The external job cache to use. Default: `None`.

```
CLI Example: .. code-block:: bash
salt-run jobs.exit_success 20160520145827701627
```

```
salt.runners.jobs.last_run(ext_source=None, outputter=None, metadata=None, function=None,
                           target=None, display_progress=False)
```

New in version 2015.8.0.

List all detectable jobs and associated functions

CLI Example:

```
salt-run jobs.last_run
salt-run jobs.last_run target=nodename
salt-run jobs.last_run function='cmd.run'
salt-run jobs.last_run metadata="{ 'foo': 'bar' }"
```

```
salt.runners.jobs.list_job(jid, ext_source=None, display_progress=False)
```

List a specific job given by its jid

**ext\_source** If provided, specifies which external job cache to use.

**display\_progress** [False] If True, fire progress events.

New in version 2015.8.8.

CLI Example:

```
salt-run jobs.list_job 20130916125524463507
salt-run jobs.list_job 20130916125524463507 --out=pprint
```

```
salt.runners.jobs.list_jobs(ext_source=None, outputter=None, search_metadata=None,
                            search_function=None, search_target=None, start_time=None,
                            end_time=None, display_progress=False)
```

List all detectable jobs and associated functions

**ext\_source** If provided, specifies which external job cache to use.

#### FILTER OPTIONS

---

**Note:** If more than one of the below options are used, only jobs which match *all* of the filters will be returned.

---

**search\_metadata** Specify a dictionary to match to the job's metadata. If any of the key-value pairs in this dictionary match, the job will be returned. Example:

```
salt-run jobs.list_jobs search_metadata='{ "foo": "bar", "baz": "qux" }'
```

**search\_function** Can be passed as a string or a list. Returns jobs which match the specified function. Globbing is allowed. Example:

```
salt-run jobs.list_jobs search_function='test.*'
salt-run jobs.list_jobs search_function='["test.*", "pkg.install"]'
```

Changed in version 2015.8.8: Multiple targets can now also be passed as a comma-separated list. For example:

```
salt-run jobs.list_jobs search_function='test.*,pkg.install'
```

**search\_target** Can be passed as a string or a list. Returns jobs which match the specified minion name. Globbing is allowed. Example:

```
salt-run jobs.list_jobs search_target='*.mydomain.tld'
salt-run jobs.list_jobs search_target='["db*", "myminion"]'
```

Changed in version 2015.8.8: Multiple targets can now also be passed as a comma-separated list. For example:

```
salt-run jobs.list_jobs search_target='db*,myminion'
```

**start\_time** Accepts any timestamp supported by the `dateutil` Python module (if this module is not installed, this argument will be ignored). Returns jobs which started after this timestamp.

**end\_time** Accepts any timestamp supported by the `dateutil` Python module (if this module is not installed, this argument will be ignored). Returns jobs which started before this timestamp.

CLI Example:

```
salt-run jobs.list_jobs
salt-run jobs.list_jobs search_function='test.*' search_target='localhost' search_
↳ metadata='{"bar": "foo"}'
salt-run jobs.list_jobs start_time='2015, Mar 16 19:00' end_time='2015, Mar 18 22:
↳ 00'
```

**salt.runners.jobs.list\_jobs\_filter**(*count*, *filter\_find\_job=True*, *ext\_source=None*, *output-ter=None*, *display\_progress=False*)

List all detectable jobs and associated functions

**ext\_source** The external job cache to use. Default: *None*.

CLI Example:

```
salt-run jobs.list_jobs_filter 50
salt-run jobs.list_jobs_filter 100 filter_find_job=False
```

**salt.runners.jobs.lookup\_jid**(*jid*, *ext\_source=None*, *returned=True*, *missing=False*, *display\_progress=False*)

Return the printout from a previously executed job

**jid** The jid to look up.

**ext\_source** The external job cache to use. Default: *None*.

**returned** [True] If True, include the minions that did return from the command.

New in version 2015.8.0.

**missing** [False] If True, include the minions that did *not* return from the command.

**display\_progress** [False] If True, fire progress events.

New in version 2015.5.0.

CLI Example:

```
salt-run jobs.lookup_jid 20130916125524463507
salt-run jobs.lookup_jid 20130916125524463507 --out=highstate
```

**salt.runners.jobs.print\_job**(*jid*, *ext\_source=None*)

Print a specific job's detail given by it's jid, including the return data.

CLI Example:

```
salt-run jobs.print_job 20130916125524463507
```

### 14.14.17 salt.runners.launchd

Manage launchd plist files

**salt.runners.launchd.write\_launchd\_plist**(*program*)

Write a launchd plist for managing salt-master or salt-minion

CLI Example:

```
salt-run launchd.write_launchd_plist salt-master
```

### 14.14.18 salt.runners.lxc

Control Linux Containers via Salt

**depends** lxc execution module

**salt.runners.lxc.cloud\_init**(*names, host=None, quiet=False, \*\*kwargs*)

Wrapper for using lxc.init in saltcloud compatibility mode

**names** Name of the containers, supports a single name or a comma delimited list of names.

**host** Minion to start the container on. Required.

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

**saltcloud\_mode** init the container with the saltcloud opts format instead

**salt.runners.lxc.find\_guest**(*name, quiet=False, path=None*)

Returns the host for a container.

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.find_guest name
```

**salt.runners.lxc.find\_guests**(*names, path=None*)

Return a dict of hosts and named guests

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

**salt.runners.lxc.freeze**(*name, quiet=False, path=None*)

Freeze the named container

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.freeze name
```

**salt.runners.lxc.info**(*name, quiet=False, path=None*)

Returns information about a container.

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.info name
```

**salt.runners.lxc.init**(*names, host=None, saltcloud\_mode=False, quiet=False, \*\*kwargs*)

Initialize a new container

```
salt-run lxc.init name host=minion_id [cpuset=cgroups_cpuset] \  
[cpushare=cgroups_cpushare] [memory=cgroups_memory] \  
[template=lxc_template_name] [clone=original name] \  
[profile=lxc_profile] [network_proflile=network_profile] \  
[nic=network_profile] [nic_opts=nic_opts] \  
[start=(true|false)] [seed=(true|false)] \  

```

```
[install=(true|false)] [config=minion_config] \  
[snapshot=(true|false)]
```

**names** Name of the containers, supports a single name or a comma delimited list of names.

**host** Minion on which to initialize the container (**required**)

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

**saltcloud\_mode** init the container with the saltcloud opts format instead See lxc.init\_interface module documentation

**cpuset** cgroups cpuset.

**cpushare** cgroups cpu shares.

**memory** cgroups memory limit, in MB

Changed in version 2015.5.0: If no value is passed, no limit is set. In earlier Salt versions, not passing this value causes a 1024MB memory limit to be set, and it was necessary to pass memory=0 to set no limit.

**template** Name of LXC template on which to base this container

**clone** Clone this container from an existing container

**profile** A LXC profile (defined in config or pillar).

**network\_profile** Network profile to use for the container

New in version 2015.5.2.

**nic** Deprecated since version 2015.5.0: Use network\_profile instead

**nic\_opts** Extra options for network interfaces. E.g.:

```
{ "eth0": { "mac": "aa:bb:cc:dd:ee:ff", "ipv4": "10.1.1.1", "ipv6":  
"2001:db8::ff00:42:8329" } }
```

**start** Start the newly created container.

**seed** Seed the container with the minion config and autosign its key. Default: true

**install** If salt-minion is not already installed, install it. Default: true

**config** Optional config parameters. By default, the id is set to the name of the container.

**salt.runners.lxc.list** (*host=None, quiet=False, path=None*)

List defined containers (running, stopped, and frozen) for the named (or all) host(s).

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.list [host=minion_id]
```

**salt.runners.lxc.purge** (*name, delete\_key=True, quiet=False, path=None*)

Purge the named container and delete its minion key if present. WARNING: Destroys all data associated with the container.

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.purge name
```

**salt.runners.lxc.start** (*name, quiet=False, path=None*)

Start the named container.

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.start name
```

`salt.runners.lxc.stop` (*name*, *quiet=False*, *path=None*)

Stop the named container.

**path** path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

```
salt-run lxc.stop name
```

`salt.runners.lxc.unfreeze` (*name*, *quiet=False*, *path=None*)

Unfreeze the named container

**path** path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

```
salt-run lxc.unfreeze name
```

### 14.14.19 salt.runners.manage

General management functions for salt, tools like seeing what hosts are up and what hosts are down

`salt.runners.manage.alived` (*subset=None*, *show\_ipv4=False*)

New in version 2015.8.0.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show\_ipv4** [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.alived
```

`salt.runners.manage.allowed` (*subset=None*, *show\_ipv4=False*)

New in version 2015.8.0.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show\_ipv4** [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.allowed
```

`salt.runners.manage.bootstrap` (*version='develop'*, *script=None*, *hosts=''*, *root\_user=False*,  
*script\_args=''*, *roster='flat'*, *ssh\_user=None*, *ssh\_password=None*,  
*ssh\_priv\_key=None*, *tmp\_dir='/tmp/.bootstrap'*,  
*http\_backend='tornado'*)

Bootstrap minions with salt-bootstrap

**version** [develop] Git tag of version to install

**script** [<https://bootstrap.saltstack.com>] URL containing the script to execute

**hosts** Comma-separated hosts [example: `hosts='host1.local,host2.local'`]. These hosts need to exist in the specified roster.

**root\_user** [False] Prepend `root@` to each host. Default changed in Salt 2016.11.0 from `True` to `False`.

Changed in version 2016.11.0.

Deprecated since version Oxygen.

**script\_args** Any additional arguments that you want to pass to the script.

New in version 2016.11.0.

**roster** [flat] The roster to use for Salt SSH. More information about roster files can be found in *Salt's Roster Documentation*.

A full list of roster types, see the *builtin roster modules* documentation.

New in version 2016.11.0.

**ssh\_user** If user isn't found in the roster, a default SSH user can be set here. Keep in mind that `ssh_user` will not override the roster `user` value if it is already defined.

New in version 2016.11.0.

**ssh\_password** If `passwd` isn't found in the roster, a default SSH password can be set here. Keep in mind that `ssh_password` will not override the roster `passwd` value if it is already defined.

New in version 2016.11.0.

**ssh\_privkey** If `priv` isn't found in the roster, a default SSH private key can be set here. Keep in mind that `ssh_password` will not override the roster `passwd` value if it is already defined.

New in version 2016.11.0.

**tmp\_dir** [/tmp/.bootstrap] The temporary directory to download the bootstrap script in. This directory will have `-<uuid4>` appended to it. For example: `/tmp/.bootstrap-a19a728e-d40a-4801-aba9-d00655c143a7/`

New in version 2016.11.0.

**http\_backend** [tornado] The backend library to use to download the script. If you need to use a `file:///` URL, then you should set this to `urllib2`.

New in version 2016.11.0.

CLI Example:

```
salt-run manage.bootstrap hosts='host1,host2'
salt-run manage.bootstrap hosts='host1,host2' version='v0.17'
salt-run manage.bootstrap hosts='host1,host2' version='v0.17' script=
↳ 'https://bootstrap.saltstack.com/develop'
salt-run manage.bootstrap hosts='ec2-user@host1,ec2-user@host2' root_
↳ user=False
```

`salt.runners.manage.bootstrap_psexec` (`hosts=''`, `master=None`, `version=None`, `arch='win32'`, `installer_url=None`, `username=None`, `password=None`)

Bootstrap Windows minions via PsExec.

**hosts** Comma separated list of hosts to deploy the Windows Salt minion.

**master** Address of the Salt master passed as an argument to the installer.

**version** Point release of installer to download. Defaults to the most recent.

**arch** Architecture of installer to download. Defaults to win32.

**installer\_url** URL of minion installer executable. Defaults to the latest version from <https://repo.saltstack.com/windows/>

**username** Optional user name for login on remote computer.

**password** Password for optional username. If omitted, PsExec will prompt for one to be entered for each host.

CLI Example:

```
salt-run manage.bootstrap_psexec hosts='host1,host2'
salt-run manage.bootstrap_psexec hosts='host1,host2' version='0.17' username=
↳ 'DOMAIN\Administrator'
salt-run manage.bootstrap_psexec hosts='host1,host2' installer_url='http://
↳ exampledomain/salt-installer.exe'
```

`salt.runners.manage.down` (*removekeys=False, tgt='\*', tgt\_type='glob', expr\_form=None*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Print a list of all the down or unresponsive salt minions Optionally remove keys of down minions

CLI Example:

```
salt-run manage.down
salt-run manage.down removekeys=True
salt-run manage.down tgt="webservers" tgt_type="nodegroup"
```

`salt.runners.manage.get_stats` (*estate=None, stack='road'*)

Print the stack stats

**estate** [None] The name of the target estate. Master stats would be requested by default

**stack** ['road'] Show stats on either road or lane stack Allowed values are 'road' or 'lane'.

CLI Example:

```
salt-run manage.get_stats [estate=alpha_minion] [stack=lane]
```

`salt.runners.manage.joined` (*subset=None, show\_ipv4=False*)

New in version 2015.8.0.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show\_ipv4** [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.joined
```

`salt.runners.manage.key_regen` ()

This routine is used to regenerate all keys in an environment. This is invasive! ALL KEYS IN THE SALT ENVIRONMENT WILL BE REGENERATED!!

The `key_regen` routine sends a command out to minions to revoke the master key and remove all minion keys, it then removes all keys from the master and prompts the user to restart the master. The minions will all reconnect and keys will be placed in pending.

After the master is restarted and minion keys are in the pending directory execute a `salt-key -A` command to accept the regenerated minion keys.

The master *must* be restarted within 60 seconds of running this command or the minions will think there is something wrong with the keys and abort.

Only Execute this runner after upgrading minions and master to 0.15.1 or higher!

CLI Example:

```
salt-run manage.key_regen
```

`salt.runners.manage.lane_stats` (*estate=None*)

Print the estate manor lane stack stats

**estate** [None] The name of the target estate. Master stats would be requested by default

CLI Example:

```
salt-run manage.lane_stats [estate=alpha_minion]
```

`salt.runners.manage.list_not_state` (*subset=None, show\_ipv4=False, state=None*)

New in version 2015.8.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent to minions)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show\_ipv4** [False] Also show the IP address each minion is connecting from.

**state** ['available'] Show minions being in specific state that is one of 'available', 'joined', 'allowed', 'alived' or 'reaped'.

CLI Example:

```
salt-run manage.list_not_state
```

**salt.runners.manage.list\_state** (*subset=None, show\_ipv4=False, state=None*)

New in version 2015.8.0.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show\_ipv4** [False] Also show the IP address each minion is connecting from.

**state** ['available'] Show minions being in specific state that is one of 'available', 'joined', 'allowed', 'alived' or 'reaped'.

CLI Example:

```
salt-run manage.list_state
```

**salt.runners.manage.not\_alived** (*subset=None, show\_ipv4=False*)

New in version 2015.8.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show\_ipv4** [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.not_alived
```

**salt.runners.manage.not\_allowed** (*subset=None, show\_ipv4=False*)

New in version 2015.8.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show\_ipv4** [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.not_allowed
```

**salt.runners.manage.not\_joined** (*subset=None, show\_ipv4=False*)

New in version 2015.8.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show\_ipv4** [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.not_joined
```

**salt.runners.manage.not\_present** (*subset=None, show\_ipv4=False*)

New in version 2015.5.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show\_ipv4** [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.not_present
```

**salt.runners.manage.not\_reaped** (*subset=None, show\_ipv4=False*)

New in version 2015.8.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show\_ipv4** [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.not_reaped
```

**salt.runners.manage.present** (*subset=None, show\_ipv4=False*)

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show\_ipv4** [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.present
```

**salt.runners.manage.reaped** (*subset=None, show\_ipv4=False*)

New in version 2015.8.0.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show\_ipv4** [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.reaped
```

**salt.runners.manage.road\_stats** (*estate=None*)

Print the estate road stack stats

**estate** [None] The name of the target estate. Master stats would be requested by default

CLI Example:

```
salt-run manage.road_stats [estate=alpha_minion]
```

**salt.runners.manage.safe\_accept** (*target, tgt\_type='glob', expr\_form=None*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Accept a minion's public key after checking the fingerprint over salt-ssh

CLI Example:

```
salt-run manage.safe_accept my_minion
salt-run manage.safe_accept minion1,minion2 tgt_type=list
```

**salt.runners.manage.status** (*output=True, tgt='\*', tgt\_type='glob', expr\_form=None, timeout=None, gather\_job\_timeout=None*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Print the status of all known salt minions

CLI Example:

```
salt-run manage.status
salt-run manage.status tgt="webservers" tgt_type="nodegroup"
salt-run manage.status timeout=5 gather_job_timeout=10
```

`salt.runners.manage.up`(*tgt='\*', tgt\_type='glob', expr\_form=None, timeout=None, gather\_job\_timeout=None*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Print a list of all of the minions that are up

CLI Example:

```
salt-run manage.up
salt-run manage.up tgt="webservers" tgt_type="nodegroup"
salt-run manage.up timeout=5 gather_job_timeout=10
```

`salt.runners.manage.versions`()

Check the version of active minions

CLI Example:

```
salt-run manage.versions
```

#### 14.14.20 salt.runners.mattermost

##### Note for 2017.7 releases!

Due to the `salt.runners.config` module not being available in this release series, importing the `salt.runners.config` module from the develop branch is required to make this module work.

Ref: [Mattermost runner failing to retrieve config values due to unavailable config runner #43479](#) Module for sending messages to Mattermost

New in version 2017.7.0.

**configuration** This module can be used by either passing an `api_url` and `hook` directly or by specifying both in a configuration profile in the salt master/minion config. For example:

```
mattermost:
  hook: peWcBiM0S9HrZG15peWcBiM0S9HrZG15
  api_url: https://example.com
```

`salt.runners.mattermost.post_event`(*event, channel=None, username=None, api\_url=None, hook=None*)

Send an event to a Mattermost channel. `:param channel`: The channel name, either will work. `:param username`: The username of the poster. `:param event`: The event to send to the Mattermost channel. `:param api_url`: The Mattermost api url, if not specified in the configuration. `:param hook`: The Mattermost hook, if not specified in the configuration. `:return`: Boolean if message was sent successfully.

`salt.runners.mattermost.post_message`(*message, channel=None, username=None, api\_url=None, hook=None*)

Send a message to a Mattermost channel. `:param channel`: The channel name, either will work. `:param username`: The username of the poster. `:param message`: The message to send to the Mattermost channel. `:param api_url`: The Mattermost api url, if not specified in the configuration. `:param hook`: The Mattermost

hook, if not specified in the configuration. :return: Boolean if message was sent successfully. CLI Example: ..  
code-block:: bash  
salt-run mattermost.post\_message message='Build is done'

### 14.14.21 salt.runners.mine

A runner to access data from the salt mine

`salt.runners.mine.get`(*tgt*, *fun*, *tgt\_type*='glob')

Gathers the data from the specified minions' mine, pass in the target, function to look up and the target type

CLI Example:

```
salt-run mine.get '*' network.interfaces
```

`salt.runners.mine.update`(*tgt*, *tgt\_type*='glob', *clear*=False, *mine\_functions*=None)

New in version 2017.7.0.

Update the mine data on a certain group of minions.

**tgt** Which minions to target for the execution.

**tgt\_type**: **glob** The type of **tgt**.

**clear**: **False** Boolean flag specifying whether updating will clear the existing mines, or will update. Default: False (update).

**mine\_functions** Update the mine data on certain functions only. This feature can be used when updating the mine for functions that require refresh at different intervals than the rest of the functions specified under `mine_functions` in the minion/master config or pillar.

CLI Example:

```
salt-run mine.update '*'  
salt-run mine.update 'juniper-edges' tgt_type='nodegroup'
```

### 14.14.22 salt.runners.nacl

This runner helps create encrypted passwords that can be included in pillars.

**depends** libnacl, <https://github.com/saltstack/libnacl>

This is often useful if you wish to store your pillars in source control or share your pillar data with others that you trust. I don't advise making your pillars public regardless if they are encrypted or not.

The following configurations can be defined in the master config so your users can create encrypted passwords using the runner `nacl`:

```
cat /etc/salt/master.d/nacl.conf  
nacl.config:  
  key: 'cKEzd4kXsbeCE7/nLTIqXwnUiD1uIlg4NoeeYcCFpd9k='  
  keyfile: /root/.nacl
```

Now with the config in the master you can use the runner `nacl` like:

```
salt-run nacl.enc 'data'
```

`salt.runners.nacl.dec`(*data*, *\*\*kwargs*)

Takes a key generated from `nacl.keygen` and decrypt some data.

CLI Examples:

```
salt-run nacl.dec pEXHQM6cuaF7A=
salt-run nacl.dec data='pEXHQM6cuaF7A=' keyfile=/root/.nacl
salt-run nacl.dec data='pEXHQM6cuaF7A=' key='cKEzd4kXsbeCE7/
↳nLTIqXwnUiD1u1g4NoeeYcCFpd9k='
```

`salt.runners.nacl.enc`(*data*, *\*\*kwargs*)

Takes a key generated from `nacl.keygen` and encrypt some data.

CLI Examples:

```
salt-run nacl.enc datatoenc
salt-run nacl.enc datatoenc keyfile=/root/.nacl
salt-run nacl.enc datatoenc key='cKEzd4kXsbeCE7/nLTIqXwnUiD1u1g4NoeeYcCFpd9k='
```

`salt.runners.nacl.keygen`(*keyfile=None*)

Use libnacl to generate a private key

CLI Examples:

```
salt-run nacl.keygen
salt-run nacl.keygen keyfile=/root/.nacl
salt-run --out=newline_values_only nacl.keygen > /root/.nacl
```

## 14.14.23 salt.runners.net

### NET Finder

New in version 2017.7.0.

A runner to find network details easily and fast. It's smart enough to know what you are looking for.

### Configuration

- Minion (proxy) config

To have the complete features, one needs to add the following mine configuration in the minion (proxy) config file:

```
mine_functions:
  net.ipaddrs: []
  net.lldp: []
  net.mac: []
  net.arp: []
  net.interfaces: []
```

Which instructs Salt to cache the data returned by the NAPALM-functions. While they are not mandatory, the less functions configured, the less details will be found by the runner.

How often the mines are refreshed, can be specified using:

```
mine_interval: <X minutes>
```

- Master config

By default the following options can be configured on the master. They are not necessary, but available in case the user has different requirements.

**target:** \* From what minions will collect the mine data. Default: \* (collect from all minions).

**expr\_form:** **glob** Minion matching expression form. Default: glob.

**ignore\_interfaces** A list of interfaces name to ignore. By default will consider all interfaces.

**display:** **True** Display on the screen or return structured object? Default: True (return on the CLI).

**outputter:** **table** Specify the outputter name when displaying on the CLI. Default: table.

Configuration example:

```
runners:
  net.find:
    target: 'edge*'
    expr_form: 'glob'
    ignore_interfaces:
      - lo0
      - em1
      - jsrv
      - fxp0
    outputter: yaml
```

`salt.runners.net.find(addr, best=True, display=True)`

Search in all possible entities (Interfaces, MAC tables, ARP tables, LLDP neighbors), using the following mine functions:

- net.mac
- net.arp
- net.lldp
- net.ipaddr
- net.interfaces

This function has the advantage that it knows where to look, but the output might become quite long as returns all possible matches.

Optional arguments:

**best:** **True** Return only the best match with the interfaces IP networks when the searching pattern is a valid IP Address or Network.

**display:** **True** Display on the screen or return structured object? Default: ``True``(return on the CLI).

CLI Example:

```
$ sudo salt-run net.find 10.10.10.7
```

Output Example:

```
Details for all interfaces that include network 10.10.10.7/32 - only best match
↳ returned
-----
↳
| Device      | Interface | Interface Description | UP | Enabled | Speed [Mbps]
| MAC Address | IP Addresses |
-----
↳
| edge01.flw01 | irb      |                          | True | True  | -1
↳ 5C:5E:AB:AC:52:B4 | 10.10.10.1/22 |
-----
↳
ARP Entries for IP 10.10.10.7
```

Device	Interface	MAC	IP	Age
edge01.flw01	irb.349 [ae0.349]	2C:60:0C:2A:4C:0A	10.10.10.7	832.0

`salt.runners.net.findarp` (*device=None, interface=None, mac=None, ip=None, display=True*)

Search for entries in the ARP tables using the following mine functions:

- net.arp

Optional arguments:

**device** Return interface data from a certain device only.

**interface** Return data selecting by interface name.

**mac** Search using a specific MAC Address.

**ip** Search using a specific IP Address.

**display: True** Display on the screen or return structured object? Default: True, will return on the CLI.

CLI Example:

```
$ sudo salt-run net.findarp mac=8C:60:0F:78:EC:41
```

Output Example:

ARP Entries for MAC 8C:60:0F:78:EC:41

Device	Interface	MAC	IP	Age
edge01.bjm01	irb.171 [ae0.171]	8C:60:0F:78:EC:41	172.172.17.19	956.0

`salt.runners.net.findmac` (*device=None, mac=None, interface=None, vlan=None, display=True*)

Search in the MAC Address tables, using the following mine functions:

- net.mac

Optional arguments:

**device** Return interface data from a certain device only.

**interface** Return data selecting by interface name.

**mac** Search using a specific MAC Address.

**vlan** Search using a VLAN ID.

**display: True** Display on the screen or return structured object? Default: True, will return on the CLI.

CLI Example:

```
$ sudo salt-run net.findmac mac=8C:60:0F:78:EC:41
```

Output Example:

MAC Address(es)

Device	Interface	MAC	VLAN	Static	Active	Moves	
edge01.bjm01	ae0.171	8C:60:0F:78:EC:41	171	False	True	0	☒

`salt.runners.net.interfaces` (*device=None, interface=None, title=None, pattern=None, ipnet=None, best=True, display=True*)

Search for interfaces details in the following mine functions:

- net.interfaces
- net.ipaddr

Optional arguments:

**device** Return interface data from a certain device only.

**interface** Return data selecting by interface name.

**pattern** Return interfaces that contain a certain pattern in their description.

**ipnet** Return interfaces whose IP networks associated include this IP network.

**best: True** When **ipnet** is specified, this argument says if the runner should return only the best match (the output will contain at most one row). Default: True (return only the best match).

**display: True** Display on the screen or return structured object? Default: True (return on the CLI).

**title** Display a custom title for the table.

CLI Example:

```
$ sudo salt-run net.interfaces interface=vt-0/0/10
```

Output Example:

```
Details for interface xe-0/0/0
```

Device	Interface	Interface Description	UP	Enabled	Speed [Mbps]
edge01.bjm01	vt-0/0/10		True	True	1000
edge01.flw01	vt-0/0/10		True	True	1000
edge01.pos01	vt-0/0/10		True	True	1000
edge01.oua01	vt-0/0/10		True	True	1000

`salt.runners.net.lldp`(*device=None, interface=None, title=None, pattern=None, chassis=None, display=True*)

Search in the LLDP neighbors, using the following mine functions:

- net.lldp

Optional arguments:

**device** Return interface data from a certain device only.

**interface** Return data selecting by interface name.

**pattern** Return LLDP neighbors that have contain this pattern in one of the following fields:

- Remote Port ID
- Remote Port Description
- Remote System Name
- Remote System Description

**chassis** Search using a specific Chassis ID.

**display: True** Display on the screen or return structured object? Default: True (return on the CLI).

**display: True** Display on the screen or return structured object? Default: True (return on the CLI).

**title** Display a custom title for the table.

CLI Example:

```
$ sudo salt-run net.lldp pattern=Ethernet1/48
```

Output Example:

```
Pattern "Ethernet1/48" found in one of the following LLDP details
-----
↪
↪
| Device | Interface | Parent Interface | Remote Chassis ID | Remote Port ID |
↪ | Remote Port Description | Remote System Name | Remote System |

`salt.runners.net.multi_find(*patterns, **kwargs)`

Execute multiple search tasks. This function is based on the *find* function. Depending on the search items, some information might overlap.

Optional arguments:

**best: True** Return only the best match with the interfaces IP networks when the searching pattern is a valid IP Address or Network.

**display: True** Display on the screen or return structured object? Default: *True* (return on the CLI).

CLI Example:

```
$ sudo salt-run net.multi_find Ethernet1/49 xe-0/1/2
```

Output Example:

```
Pattern "Ethernet1/49" found in one of the following LLDP details

#### 14.14.24 salt.runners.network

Network tools to run from the Master

`salt.runners.network.wol` (*mac*, *bcast*=`255.255.255.255`, *destport*=9)

Send a ``Magic Packet'' to wake up a Minion

CLI Example:

```

salt-run network.wol 08-00-27-13-69-77
salt-run network.wol 080027136977 255.255.255.255 7
salt-run network.wol 08:00:27:13:69:77 255.255.255.255 7

```

`salt.runners.network.wolllist` (*maclist*, *bcast*=`255.255.255.255`, *destport*=9)

Send a ``Magic Packet'' to wake up a list of Minions. This list must contain one MAC hardware address per line

CLI Example:

```

salt-run network.wolllist '/path/to/maclist'
salt-run network.wolllist '/path/to/maclist' 255.255.255.255 7
salt-run network.wolllist '/path/to/maclist' 255.255.255.255 7

```

#### 14.14.25 salt.runners.pagerduty

Runner Module for Firing Events via PagerDuty

New in version 2014.1.0.

**configuration** This module can be used by specifying the name of a configuration profile in the master config.

For example:

```

my-pagerduty-account:
  pagerduty.api_key: F3Rbyjbve43rfFWf2214
  pagerduty.subdomain: mysubdomain

```

`salt.runners.pagerduty.create_event` (*service\_key*=None, *description*=None, *details*=None, *incident\_key*=None, *profile*=None)

Create an event in PagerDuty. Designed for use in states.

CLI Example:

```

salt-run pagerduty.create_event <service_key> <description> <details>
↪ profile=my-pagerduty-account

```

The following parameters are required:

**service\_key** This key can be found by using `pagerduty.list_services`.

**description** This is a short description of the event.

**details** This can be a more detailed description of the event.

**profile** This refers to the configuration profile to use to connect to the PagerDuty service.

`salt.runners.pagerduty.list_escalation_policies` (*profile=None, api\_key=None*)

This function is an alias of `list_policies`.

List escalation policies belonging to this account

CLI Example:

```
salt-run pagerduty.list_policies my-pagerduty-account salt-run pager-
duty.list_escalation_policies my-pagerduty-account
```

`salt.runners.pagerduty.list_incidents` (*profile=None, api\_key=None*)

List incidents belonging to this account

CLI Example:

```
salt-run pagerduty.list_incidents my-pagerduty-account
```

`salt.runners.pagerduty.list_maintenance_windows` (*profile=None, api\_key=None*)

This function is an alias of `list_windows`.

List maintenance windows belonging to this account

CLI Example:

```
salt-run pagerduty.list_windows my-pagerduty-account salt-run pager-
duty.list_maintenance_windows my-pagerduty-account
```

`salt.runners.pagerduty.list_policies` (*profile=None, api\_key=None*)

List escalation policies belonging to this account

CLI Example:

```
salt-run pagerduty.list_policies my-pagerduty-account salt-run pager-
duty.list_escalation_policies my-pagerduty-account
```

`salt.runners.pagerduty.list_schedules` (*profile=None, api\_key=None*)

List schedules belonging to this account

CLI Example:

```
salt-run pagerduty.list_schedules my-pagerduty-account
```

`salt.runners.pagerduty.list_services` (*profile=None, api\_key=None*)

List services belonging to this account

CLI Example:

```
salt-run pagerduty.list_services my-pagerduty-account
```

`salt.runners.pagerduty.list_users` (*profile=None, api\_key=None*)

List users belonging to this account

CLI Example:

```
salt-run pagerduty.list_users my-pagerduty-account
```

`salt.runners.pagerduty.list_windows` (*profile=None, api\_key=None*)

List maintenance windows belonging to this account

CLI Example:

```
salt-run pagerduty.list_windows my-pagerduty-account salt-run pager-
duty.list_maintenance_windows my-pagerduty-account
```

## 14.14.26 salt.runners.pillar

Functions to interact with the pillar compiler on the master

`salt.runners.pillar.show_pillar` (*minion='\*'*, *\*\*kwargs*)

Returns the compiled pillar either of a specific minion or just the global available pillars. This function assumes that no minion has the id \*. Function also accepts `pillarenv` as attribute in order to limit to a specific pillar branch of git

CLI Example:

shows minion specific pillar:

```
salt-run pillar.show_pillar 'www.example.com'
```

shows global pillar:

```
salt-run pillar.show_pillar
```

shows global pillar for `dev` pillar environment: (note that not specifying `pillarenv` will merge all pillar environments using the master config option `pillar_source_merging_strategy`.)

```
salt-run pillar.show_pillar 'pillarenv=dev'
```

shows global pillar for `dev` pillar environment and specific `pillarenv = dev`:

```
salt-run pillar.show_pillar 'saltenv=dev' 'pillarenv=dev'
```

API Example:

```
import salt.config
import salt.runner
opts = salt.config.master_config('/etc/salt/master')
runner = salt.runner.RunnerClient(opts)
pillar = runner.cmd('pillar.show_pillar', [])
print(pillar)
```

`salt.runners.pillar.show_top` (*minion=None*, *saltenv='base'*)

Returns the compiled top data for pillar for a specific minion. If no minion is specified, we use the first minion we find.

CLI Example:

```
salt-run pillar.show_top
```

### 14.14.27 salt.runners.pkg

Package helper functions using `salt.modules.pkg`

New in version 2015.8.0.

`salt.runners.pkg.list_upgrades` (*jid*, *style='group'*, *outputter='nested'*, *ext\_source=None*)

Show list of available pkg upgrades using a specified format style

CLI Example:

```
salt-run pkg.list_upgrades jid=20141120114114417719 style=group
```

### 14.14.28 salt.runners.queue

#### General management and processing of queues.

This runner facilitates interacting with various queue backends such as the included sqlite3 queue or the planned AWS SQS and Redis queues

The queue functions such as *insert*, *delete*, and *pop* can be used for typical management of the queue.

The *process\_queue* function pops the requested number of items from the queue and creates a Salt Event that can then be processed by a Reactor. The *process\_queue* function can be called manually, or can be configured to run on a schedule with the Salt Scheduler or regular system cron. It is also possible to use the peer system to allow a minion to call the runner.

This runner, as well as the Queues system, is not api stable at this time.

There are many things that could potentially be done with queues within Salt. For the time being the focus will be on queueing infrastructure actions on specific minions. The queues generally will be populated with minion IDs. When the *process\_queue* runner function is called events are created on the Salt Event bus that indicate the queue and a list of one or more minion IDs. The reactor is set up to match on event tags for a specific queue and then take infrastructure actions on those minion IDs. These actions might be to delete the minion's key from the master, use salt-cloud to destroy the vm, or some other custom action.

#### Queued runners

Using the Salt Queues, references to the commandline arguments of other runners can be saved to be processed later. The queue runners require a queue backend that can store json data (default: *pgjsonb*).

Once the queue is setup, the *runner\_queue* will need to be configured.

```
runner_queue:
  queue: runners
  backend: pgjsonb
```

---

**Note:** only the queue is required, this defaults to using pgjsonb

---

Once this is set, then the following can be added to the scheduler on the master and it will run the specified amount of commands per time period.

```
schedule:
  runner queue:
    schedule:
      function: queue.process_runner
      minutes: 1
      kwargs:
        quantity: 2
```

The above configuration will pop 2 runner jobs off the runner queue, and then run them. And it will do this every minute, unless there are any jobs that are still running from the last time the *process\_runner* task was executed.

**salt.runners.queue.delete** (*queue, items, backend='sqlite'*)

Delete an item or items from a queue

CLI Example:

```
salt-run queue.delete myqueue myitem
salt-run queue.delete myqueue myitem backend=sqlite
salt-run queue.delete myqueue ["item1', 'item2', 'item3']"
```

`salt.runners.queue.insert(queue, items, backend='sqlite')`

Add an item or items to a queue

CLI Example:

```
salt-run queue.insert myqueue myitem
salt-run queue.insert myqueue ["item1', 'item2', 'item3']"
salt-run queue.insert myqueue myitem backend=sqlite
salt-run queue.insert myqueue ["item1', 'item2', 'item3']" backend=sqlite
```

`salt.runners.queue.insert_runner(fun, args=None, kwargs=None, queue=None, backend=None)`

Insert a reference to a runner into the queue so that it can be run later.

**fun** The runner function that is going to be run

**args** list or comma-separated string of args to send to fun

**kwargs** dictionary of keyword arguments to send to fun

**queue** queue to insert the runner reference into

**backend** backend that to use for the queue

CLI Example:

```
salt-run queue.insert_runner test.stdout_print
salt-run queue.insert_runner event.send test_insert_runner kwargs='{"data": {"foo
↳": "bar"}}'
```

`salt.runners.queue.list_items(queue, backend='sqlite')`

List contents of a queue

CLI Example:

```
salt-run queue.list_items myqueue
salt-run queue.list_items myqueue backend=sqlite
```

`salt.runners.queue.list_length(queue, backend='sqlite')`

Provide the number of items in a queue

CLI Example:

```
salt-run queue.list_length myqueue
salt-run queue.list_length myqueue backend=sqlite
```

`salt.runners.queue.list_queues(backend='sqlite')`

Return a list of Salt Queues on the backend

CLI Example:

```
salt-run queue.list_queues
salt-run queue.list_queues backend=sqlite
```

`salt.runners.queue.pop(queue, quantity=1, backend='sqlite')`

Pop one or more or all items from a queue

CLI Example:

```
salt-run queue.pop myqueue
salt-run queue.pop myqueue 6
```

```
salt-run queue.pop myqueue all
salt-run queue.pop myqueue 6 backend=sqlite
salt-run queue.pop myqueue all backend=sqlite
```

`salt.runners.queue.process_queue` (*queue*, *quantity=1*, *backend='sqlite'*)

Pop items off a queue and create an event on the Salt event bus to be processed by a Reactor.

CLI Example:

```
salt-run queue.process_queue myqueue
salt-run queue.process_queue myqueue 6
salt-run queue.process_queue myqueue all backend=sqlite
```

`salt.runners.queue.process_runner` (*quantity=1*, *queue=None*, *backend=None*)

Process queued runners

**quantity** number of runners to process

**queue** queue to insert the runner reference into

**backend** backend that to use for the queue

CLI Example:

```
salt-run queue.process_runner
salt-run queue.process_runner 5
```

#### 14.14.29 salt.runners.reactor

A convenience system to manage reactors

`salt.runners.reactor.add` (*event*, *reactors*, *saltenv='base'*, *test=None*)

Add a new reactor

CLI Example:

```
salt-run reactor.add 'salt/cloud/*/destroyed' reactors='/srv/reactor/destroy/*.sls
↪'
```

`salt.runners.reactor.delete` (*event*, *saltenv='base'*, *test=None*)

Delete a reactor

CLI Example:

```
salt-run reactor.delete 'salt/cloud/*/destroyed'
```

`salt.runners.reactor.list` (*saltenv='base'*, *test=None*)

List currently configured reactors

CLI Example:

```
salt-run reactor.list
```

#### 14.14.30 salt.runners.salt

This runner makes Salt's execution modules available on the salt master.

New in version 2016.11.0. Salt's execution modules are normally available on the salt minion. Use this runner to call execution modules on the salt master. Salt *execution modules* are the functions called by the `salt` command.

Execution modules can be called with `salt-run`:

```
salt-run salt.cmd test.ping
# call functions with arguments and keyword arguments
salt-run salt.cmd test.arg 1 2 3 key=value a=1
```

Execution modules are also available to salt runners:

```
__salt__['salt.cmd'](fun=fun, args=args, kwargs=kwargs)
```

`salt.runners.salt.cmd`(*fun*, \**args*, \*\**kwargs*)

Execute *fun* with the given *args* and *kwargs*. Parameter *fun* should be the string *name* of the execution module to call.

Note that execution modules will be *loaded every time* this function is called.

CLI example:

```
salt-run salt.cmd test.ping
# call functions with arguments and keyword arguments
salt-run salt.cmd test.arg 1 2 3 a=1
```

`salt.runners.salt.execute`(*tgt*, *fun*, *arg=()*, *timeout=None*, *tgt\_type='glob'*, *ret=''*, *jid=''*, *kwarg=None*, \*\**kwargs*)

New in version 2017.7.0.

Execute *fun* on all minions matched by *tgt* and *tgt\_type*. Parameter *fun* is the name of execution module function to call.

This function should mainly be used as a helper for runner modules, in order to avoid redundant code. For example, when inside a runner one needs to execute a certain function on arbitrary groups of minions, only has to:

```
ret1 = __salt__['salt.execute']('*', 'mod.fun')
ret2 = __salt__['salt.execute']('my_nodegroup', 'mod2.fun2', tgt_type='nodegroup')
```

It can also be used to schedule jobs directly on the master, for example:

```
schedule:
  collect_bgp_stats:
    function: salt.execute
    args:
      - edge-routers
      - bgp.neighbors
    kwargs:
      tgt_type: nodegroup
    days: 1
    returner: redis
```

### 14.14.31 salt.runners.saltutil

Sync custom types to the Master

New in version 2016.3.0.

`salt.runners.saltutil.sync_all`(*saltenv='base'*, *extmod\_whitelist=None*, *extmod\_blacklist=None*)

Sync all custom types

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] dictionary of modules to sync based on type

**extmod\_blacklist** [None] dictionary of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_all
salt-run saltutil.sync_all extmod_whitelist={'runners': ['custom_runner'], 'grains
↳ ': []}
```

**salt.runners.saltutil.sync\_cache** (*saltenv='base'*, *extmod\_blacklist=None*, *extmod\_whitelist=None*)

New in version 2017.7.0.

Sync utils modules from `salt://_cache` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_cache
```

**salt.runners.saltutil.sync\_clouds** (*saltenv='base'*, *extmod\_blacklist=None*, *extmod\_whitelist=None*)

New in version 2017.7.0.

Sync utils modules from `salt://_clouds` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_clouds
```

**salt.runners.saltutil.sync\_engines** (*saltenv='base'*, *extmod\_blacklist=None*, *extmod\_whitelist=None*)

Sync engines from `salt://_engines` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_engines
```

**salt.runners.saltutil.sync\_grains** (*saltenv='base'*, *extmod\_blacklist=None*, *extmod\_whitelist=None*)

Sync grains modules from `salt://_grains` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_grains
```

**salt.runners.saltutil.sync\_modules** (*saltenv='base'*, *extmod\_whitelist=None*,  
*extmod\_blacklist=None*)

Sync execution modules from `salt://_modules` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_modules
```

**salt.runners.saltutil.sync\_output** (*saltenv='base'*, *extmod\_whitelist=None*,  
*extmod\_blacklist=None*)

Sync output modules from `salt://_output` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_output
```

**salt.runners.saltutil.sync\_pillar** (*saltenv='base'*, *extmod\_whitelist=None*,  
*extmod\_blacklist=None*)

Sync pillar modules from `salt://_pillar` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_pillar
```

**salt.runners.saltutil.sync\_proxymodules** (*saltenv='base'*, *extmod\_whitelist=None*,  
*extmod\_blacklist=None*)

Sync proxy modules from `salt://_proxy` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_proxy
```

**salt.runners.saltutil.sync\_queues** (*saltenv='base'*, *extmod\_whitelist=None*,  
*extmod\_blacklist=None*)

Sync queue modules from `salt://_queues` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_queues
```

`salt.runners.saltutil.sync_renderers` (*saltenv='base'*, *extmod\_whitelist=None*,  
*extmod\_blacklist=None*)

Sync renderer modules from `salt://_renderers` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_renderers
```

`salt.runners.saltutil.sync_returners` (*saltenv='base'*, *extmod\_whitelist=None*,  
*extmod\_blacklist=None*)

Sync returner modules from `salt://_returners` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_returners
```

`salt.runners.saltutil.sync_roster` (*saltenv='base'*, *extmod\_whitelist=None*,  
*extmod\_blacklist=None*)

New in version 2017.7.0.

Sync utils modules from `salt://_roster` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_roster
```

`salt.runners.saltutil.sync_runners` (*saltenv='base'*, *extmod\_whitelist=None*,  
*extmod\_blacklist=None*)

Sync runners from `salt://_runners` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_runners
```

`salt.runners.saltutil.sync_sdb` (*saltenv='base'*, *extmod\_whitelist=None*, *extmod\_blacklist=None*)

New in version 2017.7.0.

Sync utils modules from `salt://_sdb` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_sdb
```

`salt.runners.saltutil.sync_states` (*saltenv='base'*, *extmod\_blacklist=None*, *extmod\_whitelist=None*)

Sync state modules from `salt://_states` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_states
```

`salt.runners.saltutil.sync_tops` (*saltenv='base'*, *extmod\_blacklist=None*, *extmod\_whitelist=None*)

New in version 2016.3.7,2016.11.4,2017.7.0.

Sync master\_tops modules from `salt://_tops` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

CLI Example:

```
salt-run saltutil.sync_tops
```

`salt.runners.saltutil.sync_utils` (*saltenv='base'*, *extmod\_blacklist=None*, *extmod\_whitelist=None*)

New in version 2016.11.0.

Sync utils modules from `salt://_utils` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_utils
```

`salt.runners.saltutil.sync_wheel` (*saltenv='base'*, *extmod\_blacklist=None*, *extmod\_whitelist=None*)

Sync wheel modules from `salt://_wheel` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_wheel
```

### 14.14.32 salt.runners.sdb

Runner for setting and querying data via the sdb API on the master

`salt.runners.sdb.delete` (*uri*)

Delete a value from a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://` or the value is not successfully deleted, return `False`.

CLI Example:

```
salt '*' sdb.delete sdb://mymemcached/foo
```

`salt.runners.sdb.get(uri)`

Get a value from a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://`, then it will be returned as-is.

CLI Example:

```
salt '*' sdb.get sdb://mymemcached/foo
```

`salt.runners.sdb.get_or_set_hash(uri, length=8, chars='abcdefghijklmnopqrstuvwxyz0123456789!@#$$%^&*(_=+)')`

Perform a one-time generation of a hash and write it to sdb. If that value has already been set return the value instead.

This is useful for generating passwords or keys that are specific to multiple minions that need to be stored somewhere centrally.

CLI Example:

```
salt-run sdb.get_or_set_hash 'SECRET_KEY' 50
```

**Warning:** This function could return strings which may contain characters which are reserved as directives by the YAML parser, such as strings beginning with `%`. To avoid issues when using the output of this function in an SLS file containing YAML+Jinja, surround the call with single quotes.

`salt.runners.sdb.set(uri, value)`

Set a value in a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://` or the value is not successfully set, return `False`.

CLI Example:

```
salt '*' sdb.set sdb://mymemcached/foo bar
```

### 14.14.33 salt.runners.smartos\_vmadm

Runner for SmartOS minions control vmadm

`salt.runners.smartos_vmadm.get(search, one=True)`

Return information for vms

**search** [string] filter vms, see the execution module.

**one** [boolean] return only one vm

---

**Note:** If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uid, hostname, and alias.

---

CLI Example:

```
salt-run vmadm.get 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.get search='alias=saskia'
```

`salt.runners.smartos_vmadm.is_running(search)`

Return true if vm is running

**search** [string] filter vms, see the execution module.

---

**Note:** If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

---

---

**Note:** If multiple vms are matched, the result will be true of ALL vms are running

---

CLI Example:

```
salt-run vmadm.is_running 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.is_running search='alias=julia'
```

**salt.runners.smartos\_vmadm.list** (*search=None, verbose=False*)

List all vms

**search** [string] filter vms, see the execution module

**verbose** [boolean] print additional information about the vm

CLI Example:

```
salt-run vmadm.list
salt-run vmadm.list search='type=KVM'
salt-run vmadm.list verbose=True
```

**salt.runners.smartos\_vmadm.nodes** (*verbose=False*)

List all compute nodes

**verbose** [boolean] print additional information about the node e.g. platform version, hvm capable, ...

CLI Example:

```
salt-run vmadm.nodes
salt-run vmadm.nodes verbose=True
```

**salt.runners.smartos\_vmadm.reboot** (*search, one=True, force=False*)

Reboot one or more vms

**search** [string] filter vms, see the execution module.

**one** [boolean] reboot only one vm

**force** [boolean] force reboot, faster but no graceful shutdown

---

**Note:** If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

---

CLI Example:

```
salt-run vmadm.reboot 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.reboot search='alias=marije'
salt-run vmadm.reboot search='type=KVM' one=False
```

**salt.runners.smartos\_vmadm.start** (*search, one=True*)

Start one or more vms

**search** [string] filter vms, see the execution module.

**one** [boolean] start only one vm

---

**Note:** If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

---

CLI Example:

```
salt-run vmadm.start 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.start search='alias=jiska'
salt-run vmadm.start search='type=KVM' one=False
```

`salt.runners.smartos_vmadm.stop`(*search*, *one=True*)

Stop one or more vms

**search** [string] filter vms, see the execution module.

**one** [boolean] stop only one vm

---

**Note:** If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

---

CLI Example:

```
salt-run vmadm.stop 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.stop search='alias=jody'
salt-run vmadm.stop search='type=KVM' one=False
```

### 14.14.34 salt.runners.search

Runner frontend to search system

`salt.runners.search.query`(*term*)

Query the search system

CLI Example:

```
salt-run search.query foo
```

### 14.14.35 salt.runners.spacewalk

#### Spacewalk Runner

New in version 2016.3.0.

Runner to interact with Spacewalk using Spacewalk API

**codeauthor** Nitin Madhok <nmadhok@clemson.edu>, Joachim Werner <joe@suse.com>, Benedikt Werner <1benediktwerner@gmail.com>

**maintainer** Benedikt Werner <1benediktwerner@gmail.com>

To use this runner, set up the Spacewalk URL, username and password in the master configuration at `/etc/salt/master` or `/etc/salt/master.d/spacewalk.conf`:

```
spacewalk:
  spacewalk01.domain.com:
    username: 'testuser'
    password: 'verybadpass'
  spacewalk02.domain.com:
    username: 'testuser'
    password: 'verybadpass'
```

---

**Note:** Optionally, `protocol` can be specified if the spacewalk server is not using the defaults. Default is `protocol: https`.

---

`salt.runners.spacewalk.addGroupsToKey` (*server, activation\_key, groups*)

Add server groups to a activation key

CLI Example:

```
salt-run spacewalk.addGroupsToKey spacewalk01.domain.com 1-my-key '[group1, ↵
↵group2]'
```

`salt.runners.spacewalk.api` (*server, command, \*args, \*\*kwargs*)

Call the Spacewalk xmlrpc api.

CLI Example:

```
salt-run spacewalk.api spacewalk01.domain.com systemgroup.create MyGroup ↵
↵Description
salt-run spacewalk.api spacewalk01.domain.com systemgroup.create arguments='[
↵"MyGroup", "Description"]'
```

State Example:

```
create_group:
  salt.runner:
    - name: spacewalk.api
    - server: spacewalk01.domain.com
    - command: systemgroup.create
    - arguments:
      - MyGroup
      - Description
```

`salt.runners.spacewalk.deleteAllActivationKeys` (*server*)

Delete all activation keys from Spacewalk

CLI Example:

```
salt-run spacewalk.deleteAllActivationKeys spacewalk01.domain.com
```

`salt.runners.spacewalk.deleteAllGroups` (*server*)

Delete all server groups from Spacewalk

`salt.runners.spacewalk.deleteAllSystems` (*server*)

Delete all systems from Spacewalk

CLI Example:

```
salt-run spacewalk.deleteAllSystems spacewalk01.domain.com
```

`salt.runners.spacewalk.unregister` (*name, server\_url*)

Unregister specified server from Spacewalk

CLI Example:

```
salt-run spacewalk.unregister my-test-vm spacewalk01.domain.com
```

### 14.14.36 salt.runners.ssh

A Runner module interface on top of the salt-ssh Python API.

This allows for programmatic use from salt-api, the Reactor, Orchestrate, etc.

`salt.runners.ssh.cmd(tgt, fun, arg=(), timeout=None, tgt_type='glob', kwarg=None, expr_form=None)`  
New in version 2015.5.0.

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Execute a single command via the salt-ssh subsystem and return all routines at once

A wrapper around the `SSHClient.cmd` method.

### 14.14.37 salt.runners.state

Execute orchestration functions

`salt.runners.state.event(tagmatch='*', count=-1, quiet=False, sock_dir=None, pretty=False, node='master')`

Watch Salt's event bus and block until the given tag is matched

New in version 2014.7.0.

This is useful for utilizing Salt's event bus from shell scripts or for taking simple actions directly from the CLI.

Enable debug logging to see ignored events.

#### Parameters

- **tagmatch** -- the event is written to stdout for each tag that matches this pattern; uses the same matching semantics as Salt's Reactor.
- **count** -- this number is decremented for each event that matches the tagmatch parameter; pass `-1` to listen forever.
- **quiet** -- do not print to stdout; just block
- **sock\_dir** -- path to the Salt master's event socket file.
- **pretty** -- Output the JSON all on a single line if `False` (useful for shell tools); pretty-print the JSON output if `True`.
- **node** -- Watch the minion-side or master-side event bus. .. versionadded:: 2016.3.0

CLI Examples:

```
# Reboot a minion and run highstate when it comes back online
salt 'jerry' system.reboot && \\\
  salt-run state.event 'salt/minion/jerry/start' count=1 quiet=True && \\\
  salt 'jerry' state.highstate

# Reboot multiple minions and run highstate when all are back online
salt -L 'kevin,stewart,dave' system.reboot && \\\
  salt-run state.event 'salt/minion/*/start' count=3 quiet=True && \\\
  salt -L 'kevin,stewart,dave' state.highstate

# Watch the event bus forever in a shell while-loop.
salt-run state.event | while read -r tag data; do
  echo $tag
  echo $data | jq --color-output .
done
```

See also:

See <https://github.com/saltstack/salt/blob/develop/tests/eventlisten.sh> for an example of usage within a shell script.

`salt.runners.state.orchestrate` (*mods*, *saltenv*='base', *test*=None, *exclude*=None, *pillar*=None, *pillarenv*=None, *pillar\_enc*=None, *orchestration\_jid*=None)

New in version 0.17.0.

Execute a state run from the master, used as a powerful orchestration system.

**See also:**

More Orchestrate documentation

- [Full Orchestrate Tutorial](#)
- [Docs for the master-side state module](#)

CLI Examples:

```
salt-run state.orchestrate webserver
salt-run state.orchestrate webserver saltenv=dev test=True
salt-run state.orchestrate webserver saltenv=dev pillarenv=aws
```

Changed in version 2014.1.1: Runner renamed from `state.sls` to `state.orchestrate`

Changed in version 2014.7.0: Runner uses the pillar variable

Changed in version develop: Runner uses the `pillar_enc` variable that allows renderers to render the pillar. This is usable when supplying the contents of a file as pillar, and the file contains gpg-encrypted entries.

**See also:**

GPG renderer documentation

CLI Examples:

```
salt-run state.orchestrate webserver pillar_enc=gpg pillar="$(cat somefile.json)"
```

`salt.runners.state.orchestrate_high` (*data*, *test*=None, *queue*=False, *pillar*=None, *\*\*kwargs*)

Execute a single state orchestration routine

New in version 2015.5.0.

CLI Example:

```
salt-run state.orchestrate_high '{
  stage_one:
    {salt.state: [{tgt: "db*"}, {sls: postgres_setup}]},
  stage_two:
    {salt.state: [{tgt: "web*"}, {sls: apache_setup}, {
      require: [{salt: stage_one}],
    }]},
}'
```

`salt.runners.state.orchestrate_single` (*fun*, *name*, *test*=None, *queue*=False, *pillar*=None, *\*\*kwargs*)

Execute a single state orchestration routine

New in version 2015.5.0.

CLI Example:

```
salt-run state.orchestrate_single fun=salt.wheel name=key.list_all
```

### 14.14.38 salt.runners.survey

A general map/reduce style salt runner for aggregating results returned by several different minions.

New in version 2014.7.0.

Aggregated results are sorted by the size of the minion pools which returned matching results.

Useful for playing the game: *``some of these things are not like the others...``* when identifying discrepancies in a large infrastructure managed by salt.

`salt.runners.survey.diff(*args, **kwargs)`

Return the DIFFERENCE of the result sets returned by each matching minion pool

New in version 2014.7.0.

These pools are determined from the aggregated and sorted results of a salt command.

This command displays the *``diffs``* as a series of 2-way differences -- namely the difference between the FIRST displayed minion pool (according to sort order) and EACH SUBSEQUENT minion pool result set.

Differences are displayed according to the Python `difflib.unified_diff()` as in the case of the salt execution module `file.get_diff`.

This command is submitted via a salt runner using the general form:

```
salt-run survey.diff [survey_sort=up/down] <target>
                   <salt-execution-module> <salt-execution-module parameters>
```

Optionally accept a `survey_sort=` parameter. Default: `survey_sort=down`

CLI Example #1: (Example to display the *``differences of files``*)

```
salt-run survey.diff survey_sort=up "*" cp.get_file_str file:///etc/hosts
```

`salt.runners.survey.hash(*args, **kwargs)`

Return the MATCHING minion pools from the aggregated and sorted results of a salt command

New in version 2014.7.0.

This command is submitted via a salt runner using the general form:

```
salt-run survey.hash [survey_sort=up/down] <target>
                   <salt-execution-module> <salt-execution-module parameters>
```

Optionally accept a `survey_sort=` parameter. Default: `survey_sort=down`

CLI Example #1: (functionally equivalent to `salt-run manage.up`)

```
salt-run survey.hash "*" test.ping
```

CLI Example #2: (find an *``outlier``* minion config file)

```
salt-run survey.hash "*" file.get_hash /etc/salt/minion survey_sort=up
```

### 14.14.39 salt.runners.test

This runner is used only for test purposes and servers no production purpose

`salt.runners.test.arg(*args, **kwargs)`

Output the given args and kwargs

Kwargs will be filtered for 'private' keynames.

`salt.runners.test.metasyntactic(locality='us')`

Return common metasyntactic variables for the given locality

`salt.runners.test.raw_arg(*args, **kwargs)`

Output the given args and kwargs

`salt.runners.test.sleep(s_time=10)`

Sleep t seconds, then return True

`salt.runners.test.stdout_print()`

Print 'foo' and return 'bar'

`salt.runners.test.stream()`

Return True

#### 14.14.40 salt.runners.thin

The thin runner is used to manage the salt thin systems.

Salt Thin is a transport-less version of Salt that can be used to run routines in a standalone way. This runner has tools which generate the standalone salt system for easy consumption.

`salt.runners.thin.generate(extra_mods='', overwrite=False, so_mods='', python2_bin='python2', python3_bin='python3', absonly=True, compress='gzip')`

Generate the salt-thin tarball and print the location of the tarball Optional additional mods to include (e.g. mako) can be supplied as a comma delimited string. Permits forcing an overwrite of the output file as well.

CLI Example:

```
salt-run thin.generate
salt-run thin.generate mako
salt-run thin.generate mako,wempy 1
salt-run thin.generate overwrite=1
```

`salt.runners.thin.generate_min(extra_mods='', overwrite=False, so_mods='', python2_bin='python2', python3_bin='python3')`

Generate the salt-thin tarball and print the location of the tarball Optional additional mods to include (e.g. mako) can be supplied as a comma delimited string. Permits forcing an overwrite of the output file as well.

CLI Example:

```
salt-run thin.generate_min
```

#### 14.14.41 salt.runners.vault

**maintainer** SaltStack

**maturity** new

**platform** all

Runner functions supporting the Vault modules. Configuration instructions are documented in the execution module docs.

`salt.runners.vault.generate_token`(*minion\_id*, *signature*, *impersonated\_by\_master=False*)

Generate a Vault token for minion *minion\_id*

**minion\_id** The id of the minion that requests a token

**signature** Cryptographic signature which validates that the request is indeed sent by the minion (or the master, see *impersonated\_by\_master*).

**impersonated\_by\_master** If the master needs to create a token on behalf of the minion, this is True. This happens when the master generates minion pillars.

`salt.runners.vault.show_policies`(*minion\_id*)

Show the Vault policies that are applied to tokens for the given minion

**minion\_id** The minions id

CLI Example:

```
salt-run vault.show_policies myminion
```

### 14.14.42 salt.runners.venafiapi

Support for Venafi

Before using this module you need to register an account with Venafi, and configure it in your `master` configuration file.

First, you need to add a placeholder to the `master` file. This is because the module will not load unless it finds an `api_key` setting, valid or not. Open up `/etc/salt/master` and add:

```
venafi:  
  api_key: None
```

Then register your email address with Venafi using the following command:

```
salt-run venafi.register <youremail@yourdomain.com>
```

This command will not return an `api_key` to you; that will be sent to you via email from Venafi. Once you have received that key, open up your `master` file and set the `api_key` to it:

```
venafi:  
  api_key: abcdef01-2345-6789-abcd-ef0123456789
```

`salt.runners.venafiapi.del_cached_domain`(*domains*)

Delete cached domains from the master

CLI Example:

```
salt-run venafi.del_cached_domain domain1.example.com, domain2.example.com
```

`salt.runners.venafiapi.gen_csr`(*minion\_id*, *dns\_name*, *zone='default'*, *country=None*, *state=None*, *loc=None*, *org=None*, *org\_unit=None*, *password=None*)

Generate a csr using the host's `private_key`. Analogous to:

```
VCert gencsr -cn [CN Value] -o "Beta Organization" -ou "Beta Group" -l  
↳ "Palo Alto" -st "California" -c US
```

CLI Example:

```
salt-run venafi.gen_csr <minion_id> <dns_name>
```

`salt.runners.venafiapi.gen_key`(*minion\_id*, *dns\_name=None*, *zone='default'*, *password=None*)

Generate and return an `private_key`. If a `dns_name` is passed in, the `private_key` will be cached under that name. The type of key and the parameters used to generate the key are based on the default certificate use policy associated with the specified zone.

CLI Example:

```
salt-run venafi.gen_key <minion_id> [dns_name] [zone] [password]
```

`salt.runners.venafiapi.get_zone_id`(*zone\_name*)

Get the zone ID for the given zone name

CLI Example:

```
salt-run venafi.get_zone_id default
```

`salt.runners.venafiapi.list_domain_cache`()

List domains that have been cached

CLI Example:

```
salt-run venafi.list_domain_cache
```

`salt.runners.venafiapi.pickup`(*id\_*)

Show certificate requests for this API key

CLI Example:

```
salt-run venafi.show_cert 01234567-89ab-cdef-0123-456789abcdef
```

`salt.runners.venafiapi.register`(*email*)

Register a new user account

CLI Example:

```
salt-run venafi.register email@example.com
```

`salt.runners.venafiapi.renew`(*minion\_id*, *dns\_name=None*, *zone='default'*, *request\_id=None*, *country='US'*, *state='California'*, *loc='Palo Alto'*, *org='Beta Organization'*, *org\_unit='Beta Group'*, *password=None*, *zone\_id=None*)

Request a new certificate

Uses the following command:

```
VCert enroll -z <zone> -k <api key> -cn <domain name>
```

CLI Example:

```
salt-run venafi.request <minion_id> <dns_name>
```

`salt.runners.venafiapi.request`(*minion\_id*, *dns\_name=None*, *zone='default'*, *request\_id=None*, *country='US'*, *state='California'*, *loc='Palo Alto'*, *org='Beta Organization'*, *org\_unit='Beta Group'*, *password=None*, *zone\_id=None*)

Request a new certificate

Uses the following command:

```
VCert enroll -z <zone> -k <api key> -cn <domain name>
```

CLI Example:

```
salt-run venafi.request <minion_id> <dns_name>
```

`salt.runners.venafiapi.show_cert(id_)`

Show certificate requests for this API key

CLI Example:

```
salt-run venafi.show_cert 01234567-89ab-cdef-0123-456789abcdef
```

`salt.runners.venafiapi.show_company(domain)`

Show company information, especially the company id

CLI Example:

```
salt-run venafi.show_company example.com
```

`salt.runners.venafiapi.show_csrs()`

Show certificate requests for this API key

CLI Example:

```
salt-run venafi.show_csrs
```

`salt.runners.venafiapi.show_policies()`

Show zone details for the API key owner's company

CLI Example:

```
salt-run venafi.show_zones
```

`salt.runners.venafiapi.show_rsa(minion_id, dns_name)`

Show a private RSA key

CLI Example:

```
salt-run venafi.show_rsa myminion domain.example.com
```

`salt.runners.venafiapi.show_zones()`

Show zone details for the API key owner's company

CLI Example:

```
salt-run venafi.show_zones
```

#### 14.14.43 salt.runners.virt

Control virtual machines via Salt

`salt.runners.virt.force_off(name)`

Force power down the named virtual machine

`salt.runners.virt.host_info(host=None)`

Return information about the host connected to this master

`salt.runners.virt.init(name, cpu, mem, image, hypervisor='kvm', host=None, seed=True, nic='default', install=True, start=True, disk='default', saltenv='base', enable_vnc=False)`

This routine is used to create a new virtual machine. This routines takes a number of options to determine what the newly created virtual machine will look like.

**name** The mandatory name of the new virtual machine. The name option is also the minion id, all minions must have an id.

**cpu** The number of cpus to allocate to this new virtual machine.

**mem** The amount of memory to allocate to this virtual machine. The number is interpreted in megabytes.

**image** The network location of the virtual machine image, commonly a location on the salt fileserver, but http, https and ftp can also be used.

**hypervisor** The hypervisor to use for the new virtual machine. Default is `kvm`.

**host** The host to use for the new virtual machine, if this is omitted Salt will automatically detect what host to use.

**seed** Set to False to prevent Salt from seeding the new virtual machine.

**nic** The nic profile to use, defaults to the ``default`` nic profile which assumes a single network interface per VM associated with the ``br0`` bridge on the master.

**install** Set to False to prevent Salt from installing a minion on the new VM before it spins up.

**disk** The disk profile to use

**saltenv** The Salt environment to use

`salt.runners.virt.list` (*host=None, quiet=False, hyper=None*)

List the virtual machines on each host, this is a simplified query, showing only the virtual machine names belonging to each host. A single host can be passed in to specify an individual host to list.

`salt.runners.virt.migrate` (*name, target=''*)

Migrate a VM from one host to another. This routine will just start the migration and display information on how to look up the progress.

`salt.runners.virt.next_host` ()

Return the host to use for the next autodeployed VM. This queries the available host and executes some math to determine the most ``available`` next host.

`salt.runners.virt.pause` (*name*)

Pause the named VM

`salt.runners.virt.purge` (*name, delete\_key=True*)

Destroy the named VM

`salt.runners.virt.query` (*host=None, quiet=False*)

Query the virtual machines. When called without options all hosts are detected and a full query is returned. A single host can be passed in to specify an individual host to query.

`salt.runners.virt.reset` (*name*)

Force power down and restart an existing VM

`salt.runners.virt.resume` (*name*)

Resume a paused VM

`salt.runners.virt.start` (*name*)

Start a named virtual machine

`salt.runners.virt.vm_info` (*name, quiet=False*)

Return the information on the named VM

#### 14.14.44 salt.runners.vistara

Vistara Runner

Runner to interact with the Vistara (<http://www.vistarait.com/>) REST API

**codeauthor** Brad Thurber <[brad.thurber@gmail.com](mailto:brad.thurber@gmail.com)>

To use this runner, the Vistara `client_id` and Vistara `oauth2 client_key` and `client_secret` must be set in the master config.

For example `/etc/salt/master.d/_vistara.conf`:

```
vistara:
  client_id: client_012345
  client_key: N0tReallyaR3alKeyButShouldB12345
  client_secret: ThisI5AreallyLongsecretKeyIwonderwhyTheyMakethemSoBigTheseDays00
```

`salt.runners.vistara.delete_device` (*name*, *safety\_on=True*)

Deletes a device from Vistara based on DNS name or partial name. By default, `delete_device` will only perform the delete if a single host is returned. Set `safety_on=False` to delete all matches (up to default API search page size)

CLI Example:

```
salt-run vistara.delete_device 'hostname-101.mycompany.com'
salt-run vistara.delete_device 'hostname-101'
salt-run vistara.delete_device 'hostname-1' safety_on=False
```

#### 14.14.45 salt.runners.winrepo

Runner to manage Windows software repo

`salt.runners.winrepo.genrepo` (*opts=None*, *fire\_event=True*)

Generate `winrepo_cache`file based on `sls` files in the `winrepo_dir`

**opts** Specify an alternate `opts` dict. Should not be used unless this function is imported into an execution module.

**fire\_event** [True] Fire an event on failure. Only supported on the master.

CLI Example:

```
salt-run winrepo.genrepo
```

`salt.runners.winrepo.update_git_repos` (*opts=None*, *clean=False*, *masterless=False*)

Checkout git repos containing Windows Software Package Definitions

**opts** Specify an alternate `opts` dict. Should not be used unless this function is imported into an execution module.

**clean** [False] Clean repo `cachedirs` which are not configured under `winrepo_remoses`.

**Warning:** This argument should not be set to `True` if a mix of git and non-git repo definitions are being used, as it will result in the non-git repo definitions being removed.

New in version 2015.8.0.

CLI Examples:

```
salt-run winrepo.update_git_repos
salt-run winrepo.update_git_repos clean=True
```

## 14.15 sdb modules

`cache`

cache Module

`confidant`

An SDB module for getting credentials from confidant.

Continued on next page

Table 14.15 -- continued from previous page

<code>consul</code>	Consul sdb Module
<code>couchdb</code>	CouchDB sdb Module
<code>env</code>	Environment sdb Module
<code>etcd_db</code>	etcd Database Module
<code>keyring_db</code>	Keyring Database Module
<code>memcached</code>	Memcached sdb Module
<code>rest</code>	Generic REST API SDB Module
<code>sqlite3</code>	SQLite sdb Module
<code>tism</code>	tISM - the Immutalbe Secrets Manager SDB Module
<code>vault</code>	Vault SDB Module
<code>yaml</code>	Pull sdb values from a YAML file

### 14.15.1 salt.sdb.cache module

cache Module

**maintainer** SaltStack

**maturity** New

**platform** all

New in version 2017.7.0.

This module provides access to Salt's cache subsystem.

Like all sdb modules, the cache module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
mastercloudcache:
  driver: cache
  bank: cloud/active/ec2/my-ec2-conf/saltmaster
  cachedir: /var/cache/salt
```

The `driver` refers to the cache module, `bank` refers to the cache bank that contains the data and `cachedir` (optional), if used, points to an alternate directory for cache data storage.

```
master_ip: sdb://mastercloudcache/public_ips
```

It is also possible to override both the `bank` and `cachedir` options inside the SDB URI:

```
master_ip: sdb://mastercloudcache/public_ips?cachedir=/var/cache/salt
```

For this reason, both the `bank` and the `cachedir` options can be omitted from the SDB profile. However, if the `bank` option is omitted, it must be specified in the URI:

```
master_ip: sdb://mastercloudcache/public_ips?bank=cloud/active/ec2/my-ec2-conf/
↳saltmaster
```

`salt.sdb.cache.delete` (*key, service=None, profile=None*)

Get a value from the cache service

`salt.sdb.cache.get` (*key, service=None, profile=None*)

Get a value from the cache service

`salt.sdb.cache.set` (*key, value, service=None, profile=None*)

Set a key/value pair in the cache service

## 14.15.2 salt.sdb.confidant

An SDB module for getting credentials from confidant.

### Configuring the Confidant module

The module can be configured via sdb in the minion config:

```
confidant:
  driver: confidant
  # The URL of the confidant web service
  url: 'https://confidant-production.example.com'
  # The context to use for KMS authentication
  auth_context:
    from: example-production-iad
    to: confidant-production-iad
    user_type: service
  # The KMS master key to use for authentication
  auth_key: "alias/authnz"
  # Cache file for KMS auth token
  token_cache_file: /run/confidant/confidant_token
  # The duration of the validity of a token, in minutes
  token_duration: 60
  # key, keyid and region can be defined in the profile, but it's generally
  # best to use IAM roles or environment variables for AWS auth.
  keyid: 98nh9h9h908h09kjjk
  key: jhf908gyeghehe0he0g8h9u0j0n0n09hj09h0
  region: us-east-1
```

**depends** confidant-common, confidant-client

### Module Documentation

`salt.sdb.confidant.get`(key, profile=None)

Read pillar data from Confidant via its API.

CLI Example:

```
salt myminion sdb.get `sdb://confidant/credentials`
```

Valid keys are: credentials, credentials\_metadata, result. credentials returns a dict of joined credential\_pairs, credentials\_metadata returns a dict of metadata relevant to the credentials mapped to the confidant service, and result returns a bool that can be used to determine if the sdb call succeeded or failed to fetch credentials from confidant (or from local cache). If result is false, the data in credentials or credentials\_metadata can't be trusted.

## 14.15.3 salt.sdb.consul module

Consul sdb Module

**maintainer** SaltStack

**maturity** New

**platform** all

This module allows access to Consul using an sdb:// URI

Like all sdb modules, the Consul module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. For example:

The `driver` refers to the Consul module, all other options are optional. For option details see: <https://python-consul.readthedocs.io/en/latest/#consul>

```
salt.sdb.consul.get_conn(profile)
    Return a client object for accessing consul
```

#### 14.15.4 salt.sdb.couchdb

CouchDB sdb Module

```
maintainer SaltStack
maturity New
depends python2-couchdb
platform all
```

This allow interaction between Salt and a CouchDB [couchdb.apache.org] database. It uses salt's `sdb` system to allow for inserts and retrievals using the `sdb://` prefix in salt configuration files.

To use the couchbase sdb module, it must first be configured in the salt master or minion config. The following arguments are required:

```
couchdb_sdb:
  driver: couchdb
  host: localhost
  port: 5984
  database: salt_sdb
```

One could then query the CouchDB instance via an `sdb://` URI such as the following:

```
password: sdb://couchdb_sdb/mykey
```

To use this interface, you must track IDs on your own or have another source to do the map-reduce logic necessary to calculate the ID you wish to fetch.

Additional contributions to build true map-reduce functionality into this module would be welcome.

```
salt.sdb.couchdb.get(key, profile=None)
    Get a value from couchdb by id
```

```
salt.sdb.couchdb.set(key, value, profile=None)
    Set a key/value pair in couchdb
```

#### 14.15.5 salt.sdb.env module

Environment sdb Module

```
maintainer SaltStack
maturity New
depends None
platform all
```

This module allows access to environment variables using an `sdb://` URI.

Example configuration for this module:

```
osenv:
  driver: env
```

**WARNING:**

OS environment variables will be available to read via SDB. Please make sure you don't have any sensitive data in your environment variables!!

Example usage of `sdb env` module:

```
set some env var:
  cmd.run:
    - name: echo {{ salt['sdb.set']('sdb://osenv/foo', 'bar') }}
    - order: 1

{% if salt['sdb.get']('sdb://osenv/foo') == 'bar' %}
always-changes-and-succeeds:
  test.succeed_with_changes:
    - name: foo
{% else %}
always-changes-and-fails:
  test.fail_with_changes:
    - name: foo
{% endif %}
```

The above example will return success.

The `env` `sdb` module can also be used with salt cloud. Assuming you have exported the environment variable named `compute` (and have `osenv` defined). The example below will look for the salt cloud config key `compute_name` in the environment:

```
my-openstack-config:
  compute_name: sdb://osenv/compute
  ..snip
```

`salt.sdb.env.get` (*key*, *profile=None*)  
Get a value

`salt.sdb.env.set` (*key*, *value*, *profile=None*)  
Set a key/value pair

### 14.15.6 salt.sdb.etcd\_db

etcd Database Module

**maintainer** SaltStack  
**maturity** New  
**depends** python-etcd  
**platform** all

New in version 2015.5.0.

This module allows access to the etcd database using an `sdb://` URI. This package is located at <https://pypi.python.org/pypi/python-etcd>.

Like all sdb modules, the etcd module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
myetcd:
  driver: etcd
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

The `driver` refers to the etcd module, `etcd.host` refers to the host that is hosting the etcd database and `etcd.port` refers to the port on that host.

```
password: sdb://myetcd/mypassword
```

`salt.sdb.etcd_db.delete`(*key*, *service=None*, *profile=None*)  
Get a value from the etcd service

`salt.sdb.etcd_db.get`(*key*, *service=None*, *profile=None*)  
Get a value from the etcd service

`salt.sdb.etcd_db.set`(*key*, *value*, *service=None*, *profile=None*)  
Set a key/value pair in the etcd service

### 14.15.7 salt.sdb.keyring\_db

Keyring Database Module

**maintainer** SaltStack

**maturity** New

**depends** keyring

**platform** all

This module allows access to the keyring package using an `sdb://` URI. This package is located at <https://pypi.python.org/pypi/keyring>.

Care must be taken when using keyring. Not all keyend backends are supported on all operating systems. Also, many backends require an agent to be running in order to work. For instance, the ``Secret Service`` backend requires a compatible agent such as `gnome-keyring-daemon` or `kwallet` to be running. The keyczar backend does not seem to enjoy the benefits of an agent, and so using it will require either that the password is typed in manually (which is unreasonable for the salt-minion and salt-master daemons, especially in production) or an agent is written for it.

Like all sdb modules, the keyring module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
mykeyring:
  driver: keyring
  service: system
```

The `driver` refers to the keyring module, `service` refers to the service that will be used inside of keyring (which may be likened unto a database table) and `mykeyring` refers to the name that will appear in the URI:

```
password: sdb://mykeyring/mypassword
```

The underlying backend configuration must be configured via keyring itself. For examples and documentation, see keyring:

<https://pypi.python.org/pypi/keyring>

New in version 2014.1.4.

`salt.sdb.keyring_db.get(key, service=None, profile=None)`  
Get a value from a keyring service

`salt.sdb.keyring_db.set(key, value, service=None, profile=None)`  
Set a key/value pair in a keyring service

### 14.15.8 salt.sdb.memcached

Memcached sdb Module

**maintainer** SaltStack

**maturity** New

**depends** python-memcached

**platform** all

This module allows access to memcached using an `sdb://` URI. This package is located at <https://pypi.python.org/pypi/python-memcached>.

Like all sdb modules, the memcached module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
mymemcache:  
  driver: memcached  
  host: localhost  
  port: 11211
```

The `driver` refers to the memcached module, `host` and `port` the memcached server to connect to (defaults to `localhost` and `11211`, and `mymemcached` refers to the name that will appear in the URI:

```
password: sdb://mymemcached/mykey
```

`salt.sdb.memcached.get(key, profile=None)`  
Get a value from memcached

`salt.sdb.memcached.set(key, value, profile=None)`  
Set a key/value pair in memcached

### 14.15.9 salt.sdb.rest module

Generic REST API SDB Module

**maintainer** SaltStack

**maturity** New

**platform** all

New in version 2015.8.0.

This module allows access to a REST interface using an `sdb://` URI.

Like all REST modules, the REST module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
my-rest-api:
  driver: rest
  urls:
    url: https://api.github.com/
  keys:
    url: https://api.github.com/users/{{user}}/keys
  backend: requests
```

The `driver` refers to the REST module, and must be set to `rest` in order to use this driver. Each of the other items inside this block refers to a separate set of HTTP items, including a URL and any options associated with it. The options used here should match the options available in `salt.utils.http.query()`.

In order to call the `urls` item in the example, the following reference can be made inside a configuration file:

```
github_urls: sdb://my-rest-api/urls
```

Key/Value pairs may also be used with this driver, and merged into the URL using the configured renderer (`jinja`, by default). For instance, in order to use the `keys` item in the example, the following reference can be made:

```
github_urls: sdb://my-rest-api/keys?user=myuser
```

This will cause the following URL to actually be called:

```
https://api.github.com/users/myuser/keys
```

Key/Value pairs will NOT be passed through as GET data. If GET data needs to be sent to the URL, then it should be configured in the SDB configuration block. For instance:

```
another-rest-api:
  driver: rest
  user_data:
    url: https://api.example.com/users/
  params:
    user: myuser
```

`salt.sdb.rest.get(key, service=None, profile=None)`

Get a value from the REST interface

`salt.sdb.rest.query(key, value=None, service=None, profile=None)`

Get a value from the REST interface

`salt.sdb.rest.set(key, value, service=None, profile=None)`

Set a key/value pair in the REST interface

### 14.15.10 salt.sdb.sqlite3

SQLite sdb Module

**maintainer** SaltStack

**maturity** New

**platform** all

This module allows access to sqlite3 using an `sdb://` URI

Like all `sdb` modules, the `sqlite3` module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. For example:

```
mysqlite:
  driver: sqlite3
  database: /tmp/sdb.sqlite
  table: sdb
  create_table: True
```

The `driver` refers to the `sqlite3` module, `database` refers to the `sqlite3` database file. `table` is the table within the db that will hold keys and values (defaults to `sdb`). The database and table will be created if they do not exist.

### Advanced Usage:

Instead of a table name, it is possible to provide custom SQL statements to create the table(s) and get and set values.

`salt.sdb.sqlite3.get(key, profile=None)`  
Get a value from `sqlite3`

`salt.sdb.sqlite3.set(key, value, profile=None)`  
Set a key/value pair in `sqlite3`

## 14.15.11 salt.sdb.tism module

tISM - the Immutalbe Secrets Manager SDB Module

**maintainer** tISM

**maturity** New

**platform** all

New in version 2017.7.0.

This module will decrypt PGP encrypted secrets against a tISM server.

```
sdb://<profile>/<encrypted secret>
```

```
sdb://tism/
```

```
→hQEMAzJ+GfdAB3KqAQf9E3cyvrPEWR1sf1tMvH0nrJ0bZa9kDFLPxvtwA0qlrInp0F7IpiiVRF+h+sW5Mb4ffb1TElMzQ+/
→G5ptd6CjmgBfBsuGeajWmvLEi4lC6/
→9v1rYGjjLe0CCcN4Dl5AHlxUUaSrxb8akTDvSANPvGhtRTZqDl1tl5UEHsyYXM8RaeCrBw50r1yvC9Ctx2saVp3xmALQvyhzkU
→H30L/r50+CBkuI/u4M2pXDcMYsvvt4ajCbJn91qaQ7BDI=
```

A profile must be setup in the minion configuration or pillar. If you want to use `sdb` in a runner or pillar you must also place a profile in the master configuration.

```
tism:
  driver: tism
  url: https://my.tismd:8080/decrypt
  token: eyJhbGciOiJIUzI1NiIsInR5cCI6IkpXVCJ9.
→eyJhZG1pb2I6Im5wZXhwIjojNTg1MTE5NDYwLCJqdGkiOiI3NnA5cWwiMmVudmV4Iiwia2V5cyI6WyJBTEwiXX0.
→RtAhG6Uorf5xnSf4Ya_GwJnoHkCsql4r1_hi0eDSLzo
```

`salt.sdb.tism.get(key, service=None, profile=None)`  
Get a decrypted secret from the tISMd API

### 14.15.12 salt.sdb.vault module

Vault SDB Module

**maintainer** SaltStack  
**maturity** New  
**platform** all

New in version 2016.11.0.

This module allows access to Hashicorp Vault using an `sdb://` URI.

Base configuration instructions are documented in the execution module docs. Below are noted extra configuration required for the `sdb` module, but the base configuration must also be completed.

Like all `sdb` modules, the `vault` module requires a configuration profile to be configured in either the minion configuration file or a pillar. This profile requires only setting the `driver` parameter to `vault`:

```
myvault:
  driver: vault
```

Once configured you can access data using a URL such as:

```
password: sdb://myvault/secret/passwords?mypassword
```

In this URL, `myvault` refers to the configuration profile, `secret/passwords` is the path where the data resides, and `mypassword` is the key of the data to return.

The above URI is analogous to running the following vault command:

```
$ vault read -field=mypassword secret/passwords
```

`salt.sdb.vault.get(key, profile=None)`  
Get a value from the vault service

`salt.sdb.vault.set(key, value, profile=None)`  
Set a key/value pair in the vault service

### 14.15.13 salt.sdb.yaml module

Pull `sdb` values from a YAML file

**maintainer** SaltStack  
**maturity** New  
**platform** all

New in version 2017.7.0.

Configuration:

```
my-yaml-file:
  driver: yaml
  files:
```

```
- /path/to/foo.yaml
- /path/to/bar.yaml
```

The files are merged together and the result is searched using the same mechanism Salt uses for searching Grains and Pillar data structures.

Optional configuration:

```
my-yaml-file:
  driver: yaml
  files:
    - /path/to/foo.yaml
    - /path/to/bar.yaml
  merge:
    strategy: smart
    merge_list: false
```

`salt.sdb.yaml.get(key, profile=None)`

Get a value from the REST interface

`salt.sdb.yaml.set(*args, **kwargs)`

Setting a value is not supported; edit the YAML files directly

## 14.16 serializer modules

<code>configparser</code>	<code>salt.serializers.configparser</code>
<code>json</code>	<code>salt.serializers.json</code>
<code>msgpack</code>	<code>salt.serializers.msgpack</code>
<code>python</code>	<code>salt.serializers.python</code>
<code>yaml</code>	<code>salt.serializers.yaml</code>
<code>yamlex</code>	<code>salt.serializers.yamlex</code>

### 14.16.1 salt.serializers.configparser module

#### `salt.serializers.configparser`

New in version 2016.3.0.

Implements a configparser serializer.

`salt.serializers.configparser.deserialize(stream_or_string, **options)`

Deserialize any string or stream like object into a Python data structure.

Parameters

- **stream\_or\_string** -- stream or string to deserialize.
- **options** -- options given to lower configparser module.

`salt.serializers.configparser.serialize(obj, **options)`

Serialize Python data to a configparser formatted string or file.

Parameters

- **obj** -- the data structure to serialize
- **options** -- options given to lower configparser module.

## 14.16.2 salt.serializers.json

### salt.serializers.json

Implements JSON serializer.

It's just a wrapper around json (or simplejson if available).

`salt.serializers.json.deserialize(stream_or_string, **options)`

Deserialize any string or stream like object into a Python data structure.

Parameters

- **stream\_or\_string** -- stream or string to deserialize.
- **options** -- options given to lower json/simplejson module.

`salt.serializers.json.serialize(obj, **options)`

Serialize Python data to JSON.

Parameters

- **obj** -- the data structure to serialize
- **options** -- options given to lower json/simplejson module.

## 14.16.3 salt.serializers.msgpack

### salt.serializers.msgpack

Implements MsgPack serializer.

`salt.serializers.msgpack.deserialize(stream_or_string, **options)`

Deserialize any string or stream like object into a Python data structure.

Parameters

- **stream\_or\_string** -- stream or string to deserialize.
- **options** -- options given to lower msgpack module.

`salt.serializers.msgpack.serialize(obj, **options)`

Serialize Python data to MsgPack.

Parameters

- **obj** -- the data structure to serialize
- **options** -- options given to lower msgpack module.

## 14.16.4 salt.serializers.python module

### salt.serializers.python

New in version 2016.3.0.

Implements a Python serializer (via pprint.format)

`salt.serializers.python.serialize(obj, **options)`

Serialize Python data to a Python string representation (via pprint.format)

Parameters

- **obj** -- the data structure to serialize
- **options** -- options given to pprint.format

## 14.16.5 salt.serializers.yaml

### salt.serializers.yaml

Implements YAML serializer.

Underneath, it is based on pyyaml and use the safe dumper and loader. It also use C bindings if they are available.

`salt.serializers.yaml.deserialize(stream_or_string, **options)`

Deserialize any string of stream like object into a Python data structure.

Parameters

- **stream\_or\_string** -- stream or string to deserialize.
- **options** -- options given to lower yaml module.

`salt.serializers.yaml.serialize(obj, **options)`

Serialize Python data to YAML.

Parameters

- **obj** -- the data structure to serialize
- **options** -- options given to lower yaml module.

## 14.16.6 salt.serializers.yamlex

### salt.serializers.yamlex

YAMLEX is a format that allows for things like sls files to be more intuitive.

It's an extension of YAML that implements all the salt magic: - it implies omap for any dict like. - it implies that string like data are str, not unicode - ...

For example, the file `states.sls` has this contents:

```
foo:
  bar: 42
  baz: [1, 2, 3]
```

The file can be parsed into Python like this

```
from salt.serializers import yamlex

with open('state.sls', 'r') as stream:
    obj = yamlex.deserialize(stream)
```

Check that obj is an OrderedDict

```
from salt.utils.odict import OrderedDict

assert isinstance(obj, dict)
assert isinstance(obj, OrderedDict)
```

`yamlex.__repr__` and `__str__` objects' methods render YAML understandable string. It means that they are template friendly.

```
print '{0}'.format(obj)
```

returns:

```
{foo: {bar: 42, baz: [1, 2, 3]}}
```

and they are still valid YAML:

```
from salt.serializers import yaml
yaml_obj = yaml.deserialize(str(obj))
assert yaml_obj == obj
```

yamlex implements also custom tags:

`!aggregate`

this tag allows structures aggregation.

For example:

```
placeholder: !aggregate foo
placeholder: !aggregate bar
placeholder: !aggregate baz
```

is rendered as

```
placeholder: [foo, bar, baz]
```

`!reset`

this tag flushes the computing value.

```
placeholder: {!aggregate foo: {foo: 42}}
placeholder: {!aggregate foo: {bar: null}}
!reset placeholder: {!aggregate foo: {baz: inga}}
```

is roughly equivalent to

```
placeholder: {!aggregate foo: {baz: inga}}
```

Document is defacto an aggregate mapping.

`salt.serializers.yamlex.deserialize(stream_or_string, **options)`

Deserialize any string of stream like object into a Python data structure.

Parameters

- **stream\_or\_string** -- stream or string to deserialize.
- **options** -- options given to lower yaml module.

`salt.serializers.yamlex.serialize(obj, **options)`

Serialize Python data to YAML.

Parameters

- **obj** -- the data structure to serialize
- **options** -- options given to lower yaml module.

## 14.17 state modules

<code>acme</code>	ACME / Let's Encrypt certificate management state
<code>alias</code>	Configuration of email aliases
<code>alternatives</code>	Configuration of the alternatives system
Continued on next page	

Table 14.17 -- continued from previous page

<i>apache</i>	Apache state
<i>apache_conf</i>	Manage Apache Confs
<i>apache_module</i>	Manage Apache Modules
<i>apache_site</i>	Manage Apache Sites
<i>aptpkg</i>	Package management operations specific to APT- and DEB-based systems
<i>archive</i>	Extract an archive
<i>artifactory</i>	This state downloads artifacts from artifactory.
<i>at</i>	Configuration disposable regularly scheduled tasks for at.
<i>augeas</i>	Configuration management using Augeas
<i>aws_sqs</i>	Manage SQS Queues
<i>beacon</i>	Management of the Salt beacons
<i>bigip</i>	A state module designed to enforce load-balancing configurations for F5 Big-IP entities.
<i>blockdev</i>	Management of Block Devices
<i>boto3_elasticache</i>	Manage Elasticache with boto3
<i>boto3_route53</i>	Manage Route53 records with Boto 3
<i>boto_apigateway</i>	Manage Apigateway Rest APIs
<i>boto_asg</i>	Manage Autoscale Groups
<i>boto_cfn</i>	Connection module for Amazon Cloud Formation
<i>boto_cloudtrail</i>	Manage CloudTrail Objects
<i>boto_cloudwatch_alarm</i>	Manage Cloudwatch alarms
<i>boto_cloudwatch_event</i>	Manage CloudTrail Objects
<i>boto_cognitoidentity</i>	Manage CognitoIdentity Functions
<i>boto_datapipeline</i>	Manage Data Pipelines
<i>boto_dynamodb</i>	Manage DynamoDB Tables
<i>boto_ec2</i>	Manage EC2
<i>boto_elasticache</i>	Manage Elasticache
<i>boto_elasticsearch_domain</i>	Manage Elasticsearch Domains
<i>boto_elb</i>	Manage ELBs
<i>boto_elbv2</i>	Manage AWS Application Load Balancer
<i>boto_iam</i>	Manage IAM objects
<i>boto_iam_role</i>	Manage IAM roles
<i>boto_iot</i>	Manage IoT Objects
<i>boto_kinesis</i>	Manage Kinesis Streams
<i>boto_kms</i>	Manage KMS keys, key policies and grants.
<i>boto_lambda</i>	Manage Lambda Functions
<i>boto_lc</i>	Manage Launch Configurations
<i>boto_rds</i>	Manage RDSs
<i>boto_route53</i>	Manage Route53 records
<i>boto_s3_bucket</i>	Manage S3 Buckets
<i>boto_secgroup</i>	Manage Security Groups
<i>boto_sns</i>	Manage SNS Topics
<i>boto_sqs</i>	Manage SQS Queues
<i>boto_vpc</i>	Manage VPCs
<i>bower</i>	Installation of Bower Packages
<i>cabal</i>	Installation of Cabal Packages
<i>ceph</i>	Manage ceph with salt.
<i>chef</i>	Execute Chef client runs
<i>chocolatey</i>	Manage Chocolatey package installs ..

Table 14.17 -- continued from previous page

<i>chronos_job</i>	Configure Chronos jobs via a salt proxy.
<i>cisconso</i>	State module for Cisco NSO Proxy minions
<i>cloud</i>	Using states instead of maps to deploy clouds
<i>cmd</i>	Execution of arbitrary commands
<i>composer</i>	Installation of Composer Packages
<i>cron</i>	Management of cron, the Unix command scheduler
<i>csf</i>	
<i>cyg</i>	Installation of Cygwin packages.
<i>ddns</i>	Dynamic DNS updates
<i>debconfmod</i>	Management of debconf selections
<i>dellchassis</i>	Manage chassis via Salt Proxies.
<i>disk</i>	Disk monitoring state
<i>docker</i>	States to manage Docker containers, images, volumes, and networks
<i>docker_container</i>	Management of Docker containers
<i>docker_image</i>	Management of Docker images
<i>docker_network</i>	Management of Docker networks
<i>docker_volume</i>	Management of Docker volumes
<i>drac</i>	Management of Dell DRAC
<i>elasticsearch</i>	State module to manage Elasticsearch.
<i>elasticsearch_index</i>	State module to manage Elasticsearch indices
<i>elasticsearch_index_template</i>	State module to manage Elasticsearch index templates
<i>environ</i>	Support for getting and setting the environment variables of the current salt process.
<i>eselect</i>	Management of Gentoo configuration using eselect
<i>etcd_mod</i>	Manage etcd Keys
<i>ethtool</i>	Configuration of network device
<i>esxi</i>	Manage VMware ESXi Hosts.
<i>event</i>	Send events through Salt's event system during state runs
<i>file</i>	Operations on regular files, special files, directories, and symlinks
<i>firewall</i>	State to check firewall configurations ..
<i>firewalld</i>	Management of firewalld
<i>gem</i>	Installation of Ruby modules packaged as gems
<i>git</i>	States to manage git repositories and git configuration
<i>github</i>	Github User State Module
<i>glance</i>	Managing Images in OpenStack Glance
<i>glusterfs</i>	Manage GlusterFS pool.
<i>gnomedesktop</i>	Configuration of the GNOME desktop
<i>gpg</i>	Management of the GPG keychains
<i>grafana</i>	Manage Grafana Dashboards
<i>grafana4_dashboard</i>	Manage Grafana v4.0 Dashboards
<i>grafana4_datasource</i>	Manage Grafana v4.0 data sources
<i>grafana4_org</i>	Manage Grafana v4.0 orgs
<i>grafana4_user</i>	Manage Grafana v4.0 users
<i>grafana_dashboard</i>	Manage Grafana v2.0 Dashboards
<i>grafana_datasource</i>	Manage Grafana v2.0 data sources
<i>grains</i>	Manage grains on the minion
<i>group</i>	Management of user groups
<i>heat</i>	Management of Heat

Continued on next page

Table 14.17 -- continued from previous page

<i>hg</i>	Interaction with Mercurial repositories
<i>hipchat</i>	Send a message to Hipchat
<i>host</i>	Management of addresses and names in hosts file
<i>htpasswd</i>	Support for htpasswd module.
<i>http</i>	HTTP monitoring states
<i>icinga2</i>	Icinga2 state
<i>ifttt</i>	Trigger an event in IFTTT
<i>incron</i>	Management of incron, the inotify cron
<i>influxdb08_database</i>	Management of Influxdb 0.8 databases
<i>influxdb08_user</i>	Management of InfluxDB 0.8 users
<i>influxdb_continuous_query</i>	Management of Influxdb continuous queries
<i>influxdb_database</i>	Management of Influxdb databases
<i>influxdb_retention_policy</i>	Management of Influxdb retention policies
<i>influxdb_user</i>	Management of InfluxDB users
<i>infoblox</i>	states for infoblox stuff
<i>ini_manage</i>	Manage ini files
<i>ipmi</i>	Manage IPMI devices over LAN
<i>ipset</i>	Management of ipsets
<i>iptables</i>	Management of iptables
<i>jboss7</i>	Manage JBoss 7 Application Server via CLI interface
<i>jenkins</i>	Management of Jenkins
<i>junos</i>	State modules to interact with Junos devices.
<i>k8s</i>	Manage Kubernetes
<i>kapacitor</i>	Kapacitor state module.
<i>keyboard</i>	Management of keyboard layouts
<i>keystone</i>	Management of Keystone users
<i>kmod</i>	Loading and unloading of kernel modules
<i>kubernetes</i>	Manage kubernetes resources as salt states
<i>layman</i>	Management of Gentoo Overlays using layman
<i>ldap</i>	Manage entries in an LDAP database
<i>libcloud_dns</i>	Manage DNS records and zones using libcloud
<i>linux_acl</i>	Linux File Access Control Lists
<i>locale</i>	Management of languages/locales
<i>logrotate</i>	Module for managing logrotate.
<i>loop</i>	Loop state
<i>lvm</i>	Management of Linux logical volumes
<i>lvs_server</i>	Management of LVS (Linux Virtual Server) Real Server
<i>lvs_service</i>	Management of LVS (Linux Virtual Server) Service
<i>lxc</i>	Manage Linux Containers
<i>mac_assistive</i>	Allows you to manage assistive access on macOS minions with 10.9+
<i>mac_defaults</i>	Writing/reading defaults from a macOS minion
<i>mac_keychain</i>	Installing of certificates to the keychain
<i>mac_package</i>	Installing of mac pkg files
<i>mac_xattr</i>	Allows you to manage extended attributes on files or directories
<i>makeconf</i>	Management of Gentoo make.conf
<i>marathon_app</i>	Configure Marathon apps via a salt proxy.
<i>mdadm</i>	Managing software RAID with mdadm
<i>memcached</i>	States for Management of Memcached Keys

Continued on next page

Table 14.17 -- continued from previous page

<i>modjk</i>	State to control Apache modjk
<i>modjk_worker</i>	Manage modjk workers
<i>module</i>	Execution of Salt modules from within states
<i>mongodb_database</i>	Management of Mongodb databases
<i>mongodb_user</i>	Management of Mongodb users
<i>monit</i>	Monit state
<i>mount</i>	Mounting of filesystems
<i>msteams</i>	Send a message card to Microsoft Teams ===== This state is useful for sending messages to Teams during state runs.
<i>mysql_database</i>	Management of MySQL databases (schemas)
<i>mysql_grants</i>	Management of MySQL grants (user permissions)
<i>mysql_query</i>	Execution of MySQL queries
<i>mysql_user</i>	Management of MySQL users
<i>netacl</i>	Network ACL
<i>netconfig</i>	Network Config
<i>netntp</i>	Network NTP
<i>netsnmp</i>	Network SNMP
<i>netusers</i>	Network Users
<i>network</i>	Configuration of network interfaces
<i>netyang</i>	NAPALM YANG state
<i>nftables</i>	Management of nftables
<i>npm</i>	Installation of NPM Packages
<i>ntp</i>	Management of NTP servers
<i>nxos</i>	State module for Cisco NX OS Switches Proxy minions
<i>openstack_config</i>	Manage OpenStack configuration file settings.
<i>openvswitch_bridge</i>	Management of Open vSwitch bridges.
<i>openvswitch_port</i>	Management of Open vSwitch ports.
<i>pagerduty</i>	Create an Event in PagerDuty
<i>pagerduty_escalation_policy</i>	Manage PagerDuty escalation policies.
<i>pagerduty_schedule</i>	Manage PagerDuty schedules.
<i>pagerduty_service</i>	Manage PagerDuty services
<i>pagerduty_user</i>	Manage PagerDuty users.
<i>pcs</i>	Management of Pacemaker/Corosync clusters with PCS
<i>pecl</i>	Installation of PHP Extensions Using pecl
<i>pdbedit</i>	Manage accounts in Samba's passdb using pdbedit
<i>pip_state</i>	Installation of Python Packages Using pip
<i>pkg</i>	Installation of packages using OS package managers such as yum or apt-get
<i>pkgbuild</i>	The pkgbuild state is the front of Salt package building backend.
<i>pkgng</i>	Manage package remote repo using FreeBSD pkgng
<i>pkgrepo</i>	Management of APT/YUM package repos
<i>portage_config</i>	Management of Portage package configuration on Gen- too
<i>ports</i>	Manage software from FreeBSD ports
<i>postgres_cluster</i>	Management of PostgreSQL clusters
<i>postgres_database</i>	Management of PostgreSQL databases
<i>postgres_extension</i>	Management of PostgreSQL extensions
<i>postgres_group</i>	Management of PostgreSQL groups (roles)
Continued on next page	

Table 14.17 -- continued from previous page

<i>postgres_initdb</i>	Initialization of PostgreSQL data directory
<i>postgres_language</i>	Management of PostgreSQL languages
<i>postgres_privileges</i>	Management of PostgreSQL Privileges
<i>postgres_schema</i>	Management of PostgreSQL schemas
<i>postgres_tablespace</i>	Management of PostgreSQL tablespace
<i>postgres_user</i>	Management of PostgreSQL users (roles)
<i>powerpath</i>	Powerpath configuration support
<i>probes</i>	Network Probes
<i>process</i>	Process Management
<i>proxy</i>	Allows you to manage proxy settings on minions
<i>pushover</i>	Send a message to PushOver
<i>pyenv</i>	Managing python installations with pyenv
<i>pyrax_queues</i>	Manage Rackspace Queues
<i>quota</i>	Management of POSIX Quotas
<i>rabbitmq_cluster</i>	Manage RabbitMQ Clusters
<i>rabbitmq_plugin</i>	Manage RabbitMQ Plugins
<i>rabbitmq_policy</i>	Manage RabbitMQ Policies
<i>rabbitmq_user</i>	Manage RabbitMQ Users
<i>rabbitmq_vhost</i>	Manage RabbitMQ Virtual Hosts
<i>rbac_solaris</i>	Management of Solaris RBAC
<i>rbenv</i>	Managing Ruby installations with rbenv
<i>rdp</i>	Manage RDP Service on Windows servers
<i>redismod</i>	Management of Redis server
<i>reg</i>	
<i>rsync</i>	State to synchronize files and directories with rsync.
<i>rvm</i>	Managing Ruby installations and gemsets with Ruby Version Manager (RVM)
<i>salt_proxy</i>	Salt proxy state
<i>saltmod</i>	Control the Salt command interface
<i>schedule</i>	Management of the Salt scheduler
<i>selinux</i>	Management of SELinux rules
<i>serverdensity_device</i>	Monitor Server with Server Density
<i>service</i>	Starting or restarting of services and daemons
<i>slack</i>	Send a message to Slack
<i>smartos</i>	Management of SmartOS Standalone Compute Nodes
<i>smtp</i>	Sending Messages via SMTP
<i>snapper</i>	Managing implicit state and baselines using snapshots
<i>solrcloud</i>	States for solrcloud alias and collection configuration
<i>splunk</i>	Splunk User State Module
<i>splunk_search</i>	Splunk Search State Module
<i>sqlite3</i>	Management of SQLite3 databases
<i>ssh_auth</i>	Control of entries in SSH authorized_key files
<i>ssh_known_hosts</i>	Control of SSH known_hosts entries
<i>stateconf</i>	Stateconf System
<i>status</i>	Minion status monitoring
<i>statuspage</i>	StatusPage
<i>stormpath_account</i>	Support for Stormpath.
<i>supervisord</i>	Interaction with the Supervisor daemon
<i>svn</i>	Manage SVN repositories
<i>sysctl</i>	Configuration of the Linux kernel using sysctl

<i>syslog_ng</i>	State module for syslog_ng
<i>sysrc</i>	
<i>telemetry_alert</i>	New in version 2016.3.0..
<i>test</i>	Test States
<i>testinframod</i>	
<i>timezone</i>	Management of timezones
<i>tls</i>	Enforce state for SSL/TLS
<i>tomcat</i>	Manage Apache Tomcat web applications
<i>trafficserver</i>	Control Apache Traffic Server
<i>tuned</i>	Interface to Red Hat tuned-adm module
<i>uptime</i>	Monitor Web Server with Uptime
<i>user</i>	Management of user accounts
<i>vault</i>	
	<b>maintainer</b> SaltStack
<i>vbox_guest</i>	VirtualBox Guest Additions installer state
<i>victorops</i>	Create an Event in VictorOps
<i>virt</i>	Manage virt
<i>virtualenv_mod</i>	Setup of Python virtualenv sandboxes.
<i>win_certutil</i>	Installing of certificates to the Windows Certificate Manager
<i>win_dacl</i>	Windows Object Access Control Lists
<i>win_dism</i>	Installing of Windows features using DISM
<i>win_dns_client</i>	Module for configuring DNS Client on Windows systems
<i>win_firewall</i>	State for configuring Windows Firewall
<i>win_iis</i>	Microsoft IIS site management
<i>win_lgpo</i>	Manage Windows Local Group Policy
<i>win_license</i>	Installation and activation of windows licenses
<i>win_network</i>	Configuration of network interfaces on Windows hosts
<i>win_path</i>	Manage the Windows System PATH
<i>win_pki</i>	Microsoft certificate management via the Pki PowerShell module.
<i>win_powercfg</i>	This module allows you to control the power settings of a windows minion via powercfg.
<i>win_servermanager</i>	Manage Windows features via the ServerManager powershell module
<i>win_smtp_server</i>	Module for managing IIS SMTP server configuration on Windows servers.
<i>win_snmp</i>	Module for managing SNMP service settings on Windows servers.
<i>win_system</i>	Management of Windows system information
<i>win_update</i>	Management of the windows update agent
<i>win_wua</i>	Installation of Windows Updates using the Windows Update Agent
<i>winrepo</i>	Manage Windows Package Repository
<i>x509</i>	Manage X509 Certificates
<i>xmpp</i>	Sending Messages over XMPP
<i>zabbix_host</i>	Management of Zabbix hosts.
<i>zabbix_hostgroup</i>	Management of Zabbix host groups.
	Continued on next page

Table 14.17 -- continued from previous page

<code>zabbix_mediatype</code>	Management of Zabbix mediatypes.
<code>zabbix_user</code>	Management of Zabbix users.
<code>zabbix_usergroup</code>	Management of Zabbix user groups.
<code>zcbuildout</code>	Management of zc.buildout
<code>zenoss</code>	State to manage monitoring in Zenoss.
<code>zk_concurrency</code>	Control concurrency of steps within state execution using zookeeper
<code>zfs</code>	Management zfs datasets
<code>zone</code>	Management of Solaris Zones
<code>zpool</code>	Management zpool

### 14.17.1 salt.states.acme module

#### ACME / Let's Encrypt certificate management state

See also the module documentation

```

reload-gitlab:
  cmd.run:
    - name: gitlab-ctl hup

dev.example.com:
  acme.cert:
    - aliases:
      - gitlab.example.com
    - email: acmemaster@example.com
    - webroot: /opt/gitlab/embedded/service/gitlab-rails/public
    - renew: 14
    - fire_event: acme/dev.example.com
    - onchanges_in:
      - cmd: reload-gitlab

```

`salt.states.acme.cert` (*name, aliases=None, email=None, webroot=None, test\_cert=False, renew=None, keysize=None, server=None, owner='root', group='root', certname=None*)

Obtain/renew a certificate from an ACME CA, probably Let's Encrypt.

#### Parameters

- **name** -- Common Name of the certificate (DNS name of certificate)
- **aliases** -- subjectAltNames (Additional DNS names on certificate)
- **email** -- e-mail address for interaction with ACME provider
- **webroot** -- True or a full path to webroot. Otherwise use standalone mode
- **test\_cert** -- Request a certificate from the Happy Hacker Fake CA (mutually exclusive with `server`)
- **renew** -- True/'force' to force a renewal, or a window of renewal before expiry in days
- **keysize** -- RSA key bits
- **server** -- API endpoint to talk to
- **owner** -- owner of private key
- **group** -- group of private key
- **certname** -- Name of the certificate to save

### 14.17.2 salt.states.alias

Configuration of email aliases

The mail aliases file can be managed to contain definitions for specific email aliases:

```
username:
  alias.present:
    - target: user@example.com
```

```
thomas:
  alias.present:
    - target: thomas@example.com
```

The default alias file is set to `/etc/aliases`, as defined in Salt's *config execution module*. To change the alias file from the default location, set the following in your minion config:

```
aliases.file: /my/alias/file
```

**salt.states.alias.absent**(*name*)

Ensure that the named alias is absent

**name** The alias to remove

**salt.states.alias.present**(*name*, *target*)

Ensures that the named alias is present with the given target or list of targets. If the alias exists but the target differs from the previous entry, the target(s) will be overwritten. If the alias does not exist, the alias will be created.

**name** The local user/address to assign an alias to

**target** The forwarding address

### 14.17.3 salt.states.alternatives

Configuration of the alternatives system

Control the alternatives system

```
{% set my_hadoop_conf = '/opt/hadoop/conf' %}

{{ my_hadoop_conf }}:
  file.directory

hadoop-0.20-conf:
  alternatives.install:
    - name: hadoop-0.20-conf
    - link: /etc/hadoop-0.20/conf
    - path: {{ my_hadoop_conf }}
    - priority: 30
    - require:
      - file: {{ my_hadoop_conf }}

hadoop-0.20-conf:
  alternatives.remove:
    - name: hadoop-0.20-conf
    - path: {{ my_hadoop_conf }}
```

**salt.states.alternatives.auto**(*name*)

New in version 0.17.0.

Instruct alternatives to use the highest priority path for <name>

**name** is the master name for this link group (e.g. pager)

`salt.states.alternatives.install(name, link, path, priority)`

Install new alternative for defined <name>

**name** is the master name for this link group (e.g. pager)

**link** is the symlink pointing to /etc/alternatives/<name>. (e.g. /usr/bin/pager)

**path** is the location of the new alternative target. NB: This file / directory must already exist. (e.g. /usr/bin/less)

**priority** is an integer; options with higher numbers have higher priority in automatic mode.

`salt.states.alternatives.remove(name, path)`

Removes installed alternative for defined <name> and <path> or fallback to default alternative, if some defined before.

**name** is the master name for this link group (e.g. pager)

**path** is the location of one of the alternative target files. (e.g. /usr/bin/less)

`salt.states.alternatives.set(name, path)`

New in version 0.17.0.

Sets alternative for <name> to <path>, if <path> is defined as an alternative for <name>.

**name** is the master name for this link group (e.g. pager)

**path** is the location of one of the alternative target files. (e.g. /usr/bin/less)

#### 14.17.4 salt.states.apache

Apache state

New in version 2014.7.0.

Allows for inputting a yaml dictionary into a file for apache configuration files.

The variable `this` is special and signifies what should be included with the above word between angle brackets (<>).

```
/etc/httpd/conf.d/website.com.conf:
  apache.configfile:
    - config:
      - VirtualHost:
          this: '*:80'
          ServerName:
            - website.com
          ServerAlias:
            - www.website.com
            - dev.website.com
          ErrorLog: logs/website.com-error_log
          CustomLog: logs/website.com-access_log combined
          DocumentRoot: /var/www/vhosts/website.com
          Directory:
            this: /var/www/vhosts/website.com
            Order: Deny,Allow
            Deny from: all
            Allow from:
              - 127.0.0.1
              - 192.168.100.0/24
            Options:
              - Indexes
              - FollowSymlinks
          AllowOverride: All
```

### 14.17.5 salt.states.apache\_conf module

Manage Apache Confs

New in version 2016.3.0.

Enable and disable apache confs.

```
Enable security conf:
  apache_conf.enabled:
    - name: security

Disable security conf:
  apache_conf.disabled:
    - name: security
```

**salt.states.apache\_conf.disabled**(*name*)

Ensure an Apache conf is disabled.

**name** Name of the Apache conf

**salt.states.apache\_conf.enabled**(*name*)

Ensure an Apache conf is enabled.

**name** Name of the Apache conf

### 14.17.6 salt.states.apache\_module

Manage Apache Modules

New in version 2014.7.0.

Enable and disable apache modules.

```
Enable cgi module:
  apache_module.enabled:
    - name: cgi

Disable cgi module:
  apache_module.disabled:
    - name: cgi
```

**salt.states.apache\_module.disabled**(*name*)

Ensure an Apache module is disabled.

New in version 2016.3.0.

**name** Name of the Apache module

**salt.states.apache\_module.enabled**(*name*)

Ensure an Apache module is enabled.

New in version 2016.3.0.

**name** Name of the Apache module

### 14.17.7 salt.states.apache\_site module

Manage Apache Sites

New in version 2016.3.0.

Enable and disable apache sites.

```
Enable default site:
  apache_site.enabled:
    - name: default
```

```
Disable default site:
  apache_site.disabled:
    - name: default
```

`salt.states.apache_site.disabled(name)`

Ensure an Apache site is disabled.

**name** Name of the Apache site

`salt.states.apache_site.enabled(name)`

Ensure an Apache site is enabled.

**name** Name of the Apache site

### 14.17.8 salt.states.aptpkg

#### Package management operations specific to APT- and DEB-based systems

`salt.states.aptpkg.held(name)`

Set package in 'hold' state, meaning it will not be upgraded.

**name** The name of the package, e.g., 'tmux'

### 14.17.9 salt.states.archive

Extract an archive

New in version 2014.1.0.

`salt.states.archive.extracted(name, source, source_hash=None, source_hash_name=None, source_hash_update=False, skip_verify=False, password=None, options=None, list_options=None, force=False, overwrite=False, clean=False, user=None, group=None, if_missing=None, trim_output=False, use_cmd_unzip=None, extract_perms=True, enforce_toplevel=True, enforce_ownership_on=None, archive_format=None, **kwargs)`

New in version 2014.1.0.

Changed in version 2016.11.0: This state has been rewritten. Some arguments are new to this release and will not be available in the 2016.3 release cycle (and earlier). Additionally, the **ZIP Archive Handling** section below applies specifically to the 2016.11.0 release (and newer).

Ensure that an archive is extracted to a specific directory.

---

#### Important: Changes for 2016.11.0

In earlier releases, this state would rely on the `if_missing` argument to determine whether or not the archive needed to be extracted. When this argument was not passed, then the state would just assume `if_missing` is the same as the `name` argument (i.e. the parent directory into which the archive would be extracted).

This caused a number of annoyances. One such annoyance was the need to know beforehand a path that would result from the extraction of the archive, and setting `if_missing` to that directory, like so:

```
extract_myapp:
  archive.extracted:
    - name: /var/www
    - source: salt://apps/src/myapp-16.2.4.tar.gz
    - user: www
    - group: www
    - if_missing: /var/www/myapp-16.2.4
```

If `/var/www` already existed, this would effectively make `if_missing` a required argument, just to get Salt to extract the archive.

Some users worked around this by adding the top-level directory of the archive to the end of the name argument, and then used `--strip` or `--strip-components` to remove that top-level dir when extracting:

```
extract_myapp:
  archive.extracted:
    - name: /var/www/myapp-16.2.4
    - source: salt://apps/src/myapp-16.2.4.tar.gz
    - user: www
    - group: www
    - tar_options: --strip-components=1
```

With the rewrite for 2016.11.0, these workarounds are no longer necessary. `if_missing` is still a supported argument, but it is no longer required. The equivalent SLS in 2016.11.0 would be:

```
extract_myapp:
  archive.extracted:
    - name: /var/www
    - source: salt://apps/src/myapp-16.2.4.tar.gz
    - user: www
    - group: www
```

Salt now uses a function called `archive.list` to get a list of files/directories in the archive. Using this information, the state can now check the minion to see if any paths are missing, and know whether or not the archive needs to be extracted. This makes the `if_missing` argument unnecessary in most use cases.

---

### Important: ZIP Archive Handling

*Note: this information applies to 2016.11.0 and later.*

Salt has two different functions for extracting ZIP archives:

1. `archive.unzip`, which uses Python's `zipfile` module to extract ZIP files.

2. `archive.cmd_unzip`, which uses the `unzip` CLI command to extract ZIP files.

Salt will prefer the use of `archive.cmd_unzip` when CLI options are specified (via the `options` argument), and will otherwise prefer the `archive.unzip` function. Use of `archive.cmd_unzip` can be forced however by setting the `use_cmd_unzip` argument to `True`. By contrast, setting this argument to `False` will force usage of `archive.unzip`. For example:

```
/var/www:
  archive.extracted:
    - source: salt://foo/bar/myapp.zip
    - use_cmd_unzip: True
```

When `use_cmd_unzip` is omitted, Salt will choose which extraction function to use based on the source archive and the arguments passed to the state. When in doubt, simply do not set this argument; it is provided as a means of overriding the logic Salt uses to decide which function to use.

There are differences in the features available in both extraction functions. These are detailed below.

- *Command-line options* (only supported by `archive.cmd_unzip`) - When the `options` argument is used, `archive.cmd_unzip` is the only function that can be used to extract the archive. Therefore, if `use_cmd_unzip` is specified and set to `False`, and `options` is also set, the state will not proceed.
- *Permissions* - Due to an [upstream bug in Python](#), permissions are not preserved when the `zipfile` module is used to extract an archive. As of the 2016.11.0 release, `archive.unzip` (as well as this state) has an `extract_perms` argument which, when set to `True` (the default), will attempt to match the permissions of the extracted files/directories to those defined within the archive. To disable this functionality and have the state not attempt to preserve the permissions from the ZIP archive, set `extract_perms` to `False`:

```
/var/www:
  archive.extracted:
    - source: salt://foo/bar/myapp.zip
    - extract_perms: False
```

**name** Directory into which the archive should be extracted

**source** Archive to be extracted

---

**Note:** This argument uses the same syntax as its counterpart in the `file.managed` state.

---

**source\_hash** Hash of source file, or file with list of hash-to-file mappings

---

**Note:** This argument uses the same syntax as its counterpart in the `file.managed` state.

---

Changed in version 2016.11.0: If this argument specifies the hash itself, instead of a URI to a file containing hashes, the hash type can now be omitted and Salt will determine the hash type based on the length of the hash. For example, both of the below states are now valid, while before only the second one would be:

```
foo_app:
  archive.extracted:
    - name: /var/www
    - source: https://mydomain.tld/foo.tar.gz
    - source_hash: 3360db35e682f1c5f9c58aa307de16d41361618c

bar_app:
  archive.extracted:
    - name: /var/www
    - source: https://mydomain.tld/bar.tar.gz
    - source_hash: sha1=5edb7d584b82ddcbf76e311601f5d4442974aaa5
```

**source\_hash\_name** When `source_hash` refers to a hash file, Salt will try to find the correct hash by matching the filename part of the source URI. When managing a file with a source of `salt://files/foo.tar.gz`, then the following line in a hash file would match:

```
acbd18db4cc2f85cedef654fccc4a4d8    foo.tar.gz
```

This line would also match:

```
acbd18db4cc2f85cedef654fccc4a4d8    ./dir1/foo.tar.gz
```

However, sometimes a hash file will include multiple similar paths:

```
37b51d194a7513e45b56f6524f2d51f2    ./dir1/foo.txt
acbd18db4cc2f85cedef654fccc4a4d8    ./dir2/foo.txt
73feffa4b7f6bb68e44cf984c85f6e88    ./dir3/foo.txt
```

In cases like this, Salt may match the incorrect hash. This argument can be used to tell Salt which filename to match, to ensure that the correct hash is identified. For example:

```
/var/www:
  archive.extracted:
    - source: https://mydomain.tld/dir2/foo.tar.gz
    - source_hash: https://mydomain.tld/hashes
    - source_hash_name: ./dir2/foo.tar.gz
```

**Note:** This argument must contain the full filename entry from the checksum file, as this argument is meant to disambiguate matches for multiple files that have the same basename. So, in the example above, simply using `foo.txt` would not match.

New in version 2016.11.0.

**source\_hash\_update** [False] Set this to `True` if archive should be extracted if `source_hash` has changed. This would extract regardless of the `if_missing` parameter.

New in version 2016.3.0.

**skip\_verify** [False] If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.3.4.

**keep\_source** [True] For `source` archives not local to the minion (i.e. from the Salt fileserver or a remote source such as `http(s)` or `ftp`), Salt will need to download the archive to the minion cache before they can be extracted. To remove the downloaded archive after extraction, set this argument to `False`.

New in version 2017.7.3.

**keep** [True] Same as `keep_source`, kept for backward-compatibility.

**Note:** If both `keep_source` and `keep` are used, `keep` will be ignored.

**password** **For ZIP archives only.** Password used for extraction.

New in version 2016.3.0.

Changed in version 2016.11.0: The newly-added `archive.is_encrypted` function will be used to determine if the archive is password-protected. If it is, then the `password` argument will be required for the state to proceed.

**options** **For tar and zip archives only.** This option can be used to specify a string of additional arguments to pass to the tar/zip command.

If this argument is not used, then the minion will attempt to use Python's native `tarfile/zipfile` support to extract it. For zip archives, this argument is mostly used to overwrite existing files with `o`.

Using this argument means that the `tar` or `unzip` command will be used, which is less platform-independent, so keep this in mind when using this option; the CLI options must be valid options for the tar/unzip implementation on the minion's OS.

New in version 2016.11.0: The `tar_options` and `zip_options` parameters have been deprecated in favor of a single argument name.

Changed in version 2015.8.11,2016.3.2: XZ-compressed tar archives no longer require `J` to manually be set in the `options`, they are now detected automatically and decompressed using the `xz` CLI com-

mand and extracted using `tar xvf`. This is a more platform-independent solution, as not all tar implementations support the `J` argument for extracting archives.

---

**Note:** For tar archives, main operators like `-x`, `--extract`, `--get`, `-c` and `-f/--file` should *not* be used here.

---

**tar\_options** Deprecated since version 2016.11.0: Use `options` instead.

**zip\_options** New in version 2016.3.1.

Deprecated since version 2016.11.0: Use `options` instead.

**list\_options** **For tar archives only.** This state uses `archive.list` to discover the contents of the source archive so that it knows which file paths should exist on the minion if the archive has already been extracted. For the vast majority of tar archives, `archive.list` ``just works''. Archives compressed using `gzip`, `bzip2`, and `xz/lzma` (with the help of the `xz` CLI command) are supported automatically. However, for archives compressed using other compression types, CLI options must be passed to `archive.list`.

This argument will be passed through to `archive.list` as its `options` argument, to allow it to successfully list the archive's contents. For the vast majority of archives, this argument should not need to be used, it should only be needed in cases where the state fails with an error stating that the archive's contents could not be listed.

New in version 2016.11.0.

**force** [False] If a path that should be occupied by a file in the extracted result is instead a directory (or vice-versa), the state will fail. Set this argument to `True` to force these paths to be removed in order to allow the archive to be extracted.

**Warning:** Use this option *very* carefully.

New in version 2016.11.0.

**overwrite** [False] Set this to `True` to force the archive to be extracted. This is useful for cases where the filenames/directories have not changed, but the content of the files have.

New in version 2016.11.1.

**clean** [False] Set this to `True` to remove any top-level files and recursively remove any top-level directory paths before extracting.

---

**Note:** Files will only be cleaned first if extracting the archive is deemed necessary, either by paths missing on the minion, or if `overwrite` is set to `True`.

---

New in version 2016.11.1.

**user** The user to own each extracted file. Not available on Windows.

New in version 2015.8.0.

Changed in version 2016.3.0: When used in combination with `if_missing`, ownership will only be enforced if `if_missing` is a directory.

Changed in version 2016.11.0: Ownership will be enforced only on the file/directory paths found by running `archive.list` on the source archive. An alternative root directory on which to enforce ownership can be specified using the `enforce_ownership_on` argument.

**group** The group to own each extracted file. Not available on Windows.

New in version 2015.8.0.

Changed in version 2016.3.0: When used in combination with `if_missing`, ownership will only be enforced if `if_missing` is a directory.

Changed in version 2016.11.0: Ownership will be enforced only on the file/directory paths found by running `archive.list` on the source archive. An alternative root directory on which to enforce ownership can be specified using the `enforce_ownership_on` argument.

**if\_missing** If specified, this path will be checked, and if it exists then the archive will not be extracted. This path can be either a directory or a file, so this option can also be used to check for a semaphore file and conditionally skip extraction.

Changed in version 2016.3.0: When used in combination with either `user` or `group`, ownership will only be enforced when `if_missing` is a directory.

Changed in version 2016.11.0: Ownership enforcement is no longer tied to this argument, it is simply checked for existence and extraction will be skipped if it is present.

**trim\_output** [False] Useful for archives with many files in them. This can either be set to `True` (in which case only the first 100 files extracted will be in the state results), or it can be set to an integer for more exact control over the max number of files to include in the state results.

New in version 2016.3.0.

**use\_cmd\_unzip** [False] Set to `True` for zip files to force usage of the `archive.cmd_unzip` function to extract.

New in version 2016.11.0.

**extract\_perms** [True] **For ZIP archives only.** When using `archive.unzip` to extract ZIP archives, Salt works around an [upstream bug in Python](#) to set the permissions on extracted files/directories to match those encoded into the ZIP archive. Set this argument to `False` to skip this workaround.

New in version 2016.11.0.

**enforce\_toplevel** [True] This option will enforce a single directory at the top level of the source archive, to prevent extracting a `tar-bomb`. Set this argument to `False` to allow archives with files (or multiple directories) at the top level to be extracted.

New in version 2016.11.0.

**enforce\_ownership\_on** When `user` or `group` is specified, Salt will default to enforcing permissions on the file/directory paths detected by running `archive.list` on the source archive. Use this argument to specify an alternate directory on which ownership should be enforced.

---

**Note:** This path must be within the path specified by the `name` argument.

---

New in version 2016.11.0.

**archive\_format** One of `tar`, `zip`, or `rar`.

Changed in version 2016.11.0: If omitted, the archive format will be guessed based on the value of the `source` argument. If the minion is running a release older than 2016.11.0, this option is required.

### Examples

1.tar with lzma (i.e. xz) compression:

```
graylog2-server:
  archive.extracted:
    - name: /opt/
    - source: https://github.com/downloads/Graylog2/graylog2-server/graylog2-
      server-0.9.6p1.tar.lzma
    - source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6
```

2.tar archive with flag for verbose output, and enforcement of user/group ownership:

```

graylog2-server:
  archive.extracted:
    - name: /opt/
    - source: https://github.com/downloads/Graylog2/graylog2-server/graylog2-
      ↪server-0.9.6p1.tar.gz
    - source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6
    - options: v
    - user: foo
    - group: foo

```

3.tar archive, with `source_hash_update` set to `True` to prevent state from attempting extraction unless the `source_hash` differs from the previous time the archive was extracted:

```

graylog2-server:
  archive.extracted:
    - name: /opt/
    - source: https://github.com/downloads/Graylog2/graylog2-server/graylog2-
      ↪server-0.9.6p1.tar.lzma
    - source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6
    - source_hash_update: True

```

#### 14.17.10 salt.states.artifactory

This state downloads artifacts from artifactory.

`salt.states.artifactory.downloaded`(*name*, *artifact*, *target\_dir*='/tmp', *target\_file*=None)

Ensures that the artifact from artifactory exists at given location. If it doesn't exist, then it will be downloaded. If it already exists then the checksum of existing file is checked against checksum in artifactory. If it is different then the step will fail.

**artifact** Details of the artifact to be downloaded from artifactory. Various options are:

- `artifactory_url`: URL of the artifactory instance
- `repository`: Repository in artifactory
- `artifact_id`: Artifact ID
- `group_id`: Group ID
- `packaging`: Packaging
- `classifier`: Classifier .. `versionadded:: 2015.8.0`
- **version**: **Version** One of the following: - `Version` to download - `latest` - Download the latest release of this artifact - `latest_snapshot` - Download the latest snapshot for this artifact
- `username`: Artifactory username .. `versionadded:: 2015.8.0`
- `password`: Artifactory password .. `versionadded:: 2015.8.0`

**target\_dir** Directory where the artifact should be downloaded. By default it is downloaded to /tmp directory.

**target\_file** Target file to download artifact to. By default file name is resolved by artifactory.

An example to download an artifact to a specific file:

```

jboss_module_downloaded:
  artifactory.downloaded:
    - artifact:
      artifactory_url: http://artifactory.intranet.example.com/artifactory
      repository: 'libs-release-local'
      artifact_id: 'module'
      group_id: 'com.company.module'
      packaging: 'jar'
      classifier: 'sources'
      version: '1.0'
    - target_file: /opt/jboss7/modules/com/company/lib/module.jar

```

---

Download artifact to the folder (automatically resolves file name):

```
jboss_module_downloaded:
  artifactory.downloaded:
    - artifact:
      artifactory_url: http://artifactory.intranet.example.com/artifactory
      repository: 'libs-release-local'
      artifact_id: 'module'
      group_id: 'com.company.module'
      packaging: 'jar'
      classifier: 'sources'
      version: '1.0'
    - target_dir: /opt/jboss7/modules/com/company/lib
```

### 14.17.11 salt.states.at

#### Configuration disposable regularly scheduled tasks for at.

The at state can be add disposable regularly scheduled tasks for your system.

`salt.states.at.absent` (*name*, *jobid=None*, *\*\*kwargs*)

Changed in version 2017.7.0.

Remove a job from queue

**jobid:** `string|int` Specific jobid to remove

**tag** [`string`] Job's tag

**runas** [`string`] Runs user-specified jobs

**\*\*kwargs** [`*`] Addition kwargs can be provided to filter jobs. See output of `at.jobcheck` for more.

```
example1:
  at.absent:
```

**Warning:** this will remove all jobs!

```
example2:
  at.absent:
    - year: 13
```

```
example3:
  at.absent:
    - tag: rose
```

```
example4:
  at.absent:
    - tag: rose
    - day: 13
    - hour: 16
```

```
example5:
  at.absent:
    - jobid: 4
```

`salt.states.at.mod_watch`(*name*, *\*\*kwargs*)

The at watcher, called to invoke the watch command.

**name** The name of the atjob

`salt.states.at.present`(*name*, *timespec*, *tag=None*, *user=None*, *job=None*, *unique\_tag=False*)

Changed in version 2017.7.0.

Add a job to queue.

**job** [string] Command to run.

**timespec** [string] The `timespec` follows the format documented in the at(1) manpage.

**tag** [string] Make a tag for the job.

**user** [string] The user to run the at job .. versionadded:: 2014.1.4

**unique\_tag** [boolean] If set to True job will not be added if a job with the tag exists. .. versionadded:: 2017.7.0

```
rose:
  at.present:
    - job: 'echo "I love saltstack" > love'
    - timespec: '9:09 11/09/13'
    - tag: love
    - user: jam
```

`salt.states.at.watch`(*name*, *timespec*, *tag=None*, *user=None*, *job=None*, *unique\_tag=False*)

New in version 2017.7.0.

Add an at job if trigger by watch

**job** [string] Command to run.

**timespec** [string] The `timespec` follows the format documented in the at(1) manpage.

**tag** [string] Make a tag for the job.

**user** [string] The user to run the at job .. versionadded:: 2014.1.4

**unique\_tag** [boolean] If set to True job will not be added if a job with the tag exists. .. versionadded:: 2017.7.0

```
minion_restart:
  at.watch:
    - job: 'salt-call --local service.restart salt-minion'
    - timespec: 'now +1 min'
    - tag: minion_restart
    - unique_tag: trye
    - watch:
      - file: /etc/salt/minion
```

### 14.17.12 salt.states.augeas

Configuration management using Augeas

New in version 0.17.0.

This state requires the augeas Python module.

Augeas can be used to manage configuration files.

**Warning:** Minimal installations of Debian and Ubuntu have been seen to have packaging bugs with python-augeas, causing the augeas module to fail to import. If the minion has the augeas module installed, and the state fails with a comment saying that the state is unavailable, first restart the salt-minion service. If the problem persists past that, the following command can be run from the master to determine what is causing the import to fail:

```
salt minion-id cmd.run 'python -c "from augeas import Augeas"'
```

For affected Debian/Ubuntu hosts, installing `libpython2.7` has been known to resolve the issue.

`salt.states.augeas.change`(*name*, *context=None*, *changes=None*, *lens=None*, *load\_path=None*, *\*\*kwargs*)

New in version 2014.7.0.

This state replaces `setValue()`.

Issue changes to Augeas, optionally for a specific context, with a specific lens.

**name** State name

**context** A file path, prefixed by `/files`. Should resolve to an actual file (not an arbitrary augeas path).

This is used to avoid duplicating the file name for each item in the changes list (for example, `set bind 0.0.0.0` in the example below operates on the file specified by `context`). If `context` is not specified, a file path prefixed by `/files` should be included with the `set` command.

The file path is examined to determine if the specified changes are already present.

```
redis-conf:
  augeas.change:
    - context: /files/etc/redis/redis.conf
    - changes:
      - set bind 0.0.0.0
      - set maxmemory 1G
```

**changes** List of changes that are issued to Augeas. Available commands are `set`, `setm`, `mv/move`, `ins/insert`, and `rm/remove`.

**lens** The lens to use, needs to be suffixed with `.lens`, e.g.: `Nginx.lens`. See the [list of stock lenses](#) shipped with Augeas.

New in version 2016.3.0.

**load\_path** A list of directories that modules should be searched in. This is in addition to the standard load path and the directories in `AUGEAS_LENS_LIB`.

Usage examples:

Set the `bind` parameter in `/etc/redis/redis.conf`:

```
redis-conf:
  augeas.change:
    - changes:
      - set /files/etc/redis/redis.conf/bind 0.0.0.0
```

**Note:** Use the `context` parameter to specify the file you want to manipulate. This way you don't have to include this in the changes every time:

```
redis-conf:
  augeas.change:
    - context: /files/etc/redis/redis.conf
    - changes:
      - set bind 0.0.0.0
      - set databases 4
      - set maxmemory 1G
```

Augeas is aware of a lot of common configuration files and their syntax. It knows the difference between for example ini and yaml files, but also files with very specific syntax, like the hosts file. This is done with *lenses*, which provide mappings between the Augeas tree and the file.

There are many [preconfigured lenses](#) that come with Augeas by default, and they specify the common locations for configuration files. So most of the time Augeas will know how to manipulate a file. In the event that you need to manipulate a file that Augeas doesn't know about, you can specify the lens to use like this:

```
redis-conf:
  augeas.change:
    - lens: redis
    - context: /files/etc/redis/redis.conf
    - changes:
      - set bind 0.0.0.0
```

**Note:** Even though Augeas knows that `/etc/redis/redis.conf` is a Redis configuration file and knows how to parse it, it is recommended to specify the lens anyway. This is because by default, Augeas loads all known lenses and their associated file paths. All these files are parsed when Augeas is loaded, which can take some time. When specifying a lens, Augeas is loaded with only that lens, which speeds things up quite a bit.

A more complex example, this adds an entry to the services file for Zabbix, and removes an obsolete service:

```
zabbix-service:
  augeas.change:
    - lens: services
    - context: /files/etc/services
    - changes:
      - ins service-name after service-name[last()]
      - set service-name[last()] zabbix-agent
      - set service-name[. = 'zabbix-agent']/#comment "Zabbix Agent service"
      - set service-name[. = 'zabbix-agent']/port 10050
      - set service-name[. = 'zabbix-agent']/protocol tcp
      - rm service-name[. = 'im-obsolete']
    - unless: grep "zabbix-agent" /etc/services
```

**Warning:** Don't forget the `unless` here, otherwise a new entry will be added every time this state is run.

### 14.17.13 salt.states.aws\_sqs

Manage SQS Queues

Create and destroy SQS queues. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses the `awscli` tool provided by Amazon. This can be downloaded from `pip`. Also check the documentation for `awscli` for configuration information.

```
myqueue:
  aws_sqs.exists:
    - region: eu-west-1
```

`salt.states.aws_sqs.absent` (*name*, *region*, *user=None*, *opts=False*)

Remove the named SQS queue if it exists.

**name** Name of the SQS queue.

**region** Region to remove the queue from

**user** Name of the user performing the SQS operations

**opts** Include additional arguments and options to the `aws` command line

`salt.states.aws_sqs.exists` (*name, region, user=None, opts=False*)  
 Ensure the SQS queue exists.  
**name** Name of the SQS queue.  
**region** Region to create the queue  
**user** Name of the user performing the SQS operations  
**opts** Include additional arguments and options to the aws command line

#### 14.17.14 salt.states.beacon

##### Management of the Salt beacons

New in version 2015.8.0.

```
ps:
  beacon.present:
    - enable: False
    - salt-master: running
    - apache2: stopped

sh:
  beacon.present:

load:
  beacon.present:
    - 1m:
      - 0.0
      - 2.0
    - 5m:
      - 0.0
      - 1.5
    - 15m:
      - 0.1
      - 1.0
```

`salt.states.beacon.absent` (*name, \*\*kwargs*)  
 Ensure beacon is absent.

**name** The name of the beacon ensured absent.

`salt.states.beacon.disabled` (*name, \*\*kwargs*)  
 Disable a beacon.

**name** The name of the beacon to disable.

`salt.states.beacon.enabled` (*name, \*\*kwargs*)  
 Enable a beacon.

**name** The name of the beacon to enable.

`salt.states.beacon.present` (*name, \*\*kwargs*)  
 Ensure beacon is configured with the included beacon data.  
**name** The name of the beacon ensure is configured.

#### 14.17.15 salt.states.bigip

A state module designed to enforce load-balancing configurations for F5 Big-IP entities.

maturity develop

platform f5\_bigip\_11.6

`salt.states.bigip.add_pool_member` (*hostname, username, password, name, member*)

A function to connect to a bigip device and add a new member to an existing pool.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the pool to modify

**member** The member to add to the pool

`salt.states.bigip.create_monitor` (*hostname, username, password, monitor\_type, name, \*\*kwargs*)

A function to connect to a bigip device and create a monitor.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**monitor\_type** The type of monitor to create

**name** The name of the monitor to create

**kwargs** [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

`salt.states.bigip.create_node` (*hostname, username, password, name, address*)

Create a new node if it does not already exist.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the node to create

**address** The address of the node

`salt.states.bigip.create_pool` (*hostname, username, password, name, members=None, allow\_nat=None, allow\_snat=None, description=None, gateway\_failsafe\_device=None, ignore\_persisted\_weight=None, ip\_tos\_to\_client=None, ip\_tos\_to\_server=None, link\_qos\_to\_client=None, link\_qos\_to\_server=None, load\_balancing\_mode=None, min\_active\_members=None, min\_up\_members=None, min\_up\_members\_action=None, min\_up\_members\_checking=None, monitor=None, profiles=None, queue\_depth\_limit=None, queue\_on\_connection\_limit=None, queue\_time\_limit=None, reselect\_tries=None, service\_down\_action=None, slow\_ramp\_time=None*)

Create a new node if it does not already exist.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the pool to create

**members** List of members to be added to the pool

**allow\_nat** [yes | no]

**allow\_snat** [yes | no]

**description** [string]

**gateway\_failsafe\_device** [string]

**ignore\_persisted\_weight** [enabled | disabled]

**ip\_tos\_to\_client** [pass-through | [integer]]

**ip\_tos\_to\_server** [pass-through | [integer]]

**link\_qos\_to\_client** [pass-through | [integer]]

**link\_qos\_to\_server** [pass-through | [integer]]

**load\_balancing\_mode** [dynamic-ratio-member | dynamic-ratio-node | fastest-app-response | fastest-node | least-connections-members | least-connections-node | least-sessions | observed-member | observed-node | predictive-member | predictive-node | ratio-least-connections-member | ratio-least-connections-node | ratio-member | ratio-node | ratio-session | round-robin | weighted-least-connections-member | weighted-least-connections-node]  
**min\_active\_members** [integer]  
**min\_up\_members** [integer]

**queue\_time\_limit** [integer]  
**reselect\_tries** [integer]  
**service\_down\_action** [drop | none | reselect | reset]  
**slow\_ramp\_time** [integer]

**salt.states.bigip.create\_profile**(*hostname, username, password, profile\_type, name, \*\*kwargs*)

A function to connect to a bigip device and create a profile.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**profile\_type** The type of profile to create

**name** The name of the profile to create

**kwargs** [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each profile type. Typically, tmsh arg names are used.

Special Characters |, , and : must be escaped using \ when used within strings.

**salt.states.bigip.create\_virtual**(*hostname, username, password, name, destination, pool=None, address\_status=None, auto\_lasthop=None, bwc\_policy=None, cmp\_enabled=None, connection\_limit=None, dhcp\_relay=None, description=None, fallback\_persistence=None, flow\_eviction\_policy=None, gtm\_score=None, ip\_forward=None, ip\_protocol=None, internal=None, twelve\_forward=None, last\_hop\_pool=None, mask=None, mirror=None, nat64=None, persist=None, profiles=None, policies=None, rate\_class=None, rate\_limit=None, rate\_limit\_mode=None, rate\_limit\_dst=None, rate\_limit\_src=None, rules=None, related\_rules=None, reject=None, source=None, source\_address\_translation=None, source\_port=None, virtual\_state=None, traffic\_classes=None, translate\_address=None, translate\_port=None, vlans=None*)

A function to connect to a bigip device and create a virtual server if it does not already exist.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the virtual to create

**destination** [ [virtual\_address\_name:port] | [ipv4:port] | [ipv6:port] ]

    **vlang\_ids** [ list]  
    **enabled** [ true | false ]

**salt.states.bigip.delete\_monitor** (*hostname, username, password, monitor\_type, name*)

Modify an existing monitor. If it does exist, only the parameters specified will be enforced.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**monitor\_type** The type of monitor to create

**name** The name of the monitor to create

**kwargs** [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

**salt.states.bigip.delete\_node** (*hostname, username, password, name*)

Delete an existing node.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the node which will be deleted.

`salt.states.bigip.delete_pool(hostname, username, password, name)`

Delete an existing pool.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the pool which will be deleted

`salt.states.bigip.delete_pool_member(hostname, username, password, name, member)`

Delete an existing pool member.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the pool to be modified

**member** The name of the member to delete from the pool

`salt.states.bigip.delete_profile(hostname, username, password, profile_type, name)`

Modify an existing profile. If it does exist, only the parameters specified will be enforced.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**profile\_type** The type of profile to create

**name** The name of the profile to create

**kwargs** [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each profile type. Typically, tmsh arg names are used.

`salt.states.bigip.delete_virtual(hostname, username, password, name)`

Delete an existing virtual.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the virtual which will be deleted

`salt.states.bigip.list_monitor(hostname, username, password, monitor_type, name)`

A function to list an existing monitor.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**monitor\_type** The type of monitor to list

**name** The name of the monitor to list

`salt.states.bigip.list_node(hostname, username, password, name)`

A function to connect to a bigip device and list a specific node.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the node to list.

`salt.states.bigip.list_pool(hostname, username, password, name)`

A function to connect to a bigip device and list a specific pool.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the pool to list.

`salt.states.bigip.list_profile(hostname, username, password, profile_type, name)`

A function to list an existing profile.

**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**profile\_type** The type of profile to list  
**name** The name of the profile to list

`salt.states.bigip.list_virtual(hostname, username, password, name)`

A function to list a specific virtual.

**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**name** The name of the virtual to list

`salt.states.bigip.manage_monitor(hostname, username, password, monitor_type, name, **kwargs)`

Create a new monitor if a monitor of this type and name does not already exist. If it does exist, only the parameters specified will be enforced.

**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**monitor\_type** The type of monitor to create  
**name** The name of the monitor to create  
**kwargs** [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

`salt.states.bigip.manage_node(hostname, username, password, name, address, connection_limit=None, description=None, dynamic_ratio=None, logging=None, monitor=None, rate_limit=None, ratio=None, session=None, node_state=None)`

Manages a node of a given bigip device. If the node does not exist it will be created, otherwise, only the properties which are different than the existing will be updated.

**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**name** The name of the node to manage.  
**address** The address of the node  
**connection\_limit** [integer]  
**description** [string]  
**dynamic\_ratio**: [integer]  
**logging** [enabled | disabled]  
**monitor** [[name] | none | default]  
**rate\_limit** [integer]  
**ratio** [integer]  
**session** [user-enabled | user-disabled]  
**node\_state (state)** [user-down | user-up ]

```

salt.states.bigip.manage_pool(hostname, username, password, name, allow_nat=None, allow_snat=None, description=None, gateway_failsafe_device=None, ignore_persisted_weight=None, ip_tos_to_client=None, ip_tos_to_server=None, link_qos_to_client=None, link_qos_to_server=None, load_balancing_mode=None, min_active_members=None, min_up_members=None, min_up_members_action=None, min_up_members_checking=None, monitor=None, profiles=None, queue_depth_limit=None, queue_on_connection_limit=None, queue_time_limit=None, reselect_tries=None, service_down_action=None, slow_ramp_time=None)

```

Create a new pool if it does not already exist. Pool members are managed separately. Only the parameters specified are enforced.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the pool to create

**allow\_nat** [yes | no]

**allow\_snat** [yes | no]

**description** [string]

**gateway\_failsafe\_device** [string]

**ignore\_persisted\_weight** [enabled | disabled]

**ip\_tos\_to\_client** [pass-through | [integer]]

**ip\_tos\_to\_server** [pass-through | [integer]]

**link\_qos\_to\_client** [pass-through | [integer]]

**link\_qos\_to\_server** [pass-through | [integer]]

**load\_balancing\_mode** [dynamic-ratio-member | dynamic-ratio-node | fastest-app-response | fastest-node | least-connections-members | least-connections-node | least-sessions | observed-member | observed-node | predictive-member | predictive-node | ratio-least-connections-member | ratio-least-connections-node | ratio-member | ratio-node | ratio-session | round-robin | weighted-least-connections-member | weighted-least-connections-node]

**min\_active\_members** [integer]

**min\_up\_members** [integer]

**min\_up\_members\_action** [failover | reboot | restart-all]

**min\_up\_members\_checking** [enabled | disabled]

**monitor** [name]

**profiles** [none | profile\_name]

**queue\_depth\_limit** [integer]

**queue\_on\_connection\_limit** [enabled | disabled]

**queue\_time\_limit** [integer]

**reselect\_tries** [integer]

**service\_down\_action** [drop | none | reselect | reset]

**slow\_ramp\_time** [integer]

```

salt.states.bigip.manage_pool_members(hostname, username, password, name, members)

```

Manage the members of an existing pool. This function replaces all current pool members. Only the parameters specified are enforced.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the pool to modify

**members** list of pool members to manage.

```

salt.states.bigip.manage_profile(hostname, username, password, profile_type, name, **kwargs)

```

Create a new profile if a monitor of this type and name does not already exists. If it does exists, only the

parameters specified will be enforced.

**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**profile\_type** The type of profile to create  
**name** The name of the profile to create  
**kwargs** [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each profile type. Typically, tmsh arg names are used.

```
salt.states.bigip.manage_virtual(hostname, username, password, name, destination,  
pool=None, address_status=None, auto_lasthop=None,  
bwc_policy=None, cmp_enabled=None, connec-  
tion_limit=None, dhcp_relay=None, description=None,  
fallback_persistence=None, flow_eviction_policy=None,  
gtm_score=None, ip_forward=None, ip_protocol=None, in-  
ternal=None, twelve_forward=None, last_hop_pool=None,  
mask=None, mirror=None, nat64=None, persist=None, pro-  
files=None, policies=None, rate_class=None, rate_limit=None,  
rate_limit_mode=None, rate_limit_dst=None,  
rate_limit_src=None, rules=None, related_rules=None, re-  
ject=None, source=None, source_address_translation=None,  
source_port=None, virtual_state=None, traffic_classes=None,  
translate_address=None, translate_port=None, vlans=None)
```

Manage a virtual server. If a virtual does not exists it will be created, otherwise only the parameters specified will be enforced.

**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**name** The name of the virtual to create  
**destination** [ [virtual\_address\_name:port] | [ipv4:port] | [ipv6.port] ]  
**pool** [ [pool\_name] | none ]  
**address\_status** [yes | no]

    vlan_ids [ list ]
    enabled [ true | false ]

```

`salt.states.bigip.modify_monitor`(*hostname*, *username*, *password*, *monitor\_type*, *name*,  
*\*\*kwargs*)

Modify an existing monitor. If it does exist, only the parameters specified will be enforced.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**monitor\_type** The type of monitor to create

**name** The name of the monitor to create

**kwargs** [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

`salt.states.bigip.modify_node`(*hostname*, *username*, *password*, *name*, *connection\_limit=None*,  
*description=None*, *dynamic\_ratio=None*, *logging=None*, *monitor=None*, *rate\_limit=None*, *ratio=None*, *session=None*,  
*node\_state=None*)

Modify an existing node. Only a node which already exists will be modified and only the parameters specified will be enforced.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the node to modify

**connection\_limit** [integer]

**description** [string]

**dynamic\_ratio** [integer]

**logging** [enabled | disabled]

**monitor** [[name] | none | default]

**rate\_limit** [integer]

**ratio** [integer]

**session** [user-enabled | user-disabled]

**node\_state (state)** [user-down | user-up ]

```
salt.states.bigip.modify_pool(hostname, username, password, name, allow_nat=None, allow_snat=None, description=None, gateway_failsafe_device=None, ignore_persisted_weight=None, ip_tos_to_client=None, ip_tos_to_server=None, link_qos_to_client=None, link_qos_to_server=None, load_balancing_mode=None, min_active_members=None, min_up_members=None, min_up_members_action=None, min_up_members_checking=None, monitor=None, profiles=None, queue_depth_limit=None, queue_on_connection_limit=None, queue_time_limit=None, reselect_tries=None, service_down_action=None, slow_ramp_time=None)
```

Modify an existing pool. Pool members are managed separately. Only the parameters specified are enforced.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the pool to create

**allow\_nat** [yes | no]

**allow\_snat** [yes | no]

**description** [string]

**gateway\_failsafe\_device** [string]

**ignore\_persisted\_weight** [enabled | disabled]

**ip\_tos\_to\_client** [pass-through | [integer]]

**ip\_tos\_to\_server** [pass-through | [integer]]

#### 14.17.16 salt.states.blockdev

Management of Block Devices

A state module to manage blockdevices

```
/dev/sda:
  blockdev.tuned:
    - read-only: True

master-data:
  blockdev.tuned:
    - name: /dev/vg/master-data
    - read-only: True
    - read-ahead: 1024
```

New in version 2014.7.0.

`salt.states.blockdev.formatted` (*name*, *fs\_type*='ext4', *force*=False, *\*\*kwargs*)

Manage filesystems of partitions.

**name** The name of the block device

**fs\_type** The filesystem it should be formatted as

**force** Force mke2fs to create a filesystem, even if the specified device is not a partition on a block special device. This option is only enabled for ext and xfs filesystems

This option is dangerous, use it with caution.

New in version 2016.11.0.

`salt.states.blockdev.tuned(name, **kwargs)`

Manage options of block device

**name** The name of the block device

**opts:**

- **read-ahead** Read-ahead buffer size
- **filesystem-read-ahead** Filesystem Read-ahead buffer size
- **read-only** Set Read-Only
- **read-write** Set Read-Write

### 14.17.17 salt.states.boto3\_elasticache module

#### Manage Elasticache with boto3

New in version 2017.7.0.

Create, destroy and update Elasticache clusters. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto3 behind the scenes - as a result it inherits any limitations it boto3's implementation of the AWS API. It is also designed to as directly as possible leverage boto3's parameter naming and semantics. This allows one to use <http://boto3.readthedocs.io/en/latest/reference/services/elasticache.html> as an excellent source for details too involved to reiterate here.

Note: This module is designed to be transparent ("intentionally ignorant" is the phrase I used to describe it to my boss) to new AWS / boto options - since all AWS API params are passed directly through both the state and executions modules, any new args to existing functions which become available after this documentation is written should work immediately.

Brand new API calls, of course, would still require new functions to be added :)

This module accepts explicit elasticache credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information is available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elasticache.keyid: GKTADJGHEIQSXMKKRBJ08H
elasticache.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
  region: us-east-1
```

XXX FIXME .. code-block:: yaml

**Ensure myelasticache exists:**

**boto3\_elasticache.present:**

- name: myelasticsearch
- engine: redis
- cache\_node\_type: cache.t1.micro
- num\_cache\_nodes: 1
- notification\_topic\_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklklgjsdfjajkghs

# Using a profile from pillars Ensure myelasticsearch exists:

**boto3\_elasticsearch.present:**

- name: myelasticsearch
- engine: redis
- cache\_node\_type: cache.t1.micro
- num\_cache\_nodes: 1
- notification\_topic\_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
- region: us-east-1
- profile: myprofile

# Passing in a profile Ensure myelasticsearch exists:

**boto3\_elasticsearch.present:**

- name: myelasticsearch
- engine: redis
- cache\_node\_type: cache.t1.micro
- num\_cache\_nodes: 1
- notification\_topic\_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
- region: us-east-1
- **profile:** keyid: GKTADJGHEIQSXMKKRBJ08H key: askdjghsdfjkghWupUjasdfklklgjsdfjajkghs

```
salt.states.boto3_elasticsearch.cache_cluster_absent(name, wait=600, region=None,  
                                                    key=None, keyid=None, pro-  
                                                    file=None, **args)
```

Ensure a given cache cluster is deleted.

**name** Name of the cache cluster.

**wait** Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.

**CacheClusterId** The node group (shard) identifier. Note: In general this parameter is not needed, as `name` is used if it's not provided.

**FinalSnapshotIdentifier** The user-supplied name of a final cache cluster snapshot. This is the unique name that identifies the snapshot. ElastiCache creates the snapshot, and then deletes the cache cluster immediately afterward.

**region** Region to connect to.  
**key** Secret key to be used.  
**keyid** Access key to be used.  
**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto3_elasticache.cache_cluster_present(name, wait=900, security_groups=None, region=None, key=None, keyid=None, profile=None, **args)
```

Ensure a given cache cluster exists.

**name** Name of the cache cluster (cache cluster id).

**wait** Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.

**security\_groups** One or more VPC security groups (names and/or IDs) associated with the cache cluster. Note: This is additive with any sec groups provided via the SecurityGroupIds parameter below. Use this parameter ONLY when you are creating a cluster in a VPC.

**CacheClusterId** The node group (shard) identifier. This parameter is stored as a lowercase string. Constraints:

A name must contain from 1 to 20 alphanumeric characters or hyphens. The first character must be a letter. A name cannot end with a hyphen or contain two consecutive hyphens.

Note: In general this parameter is not needed, as `name` is used if it's not provided.

**ReplicationGroupId** The ID of the replication group to which this cache cluster should belong. If this parameter is specified, the cache cluster is added to the specified replication group as a read replica; otherwise, the cache cluster is a standalone primary that is not part of any replication group. If the specified replication group is Multi-AZ enabled and the Availability Zone is not specified, the cache cluster is created in Availability Zones that provide the best spread of read replicas across Availability Zones. Notes: This parameter is ONLY valid if the Engine parameter is redis.

Due to current limitations on Redis (cluster mode disabled), this parameter is not supported on Redis (cluster mode enabled) replication groups.

**AZMode** Specifies whether the nodes in this Memcached cluster are created in a single Availability Zone or created across multiple Availability Zones in the cluster's region. If the AZMode and PreferredAvailabilityZones are not specified, ElastiCache assumes single-az mode. Note: This parameter is ONLY supported for Memcached cache clusters.

**PreferredAvailabilityZone** The EC2 Availability Zone in which the cache cluster is created. All nodes belonging to this Memcached cache cluster are placed in the preferred Availability Zone. If you want to create your nodes across multiple Availability Zones, use PreferredAvailabilityZones. Default: System chosen Availability Zone.

**PreferredAvailabilityZones** A list of the Availability Zones in which cache nodes are created. The order of the zones in the list is not important. The number of Availability Zones listed must equal the value of NumCacheNodes. If you want all the nodes in the same Availability Zone, use PreferredAvailabilityZone instead, or repeat the Availability Zone multiple times in the list. Note: This option is ONLY supported on Memcached. Note: If you are creating your cache cluster in an Amazon VPC (recommended) you can only locate nodes in Availability Zones that are associated with the subnets in the selected subnet group.

Default: System chosen Availability Zones.

**NumCacheNodes** The initial (integer) number of cache nodes that the cache cluster has. Notes: For clusters running Redis, this value must be 1.

For clusters running Memcached, this value must be between 1 and 20.

**CacheNodeType** The compute and memory capacity of the nodes in the node group (shard). Valid node types (and pricing for them) are exhaustively described at <https://aws.amazon.com/elasticache/pricing/> Notes: All T2 instances must be created in a VPC

Redis backup/restore is not supported for Redis (cluster mode disabled) T1 and T2 instances.

Backup/restore is supported on Redis (cluster mode enabled) T2 instances. Redis Append-only files (AOF) functionality is not supported for T1 or T2 instances.

**Engine** The name of the cache engine to be used for this cache cluster. Valid values for this parameter are: memcached | redis

**EngineVersion** The version number of the cache engine to be used for this cache cluster. To view the supported cache engine versions, use the DescribeCacheEngineVersions operation. Note: You can upgrade to a newer engine version but you cannot downgrade to an earlier engine version. If you want to use an earlier engine version, you must delete the existing cache cluster or replication group and create it anew with the earlier engine version.

**CacheParameterGroupName** The name of the parameter group to associate with this cache cluster. If this argument is omitted, the default parameter group for the specified engine is used. You cannot use any parameter group which has cluster-enabled='yes' when creating a cluster.

**CacheSubnetGroupName** The name of the Cache Subnet Group to be used for the cache cluster. Use this parameter ONLY when you are creating a cache cluster within a VPC.

Note: If you're going to launch your cluster in an Amazon VPC, you need to create a subnet group before you start creating a cluster.

**CacheSecurityGroupNames** A list of Cache Security Group names to associate with this cache cluster. Use this parameter ONLY when you are creating a cache cluster outside of a VPC.

**SecurityGroupIds** One or more VPC security groups associated with the cache cluster. Use this parameter ONLY when you are creating a cache cluster within a VPC.

**Tags** A list of tags to be added to this resource. Note that due to shortcomings in the AWS API for ElastiCache, these can only be set during resource creation - later modification is not (currently) supported.

**SnapshotArns** A single-element string list containing an Amazon Resource Name (ARN) that uniquely identifies a Redis RDB snapshot file stored in Amazon S3. The snapshot file is used to populate the node group (shard). The Amazon S3 object name in the ARN cannot contain any commas. Note: This parameter is ONLY valid if the Engine parameter is redis.

**SnapshotName** The name of a Redis snapshot from which to restore data into the new node group (shard). The snapshot status changes to restoring while the new node group (shard) is being created. Note: This parameter is ONLY valid if the Engine parameter is redis.

**PreferredMaintenanceWindow** Specifies the weekly time range during which maintenance on the cache cluster is permitted. It is specified as a range in the format ddd:hh24:mi-ddd:hh24:mi (24H Clock UTC). The minimum maintenance window is a 60 minute period. Valid values for ddd are: sun, mon, tue, wed, thu, fri, sat Example: sun:23:00-mon:01:30

**Port** The port number on which each of the cache nodes accepts connections. Default: 6379

**NotificationTopicArn** The Amazon Resource Name (ARN) of the Amazon Simple Notification Service (SNS) topic to which notifications are sent. Note: The Amazon SNS topic owner must be the same as the cache cluster owner.

**AutoMinorVersionUpgrade** This (boolean) parameter is currently disabled.

**SnapshotRetentionLimit** The number of days for which ElastiCache retains automatic snapshots before deleting them. Note: This parameter is ONLY valid if the Engine parameter is redis. Default: 0 (i.e., automatic backups are disabled for this cache cluster).

**SnapshotWindow** The daily time range (in UTC) during which ElastiCache begins taking a daily snapshot of your node group (shard). If you do not specify this parameter, ElastiCache automatically chooses an appropriate time range. Note: This parameter is ONLY valid if the Engine parameter is redis. Example: 05:00-09:00

**AuthToken** The password used to access a password protected server. Password constraints: Must be only printable ASCII characters. Must be at least 16 characters and no more than 128 characters in length. Cannot contain any of the following characters: `/, `", or ``@`.

**CacheNodeIdsToRemove** A list of cache node IDs to be removed. A node ID is a numeric identifier (0001, 0002, etc.). This parameter is only valid when NumCacheNodes is less than the existing number of cache nodes. The number of cache node IDs supplied in this parameter must match the difference between the existing number of cache nodes in the cluster or pending cache nodes, whichever is greater, and the value of NumCacheNodes in the request.

**NewAvailabilityZones** The list of Availability Zones where the new Memcached cache nodes are created. This parameter is only valid when NumCacheNodes in the request is greater than the sum of the number of active cache nodes and the number of cache nodes pending creation (which may be zero). The number of Availability Zones supplied in this list must match the cache nodes being added in this request. Note: This option is only supported on Memcached clusters.

**NotificationTopicStatus** The status of the SNS notification topic. Notifications are sent only if the status is active. Valid values: active | inactive

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto3_elasticache.cache_subnet_group_absent(name, region=None,
                                                         key=None, keyid=None,
                                                         profile=None, **args)
```

Ensure a given cache subnet group is deleted.

**name** Name of the cache subnet group.

**CacheSubnetGroupName** A name for the cache subnet group. Note: In general this parameter is not needed, as `name` is used if it's not provided.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto3_elasticache.cache_subnet_group_present(name, subnets=None,
                                                         region=None, key=None,
                                                         keyid=None, profile=None,
                                                         **args)
```

Ensure cache subnet group exists.

**name** A name for the cache subnet group. This value is stored as a lowercase string. Constraints: Must contain no more than 255 alphanumeric characters or hyphens.

**subnets** A list of VPC subnets (IDs, Names, or a mix) for the cache subnet group.

**CacheSubnetGroupName** A name for the cache subnet group. This value is stored as a lowercase string. Constraints: Must contain no more than 255 alphanumeric characters or hyphens. Note: In general this parameter is not needed, as `name` is used if it's not provided.

**CacheSubnetGroupDescription** A description for the cache subnet group.

**SubnetIds** A list of VPC subnet IDs for the cache subnet group. This is ADDITIVE with `subnets` above.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto3_elasticache.replication_group_absent(name, wait=600, re-
                                                         gion=None, key=None,
                                                         keyid=None, profile=None,
                                                         **args)
```

Ensure a given replication group is deleted.

**name** Name of the replication group.

**wait** Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.

**ReplicationGroupId** The replication group identifier. Note: In general this parameter is not needed, as `name`

is used if it's not provided.

**RetainPrimaryCluster** If set to true, all of the read replicas are deleted, but the primary node is retained.

**FinalSnapshotIdentifier** The name of a final node group (shard) snapshot. ElastiCache creates the snapshot from the primary node in the cluster, rather than one of the replicas; this is to ensure that it captures the freshest data. After the final snapshot is taken, the replication group is immediately deleted.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto3_elasticache.replication_group_present(name, wait=900, security_groups=None,
region=None, key=None, keyid=None, profile=None,
**args)
```

Ensure a replication group exists and is in the given state.

**name** Name of replication group

**wait** Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.

**security\_groups** One or more VPC security groups (names and/or IDs) associated with the cache cluster. Note: This is additive with any sec groups provided via the SecurityGroupIds parameter below. Use this parameter ONLY when you are creating a cluster in a VPC.

**ReplicationGroupId** The replication group identifier. This parameter is stored as a lowercase string. Constraints:

A name must contain from 1 to 20 alphanumeric characters or hyphens. The first character must be a letter. A name cannot end with a hyphen or contain two consecutive hyphens.

Note: In general this parameter is not needed, as `name` is used if it's not provided.

**ReplicationGroupDescription** A user-created description for the replication group.

**PrimaryClusterId** The identifier of the cache cluster that serves as the primary for this replication group. This cache cluster must already exist and have a status of available. This parameter is not required if NumCacheClusters, NumNodeGroups, or ReplicasPerNodeGroup is specified.

**AutomaticFailoverEnabled** Specifies whether a read-only replica is automatically promoted to read/write primary if the existing primary fails. If true, Multi-AZ is enabled for this replication group. If false, Multi-AZ is disabled for this replication group. Notes: AutomaticFailoverEnabled must be enabled for Redis (cluster mode enabled)

replication groups. ElastiCache Multi-AZ replication groups is not supported on:

Redis versions earlier than 2.8.6. Redis (cluster mode disabled): T1 and T2 node types. Redis (cluster mode enabled): T2 node types.

Default: False

**NumCacheClusters** The number of clusters this replication group initially has. This parameter is not used if there is more than one node group (shard). You should use ReplicasPerNodeGroup instead. If Multi-AZ is enabled, the value of this parameter must be at least 2. The maximum permitted value for NumCacheClusters is 6 (primary plus 5 replicas).

**PreferredCacheClusterAZs** A list of EC2 Availability Zones in which the replication group's cache clusters are created. The order of the Availability Zones in the list is the order in which clusters are allocated. The primary cluster is created in the first AZ in the list. This parameter is not used if there is more than one node group (shard). You should use NodeGroupConfiguration instead. The number of Availability Zones listed must equal the value of NumCacheClusters. Note: If you are creating your replication group in an Amazon VPC (recommended), you can

only locate cache clusters in Availability Zones associated with the subnets in the selected subnet group.

Default: System chosen Availability Zones.

- NumNodeGroups** An optional parameter that specifies the number of node groups (shards) for this Redis (cluster mode enabled) replication group. For Redis (cluster mode disabled) either omit this parameter or set it to 1. Default: 1
- ReplicasPerNodeGroup** An optional parameter that specifies the number of replica nodes in each node group (shard). Valid values are: 0 to 5
- NodeGroupConfiguration** A list of node group (shard) configuration options. Each node group (shard) configuration has the following: Slots, PrimaryAvailabilityZone, ReplicaAvailabilityZones, ReplicaCount. If you're creating a Redis (cluster mode disabled) or a Redis (cluster mode enabled) replication group, you can use this parameter to configure one node group (shard) or you can omit this parameter. For fiddly details of the expected data layout of this param, see [http://boto3.readthedocs.io/en/latest/reference/services/elasticache.html?#ElastiCache.Client.create\\_replication\\_group](http://boto3.readthedocs.io/en/latest/reference/services/elasticache.html?#ElastiCache.Client.create_replication_group)
- CacheNodeType** The compute and memory capacity of the nodes in the node group (shard). See <https://aws.amazon.com/elasticache/pricing/> for current sizing, prices, and constraints. Notes: All T2 instances are created in an Amazon Virtual Private Cloud (Amazon VPC).  
Backup/restore is not supported for Redis (cluster mode disabled) T1 and T2 instances.  
Backup/restore is supported on Redis (cluster mode enabled) T2 instances. Redis Append-only files (AOF) functionality is not supported for T1 or T2 instances.
- Engine** The name of the cache engine to be used for the cache clusters in this replication group.
- EngineVersion** The version number of the cache engine to be used for the cache clusters in this replication group. To view the supported cache engine versions, use the DescribeCacheEngineVersions operation. Note: You can upgrade to a newer engine version but you cannot downgrade to an earlier engine version. If you want to use an earlier engine version, you must delete the existing cache cluster or replication group and create it anew with the earlier engine version.
- CacheParameterGroupName** The name of the parameter group to associate with this replication group. If this argument is omitted, the default cache parameter group for the specified engine is used. Notes: If you are running Redis version 3.2.4 or later, only one node group (shard), and want to use a default parameter group, we recommend that you specify the parameter group by name. To create a Redis (cluster mode disabled) replication group, use CacheParameterGroupName=default.redis3.2 To create a Redis (cluster mode enabled) replication group, use CacheParameterGroupName=default.redis3.2.cluster.on
- CacheSubnetGroupName** The name of the cache subnet group to be used for the replication group. Note: If you're going to launch your cluster in an Amazon VPC, you need to create a subnet group before you start creating a cluster. For more information, see Subnets and Subnet Groups.
- CacheSecurityGroupNames** A list of cache security group names to associate with this replication group.
- SecurityGroupIds** One or more Amazon VPC security groups associated with this replication group. Use this parameter only when you are creating a replication group in an VPC.
- Tags** A list of tags to be added to this resource. Note that due to shortcomings in the AWS API for ElastiCache, these can only be set during resource creation - later modification is not (currently) supported.
- SnapshotArns** A list of ARNs that uniquely identify the Redis RDB snapshot files stored in Amazon S3. These snapshot files are used to populate the replication group. The Amazon S3 object name in the ARN cannot contain any commas. The list must match the number of node groups (shards) in the replication group, which means you cannot repartition. Note: This parameter is only valid if the Engine parameter is redis.
- SnapshotName** The name of a snapshot from which to restore data into the new replication group. The snapshot status changes to restoring while the new replication group is being created. Note: This parameter is only valid if the Engine parameter is redis.
- PreferredMaintenanceWindow** Specifies the weekly time range during which maintenance on the cluster is performed. It is specified as a range in the format ddd:hh24:mi-ddd:hh24:mi (24H Clock UTC). The minimum maintenance window is a 60 minute period. Valid values for ddd are: sun, mon, tue, wed, thu, fri, sat Example: sun:23:00-mon:01:30
- Port** The port number on which each member of the replication group accepts connections.
- NotificationTopicArn** The ARN of an SNS topic to which notifications are sent. Note: The SNS topic owner must be the same as the cache cluster owner.

- AutoMinorVersionUpgrade** This parameter is currently disabled.
- SnapshotRetentionLimit** The number of days for which ElastiCache will retain automatic snapshots before deleting them. Note: This parameter is only valid if the Engine parameter is redis . Default: 0 (that is, automatic backups are disabled for this cache cluster).
- SnapshotWindow** The daily time range (in UTC) during which ElastiCache begins taking a daily snapshot of your node group (shard). If you do not specify this parameter, ElastiCache automatically chooses an appropriate time range. Note: This parameter is only valid if the Engine parameter is redis . Example: 05:00-09:00
- AuthToken** The password used to access a password protected server. Password constraints:  
Must be only printable ASCII characters. Must be at least 16 characters and no more than 128 characters in length. Cannot contain any of the following characters: `/, `", or `@`.
- SnapshottingClusterId** The cache cluster ID that is used as the daily snapshot source for the replication group.
- NotificationTopicStatus** The status of the SNS notification topic. Notifications are sent only if the status is active. Valid values: active | inactive
- region** Region to connect to.
- key** Secret key to be used.
- keyid** Access key to be used.
- profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

#### 14.17.18 salt.states.boto3\_route53 module

Manage Route53 records with Boto 3

New in version 2017.7.0.

Create and delete Route53 records. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit route53 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
route53.keyid: GKTADJGHEIQSXMKRB08H
route53.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKRB08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
  region: us-east-1
```

An exciting new AWS Route 53 Hosted Zone:

```
boto_route53.hosted_zone_present:
- Name: example.com.
- PrivateZone: true
- VPCs:
  - VPCName: MyLittleVPC
    VPCRegion: us-east-1
  - VPCId: vpc-12345678
- region: us-east-1
```

- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdffkjghWupUjasdfklkdfklgjsdfjajkghs

mycnamerecord:

- boto\_route53.rr\_present:
  - Name: test.example.com.
  - ResourceRecords:
    - my-elb.us-east-1.elb.amazonaws.com.
  - DomainName: example.com.
  - TTL: 60
  - Type: CNAME
  - region: us-east-1
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdffkjghWupUjasdfklkdfklgjsdfjajkghs

**salt.states.boto3\_route53.hosted\_zone\_absent** (*name*, *Name=None*, *PrivateZone=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the Route53 Hostes Zone described is absent

**name** The name of the state definition.

**Name** The name of the domain. This should be a fully-specified domain, and should terminate with a period. If not provided, the value of name will be used.

**PrivateZone** Set True if deleting a private hosted zone.

**salt.states.boto3\_route53.hosted\_zone\_present** (*name*, *Name=None*, *PrivateZone=False*, *CallerReference=None*, *Comment=''*, *VPCs=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure a hosted zone exists with the given attributes.

**name** The name of the state definition. This will be used as the `CallerReference` param when creating the hosted zone to help ensure idempotency.

**Name** The name of the domain. This should be a fully-specified domain, and should terminate with a period. This is the name you have registered with your DNS registrar. It is also the name you will delegate from your registrar to the Amazon Route 53 delegation servers returned in response to this request. If not provided, the value of name will be used.

**PrivateZone** Set True if creating a private hosted zone. If true, then `VPCs` is also required.

**Comment** Any comments you want to include about the hosted zone.

**CallerReference** A unique string that identifies the request and that allows `create_hosted_zone()` calls to be retried without the risk of executing the operation twice. This helps ensure idempotency across state calls, but can cause issues if a zone is deleted and then an attempt is made to recreate it with the same CallerReference. If not provided, a unique UUID will be generated at each state run, which can potentially lead to duplicate zones being created if the state is run again while the previous zone creation is still in PENDING status (which can occasionally take several minutes to clear). Maximum length of 128.

**VPCs** A list of dicts, each dict composed of a VPCRegion, and either a VPCId or a VPCName. Note that this param is ONLY used if PrivateZone == True

**VPCId** When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCName.

**VPCName** When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCId.

**VPCRegion** When creating a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from VPCId or VPCName, if possible. This will fail if a given VPCName exists in multiple regions visible to the bound account, in which case you'll need to provide an explicit value for VPCRegion.

`salt.states.boto3_route53.rr_absent` (*name, HostedZoneId=None, DomainName=None, PrivateZone=False, Name=None, Type=None, SetIdentifier=None, region=None, key=None, keyid=None, profile=None*)

Ensure the Route53 record is deleted.

**name** The name of the state definition. This will be used for Name if the latter is not provided.

**HostedZoneId** The ID of the zone to delete the record from. Exclusive with DomainName.

**DomainName** The domain name of the zone to delete the record from. Exclusive with HostedZoneId.

**PrivateZone** Set to True if the RR to be removed is in a private zone, False if public.

**Name** Name of the resource record.

**Type** The record type (A, NS, MX, TXT, etc.)

**SetIdentifier** Valid for Weighted, Latency, Geolocation, and Failover resource record sets only. An identifier that differentiates among multiple resource record sets that have the same combination of DNS name and type. The value of SetIdentifier must be unique for each resource record set that has the same combination of DNS name and type. Omit SetIdentifier for any other types of record sets.

**region** The region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

`salt.states.boto3_route53.rr_present` (*name, HostedZoneId=None, DomainName=None, PrivateZone=False, Name=None, Type=None, SetIdentifier=None, Weight=None, Region=None, GeoLocation=None, Failover=None, TTL=None, ResourceRecords=None, AliasTarget=None, HealthCheckId=None, TrafficPolicyInstanceId=None, region=None, key=None, keyid=None, profile=None*)

Ensure the Route53 record is present.

**name** The name of the state definition. This will be used for Name if the latter is not provided.

**HostedZoneId** The ID of a zone to create the record in. Exclusive with DomainName.

**DomainName** The domain name of a zone to create the record in. Exclusive with HostedZoneId.

**PrivateZone** Set to True if the resource record should be in a private zone, False if public.

**Name** Name of the Route 53 resource record being managed.

**Type** The record type (A, NS, MX, TXT, etc.)

**SetIdentifier** Valid for Weighted, Latency, Geolocation, and Failover resource record sets only. An identifier that differentiates among multiple resource record sets that have the same combination of DNS name and type. The value of SetIdentifier must be unique for each resource record set that has the same combination of DNS name and type. Omit SetIdentifier for any other types of record sets.

**Weight** Valid for Weighted resource record sets only. Among resource record sets that have the same combination of DNS name and type, a value that determines the proportion of DNS queries that Amazon Route 53 responds to using the current resource record set. Amazon Route 53 calculates the sum of the weights for the resource record sets that have the same combination of DNS name and type. Amazon Route 53 then responds to queries based on the ratio of a resource's weight to the total.

**Note the following:**

- You must specify a value for the Weight element for every weighted resource record set.
- You can only specify one ResourceRecord per weighted resource record set.
- You can't create latency, failover, or geolocation resource record sets that have the same values for the Name and Type elements as weighted resource record sets.
- You can create a maximum of 100 weighted resource record sets that have the same values for the Name and Type elements.
- For weighted (but not weighted alias) resource record sets, if you set Weight to 0 for a resource record set, Amazon Route 53 never responds to queries with the applicable value for that resource record set. However, if you set Weight to 0 for all resource record sets that have the same combination of DNS name and type, traffic is routed to all resources with equal probability. The effect of setting Weight to 0 is different when you associate health checks with weighted resource record sets. For more information, see **Options**

for Configuring Amazon Route 53 Active-Active and Active-Passive Failover`\_\_ in the Amazon Route 53 Developer Guide. .. \_\_: <http://docs.aws.amazon.com/Route53/latest/DeveloperGuide/dns-failover-configuring-options.html>

**Region** Valid for Latency-based resource record sets only. The Amazon EC2 Region where the resource that is specified in this resource record set resides. The resource typically is an AWS resource, such as an EC2 instance or an ELB load balancer, and is referred to by an IP address or a DNS domain name, depending on the record type.

**GeoLocation** Geo location resource record sets only. A dict that lets you control how Route 53 responds to DNS queries based on the geographic origin of the query. For example, if you want all queries from Africa to be routed to a web server with an IP address of 192.0.2.111, create a resource record set with a Type of A and a ContinentCode of AF.

**ContinentCode** The two-letter code for the continent. Valid values: AF | AN | AS | EU | OC | NA | SA Constraint: Specifying ContinentCode with either CountryCode or SubdivisionCode returns an InvalidInput error.

**CountryCode** The two-letter code for the country.

**SubdivisionCode** The code for the subdivision, for example, a state in the United States or a province in Canada.

#### Notes

- Creating geolocation and geolocation alias resource record sets in private hosted zones is not supported.
- If you create separate resource record sets for overlapping geographic regions (for example, one resource record set for a continent and one for a country on the same continent), priority goes to the smallest geographic region. This allows you to route most queries for a continent to one resource and to route queries for a country on that continent to a different resource.
- You can't create two geolocation resource record sets that specify the same geographic location.
- The value \* in the CountryCode element matches all geographic locations that aren't specified in other geolocation resource record sets that have the same values for the Name and Type elements.
- Geolocation works by mapping IP addresses to locations. However, some IP addresses aren't mapped to geographic locations, so even if you create geolocation resource record sets that cover all seven continents, Amazon Route 53 will receive some DNS queries from locations that it can't identify. We recommend that you create a resource record set for which the value of CountryCode is \*, which handles both queries that come from locations for which you haven't created geolocation resource record sets and queries from IP addresses that aren't mapped to a location. If you don't create a \* resource record set, Amazon Route 53 returns a ``no answer'' response for queries from those locations.
- You can't create non-geolocation resource record sets that have the same values for the Name and Type elements as geolocation resource record sets.

**TTL** The resource record cache time to live (TTL), in seconds. Note the following:

- If you're creating an alias resource record set, omit TTL. Amazon Route 53 uses the value of TTL for the alias target.
- If you're associating this resource record set with a health check (if you're adding a HealthCheckId element), we recommend that you specify a TTL of 60 seconds or less so clients respond quickly to changes in health status.
- All of the resource record sets in a group of weighted, latency, geolocation, or failover resource record sets must have the same value for TTL.
- If a group of weighted resource record sets includes one or more weighted alias resource record sets for which the alias target is an ELB load balancer, we recommend that you specify a TTL of 60 seconds for all of the non-alias weighted resource record sets that have the same name and type. Values other than 60 seconds (the TTL for load balancers) will change the effect of the values that

you specify for `Weight`.

**ResourceRecords** A list, containing one or more values for the resource record. No single value can exceed 4,000 characters. For details on how to format values for different record types, see [`Supported DNS Resource Record Types`](http://docs.aws.amazon.com/Route53/latest/DeveloperGuide/ResourceRecordTypes.html) in the Amazon Route 53 Developer Guide. .. `__`: <http://docs.aws.amazon.com/Route53/latest/DeveloperGuide/ResourceRecordTypes.html>

Note: You can specify more than one value for all record types except CNAME and SOA.

It is also possible to pass ``magic`` strings as resource record values. This functionality can easily be extended, but for the moment supports the following:

```
`magic:ec2_instance_tag:some_tag_name:some_string:some_instance_attr'
```

This tells salt to lookup an EC2 instance with a tag ``some_tag_name`` which has the value ``some_string`` and substitute the ``some_instance_attr`` attribute of that instance as the resource record value being evaluated.

This should work generally for any EC2 instance tags, as long as the instance attribute being fetched is available to `getattr(instance, `attribute`)` as seen in the code below. Anything else will most likely require this function to be extended to handle it.

The canonical use-case for this (at least at our site) is to query the Name tag (which we always populate with the host's FQDN) to lookup the public or private IPs bound to the instance, so we can then automatically create Route 53 records for them.

**AliasTarget** The rules governing how to define an `AliasTarget` for the various supported use-cases are obtuse beyond reason and attempting to paraphrase them (or even worse, cut-and-paste them in their entirety) would be silly and counterproductive. If you need this feature, then Read The Fine Materials at the [`Boto 3 Route 53 page`](http://boto3.readthedocs.io/en/latest/reference/services/route53.html#Route53.Client.change_resource_record_sets) and/or the [`AWS Route 53 docs`](http://docs.aws.amazon.com/Route53/latest/APIReference/API_AliasTarget.html) and suss them for yourself - I sure won't claim to understand them particularly well. .. `__`: [http://boto3.readthedocs.io/en/latest/reference/services/route53.html#Route53.Client.change\\_resource\\_record\\_sets](http://boto3.readthedocs.io/en/latest/reference/services/route53.html#Route53.Client.change_resource_record_sets) .. `__`: [http://docs.aws.amazon.com/Route53/latest/APIReference/API\\_AliasTarget.html](http://docs.aws.amazon.com/Route53/latest/APIReference/API_AliasTarget.html)

**region** The region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

## 14.17.19 salt.states.boto\_apigateway module

### Manage Apigateway Rest APIs

New in version 2016.11.0.

Create and destroy rest apis depending on a swagger version 2 definition file. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```

myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkdflkjgsdfjajkgghs
  region: us-east-1

```

```

Ensure Apigateway API exists:
boto_apigateway.present:
  - name: myfunction
  - region: us-east-1
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdfjkghWupUjasdfklkdflkjgsdfjajkgghs

```

`salt.states.boto_apigateway.absent`(*name*, *api\_name*, *stage\_name*, *nuke\_api=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the *stage\_name* associated with the given *api\_name* deployed by `boto_apigateway`'s present state is removed. If the currently associated deployment to the given *stage\_name* has no other stages associated with it, the deployment will also be removed.

**name** Name of the swagger file in YAML format

**api\_name** Name of the rest api on AWS ApiGateway to ensure is absent.

**stage\_name** Name of the stage to be removed irrespective of the swagger file content. If the current deployment associated with the *stage\_name* has no other stages associated with it, the deployment will also be removed.

**nuke\_api** If True, removes the API itself only if there are no other stages associated with any other deployments once the given *stage\_name* is removed.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_apigateway.present`(*name*, *api\_name*, *swagger\_file*, *stage\_name*, *api\_key\_required*, *lambda\_integration\_role*, *lambda\_region=None*, *stage\_variables=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *lambda\_funcname\_format='{stage}\_{api}\_{resource}\_{method}'*, *authorization\_type='NONE'*, *error\_response\_template=None*, *response\_template=None*)

Ensure the specified *api\_name* with the corresponding swaggerfile is deployed to the given *stage\_name* in AWS ApiGateway.

this state currently only supports ApiGateway integration with AWS Lambda, and CORS support is handled through a Mock integration.

There may be multiple deployments for the API object, each deployment is tagged with a description (i.e. unique label) in pretty printed json format consisting of the following key/values.

```

{ ``api_name":  api_name, ``swagger_file":  basename_of_swagger_file ``swagger_file_md5sum":  md5sum_of_swagger_file, ``swagger_info_object":  info_object_content_in_swagger_file
}

```

Please note that the name of the lambda function to be integrated will be derived via the provided `lambda_funcname_format` parameters:

the default `lambda_funcname_format` is a string with the following substitutable keys: ```{stage}_{api}_{resource}_{method}``. The user can choose to reorder the known keys.`

the stage key corresponds to the *stage\_name* passed in. the api key corresponds to

the `api_name` passed in. the resource corresponds to the resource path defined in the passed swagger file. the method corresponds to the method for a resource path defined in the passed swagger file.

for the default `lambda_funcname_format`, given the following input:

```
api_name = ` Test Service' stage_name = `alpha' basePath = `/api' path
= `/a/{b}/c' method = `POST'
```

**we will end up with the following Lambda Function Name that will be looked up:**

```
`test_service_alpha_a_b_c_post'
```

**The canonicalization of these input parameters is done in the following order:**

1. `lambda_funcname_format` is formatted with the input parameters as passed,
2. resulting string is stripped for leading/trailing spaces,
3. path parameter's curly braces are removed from the resource path,
4. consecutive spaces and forward slashes in the paths are replaced with `\_'`
5. consecutive `\_' are replaced with `\_'`

Please note that for error response handling, the swagger file must have an error response model with the following schema. The lambda functions should throw exceptions for any non successful responses. An optional pattern field can be specified in `errorMessage` field to aid the response mapping from Lambda to the proper error return status codes.

**name** The name of the state definition

**api\_name** The name of the rest api that we want to ensure exists in AWS API Gateway

**swagger\_file** Name of the location of the swagger rest api definition file in YAML format.

**stage\_name** Name of the stage we want to be associated with the given `api_name` and `swagger_file` definition

**api\_key\_required** True or False - whether the API Key is required to call API methods

**lambda\_integration\_role** The name or ARN of the IAM role that the AWS ApiGateway assumes when it executes your lambda function to handle incoming requests

**lambda\_region** The region where we expect to find the lambda functions. This is used to determine the region where we should look for the Lambda Function for integration purposes. The region determination is based on the following priority:

1. `lambda_region` as passed in (is not None)
- 2) if `lambda_region` is None, use the region as if a `boto_lambda` function were executed without explicitly specifying lambda region. 3) if region determined in (2) is different than the region used by `boto_apigateway` functions, a final lookup will be attempted using the `boto_apigateway` region.

**stage\_variables** A dict with variables and their values, or a pillar key (string) that contains a dict with variables and their values. key and values in the dict must be strings. `{'string': 'string'}`

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**lambda\_funcname\_format** Please review the earlier example for the usage. The only substitutable keys in the funcname format are `{stage}`, `{api}`, `{resource}`, `{method}`. Any other keys or positional substitution parameters will be flagged as an invalid input.

**authorization\_type** This field can be either ``NONE'`, or ``AWS_IAM'`. This will be applied to all methods in the given swagger spec file. Default is set to ``NONE'`

**error\_response\_template** String value that defines the response template mapping that should be applied in cases error occurs. Refer to AWS documentation for details:

<http://docs.aws.amazon.com/apigateway/latest/developerguide/>

api-gateway-mapping-template-reference.html

If set to None, the following default value is used: ``#set($inputRoot = $input.path(`$'))`

```
` `{
` ``errorMessage": ``$inputRoot.errorMessage",
` ``errorType": ``$inputRoot.errorType",
` ``stackTrace": [
` `#foreach($stackTrace in $inputRoot.stackTrace)
` `[
` `#foreach($elem in $stackTrace)
` ``$elem"
` `#if($foreach.hasNext),#end
` `#end
` `]
` `#if($foreach.hasNext),#end
` `#end
` `]
` `}
```

New in version 2017.7.0.

**response\_template** String value that defines the response template mapping applied in case of success (including OPTIONS method) If set to None, empty ({}), template is assumed, which will transfer response from the lambda function as is.

New in version 2017.7.0.

`salt.states.boto_apigateway.usage_plan_absent` (*name*, *plan\_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensures usage plan identified by name is no longer present

New in version 2017.7.0.

**name** name of the state

**plan\_name** name of the plan to remove

```
usage plan absent:
  boto_apigateway.usage_plan_absent:
    - plan_name: my_usage_plan
    - profile: my_profile
```

`salt.states.boto_apigateway.usage_plan_association_absent` (*name*, *plan\_name*, *api\_stages*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensures usage plan identified by name is removed from provided `api_stages` If a plan is associated to stages not listed in `api_stages` parameter, those associations remain intact.

New in version 2017.7.0.

**name** name of the state

**plan\_name** name of the plan to use

**api\_stages** list of dictionaries, where each dictionary consists of the following keys:  
**apiId** apiId of the api to detach usage plan from  
**stage** stage name of the api to detach usage plan from

```
UsagePlanAssociationAbsent:
  boto_apigateway.usage_plan_association_absent:
    - plan_name: my_plan
    - api_stages:
      - apiId: 9kb0404ec0
        stage: my_stage
      - apiId: l9v7o2aj90
        stage: my_stage
    - profile: my_profile
```

`salt.states.boto_apigateway.usage_plan_association_present`(*name*, *plan\_name*, *api\_stages*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensures usage plan identified by name is added to provided api\_stages

New in version 2017.7.0.

**name** name of the state

**plan\_name** name of the plan to use

**api\_stages** list of dictionaries, where each dictionary consists of the following keys:

**apiId** apiId of the api to attach usage plan to

**stage** stage name of the api to attach usage plan to

```
UsagePlanAssociationPresent:
  boto_apigateway.usage_plan_association_present:
    - plan_name: my_plan
    - api_stages:
      - apiId: 9kb0404ec0
        stage: my_stage
      - apiId: l9v7o2aj90
        stage: my_stage
    - profile: my_profile
```

`salt.states.boto_apigateway.usage_plan_present`(*name*, *plan\_name*, *description=None*, *throttle=None*, *quota=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the specified usage plan with the corresponding metrics is deployed

New in version 2017.7.0.

**name** name of the state

**plan\_name** [Required] name of the usage plan

**throttle** [Optional] throttling parameters expressed as a dictionary. If provided, at least one of the throttling parameters must be present

**rateLimit** rate per second at which capacity bucket is populated

**burstLimit** maximum rate allowed

**quota** [Optional] quota on the number of api calls permitted by the plan. If provided, limit and period must be present

**limit** [Required] number of calls permitted per quota period

**offset** [Optional] number of calls to be subtracted from the limit at the beginning of the period

**period** [Required] period to which quota applies. Must be DAY, WEEK or MONTH

```
UsagePlanPresent:
  boto_apigateway.usage_plan_present:
    - plan_name: my_usage_plan
    - throttle:
        rateLimit: 70
        burstLimit: 100
    - quota:
        limit: 1000
        offset: 0
        period: DAY
    - profile: my_profile
```

### 14.17.20 salt.states.boto\_asg

#### Manage Autoscale Groups

New in version 2014.7.0.

Create and destroy autoscale groups. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit autoscale credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

<http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html>

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
asg.keyid: GKTADJGHEIQSXMKKRBJ08H
asg.key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjajkgghs
```

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjajkgghs
  region: us-east-1
```

```
Ensure myasg exists:
  boto_asg.present:
    - name: myasg
    - launch_config_name: mylc
    - availability_zones:
        - us-east-1a
        - us-east-1b
    - min_size: 1
    - max_size: 1
    - desired_capacity: 1
    - load_balancers:
        - myelb
    - suspended_processes:
        - AddToLoadBalancer
        - AlarmNotification
```

```

- scaling_policies
  - adjustment_type: ChangeInCapacity
  - as_name: api-production-iad
  - cooldown: 1800
  - min_adjustment_step: None
  - name: ScaleDown
  - scaling_adjustment: -1
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjajkghs

# Using a profile from pillars.
Ensure myasg exists:
boto_asg.present:
  - name: myasg
  - launch_config_name: mylc
  - availability_zones:
    - us-east-1a
    - us-east-1b
  - min_size: 1
  - max_size: 1
  - desired_capacity: 1
  - load_balancers:
    - myelb
  - profile: myprofile

# Passing in a profile.
Ensure myasg exists:
boto_asg.present:
  - name: myasg
  - launch_config_name: mylc
  - availability_zones:
    - us-east-1a
    - us-east-1b
  - min_size: 1
  - max_size: 1
  - desired_capacity: 1
  - load_balancers:
    - myelb
  - profile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjajkghs
    region: us-east-1

# Deleting an autoscale group with running instances.
Ensure myasg is deleted:
boto_asg.absent:
  - name: myasg
  # If instances exist, we must force the deletion of the asg.
  - force: True

```

It's possible to specify cloudwatch alarms that will be setup along with the ASG. Note the alarm name will be the name attribute defined, plus the ASG resource name.

```

Ensure myasg exists:
boto_asg.present:
  - name: myasg
  - launch_config_name: mylc

```

```

- availability_zones:
  - us-east-1a
  - us-east-1b
- min_size: 1
- max_size: 1
- desired_capacity: 1
- load_balancers:
  - myelb
- profile: myprofile
- alarms:
  CPU:
    name: 'ASG CPU **MANAGED BY SALT**'
    attributes:
      metric: CPUUtilization
      namespace: AWS/EC2
      statistic: Average
      comparison: '>='
      threshold: 65.0
      period: 60
      evaluation_periods: 30
      unit: null
      description: 'ASG CPU'
      alarm_actions: [ 'arn:aws:sns:us-east-1:12345:myalarm' ]
      insufficient_data_actions: []
      ok_actions: [ 'arn:aws:sns:us-east-1:12345:myalarm' ]

```

You can also use alarms from pillars, and override values from the pillar alarms by setting overrides on the resource. Note that `boto_asg_alarms` will be used as a default value for all resources, if defined and can be used to ensure alarms are always set for an ASG resource.

Setting the alarms in a pillar:

```

my_asg_alarm:
  CPU:
    name: 'ASG CPU **MANAGED BY SALT**'
    attributes:
      metric: CPUUtilization
      namespace: AWS/EC2
      statistic: Average
      comparison: '>='
      threshold: 65.0
      period: 60
      evaluation_periods: 30
      unit: null
      description: 'ASG CPU'
      alarm_actions: [ 'arn:aws:sns:us-east-1:12345:myalarm' ]
      insufficient_data_actions: []
      ok_actions: [ 'arn:aws:sns:us-east-1:12345:myalarm' ]

```

Overriding the alarm values on the resource:

```

Ensure myasg exists:
  boto_asg.present:
    - name: myasg
    - launch_config_name: mylc
    - availability_zones:
      - us-east-1a
      - us-east-1b

```

```

- min_size: 1
- max_size: 1
- desired_capacity: 1
- load_balancers:
  - myelb
- profile: myprofile
- alarms_from_pillar: my_asg_alarm
# override CPU:attributes:threshold
- alarms:
  CPU:
    attributes:
      threshold: 50.0

```

`salt.states.boto_asg.absent`(*name*, *force=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *remove\_lc=False*)

Ensure the named autoscale group is deleted.

**name** Name of the autoscale group.

**force** Force deletion of autoscale group.

**remove\_lc** Delete the launch config as well.

**region** The region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_asg.present`(*name*, *launch\_config\_name*, *availability\_zones*, *min\_size*, *max\_size*, *launch\_config=None*, *desired\_capacity=None*, *load\_balancers=None*, *default\_cooldown=None*, *health\_check\_type=None*, *health\_check\_period=None*, *placement\_group=None*, *vpc\_zone\_identifier=None*, *subnet\_names=None*, *tags=None*, *termination\_policies=None*, *termination\_policies\_from\_pillar='boto\_asg\_termination\_policies'*, *suspended\_processes=None*, *scaling\_policies=None*, *scaling\_policies\_from\_pillar='boto\_asg\_scaling\_policies'*, *scheduled\_actions=None*, *scheduled\_actions\_from\_pillar='boto\_asg\_scheduled\_actions'*, *alarms=None*, *alarms\_from\_pillar='boto\_asg\_alarms'*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *notification\_arn=None*, *notification\_arn\_from\_pillar='boto\_asg\_notification\_arn'*, *notification\_types=None*, *notification\_types\_from\_pillar='boto\_asg\_notification\_types'*)

Ensure the autoscale group exists.

**name** Name of the autoscale group.

**launch\_config\_name** Name of the launch config to use for the group. Or, if `launch_config` is specified, this will be the launch config name's prefix. (see below)

**launch\_config** A dictionary of launch config attributes. If specified, a launch config will be used or created, matching this set of attributes, and the autoscale group will be set to use that launch config. The launch config name will be the `launch_config_name` followed by a hyphen followed by a hash of the `launch_config` dict contents. Example:

```

my_asg:
  boto_asg.present:
    - launch_config:
      - ebs_optimized: false
      - instance_profile_name: my_iam_profile
      - kernel_id: ''
      - ramdisk_id: ''

```

```

- key_name: my_ssh_key
- image_name: aws2015091-hvm
- instance_type: c3.xlarge
- instance_monitoring: false
- security_groups:
  - my_sec_group_01
  - my_sec_group_02

```

**availability\_zones** List of availability zones for the group.

**min\_size** Minimum size of the group.

**max\_size** Maximum size of the group.

**desired\_capacity** The desired capacity of the group.

**load\_balancers** List of load balancers for the group. Once set this can not be updated (Amazon restriction).

**default\_cooldown** Number of seconds after a Scaling Activity completes before any further scaling activities can start.

**health\_check\_type** The service you want the health status from, Amazon EC2 or Elastic Load Balancer (EC2 or ELB).

**health\_check\_period** Length of time in seconds after a new EC2 instance comes into service that Auto Scaling starts checking its health.

**placement\_group** Physical location of your cluster placement group created in Amazon EC2. Once set this can not be updated (Amazon restriction).

**vpc\_zone\_identifier** A list of the subnet identifiers of the Virtual Private Cloud.

**subnet\_names** For VPC, a list of subnet names (NOT subnet IDs) to deploy into. Exclusive with `vpc_zone_identifier`.

**tags** A list of tags. Example:

```

- key: 'key'
  value: 'value'
  propagate_at_launch: true

```

**termination\_policies** A list of termination policies. Valid values are:

- OldestInstance
- NewestInstance
- OldestLaunchConfiguration
- ClosestToNextInstanceHour
- Default

If no value is specified, the Default value is used.

**termination\_policies\_from\_pillar:** name of pillar dict that contains termination policy settings. Termination policies defined for this specific state will override those from pillar.

**suspended\_processes** List of processes to be suspended. see [http://docs.aws.amazon.com/AutoScaling/latest/DeveloperGuide/US\\_SuspendResume.html](http://docs.aws.amazon.com/AutoScaling/latest/DeveloperGuide/US_SuspendResume.html)

**scaling\_policies** List of scaling policies. Each policy is a dict of key-values described by <https://boto.readthedocs.io/en/latest/ref/autoscale.html#boto.ec2.autoscale.policy.ScalingPolicy>

**scaling\_policies\_from\_pillar:** name of pillar dict that contains scaling policy settings. Scaling policies defined for this specific state will override those from pillar.

**scheduled\_actions:** a dictionary of scheduled actions. Each key is the name of scheduled action and each value is dictionary of options. For example:

```

- scheduled_actions:
  scale_up_at_10:
    desired_capacity: 4
    min_size: 3
    max_size: 5
    recurrence: "0 9 * * 1-5"
  scale_down_at_7:
    desired_capacity: 1

```

```
min_size: 1
max_size: 1
recurrence: "@ 19 * * 1-5"
```

**scheduled\_actions\_from\_pillar:** name of pillar dict that contains `scheduled_actions` settings. Scheduled actions for this specific state will override those from pillar.

**alarms:** a dictionary of name->boto\_cloudwatch\_alarm sections to be associated with this ASG. All attributes should be specified except for dimension which will be automatically set to this ASG.

See the `salt.states.boto_cloudwatch_alarm` state for information about these attributes.

If any alarm actions include `self:` this will be replaced with the asg name. For example, alarm\_actions reading `[[scaling_policy:self:ScaleUp]]` will map to the arn for this asg's scaling policy named `ScaleUp`. In addition, any alarms that have only `scaling_policy` as actions will be ignored if `min_size` is equal to `max_size` for this ASG.

**alarms\_from\_pillar:** name of pillar dict that contains alarm settings. Alarms defined for this specific state will override those from pillar.

**region** The region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**notification\_arn** The AWS arn that notifications will be sent to

**notification\_arn\_from\_pillar** name of the pillar dict that contains `notification_arn` settings. A `notification_arn` defined for this specific state will override the one from pillar.

**notification\_types** A list of event names that will trigger a notification. The list of valid notification types is:

- `autoscaling:EC2_INSTANCE_LAUNCH`
- `autoscaling:EC2_INSTANCE_LAUNCH_ERROR`
- `autoscaling:EC2_INSTANCE_TERMINATE`
- `autoscaling:EC2_INSTANCE_TERMINATE_ERROR`
- `autoscaling:TEST_NOTIFICATION`

**notification\_types\_from\_pillar** name of the pillar dict that contains `notification_types` settings. `notification_types` defined for this specific state will override those from the pillar.

### 14.17.21 salt.states.boto\_cfn

Connection module for Amazon Cloud Formation

New in version 2015.8.0.

**depends** boto

**configuration** This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at <http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html>

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkgghs
```

```
stack-present:
  boto_cfn.present:
    - name: mystack
    - template_body: salt://base/mytemplate.json
```

```

- disable_rollback: true
- region: eu-west-1
- keyid: 'AKIAJHTMIQ2ASDFLASDF'
- key: 'fdkjsafkljsASSADfalkfjasdf'

```

```

stack-absent:
  boto_cfn.absent:
    - name: mystack

```

`salt.states.boto_cfn.absent` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure cloud formation stack is absent.

*name* (string) – The name of the stack to delete.

*region* (string) - Region to connect to.

*key* (string) - Secret key to be used.

*keyid* (string) - Access key to be used.

*profile* (dict) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_cfn.present` (*name*, *template\_body=None*, *template\_url=None*, *parameters=None*, *notification\_arns=None*, *disable\_rollback=None*, *timeout\_in\_minutes=None*, *capabilities=None*, *tags=None*, *on\_failure=None*, *stack\_policy\_body=None*, *stack\_policy\_url=None*, *use\_previous\_template=None*, *stack\_policy\_during\_update\_body=None*, *stack\_policy\_during\_update\_url=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure cloud formation stack is present.

*name* (string) - Name of the stack.

*template\_body* (string) – Structure containing the template body. Can also be loaded from a file by using `salt://`.

*template\_url* (string) – Location of file containing the template body. The URL must point to a template located in an S3 bucket in the same region as the stack.

*parameters* (list) – A list of key/value tuples that specify input parameters for the stack. A 3-tuple (key, value, bool) may be used to specify the UsePreviousValue option.

*notification\_arns* (list) – The Simple Notification Service (SNS) topic ARNs to publish stack related events. You can find your SNS topic ARNs using the [SNS\\_console](#) or your Command Line Interface (CLI).

*disable\_rollback* (bool) – Indicates whether or not to rollback on failure.

*timeout\_in\_minutes* (integer) – The amount of time that can pass before the stack status becomes CREATE\_FAILED; if DisableRollback is not set or is set to False, the stack will be rolled back.

*capabilities* (list) – The list of capabilities you want to allow in the stack. Currently, the only valid capability is 'CAPABILITY\_IAM'.

*tags* (dict) – A set of user-defined Tags to associate with this stack, represented by key/value pairs. Tags defined for the stack are propagated to EC2 resources that are created as part of the stack. A maximum number of 10 tags can be specified.

*on\_failure* (string) – Determines what action will be taken if stack creation fails. This must be one of: DO\_NOTHING, ROLLBACK, or DELETE. You can specify either OnFailure or DisableRollback, but not both.

`stack_policy_body` (string) – Structure containing the stack policy body. Can also be loaded from a file by using `salt://`.

`stack_policy_url` (string) – Location of a file containing the stack policy. The URL must point to a policy (max size: 16KB) located in an S3 bucket in the same region as the stack. If you pass `StackPolicyBody` and `StackPolicyURL`, only `StackPolicyBody` is used.

`use_previous_template` (boolean) – Used only when templates are not the same. Set to `True` to use the previous template instead of uploading a new one via `TemplateBody` or `TemplateURL`.

`stack_policy_during_update_body` (string) – Used only when templates are not the same. Structure containing the temporary overriding stack policy body. If you pass `StackPolicyDuringUpdateBody` and `StackPolicyDuringUpdateURL`, only `StackPolicyDuringUpdateBody` is used. Can also be loaded from a file by using `salt://`.

`stack_policy_during_update_url` (string) – Used only when templates are not the same. Location of a file containing the temporary overriding stack policy. The URL must point to a policy (max size: 16KB) located in an S3 bucket in the same region as the stack. If you pass `StackPolicyDuringUpdateBody` and `StackPolicyDuringUpdateURL`, only `StackPolicyDuringUpdateBody` is used.

`region` (string) - Region to connect to.

`key` (string) - Secret key to be used.

`keyid` (string) - Access key to be used.

`profile` (dict) - A dict with `region`, `key` and `keyid`, or a pillar key (string) that contains a dict with `region`, `key` and `keyid`.

## 14.17.22 salt.states.boto\_cloudtrail module

### Manage CloudTrail Objects

New in version 2016.3.0.

Create and destroy CloudTrail objects. Be aware that this interacts with Amazon's services, and so may incur charges.

#### depends

- boto
- boto3

The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
```

```
key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
region: us-east-1
```

```
Ensure trail exists:
  boto_cloudtrail.present:
    - Name: mytrail
    - S3BucketName: mybucket
    - S3KeyPrefix: prefix
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

`salt.states.boto_cloudtrail.absent`(*name*, *Name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure trail with passed properties is absent.

**name** The name of the state definition.

**Name** Name of the trail.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_cloudtrail.present`(*name*, *Name*, *S3BucketName*, *S3KeyPrefix=None*, *SnsTopicName=None*, *IncludeGlobalServiceEvents=True*, *IsMultiRegionTrail=None*, *EnableLogFileValidation=False*, *CloudWatchLogsLogGroupArn=None*, *CloudWatchLogsRoleArn=None*, *KmsKeyId=None*, *LoggingEnabled=True*, *Tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure trail exists.

**name** The name of the state definition

**Name** Name of the trail.

**S3BucketName** Specifies the name of the Amazon S3 bucket designated for publishing log files.

**S3KeyPrefix** Specifies the Amazon S3 key prefix that comes after the name of the bucket you have designated for log file delivery.

**SnsTopicName** Specifies the name of the Amazon SNS topic defined for notification of log file delivery. The maximum length is 256 characters.

**IncludeGlobalServiceEvents** Specifies whether the trail is publishing events from global services such as IAM to the log files.

**EnableLogFileValidation** Specifies whether log file integrity validation is enabled. The default is false.

**CloudWatchLogsLogGroupArn** Specifies a log group name using an Amazon Resource Name (ARN), a unique identifier that represents the log group to which CloudTrail logs will be delivered. Not required unless you specify CloudWatchLogsRoleArn.

**CloudWatchLogsRoleArn** Specifies the role for the CloudWatch Logs endpoint to assume to write to a user's log group.

**KmsKeyId** Specifies the KMS key ID to use to encrypt the logs delivered by CloudTrail. The value can be a an alias name prefixed by ``alias/``, a fully specified ARN to an alias, a fully specified ARN to a key, or a globally unique identifier.

**LoggingEnabled** Whether logging should be enabled for the trail

**Tags** A dictionary of tags that should be set on the trail

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and

keyid.

### 14.17.23 salt.states.boto\_cloudwatch\_alarm

Manage Cloudwatch alarms

New in version 2014.7.0.

Create and destroy cloudwatch alarms. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

<http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html>

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
cloudwatch.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudwatch.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
  region: us-east-1
```

```
my test alarm:
  boto_cloudwatch_alarm.present:
    - name: my test alarm
    - attributes:
        metric: ApproximateNumberOfMessagesVisible
        namespace: AWS/SQS
        statistic: Average
        comparison: ">="
        threshold: 20000.0
        period: 60
        evaluation_periods: 1
        description: test alarm via salt
        dimensions:
          QueueName:
            - the-sqs-queue-name
        alarm_actions:
          - arn:aws:sns:us-east-1:1111111:myalerting-action
```

**salt.states.boto\_cloudwatch\_alarm.absent** (*name, region=None, key=None, keyid=None, profile=None*)

Ensure the named cloudwatch alarm is deleted.

**name** Name of the alarm.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_cloudwatch_alarm.present`(*name*, *attributes*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the cloudwatch alarm exists.

**name** Name of the alarm

**attributes** A dict of key/value cloudwatch alarm attributes.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

## 14.17.24 salt.states.boto\_cloudwatch\_event module

### Manage CloudTrail Objects

New in version 2016.11.0.

Create and destroy CloudWatch event rules. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
cloudwatch_event.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudwatch_event.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
  region: us-east-1
```

```
Ensure event rule exists:
boto_cloudwatch_event.present:
  - Name: mytrail
  - ScheduleExpression: 'rate(120 minutes)'
  - State: 'DISABLED'
  - Targets:
    - Id: "target1"
      Arn: "arn:aws:lambda:us-west-1:124456715622:function:my_function"
      Input: '{"arbitrary": "json"}'
  - region: us-east-1
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
```

`salt.states.boto_cloudwatch_event.absent`(*name*, *Name=None*, *region=None*, *key=None*,  
*keyid=None*, *profile=None*)

Ensure CloudWatch event rule with passed properties is absent.

**name** The name of the state definition.

**Name** Name of the event rule. Defaults to the value of the `name` param if not provided.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_cloudwatch_event.present`(*name*, *Name=None*, *ScheduleExpression=None*,  
*EventPattern=None*, *Description=None*,  
*RoleArn=None*, *State=None*, *Targets=None*,  
*region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure trail exists.

**name** The name of the state definition

**Name** Name of the event rule. Defaults to the value of the `name` param if not provided.

**ScheduleExpression** The scheduling expression. For example, ``cron(0 20 \* \* ? \*)``, ``rate(5 minutes)``

**EventPattern** The event pattern.

**Description** A description of the rule

**State** Indicates whether the rule is ENABLED or DISABLED.

**RoleArn** The Amazon Resource Name (ARN) of the IAM role associated with the rule.

**Targets** A list of rresources to be invoked when the rule is triggered.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 14.17.25 salt.states.boto\_cognitoidentity module

#### Manage CognitoIdentity Functions

New in version 2016.11.0.

Create and destroy CognitoIdentity identity pools. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfkldfklgjsdfjakghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
```

```
key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
region: us-east-1
```

```
Ensure function exists:
boto_cognitoidentity.pool_present:
- PoolName: my_identity_pool
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

`salt.states.boto_cognitoidentity.pool_absent` (*name*, *IdentityPoolName*, *RemoveAllMatched=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure cognito identity pool with passed properties is absent.

**name** The name of the state definition.

**IdentityPoolName** Name of the Cognito Identity Pool. Please note that this may match multiple pools with the same given name, in which case, all will be removed.

**RemoveAllMatched** If True, all identity pools with the matching IdentityPoolName will be removed. If False and there are more than one identity pool with the matching IdentityPoolName, no action will be taken. If False and there is only one identity pool with the matching IdentityPoolName, the identity pool will be removed.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_cognitoidentity.pool_present` (*name*, *IdentityPoolName*, *AuthenticatedRole*, *AllowUnauthenticatedIdentities=False*, *UnauthenticatedRole=None*, *SupportedLoginProviders=None*, *DeveloperProviderName=None*, *OpenIdConnectProviderARNs=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure Cognito Identity Pool exists.

**name** The name of the state definition

**IdentityPoolName** Name of the Cognito Identity Pool

**AuthenticatedRole** An IAM role name or ARN that will be associated with temporary AWS credentials for an authenticated cognito identity.

**AllowUnauthenticatedIdentities** Whether to allow anonymous user identities

**UnauthenticatedRole** An IAM role name or ARN that will be associated with anonymous user identities

**SupportedLoginProviders** A dictionary or pillar that contains key:value pairs mapping provider names to provider app IDs.

**DeveloperProviderName** A string which is the domain by which Cognito will refer to your users. This name acts as a placeholder that allows your backend and the Cognito service to communicate about the developer provider. Once you have set a developer provider name, you cannot change it. Please take care in setting this parameter.

**OpenIdConnectProviderARNs** A list or pillar name that contains a list of OpenID Connect provider ARNs.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 14.17.26 salt.states.boto\_datapipeline module

Manage Data Pipelines

New in version 2016.3.0.

Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto3, which can be installed via package, or pip.

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
datapipeline.keyid: GKTADJGHEIQSXMKKRBJ08H
datapipeline.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
  region: us-east-1
```

```
Ensure daily data pipeline exists:
boto_datapipeline.present:
  - name: my-datapipeline
  - pipeline_objects:
      DefaultSchedule:
        name: Every 1 day
        fields:
          period: 1 Day
          type: Schedule
          startAt: FIRST_ACTIVATION_DATE_TIME
  - parameter_values:
      myDDBTableName: my-dynamo-table
```

**salt.states.boto\_datapipeline.absent**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure a pipeline with the service\_name does not exist

**name** Name of the service to ensure a data pipeline does not exist for.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto\_datapipeline.present**(*name*, *pipeline\_objects=None*, *pipeline\_objects\_from\_pillars='boto\_datapipeline\_pipeline\_objects'*, *parameter\_objects=None*, *parameter\_objects\_from\_pillars='boto\_datapipeline\_parameter\_objects'*, *parameter\_values=None*, *parameter\_values\_from\_pillars='boto\_datapipeline\_parameter\_values'*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the data pipeline exists with matching definition.

**name** Name of the service to ensure a data pipeline exists for.

**pipeline\_objects** Pipeline objects to use. Will override objects read from pillars.  
**pipeline\_objects\_from\_pillars** The pillar key to use for lookup.  
**parameter\_objects** Parameter objects to use. Will override objects read from pillars.  
**parameter\_objects\_from\_pillars** The pillar key to use for lookup.  
**parameter\_values** Parameter values to use. Will override values read from pillars.  
**parameter\_values\_from\_pillars** The pillar key to use for lookup.  
**region** Region to connect to.  
**key** Secret key to be used.  
**keyid** Access key to be used.  
**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 14.17.27 salt.states.boto\_dynamodb

#### Manage DynamoDB Tables

New in version 2015.5.0.

Create and destroy DynamoDB tables. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit DynamoDB credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
region: us-east-1
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
  region: us-east-1
```

```
Ensure DynamoDB table does not exist:
boto_dynamodb.absent:
- table_name: new_table
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
- region: us-east-1
```

```
Ensure DynamoDB table exists:
boto_dynamodb.present:
- table_name: new_table
- read_capacity_units: 1
- write_capacity_units: 2
- hash_key: primary_id
- hash_key_data_type: N
- range_key: start_timestamp
- range_key_data_type: N
```

```

- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjajkghs
- region: us-east-1
- local_indexes:
  - index:
    - name: "primary_id_end_timestamp_index"
    - hash_key: primary_id
    - hash_key_data_type: N
    - range_key: end_timestamp
    - range_key_data_type: N
- global_indexes:
  - index:
    - name: "name_end_timestamp_index"
    - hash_key: name
    - hash_key_data_type: S
    - range_key: end_timestamp
    - range_key_data_type: N
    - read_capacity_units: 3
    - write_capacity_units: 4

```

It's possible to specify cloudwatch alarms that will be setup along with the DynamoDB table. Note the alarm name will be defined by the name attribute provided, plus the DynamoDB resource name.

```

Ensure DynamoDB table exists:
boto_dynamodb.present:
- name: new_table
- read_capacity_units: 1
- write_capacity_units: 2
- hash_key: primary_id
- hash_key_data_type: N
- range_key: start_timestamp
- range_key_data_type: N
- alarms:
  ConsumedWriteCapacityUnits:
    name: 'DynamoDB ConsumedWriteCapacityUnits **MANAGED BY SALT**'
    attributes:
      metric: ConsumedWriteCapacityUnits
      namespace: AWS/DynamoDB
      statistic: Sum
      comparison: '>='
      # threshold_percent is used to calculate the actual threshold
      # based on the provisioned capacity for the table.
      threshold_percent: 0.75
      period: 300
      evaluation_periods: 2
      unit: Count
      description: 'DynamoDB ConsumedWriteCapacityUnits'
      alarm_actions: [ 'arn:aws:sns:us-east-1:1234:my-alarm' ]
      insufficient_data_actions: []
      ok_actions: [ 'arn:aws:sns:us-east-1:1234:my-alarm' ]
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjajkghs
- region: us-east-1

```

You can also use alarms from pillars, and override values from the pillar alarms by setting overrides on the resource. Note that `boto\_dynamodb\_alarms` will be used as a default value for all resources, if defined and can be used to ensure alarms are always set for a resource.

Setting the alarms in a pillar:

```
boto_dynamodb_alarms:
  ConsumedWriteCapacityUnits:
    name: 'DynamoDB ConsumedWriteCapacityUnits **MANAGED BY SALT**'
    attributes:
      metric: ConsumedWriteCapacityUnits
      namespace: AWS/DynamoDB
      statistic: Sum
      comparison: '>='
      # threshold_percent is used to calculate the actual threshold
      # based on the provisioned capacity for the table.
      threshold_percent: 0.75
      period: 300
      evaluation_periods: 2
      unit: Count
      description: 'DynamoDB ConsumedWriteCapacityUnits'
      alarm_actions: [ 'arn:aws:sns:us-east-1:1234:my-alarm' ]
      insufficient_data_actions: []
      ok_actions: [ 'arn:aws:sns:us-east-1:1234:my-alarm' ]
```

Ensure DynamoDB table exists:

```
boto_dynamodb.present:
- name: new_table
- read_capacity_units: 1
- write_capacity_units: 2
- hash_key: primary_id
- hash_key_data_type: N
- range_key: start_timestamp
- range_key_data_type: N
- alarms:
  ConsumedWriteCapacityUnits:
    attributes:
      threshold_percent: 0.90
      period: 900
```

#### **exception** salt.states.boto\_dynamodb.**GsiNotUpdatableError**

Raised when a global secondary index cannot be updated.

salt.states.boto\_dynamodb.**absent**(name, region=None, key=None, keyid=None, profile=None)

Ensure the DynamoDB table does not exist.

**name** Name of the DynamoDB table.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto\_dynamodb.**present**(name=None, table\_name=None, region=None, key=None, keyid=None, profile=None, read\_capacity\_units=None, write\_capacity\_units=None, alarms=None, alarms\_from\_pillar='boto\_dynamodb\_alarms', hash\_key=None, hash\_key\_data\_type=None, range\_key=None, range\_key\_data\_type=None, local\_indexes=None, global\_indexes=None, backup\_configs\_from\_pillars='boto\_dynamodb\_backup\_configs')

Ensure the DynamoDB table exists. Table throughput can be updated after table creation.

Global secondary indexes (GSIs) are managed with some exceptions: \* If a GSI deletion is detected, a failure

will occur (deletes should be done manually in the AWS console).

- If multiple GSIs are added in a single Salt call, a failure will occur (boto supports one creation at a time). Note that this only applies after table creation; multiple GSIs can be created during table creation.
- Updates to existing GSIs are limited to read/write capacity only (DynamoDB limitation).

**name** Name of the DynamoDB table

**table\_name** Name of the DynamoDB table (deprecated)

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**read\_capacity\_units** The read throughput for this table

**write\_capacity\_units** The write throughput for this table

**hash\_key** The name of the attribute that will be used as the hash key for this table

**hash\_key\_data\_type** The DynamoDB datatype of the hash key

**range\_key** The name of the attribute that will be used as the range key for this table

**range\_key\_data\_type** The DynamoDB datatype of the range key

**local\_indexes** The local indexes you would like to create

**global\_indexes** The global indexes you would like to create

**backup\_configs\_from\_pillars** Pillars to use to configure DataPipeline backups

### 14.17.28 salt.states.boto\_ec2

Manage EC2

New in version 2015.8.0.

This module provides an interface to the Elastic Compute Cloud (EC2) service from AWS.

The below code creates a key pair:

```
create-key-pair:
  boto_ec2.key_present:
    - name: mykeypair
    - save_private: /root/
    - region: eu-west-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkdflkjgjsdfjajkghs
```

```
import-key-pair:
  boto_ec2.key_present:
    - name: mykeypair
    - upload_public: 'ssh-rsa AAAA'
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkdflkjgjsdfjajkghs
```

You can also use salt:// in order to define the public key.

```
import-key-pair:
  boto_ec2.key_present:
    - name: mykeypair
    - upload_public: salt://mybase/public_key.pub
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkdflkjgjsdfjajkghs
```

The below code deletes a key pair:

```
delete-key-pair:
  boto_ec2.key_absent:
    - name: mykeypair
    - region: eu-west-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkdflkjgsdfjajkghs
```

`salt.states.boto_ec2.eni_absent` (*name*, *release\_eip=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the EC2 ENI is absent.

New in version 2016.3.0.

**name** Name tag associated with the ENI.

**release\_eip** True/False - release any EIP associated with the ENI

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_ec2.eni_present` (*name*, *subnet\_id=None*, *subnet\_name=None*, *private\_ip\_address=None*, *description=None*, *groups=None*, *source\_dest\_check=True*, *allocate\_eip=None*, *arecords=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the EC2 ENI exists.

New in version 2016.3.0.

**name** Name tag associated with the ENI.

**subnet\_id** The VPC subnet ID the ENI will exist within.

**subnet\_name** The VPC subnet name the ENI will exist within.

**private\_ip\_address** The private ip address to use for this ENI. If this is not specified AWS will automatically assign a private IP address to the ENI. Must be specified at creation time; will be ignored afterward.

**description** Description of the key.

**groups** A list of security groups to apply to the ENI.

**source\_dest\_check** Boolean specifying whether source/destination checking is enabled on the ENI.

**allocate\_eip** allocate and associate an EIP to the ENI. Could be 'standard' to allocate Elastic IP to EC2 region or 'vpc' to get it for a particular VPC

Changed in version 2016.11.0.

**arecords** A list of arecord dicts with attributes needed for the DNS add\_record state. By default the boto\_route53.add\_record state will be used, which requires: name, zone, ttl, and identifier. See the boto\_route53 state for information about these attributes. Other DNS modules can be called by specifying the provider keyword. By default, the private ENI IP address will be used, set 'public: True' in the arecord dict to use the ENI's public IP address

New in version 2016.3.0.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_ec2.instance_absent` (*name*, *instance\_name=None*, *instance\_id=None*, *release\_eip=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *filters=None*)

Ensure an EC2 instance does not exist (is stopped and removed).

**name** (string) - The name of the state definition.  
**instance\_name** (string) - The name of the instance.  
**instance\_id** (string) - The ID of the instance.  
**release\_eip** (bool) - Release any associated EIPs during termination.  
**region** (string) - Region to connect to.  
**key** (string) - Secret key to be used.  
**keyid** (string) - Access key to be used.  
**profile** (variable) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.  
**filters** (dict) - A dict of additional filters to use in matching the instance to delete.  
 YAML example fragment:

```

salt.states.boto_ec2.instance_present(name, instance_name=None, instance_id=None,
                                     image_id=None, image_name=None,
                                     tags=None, key_name=None, security_groups=None,
                                     user_data=None, instance_type=None, placement=None,
                                     kernel_id=None, ramdisk_id=None, vpc_id=None,
                                     vpc_name=None, monitoring_enabled=None,
                                     subnet_id=None, subnet_name=None, private_ip_address=None,
                                     block_device_map=None, disable_api_termination=None,
                                     instance_initiated_shutdown_behavior=None,
                                     placement_group=None, client_token=None,
                                     security_group_ids=None, security_group_names=None,
                                     additional_info=None, tenancy=None, instance_profile_arn=None,
                                     instance_profile_name=None, ebs_optimized=None,
                                     network_interfaces=None, network_interface_name=None,
                                     network_interface_id=None, attributes=None,
                                     target_state=None, public_ip=None, allocation_id=None,
                                     allocate_eip=False, region=None, key=None,
                                     keyid=None, profile=None)
  
```

Ensure an EC2 instance is running with the given attributes and state.

**name** (string) - The name of the state definition. Recommended that this match the instance\_name attribute (generally the FQDN of the instance).  
**instance\_name** (string) - The name of the instance, generally its FQDN. Exclusive with `instance\_id`.  
**instance\_id** (string) - The ID of the instance (if known). Exclusive with `instance\_name`.  
**image\_id** (string) - The ID of the AMI image to run.  
**image\_name** (string) - The name of the AMI image to run.  
**tags** (dict) - Tags to apply to the instance.  
**key\_name** (string) - The name of the key pair with which to launch instances.  
**security\_groups** (list of strings) - The names of the EC2 classic security groups with which to associate instances.  
**user\_data** (string) - The Base64-encoded MIME user data to be made available to the instance(s) in this reservation.  
**instance\_type** (string) - The EC2 instance size/type. Note that only certain types are compatible with HVM based AMIs.  
**placement** (string) - The Availability Zone to launch the instance into.  
**kernel\_id** (string) - The ID of the kernel with which to launch the instances.  
**ramdisk\_id** (string) - The ID of the RAM disk with which to launch the instances.  
**vpc\_id** (string) - The ID of a VPC to attach the instance to.  
**vpc\_name** (string) - The name of a VPC to attach the instance to.  
**monitoring\_enabled** (bool) - Enable detailed CloudWatch monitoring on the instance.

- subnet\_id** (string) – The ID of the subnet within which to launch the instances for VPC.
- subnet\_name** (string) – The name of the subnet within which to launch the instances for VPC.
- private\_ip\_address** (string) – If you’re using VPC, you can optionally use this parameter to assign the instance a specific available IP address from the subnet (e.g., 10.0.0.25).
- block\_device\_map** (boto.ec2.blockdevicemapping.BlockDeviceMapping) – A BlockDeviceMapping data structure describing the EBS volumes associated with the Image.
- disable\_api\_termination** (bool) – If True, the instances will be locked and will not be able to be terminated via the API.
- instance\_initiated\_shutdown\_behavior** (string) – Specifies whether the instance stops or terminates on instance-initiated shutdown. Valid values are:
- ‘stop’
  - ‘terminate’
- placement\_group** (string) – If specified, this is the name of the placement group in which the instance(s) will be launched.
- client\_token** (string) – Unique, case-sensitive identifier you provide to ensure idempotency of the request. Maximum 64 ASCII characters.
- security\_group\_ids** (list of strings) – The IDs of the VPC security groups with which to associate instances.
- security\_group\_names** (list of strings) – The names of the VPC security groups with which to associate instances.
- additional\_info** (string) – Specifies additional information to make available to the instance(s).
- tenancy** (string) – The tenancy of the instance you want to launch. An instance with a tenancy of ‘dedicated’ runs on single-tenant hardware and can only be launched into a VPC. Valid values are: “default” or “dedicated”. NOTE: To use dedicated tenancy you MUST specify a VPC subnet-ID as well.
- instance\_profile\_arn** (string) – The Amazon resource name (ARN) of the IAM Instance Profile (IIP) to associate with the instances.
- instance\_profile\_name** (string) – The name of the IAM Instance Profile (IIP) to associate with the instances.
- ebs\_optimized** (bool) – Whether the instance is optimized for EBS I/O. This optimization provides dedicated throughput to Amazon EBS and a tuned configuration stack to provide optimal EBS I/O performance. This optimization isn’t available with all instance types.
- network\_interfaces** (boto.ec2.networkinterface.NetworkInterfaceCollection) – A NetworkInterfaceCollection data structure containing the ENI specifications for the instance.
- network\_interface\_name**  
(string) - The name of Elastic Network Interface to attach  
New in version 2016.11.0.
- network\_interface\_id**  
(string) - The id of Elastic Network Interface to attach  
New in version 2016.11.0.
- attributes** (dict) - Instance attributes and value to be applied to the instance. Available options are:
- instanceType - A valid instance type (m1.small)
  - kernel - Kernel ID (None)
  - ramdisk - Ramdisk ID (None)
  - userData - Base64 encoded String (None)
  - disableApiTermination - Boolean (true)
  - instanceInitiatedShutdownBehavior - stop|terminate
  - blockDeviceMapping - List of strings - ie: [‘/dev/sda=false’]
  - sourceDestCheck - Boolean (true)
  - groupSet - Set of Security Groups or IDs
  - ebsOptimized - Boolean (false)
  - sriovNetSupport - String - ie: ‘simple’
- target\_state** (string) - The desired target state of the instance. Available options are:
- running
  - stopped
- Note that this option is currently UNIMPLEMENTED.
- public\_ip:** (string) - The IP of a previously allocated EIP address, which will be attached to the instance. EC2

Classic instances ONLY - for VCP pass in an `allocation_id` instead.

**allocation\_id**: (string) - The ID of a previously allocated EIP address, which will be attached to the instance.

VPC instances ONLY - for Classic pass in a `public_ip` instead.

**allocate\_eip**: (bool) - Allocate and attach an EIP on-the-fly for this instance. Note you'll want to release this address when terminating the instance, either manually or via the `'release_eip'` flag to `'instance_absent'`.

**region** (string) - Region to connect to.

**key** (string) - Secret key to be used.

**keyid** (string) - Access key to be used.

**profile** (variable) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.3.0.

`salt.states.boto_ec2.key_absent`(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Deletes a key pair

`salt.states.boto_ec2.key_present`(*name*, *save\_private=None*, *upload\_public=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure key pair is present.

`salt.states.boto_ec2.snapshot_created`(*name*, *ami\_name*, *instance\_name*, *wait\_until\_available=True*, *wait\_timeout\_seconds=300*, *\*\*kwargs*)

Create a snapshot from the given instance

New in version 2016.3.0.

`salt.states.boto_ec2.volume_absent`(*name*, *volume\_name=None*, *volume\_id=None*, *instance\_name=None*, *instance\_id=None*, *device=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the EC2 volume is detached and absent.

New in version 2016.11.0.

**name** State definition name.

**volume\_name** Name tag associated with the volume. For safety, if this matches more than one volume, the state will refuse to apply.

**volume\_id** Resource ID of the volume.

**instance\_name** Only remove volume if it is attached to instance with this Name tag. Exclusive with `'instance_id'`. Requires `'device'`.

**instance\_id** Only remove volume if it is attached to this instance. Exclusive with `'instance_name'`. Requires `'device'`.

**device** Match by device rather than ID. Requires one of `'instance_name'` or `'instance_id'`.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_ec2.volumes_tagged`(*name*, *tag\_maps*, *authoritative=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure EC2 volume(s) matching the given filters have the defined tags.

New in version 2016.11.0.

**name** State definition name.

**tag\_maps** List of dicts of filters and tags, where `'filters'` is a dict suitable for passing to the `'filters'` argument of `boto_ec2.get_all_volumes()`, and `'tags'` is a dict of tags to be set on volumes as matched by the given filters. The filter syntax is extended to permit passing either a list of `volume_ids` or an `instance_name` (with `instance_name` being the Name tag of the instance to which the desired volumes are mapped).

Each mapping in the list is applied separately, so multiple sets of volumes can be all tagged differently with one call to this function.

YAML example fragment:

**authoritative** Should un-declared tags currently set on matched volumes be deleted? Boolean.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 14.17.29 salt.states.boto\_elasticache

#### Manage Elasticache

New in version 2014.7.0.

Create, destroy and update Elasticache clusters. Be aware that this interacts with Amazon's services, and so may incur charges.

Note: This module currently only supports creation and deletion of elasticache resources and will not modify clusters when their configuration changes in your state files.

This module uses `boto`, which can be installed via `package`, or `pip`.

This module accepts explicit elasticache credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elasticache.keyid: GKTADJGHEIQSXMKKRBJ08H
elasticache.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
  region: us-east-1
```

```
Ensure myelasticache exists:
  boto_elasticache.present:
    - name: myelasticache
    - engine: redis
    - cache_node_type: cache.t1.micro
    - num_cache_nodes: 1
    - notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

*# Using a profile from pillars*

```
Ensure myelasticache exists:
  boto_elasticache.present:
    - name: myelasticache
    - engine: redis
```

```

- cache_node_type: cache.t1.micro
- num_cache_nodes: 1
- notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
- region: us-east-1
- profile: myprofile

# Passing in a profile
Ensure myelasticache exists:
boto_elasticache.present:
  - name: myelasticache
  - engine: redis
  - cache_node_type: cache.t1.micro
  - num_cache_nodes: 1
  - notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
  - region: us-east-1
  - profile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdfklkdflkjgsdfjajkghs

```

`salt.states.boto_elasticache.absent`(*name*, *wait=True*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the named elasticache cluster is deleted.

**name** Name of the cache cluster.

**wait** Boolean. Wait for confirmation from boto that the cluster is in the deleting state.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_elasticache.creategroup`(*name*, *primary\_cluster\_id*, *replication\_group\_description*, *wait=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the a replication group is create.

**name** Name of replication group

**wait** Waits for the group to be available

**primary\_cluster\_id** Name of the master cache node

**replication\_group\_description** Description for the group

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_elasticache.present`(*name*, *engine=None*, *cache\_node\_type=None*, *num\_cache\_nodes=None*, *preferred\_availability\_zone=None*, *port=None*, *cache\_parameter\_group\_name=None*, *cache\_security\_group\_names=None*, *replication\_group\_id=None*, *auto\_minor\_version\_upgrade=True*, *security\_group\_ids=None*, *cache\_subnet\_group\_name=None*, *engine\_version=None*, *notification\_topic\_arn=None*, *preferred\_maintenance\_window=None*, *wait=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the cache cluster exists.

**name** Name of the cache cluster (cache cluster id).

**engine** The name of the cache engine to be used for this cache cluster. Valid values are memcached or redis.

**cache\_node\_type** The compute and memory capacity of the nodes in the cache cluster. cache.t1.micro, cache.m1.small, etc. See: [https://boto.readthedocs.io/en/latest/ref/elasticsearch.html#boto.elasticcache.layer1.ElastiCacheConnection.create\\_cache\\_cluster](https://boto.readthedocs.io/en/latest/ref/elasticsearch.html#boto.elasticcache.layer1.ElastiCacheConnection.create_cache_cluster)

**num\_cache\_nodes** The number of cache nodes that the cache cluster will have.

**preferred\_availability\_zone** The EC2 Availability Zone in which the cache cluster will be created. All cache nodes belonging to a cache cluster are placed in the preferred availability zone.

**port** The port number on which each of the cache nodes will accept connections.

**cache\_parameter\_group\_name** The name of the cache parameter group to associate with this cache cluster. If this argument is omitted, the default cache parameter group for the specified engine will be used.

**cache\_security\_group\_names** A list of cache security group names to associate with this cache cluster. Use this parameter only when you are creating a cluster outside of a VPC.

**replication\_group\_id** The replication group to which this cache cluster should belong. If this parameter is specified, the cache cluster will be added to the specified replication group as a read replica; otherwise, the cache cluster will be a standalone primary that is not part of any replication group.

**auto\_minor\_version\_upgrade** Determines whether minor engine upgrades will be applied automatically to the cache cluster during the maintenance window. A value of True allows these upgrades to occur; False disables automatic upgrades.

**security\_group\_ids** One or more VPC security groups associated with the cache cluster. Use this parameter only when you are creating a cluster in a VPC.

**cache\_subnet\_group\_name** The name of the cache subnet group to be used for the cache cluster. Use this parameter only when you are creating a cluster in a VPC.

**engine\_version** The version number of the cache engine to be used for this cluster.

**notification\_topic\_arn** The Amazon Resource Name (ARN) of the Amazon Simple Notification Service (SNS) topic to which notifications will be sent. The Amazon SNS topic owner must be the same as the cache cluster owner.

**preferred\_maintenance\_window** The weekly time range (in UTC) during which system maintenance can occur. Example: sun:05:00-sun:09:00

**wait** Boolean. Wait for confirmation from boto that the cluster is in the available state.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```

salt.states.boto_elasticache.subnet_group_present(name, subnet_ids=None, subnet_names=None, description=None, tags=None, region=None, key=None, keyid=None, profile=None)

```

Ensure ElastiCache subnet group exists.

New in version 2015.8.0.

**name** The name for the ElastiCache subnet group. This value is stored as a lowercase string.

**subnet\_ids** A list of VPC subnet IDs for the cache subnet group. Exclusive with subnet\_names.

**subnet\_names** A list of VPC subnet names for the cache subnet group. Exclusive with subnet\_ids.

**description** Subnet group description.

**tags** A list of tags.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 14.17.30 salt.states.boto\_elasticsearch\_domain module

#### Manage Elasticsearch Domains

New in version 2016.11.0.

Create and destroy Elasticsearch domains. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via `package`, or `pip`.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
  region: us-east-1
```

```
Ensure domain exists:
  boto_elasticsearch_domain.present:
    - DomainName: mydomain
    - profile='user-credentials'
    - ElasticsearchVersion: "2.3"
    - ElasticsearchClusterConfig:
      InstanceType: "t2.micro.elasticsearch"
      InstanceCount: 1
      DedicatedMasterEnabled: False
      ZoneAwarenessEnabled: False
    - EBSOptions:
      EBSEnabled: True
      VolumeType: "gp2"
      VolumeSize: 10
      Iops: 0
    - AccessPolicies:
      Version: "2012-10-17"
      Statement:
        - Effect: "Allow"
        - Principal:
            AWS: "*"
        - Action:
            - "es:*"
        - Resource: "arn:aws:es:*:111111111111:domain/mydomain/*"
        - Condition:
            IPAddress:
              "aws:SourceIp":
                - "127.0.0.1",
                - "127.0.0.2",
    - SnapshotOptions:
      AutomatedSnapshotStartHour: 0
```

```

- AdvancedOptions:
  rest.action.multi.allow_explicit_index": "true"
- Tags:
  a: "b"
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjakghs

```

`salt.states.boto_elasticsearch_domain.absent`(*name*, *DomainName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure domain with passed properties is absent.

**name** The name of the state definition.

**DomainName** Name of the domain.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_elasticsearch_domain.present`(*name*, *DomainName*, *ElasticsearchClusterConfig=None*, *EBSOptions=None*, *AccessPolicies=None*, *SnapshotOptions=None*, *AdvancedOptions=None*, *Tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *ElasticsearchVersion='1.5'*)

Ensure domain exists.

**name** The name of the state definition

**DomainName** Name of the domain.

**ElasticsearchClusterConfig** Configuration options for an Elasticsearch domain. Specifies the instance type and number of instances in the domain cluster.

**InstanceType** (string) -- The instance type for an Elasticsearch cluster.

**InstanceCount** (integer) -- The number of instances in the specified domain cluster.

**DedicatedMasterEnabled** (boolean) -- A boolean value to indicate whether a dedicated master node is enabled. See About Dedicated Master Nodes for more information.

**ZoneAwarenessEnabled** (boolean) -- A boolean value to indicate whether zone awareness is enabled. See About Zone Awareness for more information.

**DedicatedMasterType** (string) -- The instance type for a dedicated master node.

**DedicatedMasterCount** (integer) -- Total number of dedicated master nodes, active and on standby, for the cluster.

**EBSOptions** Options to enable, disable and specify the type and size of EBS storage volumes.

**EBSEnabled** (boolean) -- Specifies whether EBS-based storage is enabled.

**VolumeType** (string) -- Specifies the volume type for EBS-based storage.

**VolumeSize** (integer) -- Integer to specify the size of an EBS volume.

**Iops** (integer) -- Specifies the IOPD for a Provisioned IOPS EBS volume (SSD).

**AccessPolicies** IAM access policy

**SnapshotOptions** Option to set time, in UTC format, of the daily automated snapshot. Default value is 0 hours.

`AutomatedSnapshotStartHour` (integer) -- Specifies the time, in UTC format, when the service takes a daily automated snapshot of the specified Elasticsearch domain. Default value is 0 hours.

**AdvancedOptions** Option to allow references to indices in an HTTP request body. Must be false when configuring access to individual sub-resources. By default, the value is true .

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**ElasticsearchVersion** String of format X.Y to specify version for the Elasticsearch domain eg. ``1.5" or ``2.3".

### 14.17.31 salt.states.boto\_elb

Manage ELBs

New in version 2014.7.0.

Create and destroy ELBs. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit elb credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elb.keyid: GKTADJGHEIQSXMKKRBJ08H
elb.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
  region: us-east-1
```

```
Ensure myelb ELB exists:
boto_elb.present:
  - name: myelb
  - region: us-east-1
  - availability_zones:
    - us-east-1a
    - us-east-1c
    - us-east-1d
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
  - listeners:
    - elb_port: 443
      instance_port: 80
      elb_protocol: HTTPS
      instance_protocol: HTTP
      certificate: 'arn:aws:iam::1111111:server-certificate/mycert'
      policies:
        - my-ssl-policy
        - cookie-policy
    - elb_port: 8210
```

```

    instance_port: 8210
    elb_protocol: TCP
  - backends:
    - instance_port: 80
      policies:
        - enable-proxy-protocol
  - health_check:
    target: 'HTTP:80/'
  - attributes:
    cross_zone_load_balancing:
      enabled: true
    access_log:
      enabled: true
      s3_bucket_name: 'mybucket'
      s3_bucket_prefix: 'my-logs'
      emit_interval: 5
    connecting_settings:
      idle_timeout: 60
  - cnames:
    - name: mycname.example.com.
      zone: example.com.
      ttl: 60
    - name: myothercname.example.com.
      zone: example.com.
  - security_groups:
    - my-security-group
  - policies:
    - policy_name: my-ssl-policy
      policy_type: SSLNegotiationPolicyType
      policy:
        Protocol-TLSv1.2: true
        Protocol-SSLv3: false
        Server-Defined-Cipher-Order: true
        ECDHE-ECDSA-AES128-GCM-SHA256: true
    - policy_name: cookie-policy
      policy_type: LBCookieStickinessPolicyType
      policy: {} # no policy means this is a session cookie
    - policy_name: enable-proxy-protocol
      policy_type: ProxyProtocolPolicyType
      policy:
        ProxyProtocol: true

```

*# Using a profile from pillars*

Ensure myelb ELB exists:

```

  boto_elb.present:
    - name: myelb
    - region: us-east-1
    - profile: myelbprofile

```

*# Passing in a profile*

Ensure myelb ELB exists:

```

  boto_elb.present:
    - name: myelb
    - region: us-east-1
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdfjkgHwupUjasdfldkdfklgjsdfjajkghs

```

It's possible to specify attributes from pillars by specifying a pillar. You can override the values defined in the pillar by setting the attributes on the resource. The module will use the default pillar key `boto\_elb\_attributes`, which allows you to set default attributes for all ELB resources.

Setting the attributes pillar:

```
my_elb_attributes:
  cross_zone_load_balancing:
    enabled: true
  connection_draining:
    enabled: true
    timeout: 20
  access_log:
    enabled: true
    s3_bucket_name: 'mybucket'
    s3_bucket_prefix: 'my-logs'
    emit_interval: 5
```

Overriding the attribute values on the resource:

```
Ensure myelb ELB exists:
  boto_elb.present:
    - name: myelb
    - region: us-east-1
    - attributes_from_pillar: my_elb_attributes
    # override cross_zone_load_balancing:enabled
    - attributes:
        cross_zone_load_balancing:
          enabled: false
    - profile: myelbprofile
```

It's possible to specify cloudwatch alarms that will be setup along with the ELB. Note the alarm name will be defined by the name attribute provided, plus the ELB resource name.

```
Ensure myelb ELB exists:
  boto_elb.present:
    - name: myelb
    - region: us-east-1
    - profile: myelbprofile
    - alarms:
        UnHealthyHostCount:
          name: 'ELB UnHealthyHostCount **MANAGED BY SALT**'
          attributes:
            metric: UnHealthyHostCount
            namespace: AWS/ELB
            statistic: Average
            comparison: '>='
            threshold: 1.0
            period: 600
            evaluation_periods: 6
            unit: null
            description: ELB UnHealthyHostCount
            alarm_actions: ['arn:aws:sns:us-east-1:12345:myalarm']
            insufficient_data_actions: []
            ok_actions: ['arn:aws:sns:us-east-1:12345:myalarm']
```

You can also use alarms from pillars, and override values from the pillar alarms by setting overrides on the resource. Note that `boto\_elb\_alarms` will be used as a default value for all resources, if defined and can be used to ensure alarms are always set for a resource.

Setting the alarms in a pillar:

```
my_elb_alarm:
  UnHealthyHostCount:
    name: 'ELB UnHealthyHostCount **MANAGED BY SALT**'
    attributes:
      metric: UnHealthyHostCount
      namespace: AWS/ELB
      statistic: Average
      comparison: '>='
      threshold: 1.0
      period: 600
      evaluation_periods: 6
      unit: null
      description: ELB UnHealthyHostCount
      alarm_actions: ['arn:aws:sns:us-east-1:12345:myalarm']
      insufficient_data_actions: []
      ok_actions: ['arn:aws:sns:us-east-1:12345:myalarm']
```

Overriding the alarm values on the resource:

```
Ensure myelb ELB exists:
  boto_elb.present:
    - name: myelb
    - region: us-east-1
    - profile: myelbprofile
    - alarms_from_pillar: my_elb_alarm
    # override UnHealthyHostCount:attributes:threshold
    - alarms:
      UnHealthyHostCount:
        attributes:
          threshold: 2.0
```

Tags can also be set:

New in version 2016.3.0.

```
Ensure myelb ELB exists:
  boto_elb.present:
    - name: myelb
    - region: us-east-1
    - profile: myelbprofile
    - tags:
      MyTag: 'My Tag Value'
      OtherTag: 'My Other Value'
```

**salt.states.boto\_elb.absent**(*name, region=None, key=None, keyid=None, profile=None*)

Ensure an ELB does not exist

**name** name of the ELB

**salt.states.boto\_elb.present**(*name, listeners, availability\_zones=None, subnets=None, subnet\_names=None, security\_groups=None, scheme='internet-facing', health\_check=None, attributes=None, attributes\_from\_pillar='boto\_elb\_attributes', cnames=None, alarms=None, alarms\_from\_pillar='boto\_elb\_alarms', policies=None, policies\_from\_pillar='boto\_elb\_policies', backends=None, region=None, key=None, keyid=None, profile=None, wait\_for\_sync=True, tags=None, instance\_ids=None, instance\_names=None*)

Ensure the ELB exists.

**name** Name of the ELB.

**availability\_zones** A list of availability zones for this ELB.

**listeners** A list of listener lists; example:

```
[
  ['443', 'HTTPS', 'arn:aws:iam::1111111:server-certificate/mycert'],
  ['8443', '80', 'HTTPS', 'HTTP', 'arn:aws:iam::1111111:server-certificate/
  ↪mycert']
]
```

**subnets** A list of subnet IDs in your VPC to attach to your LoadBalancer.

**subnet\_names** A list of subnet names in your VPC to attach to your LoadBalancer.

**security\_groups** The security groups assigned to your LoadBalancer within your VPC. Must be passed either as a list or a comma-separated string.

For example, a list:

```
- security_groups:
  - secgroup-one
  - secgroup-two
```

Or as a comma-separated string:

```
- security_groups: secgroup-one,secgroup-two
```

**scheme** The type of a LoadBalancer, `internet-facing` or `internal`. Once set, can not be modified.

**health\_check** A dict defining the health check for this ELB.

**attributes** A dict defining the attributes to set on this ELB. Unknown keys will be silently ignored.

See the [salt.modules.boto\\_elb.set\\_attributes](#) function for recognized attributes.

**attributes\_from\_pillar** name of pillar dict that contains attributes. Attributes defined for this specific state will override those from pillar.

**cnames** A list of cname dicts with attributes needed for the DNS `add_record` state. By default the `boto_route53.add_record` state will be used, which requires: name, zone, ttl, and identifier. See the `boto_route53` state for information about these attributes. Other DNS modules can be called by specifying the provider keyword. the cnames dict will be passed to the state as kwargs.

See the [salt.states.boto\\_route53](#) state for information about these attributes.

**alarms**: a dictionary of name->boto\_cloudwatch\_alarm sections to be associated with this ELB. All attributes should be specified except for dimension which will be automatically set to this ELB.

See the [salt.states.boto\\_cloudwatch\\_alarm](#) state for information about these attributes.

**alarms\_from\_pillar**: name of pillar dict that contains alarm settings. Alarms defined for this specific state will override those from pillar.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**wait\_for\_sync** Wait for an INSYNC change status from Route53.

**tags** dict of tags

**instance\_ids** list of instance ids. The state will ensure that these, and ONLY these, instances are registered with the ELB. This is additive with `instance_names`.

**instance\_names** list of instance names. The state will ensure that these, and ONLY these, instances are registered with the ELB. This is additive with `instance_ids`.

```
salt.states.boto_elb.register_instances(name, instances, region=None, key=None,
                                       keyid=None, profile=None)
```

Add EC2 instance(s) to an Elastic Load Balancer. Removing an instance from the `instances` list does not remove it from the ELB.

**name** The name of the Elastic Load Balancer to add EC2 instances to.

**instances** A list of EC2 instance IDs that this Elastic Load Balancer should distribute traffic to. This state will only ever append new instances to the ELB. EC2 instances already associated with this ELB will not be removed if they are not in the `instances` list.

New in version 2015.8.0.

```
add-instances:
  boto_elb.register_instances:
    - name: myloadbalancer
    - instances:
      - instance-id1
      - instance-id2
```

### 14.17.32 salt.states.boto\_elbv2 module

Manage AWS Application Load Balancer

New in version 2017.7.0.

Add and remove targets from an ALB target group.

This module uses `boto3`, which can be installed via `package`, or `pip`.

This module accepts explicit `alb` credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elbv2.keyid: GKTADJGHEIQSXMKKRBJ08H
elbv2.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
elbv2.region: us-west-2
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
  region: us-east-1
```

`salt.states.boto_elbv2.targets_deregistered`(*name*, *targets*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Remove targets to an Application Load Balancer target group.

**name** The ARN of the Application Load Balancer Target Group to remove targets from.

**targets** A list of target IDs or a string of a single target registered to the target group to be removed

New in version Unknown.

```
remove-targets:
  boto_elb.targets_deregistered:
    - name: arn:myloadbalancer
    - targets:
      - instance-id1
      - instance-id2
```

`salt.states.boto_elbv2.targets_registered`(*name*, *targets*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

New in version 2017.7.0.

Add targets to an Application Load Balancer target group. This state will not remove targets.

**name** The ARN of the Application Load Balancer Target Group to add targets to.

**targets** A list of target IDs or a string of a single target that this target group should distribute traffic to.

```
add-targets:
  boto_elb.targets_registered:
    - name: arn:myloadbalancer
    - targets:
      - instance-id1
      - instance-id2
```

### 14.17.33 salt.states.boto\_iam

#### Manage IAM objects

New in version 2015.8.0.

This module uses `boto`, which can be installed via `package`, or `pip`.

This module accepts explicit IAM credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
delete-user:
  boto_iam.user_absent:
    - name: myuser
    - delete_keys: true
```

```
delete-keys:
  boto_iam.keys_absent:
    - access_keys:
      - 'AKIAJHTMIQ2ASDFLASDF'
      - 'PQIAJHTMIQ2ASRTLASFR'
    - user_name: myuser
```

```
create-user:
  boto_iam.user_present:
    - name: myuser
    - policies:
      mypolicy: |
        {
          "Version": "2012-10-17",
          "Statement": [{
            "Effect": "Allow",
            "Action": "*",
            "Resource": "*"}]
        }
    - password: NewPassword$$1
    - region: eu-west-1
```

```
- keyid: 'AKIAJHTMIQ2ASDFLASDF'
- key: 'fdkjsafkljsASSADFalkfjasdf'
```

```
create-group:
  boto_iam.group_present:
    - name: mygroup
    - users:
      - myuser
      - myuser1
    - policies:
      mypolicy: |
        {
          "Version": "2012-10-17",
          "Statement": [{
            "Effect": "Allow",
            "Action": "*",
            "Resource": "*"}]
        }
    - region: eu-west-1
    - keyid: 'AKIAJHTMIQ2ASDFLASDF'
    - key: 'safsdosal;fdkjsafkljsASSADFalkfj'
```

```
change-policy:
  boto_iam.account_policy:
    - change_password: True
    - region: eu-west-1
    - keyid: 'AKIAJHTMIQ2ASDFLASDF'
    - key: 'safsdosal;fdkjsafkljsASSADFalkfj'
```

```
create server certificate:
  boto_iam.server_cert_present:
    - name: mycert
    - public_key: salt://base/mycert.crt
    - private_key: salt://base/mycert.key
    - cert_chain: salt://base/mycert_chain.crt
    - region: eu-west-1
    - keyid: 'AKIAJHTMIQ2ASDFLASDF'
    - key: 'fdkjsafkljsASSADFalkfjasdf'
```

```
delete server certificate:
  boto_iam.server_cert_absent:
    - name: mycert
```

```
create keys for user:
  boto_iam.keys_present:
    - name: myusername
    - number: 2
    - save_dir: /root
    - region: eu-west-1
    - keyid: 'AKIAJHTMIQ2ASDFLASDF'
    - key: 'fdkjsafkljsASSADFalkfjasdf'
```

```
create policy:
  boto_iam.policy_present:
    - name: myname
    - policy_document: '{"MyPolicy": "Statement": [{"Action": ["sqs:*"], "Effect":
      →"Allow", "Resource": ["arn:aws:sqs:*:*:*"], "Sid": "MyPolicySqs1"}]}'
```

```
- region: eu-west-1
- keyid: 'AKIAJHTMIQ2ASDFLASDF'
- key: 'fdkjsafkljsASSADFalkfjasdf'
```

```
add-saml-provider:
  boto_iam.saml_provider_present:
    - name: my_saml_provider
    - saml_metadata_document: salt://base/files/provider.xml
    - keyid: 'AKIAJHTMIQ2ASDFLASDF'
    - key: 'safsdfsal;fdkjsafkljsASSADFalkfj'
```

`salt.states.boto_iam.account_policy` (*name=None, allow\_users\_to\_change\_password=None, hard\_expiry=None, max\_password\_age=None, minimum\_password\_length=None, password\_reuse\_prevention=None, require\_lowercase\_characters=None, require\_numbers=None, require\_symbols=None, require\_uppercase\_characters=None, region=None, key=None, keyid=None, profile=None*)

Change account policy.

New in version 2015.8.0.

**name (string)** The name of the account policy

**allow\_users\_to\_change\_password (bool)** Allows all IAM users in your account to use the AWS Management Console to change their own passwords.

**hard\_expiry (bool)** Prevents IAM users from setting a new password after their password has expired.

**max\_password\_age (int)** The number of days that an IAM user password is valid.

**minimum\_password\_length (int)** The minimum number of characters allowed in an IAM user password.

**password\_reuse\_prevention (int)** Specifies the number of previous passwords that IAM users are prevented from reusing.

**require\_lowercase\_characters (bool)** Specifies whether IAM user passwords must contain at least one lowercase character from the ISO basic Latin alphabet (a to z).

**require\_numbers (bool)** Specifies whether IAM user passwords must contain at least one numeric character (0 to 9).

**require\_symbols (bool)** Specifies whether IAM user passwords must contain at least one of the following non-alphanumeric characters: `!@#$%^&*()_+=[ ]{|}``

**require\_uppercase\_characters (bool)** Specifies whether IAM user passwords must contain at least one uppercase character from the ISO basic Latin alphabet (A to Z).

**region (string)** Region to connect to.

**key (string)** Secret key to be used.

**keyid (string)** Access key to be used.

**profile (dict)** A dict with region, key and keyid, or a pillar key (string)

`salt.states.boto_iam.group_absent` (*name, region=None, key=None, keyid=None, profile=None*)

New in version 2015.8.0.

Ensure the IAM group is absent.

**name (string)** The name of the group.

**region (string)** Region to connect to.

**key (string)** Secret key to be used.

**keyid (string)** Access key to be used.

**profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```

salt.states.boto_iam.group_present(name, policies=None, policies_from_pillars=None,
                                   managed_policies=None, users=None, path='/', re-
                                   gion=None, key=None, keyid=None, profile=None,
                                   delete_policies=True)

```

New in version 2015.8.0.

Ensure the IAM group is present

**name (string)** The name of the new group.

**path (string)** The path for the group, defaults to `/'

**policies (dict)** A dict of IAM group policy documents.

**policies\_from\_pillars (list)** A list of pillars that contain role policy dicts. Policies in the pillars will be merged in the order defined in the list and key conflicts will be handled by later defined keys overriding earlier defined keys. The policies defined here will be merged with the policies defined in the policies argument.

If keys conflict, the keys in the policies argument will override the keys defined in policies\_from\_pillars.

**managed\_policies (list)** A list of policy names or ARNs that should be attached to this group.

**users (list)** A list of users to be added to the group.

**region (string)** Region to connect to.

**key (string)** Secret key to be used.

**keyid (string)** Access key to be used.

**profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**delete\_policies (boolean)** Delete or detach existing policies that are not in the given list of policies. Default value is True. If False is specified, existing policies will not be deleted or detached allowing manual modifications on the IAM group to be persistent.

```

salt.states.boto_iam.keys_absent(access_keys, user_name, region=None, key=None, keyid=None,
                                 profile=None)

```

New in version 2015.8.0.

Ensure the IAM user access\_key\_id is absent.

**access\_key\_id (list)** A list of access key ids

**user\_name (string)** The username of the user

**region (string)** Region to connect to.

**key (string)** Secret key to be used.

**keyid (string)** Access key to be used.

**profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```

salt.states.boto_iam.keys_present(name, number, save_dir, region=None,
                                  key=None, keyid=None, profile=None,
                                  save_format='{2}\n{0}\n{3}\n{1}\n')

```

New in version 2015.8.0.

Ensure the IAM access keys are present.

**name (string)** The name of the new user.

**number (int)** Number of keys that user should have.

**save\_dir (string)** The directory that the key/keys will be saved. Keys are saved to a file named according to the username provided.

**region (string)** Region to connect to.

**key (string)** Secret key to be used.

**keyid (string)** Access key to be used.

**profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**save\_format (dict)** Save format is repeated for each key. Default format is ``{2}

{0} {3} {1} ",

where {0} and {1} are placeholders for new key\_id and key respectively, whereas {2} and {3} are ``key\_id-{number}`" and ``key-{number}`" strings kept for compatibility.

`salt.states.boto_iam.policy_absent` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)  
New in version 2015.8.0.

Ensure the IAM managed policy with the specified name is absent

**name** (string) The name of the new policy.

**region** (string) Region to connect to.

**key** (string) Secret key to be used.

**keyid** (string) Access key to be used.

**profile** (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.policy_present` (*name*, *policy\_document*, *path=None*, *description=None*,  
*region=None*, *key=None*, *keyid=None*, *profile=None*)

New in version 2015.8.0.

Ensure the IAM managed policy is present

**name** (string) The name of the new policy.

**policy\_document** (dict) The document of the new policy

**path** (string) The path in which the policy will be created. Default is `/'.

**description** (string) Description

**region** (string) Region to connect to.

**key** (string) Secret key to be used.

**keyid** (string) Access key to be used.

**profile** (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.saml_provider_absent` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the SAML provider with the specified name is absent.

**name** (string) The name of the SAML provider.

**saml\_metadata\_document** (string) The xml document of the SAML provider.

**region** (string) Region to connect to.

**key** (string) Secret key to be used.

**keyid** (string) Access key to be used.

**profile** (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.saml_provider_present` (*name*, *saml\_metadata\_document*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the SAML provider with the specified name is present.

**name** (string) The name of the SAML provider.

**saml\_metadata\_document** (string) The xml document of the SAML provider.

**region** (string) Region to connect to.

**key** (string) Secret key to be used.

**keyid** (string) Access key to be used.

**profile** (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.server_cert_absent` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Deletes a server certificate.

New in version 2015.8.0.

**name** (string) The name for the server certificate. Do not include the path in this value.

**region** (string) The name of the region to connect to.

**key** (string) The key to be used in order to connect

**keyid** (string) The keyid to be used in order to connect

**profile (string)** The profile that contains a dict of region, key, keyid

`salt.states.boto_iam.server_cert_present` (*name, public\_key, private\_key, cert\_chain=None, path=None, region=None, key=None, keyid=None, profile=None*)

Crete server certificate.

New in version 2015.8.0.

**name (string)** The name for the server certificate. Do not include the path in this value.

**public\_key (string)** The contents of the public key certificate in PEM-encoded format.

**private\_key (string)** The contents of the private key in PEM-encoded format.

**cert\_chain (string)** The contents of the certificate chain. This is typically a concatenation of the PEM-encoded public key certificates of the chain.

**path (string)** The path for the server certificate.

**region (string)** The name of the region to connect to.

**key (string)** The key to be used in order to connect

**keyid (string)** The keyid to be used in order to connect

**profile (string)** The profile that contains a dict of region, key, keyid

`salt.states.boto_iam.user_absent` (*name, delete\_keys=True, delete\_mfa\_devices=True, delete\_profile=True, region=None, key=None, keyid=None, profile=None*)

New in version 2015.8.0.

Ensure the IAM user is absent. User cannot be deleted if it has keys.

**name (string)** The name of the new user.

**delete\_keys (bool)** Delete all keys from user.

**delete\_mfa\_devices (bool)** Delete all mfa devices from user.

New in version 2016.3.0.

**delete\_profile (bool)** Delete profile from user.

New in version 2016.3.0.

**region (string)** Region to connect to.

**key (string)** Secret key to be used.

**keyid (string)** Access key to be used.

**profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.user_present` (*name, policies=None, policies\_from\_pillars=None, managed\_policies=None, password=None, path=None, region=None, key=None, keyid=None, profile=None*)

New in version 2015.8.0.

Ensure the IAM user is present

**name (string)** The name of the new user.

**policies (dict)** A dict of IAM group policy documents.

**policies\_from\_pillars (list)** A list of pillars that contain role policy dicts. Policies in the pillars will be merged in the order defined in the list and key conflicts will be handled by later defined keys overriding earlier defined keys. The policies defined here will be merged with the policies defined in the policies argument.

If keys conflict, the keys in the policies argument will override the keys defined in policies\_from\_pillars.

**managed\_policies (list)** A list of managed policy names or ARNs that should be attached to this user.

**password (string)** The password for the new user. Must comply with account policy.

**path (string)** The path of the user. Default is `/'.

New in version 2015.8.2.

**region (string)** Region to connect to.

**key (string)** Secret key to be used.

**keyid (string)** Access key to be used.

**profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 14.17.34 salt.states.boto\_iam\_role

#### Manage IAM roles

New in version 2014.7.0.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit IAM credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
iam.keyid: GKTADJGHEIQSXMKKRBJ08H
iam.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
  region: us-east-1
```

Creating a role will automatically create an instance profile and associate it with the role. This is the default behavior of the AWS console.

```
myrole:
  boto_iam_role.present:
    - region: us-east-1
    - key: GKTADJGHEIQSXMKKRBJ08H
    - keyid: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
    - policies_from_pillars:
      - shared_iam_bootstrap_policy
    - policies:
      MySQLSPolicy:
        Statement:
          - Action:
              - sqs:*
            Effect: Allow
            Resource:
              - arn:aws:sqs:*:*:*
            Sid: MyPolicySQS1
      MyS3Policy:
        Statement:
          - Action:
              - s3:GetObject
            Effect: Allow
            Resource:
              - arn:aws:s3:*:*:mybucket/*

# Using a credentials profile from pillars
myrole:
  boto_iam_role.present:
```

```

    - profile: myiamprofile
# Passing in a credentials profile
myrole:
  boto_iam_role.present:
    - profile:
      key: GKTADJGHEIQSXMKKRBJ08H
      keyid: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
      region: us-east-1

```

If `delete_policies: False` is specified, existing policies that are not in the given list of policies will not be deleted. This allows manual modifications on the IAM role to be persistent. This functionality was added in 2015.8.0.

**Note:** When using the `profile` parameter and `region` is set outside of the profile group, `region` is ignored and a default region will be used.

If `region` is missing from the `profile` data set, `us-east-1` will be used as the default region.

`salt.states.boto_iam_role.absent` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the IAM role is deleted.

**name** Name of the IAM role.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with `region`, `key` and `keyid`, or a pillar key (string) that contains a dict with `region`, `key` and `keyid`.

`salt.states.boto_iam_role.present` (*name*, *policy\_document=None*, *policy\_document\_from\_pillars=None*, *path=None*, *policies=None*, *policies\_from\_pillars=None*, *managed\_policies=None*, *create\_instance\_profile=True*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *delete\_policies=True*)

Ensure the IAM role exists.

**name** Name of the IAM role.

**policy\_document** The policy that grants an entity permission to assume the role. (See [https://boto.readthedocs.io/en/latest/ref/iam.html#boto.iam.connection.IAMConnection.create\\_role](https://boto.readthedocs.io/en/latest/ref/iam.html#boto.iam.connection.IAMConnection.create_role))

**policy\_document\_from\_pillars** A pillar key that contains a role policy document. The statements defined here will be appended with the policy document statements defined in the `policy_document` argument.

New in version 2017.7.0.

**path** The path to the role/instance profile. (See [https://boto.readthedocs.io/en/latest/ref/iam.html#boto.iam.connection.IAMConnection.create\\_role](https://boto.readthedocs.io/en/latest/ref/iam.html#boto.iam.connection.IAMConnection.create_role))

**policies** A dict of IAM role policies.

**policies\_from\_pillars** A list of pillars that contain role policy dicts. Policies in the pillars will be merged in the order defined in the list and key conflicts will be handled by later defined keys overriding earlier defined keys. The policies defined here will be merged with the policies defined in the `policies` argument. If keys conflict, the keys in the `policies` argument will override the keys defined in `policies_from_pillars`.

**managed\_policies** A list of (AWS or Customer) managed policies to be attached to the role.

**create\_instance\_profile** A boolean of whether or not to create an instance profile and associate it with this role.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**delete\_policies** Deletes existing policies that are not in the given list of policies. Default value is True. If False is specified, existing policies will not be deleted allowing manual modifications on the IAM role to be persistent.

New in version 2015.8.0.

### 14.17.35 salt.states.boto\_iot module

#### Manage IoT Objects

New in version 2016.3.0.

Create and destroy IoT objects. Be aware that this interacts with Amazon's services, and so may incur charges.

##### depends

- boto
- boto3

The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
  region: us-east-1
```

```
Ensure policy exists:
  boto_iot.policy_present:
    - policyName: mypolicy
    - policyDocument:
        Version: "2012-10-17"
        Statement:
          Action:
            - iot:Publish
          Resource:
            - "*"
          Effect: "Allow"
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
```

```
Ensure topic rule exists:
  boto_iot.topic_rule_present:
    - ruleName: myrule
```

```

- sql: "SELECT * FROM 'iot/test'"
- description: 'test rule'
- ruleDisabled: false
- actions:
  - lambda:
      functionArn: "arn:aws:us-east-1:1234:function/functionname"
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRB08H
- key: askdjghsdfjkgHwupUjasdfklkdfklgjsdfjajkghs

```

`salt.states.boto_iot.policy_absent`(*name*, *policyName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure policy with passed properties is absent.

**name** The name of the state definition.

**policyName** Name of the policy.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iot.policy_attached`(*name*, *policyName*, *principal*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure policy is attached to the given principal.

**name** The name of the state definition

**policyName** Name of the policy.

**principal** The principal which can be a certificate ARN or a Cognito ID.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iot.policy_detached`(*name*, *policyName*, *principal*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure policy is attached to the given principal.

**name** The name of the state definition.

**policyName** Name of the policy.

**principal** The principal which can be a certificate ARN or a Cognito ID.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iot.policy_present`(*name*, *policyName*, *policyDocument*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure policy exists.

**name** The name of the state definition

**policyName** Name of the policy.

**policyDocument** The JSON document that describes the policy. The length of the policyDocument must be a minimum length of 1, with a maximum length of 2048, excluding whitespace.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and

keyid.

`salt.states.boto_iot.thing_type_absent`(*name*, *thingTypeName*, *region=None*, *key=None*,  
*keyid=None*, *profile=None*)

Ensure thing type with passed properties is absent.

New in version 2016.11.0.

**name** The name of the state definition.

**thingTypeName** Name of the thing type.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iot.thing_type_present`(*name*, *thingTypeName*, *thingTypeDescription*,  
*searchableAttributesList*, *region=None*, *key=None*,  
*keyid=None*, *profile=None*)

Ensure thing type exists.

New in version 2016.11.0.

**name** The name of the state definition

**thingTypeName** Name of the thing type

**thingTypeDescription** Description of the thing type

**searchableAttributesList** List of string attributes that are searchable for the thing type

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used

**profile** A dict with region, key, keyid, or a pillar key (string) that contains a dict with region, key, and keyid

`salt.states.boto_iot.topic_rule_absent`(*name*, *ruleName*, *region=None*, *key=None*,  
*keyid=None*, *profile=None*)

Ensure topic rule with passed properties is absent.

**name** The name of the state definition.

**ruleName** Name of the policy.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iot.topic_rule_present`(*name*, *ruleName*, *sql*, *actions*, *description=''*,  
*ruleDisabled=False*, *region=None*, *key=None*,  
*keyid=None*, *profile=None*)

Ensure topic rule exists.

**name** The name of the state definition

**ruleName** Name of the rule.

**sql** The SQL statement used to query the topic.

**actions** The actions associated with the rule.

**description** The description of the rule.

**ruleDisable** Specifies whether the rule is disabled.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 14.17.36 salt.states.boto\_kinesis module

#### Manage Kinesis Streams

New in version 2017.7.0.

Create and destroy Kinesis streams. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit Kinesis credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
region: us-east-1
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
  region: us-east-1
```

```
Ensure Kinesis stream does not exist:
boto_kinesis.absent:
  - name: new_stream
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
  - region: us-east-1
```

```
Ensure Kinesis stream exists:
boto_kinesis.present:
  - name: new_stream
  - retention_hours: 168
  - enhanced_monitoring: ['ALL']
  - num_shards: 2
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
  - region: us-east-1
```

**salt.states.boto\_kinesis.absent** (*name, region=None, key=None, keyid=None, profile=None*)

Delete the kinesis stream, if it exists.

**name** (string) Stream name

**region** (string) Region to connect to.

**key** (string) Secret key to be used.

**keyid** (string) Access key to be used.

**profile** (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto\_kinesis.present** (*name, retention\_hours=None, enhanced\_monitoring=None, num\_shards=None, do\_reshard=True, region=None, key=None, keyid=None, profile=None*)

Ensure the kinesis stream is properly configured and scaled.

**name (string)** Stream name

**retention\_hours (int)** Retain data for this many hours. AWS allows minimum 24 hours, maximum 168 hours.

**enhanced\_monitoring (list of string)** Turn on enhanced monitoring for the specified shard-level metrics. Pass in ['ALL'] or True for all metrics, [] or False for no metrics. Turn on individual metrics by passing in a list: ['IncomingBytes', 'OutgoingBytes'] Note that if only some metrics are supplied, the remaining metrics will be turned off.

**num\_shards (int)** Reshard stream (if necessary) to this number of shards !!!!! Resharding is expensive! Each split or merge can take up to 30 seconds, and the reshard method balances the partition space evenly. Resharding from N to N+1 can require 2N operations. Resharding is much faster with powers of 2 (e.g. 2^N to 2^(N+1)) !!!!!

**do\_reshard (boolean)** If set to False, this script will NEVER reshard the stream, regardless of other input. Useful for testing.

**region (string)** Region to connect to.

**key (string)** Secret key to be used.

**keyid (string)** Access key to be used.

**profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 14.17.37 salt.states.boto\_kms

Manage KMS keys, key policies and grants.

New in version 2015.8.0.

Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit kms credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elb.keyid: GKTADJGHEIQSXMKKRBJ08H
elb.key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
  region: us-east-1
```

```
Ensure mykey key exists:
  boto_kms.key_present:
    - name: mykey
    - region: us-east-1

# Using a profile from pillars
Ensure mykey key exists:
  boto_kms.key_present:
    - name: mykey
    - region: us-east-1
    - profile: myprofile
```

```
# Passing in a profile
Ensure mykey key exists:
  boto_key.key_present:
    - name: mykey
    - region: us-east-1
    - profile:
        keyid: GKTADJGHEIQSXMKKRBJ08H
        key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
```

```
salt.states.boto_kms.key_present(name, policy, description=None, key_usage=None,
                                   grants=None, manage_grants=False, key_rotation=False,
                                   enabled=True, region=None, key=None, keyid=None, profile=None)
```

Ensure the KMS key exists. KMS keys can not be deleted, so this function must be used to ensure the key is enabled or disabled.

**name** Name of the key.

**policy** Key usage policy.

**description** Description of the key.

**key\_usage** Specifies the intended use of the key. Can only be set on creation, defaults to ENCRYPT\_DECRYPT, which is also the only supported option.

**grants** A list of grants to apply to the key. Not currently implemented.

**manage\_grants** Whether or not to manage grants. False by default, which will not manage any grants.

**key\_rotation** Whether or not key rotation is enabled for the key. False by default.

**enabled** Whether or not the key is enabled. True by default.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 14.17.38 salt.states.boto\_lambda module

#### Manage Lambda Functions

New in version 2016.3.0.

Create and destroy Lambda Functions. Be aware that this interacts with Amazon's services, and so may incur charges.

#### depends

- boto
- boto3

The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
  region: us-east-1
```

```
Ensure function exists:
  boto_lambda.function_present:
    - FunctionName: myfunction
    - Runtime: python2.7
    - Role: iam_role_name
    - Handler: entry_function
    - ZipFile: code.zip
    - S3Bucket: bucketname
    - S3Key: keyname
    - S3ObjectVersion: version
    - Description: "My Lambda Function"
    - Timeout: 3
    - MemorySize: 128
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
```

`salt.states.boto_lambda.alias_absent`(*name*, *FunctionName*, *Name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure alias with passed properties is absent.

**name** The name of the state definition.

**FunctionName** Name of the function.

**Name** Name of the alias.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_lambda.alias_present`(*name*, *FunctionName*, *Name*, *FunctionVersion*, *Description=''*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure alias exists.

**name** The name of the state definition.

**FunctionName** Name of the function for which you want to create an alias.

**Name** The name of the alias to be created.

**FunctionVersion** Function version for which you are creating the alias.

**Description** A short, user-defined function description. Lambda does not use this value. Assign a meaningful description as you see fit.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_lambda.event_source_mapping_absent`(*name*, *EventSourceArn*, *FunctionName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure event source mapping with passed properties is absent.

**name** The name of the state definition.  
**EventSourceArn** ARN of the event source.  
**FunctionName** Name of the lambda function.  
**region** Region to connect to.  
**key** Secret key to be used.  
**keyid** Access key to be used.  
**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_lambda.event_source_mapping_present(name, EventSourceArn, FunctionName, StartingPosition, Enabled=True, BatchSize=100, region=None, key=None, keyid=None, profile=None)
```

Ensure event source mapping exists.

**name** The name of the state definition.  
**EventSourceArn** The Amazon Resource Name (ARN) of the Amazon Kinesis or the Amazon DynamoDB stream that is the event source.  
**FunctionName** The Lambda function to invoke when AWS Lambda detects an event on the stream.

You can specify an unqualified function name (for example, ``Thumbnail``) or you can specify Amazon Resource Name (ARN) of the function (for example, ``arn:aws:lambda:us-west-2:account-id:function:ThumbNail``). AWS Lambda also allows you to specify only the account ID qualifier (for example, ``account-id:Thumbnail``). Note that the length constraint applies only to the ARN. If you specify only the function name, it is limited to 64 character in length.

**StartingPosition** The position in the stream where AWS Lambda should start reading. (TRIM\_HORIZON | LATEST)

**Enabled** Indicates whether AWS Lambda should begin polling the event source. By default, Enabled is true.  
**BatchSize** The largest number of records that AWS Lambda will retrieve from your event source at the time of invoking your function. Your function receives an event with all the retrieved records. The default is 100 records.

**region** Region to connect to.  
**key** Secret key to be used.  
**keyid** Access key to be used.  
**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_lambda.function_absent(name, FunctionName, region=None, key=None, keyid=None, profile=None)
```

Ensure function with passed properties is absent.

**name** The name of the state definition.  
**FunctionName** Name of the function.  
**region** Region to connect to.  
**key** Secret key to be used.  
**keyid** Access key to be used.  
**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_lambda.function_present(name, FunctionName, Runtime, Role, Handler, ZipFile=None, S3Bucket=None, S3Key=None, S3ObjectVersion=None, Description='', Timeout=3, MemorySize=128, Permissions=None, RoleRetries=5, region=None, key=None, keyid=None, profile=None, VpcConfig=None, Environment=None)
```

Ensure function exists.

**name** The name of the state definition

**FunctionName** Name of the Function.

**Runtime** The Runtime environment for the function. One of `nodejs`, `java8`, or `python2.7`

**Role** The name or ARN of the IAM role that the function assumes when it executes your function to access any other AWS resources.

**Handler** The function within your code that Lambda calls to begin execution. For Node.js it is the module-name.\*export\* value in your function. For Java, it can be package.classname::handler or package.class-name.

**ZipFile** A path to a .zip file containing your deployment package. If this is specified, S3Bucket and S3Key must not be specified.

**S3Bucket** Amazon S3 bucket name where the .zip file containing your package is stored. If this is specified, S3Key must be specified and ZipFile must NOT be specified.

**S3Key** The Amazon S3 object (the deployment package) key name you want to upload. If this is specified, S3Key must be specified and ZipFile must NOT be specified.

**S3ObjectVersion** The version of S3 object to use. Optional, should only be specified if S3Bucket and S3Key are specified.

**Description** A short, user-defined function description. Lambda does not use this value. Assign a meaningful description as you see fit.

**Timeout** The function execution time at which Lambda should terminate this function. Because the execution time has cost implications, we recommend you set this value based on your expected execution time. The default is 3 seconds.

**MemorySize** The amount of memory, in MB, your function is given. Lambda uses this memory size to infer the amount of CPU and memory allocated to your function. Your function use-case determines your CPU and memory requirements. For example, a database operation might need less memory compared to an image processing function. The default value is 128 MB. The value must be a multiple of 64 MB.

**VpcConfig** If your Lambda function accesses resources in a VPC, you must provide this parameter identifying the list of security group IDs/Names and subnet IDs/Name. These must all belong to the same VPC. This is a dict of the form:

If VpcConfig is provided at all, you MUST pass at least one security group and one subnet.

**Permissions** A list of permission definitions to be added to the function's policy

**RoleRetries** IAM Roles may take some time to propagate to all regions once created. During that time function creation may fail; this state will automatically retry this number of times. The default is 5.

**Environment** The parent object that contains your environment's configuration settings. This is a dictionary of the form: {  
    `Variables`: { `VariableName`: `VariableValue`  
    }  
}

New in version 2017.7.0.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 14.17.39 salt.states.boto\_lc

Manage Launch Configurations

New in version 2014.7.0.

Create and destroy Launch Configurations. Be aware that this interacts with Amazon's services, and so may incur charges.

A limitation of this module is that you can not modify launch configurations once they have been created. If a launch configuration with the specified name exists, this module will always report success, even if the specified configuration doesn't match. This is due to a limitation in Amazon's launch configuration API, as it only allows launch configurations to be created and deleted.

Also note that a launch configuration that's in use by an autoscale group can not be deleted until the autoscale group is no longer using it. This may affect the way in which you want to order your states.

This module uses `boto`, which can be installed via `package`, or `pip`.

This module accepts explicit autoscale credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
asg.keyid: GKTADJGHEIQSXMKKRBJ08H
asg.key: askdjghsdjfkghWupUjasdfldkflgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdjfkghWupUjasdfldkflgjsdfjajkghs
  region: us-east-1
```

Credential information is shared with autoscale groups as launch configurations and autoscale groups are completely dependent on each other.

```
Ensure mylc exists:
  boto_lc.present:
    - name: mylc
    - image_id: ami-0b9c9f62
    - key_name: mykey
    - security_groups:
      - mygroup
    - instance_type: m1.small
    - instance_monitoring: true
    - block_device_mappings:
      - '/dev/sda1':
          size: 20
          volume_type: 'io1'
          iops: 220
          delete_on_termination: true
    - cloud_init:
        boothooks:
          'disable-master.sh': |
            #!/bin/bash
            echo "manual" > /etc/init/salt-master.override
        scripts:
          'run_salt.sh': |
            #!/bin/bash

            add-apt-repository -y ppa:saltstack/salt
            apt-get update
            apt-get install -y salt-minion
            salt-call state.highstate
    - region: us-east-1
```

```

- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkdflkjgsdfjajkghs

# Using a profile from pillars.
Ensure mylc exists:
  boto_lc.present:
    - name: mylc
    - image_id: ami-0b9c9f62
    - profile: myprofile

# Passing in a profile.
Ensure mylc exists:
  boto_lc.present:
    - name: mylc
    - image_id: ami-0b9c9f62
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdfjkghWupUjasdfklkdflkjgsdfjajkghs
      region: us-east-1

```

**salt.states.boto\_lc.absent** (*name, region=None, key=None, keyid=None, profile=None*)

Ensure the named launch configuration is deleted.

**name** Name of the launch configuration.

**region** The region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto\_lc.present** (*name, image\_id, key\_name=None, vpc\_id=None, vpc\_name=None, security\_groups=None, user\_data=None, cloud\_init=None, instance\_type='m1.small', kernel\_id=None, ramdisk\_id=None, block\_device\_mappings=None, instance\_monitoring=False, spot\_price=None, instance\_profile\_name=None, ebs\_optimized=False, associate\_public\_ip\_address=None, region=None, key=None, keyid=None, profile=None*)

Ensure the launch configuration exists.

**name** Name of the launch configuration.

**image\_id** AMI to use for instances. AMI must exist or creation of the launch configuration will fail.

**key\_name** Name of the EC2 key pair to use for instances. Key must exist or creation of the launch configuration will fail.

**vpc\_id** The VPC id where the security groups are defined. Only necessary when using named security groups that exist outside of the default VPC. Mutually exclusive with vpc\_name.

**vpc\_name** Name of the VPC where the security groups are defined. Only Necessary when using named security groups that exist outside of the default VPC. Mutually exclusive with vpc\_id.

**security\_groups** List of Names or security group id's of the security groups with which to associate the EC2 instances or VPC instances, respectively. Security groups must exist, or creation of the launch configuration will fail.

**user\_data** The user data available to launched EC2 instances.

**cloud\_init** A dict of cloud\_init configuration. Currently supported values: scripts, cloud-config. Mutually exclusive with user\_data.

**instance\_type** The instance type. ex: m1.small.

**kernel\_id** The kernel id for the instance.

**ramdisk\_id** The RAM disk ID for the instance.

**block\_device\_mappings** A dict of block device mappings that contains a dict with volume\_type, delete\_on\_termination, iops, size, encrypted, snapshot\_id.

- volume\_type** Indicates what volume type to use. Valid values are standard, io1, gp2. Default is standard.
- delete\_on\_termination** Indicates whether to delete the volume on instance termination (true) or not (false).
- iops** For Provisioned IOPS (SSD) volumes only. The number of I/O operations per second (IOPS) to provision for the volume.
- size** Desired volume size (in GiB).
- encrypted** Indicates whether the volume should be encrypted. Encrypted EBS volumes must be attached to instances that support Amazon EBS encryption. Volumes that are created from encrypted snapshots are automatically encrypted. There is no way to create an encrypted volume from an unencrypted snapshot or an unencrypted volume from an encrypted snapshot.
- instance\_monitoring** Whether instances in group are launched with detailed monitoring.
- spot\_price** The spot price you are bidding. Only applies if you are building an autoscaling group with spot instances.
- instance\_profile\_name** The name or the Amazon Resource Name (ARN) of the instance profile associated with the IAM role for the instance. Instance profile must exist or the creation of the launch configuration will fail.
- ebs\_optimized** Specifies whether the instance is optimized for EBS I/O (true) or not (false).
- associate\_public\_ip\_address** Used for Auto Scaling groups that launch instances into an Amazon Virtual Private Cloud. Specifies whether to assign a public IP address to each instance launched in a Amazon VPC.
- region** The region to connect to.
- key** Secret key to be used.
- keyid** Access key to be used.
- profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

#### 14.17.40 salt.states.boto\_rds

##### Manage RDSs

New in version 2015.8.0.

Create and destroy RDS instances. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit rds credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
rds.keyid: GKTADJGHEIQSXMKKRBJ08H
rds.key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
  region: us-east-1
```

```

Ensure myrds RDS exists:
boto_rds.present:
- name: myrds
- allocated_storage: 5
- storage_type: standard
- db_instance_class: db.t2.micro
- engine: MySQL
- master_username: myuser
- master_user_password: mypass
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkgHwupUjasdfklkdfklgjsdfjajkgHs
- tags:
  key: value

```

```

Ensure parameter group exists:
create-parameter-group:
  boto_rds.parameter_present:
    - name: myparametergroup
    - db_parameter_group_family: mysql5.6
    - description: "parameter group family"
    - parameters:
      - binlog_cache_size: 32768
      - binlog_checksum: CRC32
    - region: eu-west-1

```

**depends** boto3

`salt.states.boto_rds.absent`(*name*, *skip\_final\_snapshot=None*, *final\_db\_snapshot\_identifier=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *wait\_for\_deletion=True*, *timeout=180*)

Ensure RDS instance is absent.

**name** Name of the RDS instance.

**skip\_final\_snapshot** Whether a final db snapshot is created before the instance is deleted. If True, no snapshot is created. If False, a snapshot is created before deleting the instance.

**final\_db\_snapshot\_identifier** If a final snapshot is requested, this is the identifier used for that snapshot.

**tags** A dict of tags.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**wait\_for\_deletion (bool)** Wait for the RDS instance to be deleted completely before finishing the state.

**timeout (in seconds)** The amount of time that can pass before raising an Exception.

`salt.states.boto_rds.parameter_present`(*name*, *db\_parameter\_group\_family*, *description*, *parameters=None*, *apply\_method='pending-reboot'*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure DB parameter group exists and update parameters.

**name** The name for the parameter group.

**db\_parameter\_group\_family** The DB parameter group family name. A DB parameter group can be associated with one and only one DB parameter group family, and can be applied only to a DB instance running a database engine and engine version compatible with that DB parameter group family.

**description** Parameter group description.

**parameters** The DB parameters that need to be changed of type dictionary.

**apply\_method** The *apply-immediate* method can be used only for dynamic parameters; the *pending-reboot* method can be used with MySQL and Oracle DB instances for either dynamic or static parameters. For Microsoft SQL Server DB instances, the *pending-reboot* method can be used only for static parameters.

**tags** A dict of tags.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```

salt.states.boto_rds.present(name, allocated_storage, db_instance_class, engine, master_username, master_user_password, db_name=None, storage_type=None, db_security_groups=None, vpc_security_group_ids=None, availability_zone=None, db_subnet_group_name=None, preferred_maintenance_window=None, db_parameter_group_name=None, db_cluster_identifier=None, tde_credential_arn=None, tde_credential_password=None, storage_encrypted=None, kms_keyid=None, backup_retention_period=None, preferred_backup_window=None, port=None, multi_az=None, engine_version=None, auto_minor_version_upgrade=None, license_model=None, iops=None, option_group_name=None, character_set_name=None, publicly_accessible=None, wait_status=None, tags=None, copy_tags_to_snapshot=None, region=None, domain=None, key=None, keyid=None, monitoring_interval=None, monitoring_role_arn=None, domain_iam_role_name=None, promotion_tier=None, profile=None)

```

Ensure RDS instance exists.

**name** Name of the RDS state definition.

**allocated\_storage** The amount of storage (in gigabytes) to be initially allocated for the database instance.

**db\_instance\_class** The compute and memory capacity of the Amazon RDS DB instance.

**engine** The name of the database engine to be used for this instance. Supported engine types are: MySQL, mariadb, oracle-se1, oracle-se, oracle-ee, sqlserver-ee, sqlserver-se, sqlserver-ex, sqlserver-web, postgres and aurora. For more information, please see the `engine` argument in the Boto3 RDS `create_db_instance` documentation.

**master\_username** The name of master user for the client DB instance.

**master\_user\_password** The password for the master database user. Can be any printable ASCII character except ``"/, `", or `@"`.

**db\_name** The meaning of this parameter differs according to the database engine you use. See the Boto3 RDS documentation to determine the appropriate value for your configuration. [https://boto3.readthedocs.io/en/latest/reference/services/rds.html#RDS.Client.create\\_db\\_instance](https://boto3.readthedocs.io/en/latest/reference/services/rds.html#RDS.Client.create_db_instance)

**storage\_type** Specifies the storage type to be associated with the DB instance. Options are standard, gp2 and io1. If you specify io1, you must also include a value for the `iops` parameter.

**db\_security\_groups** A list of DB security groups to associate with this DB instance.

**vpc\_security\_group\_ids** A list of EC2 VPC security groups to associate with this DB instance.

**availability\_zone** The EC2 Availability Zone that the database instance will be created in.

**db\_subnet\_group\_name** A DB subnet group to associate with this DB instance.

**preferred\_maintenance\_window** The weekly time range (in UTC) during which system maintenance can occur.

**db\_parameter\_group\_name** A DB parameter group to associate with this DB instance.

**db\_cluster\_identifier** If the DB instance is a member of a DB cluster, contains the name of the DB cluster that the DB instance is a member of.

**tde\_credential\_arn** The ARN from the Key Store with which the instance is associated for TDE encryption.

**tde\_credential\_password** The password to use for TDE encryption if an encryption key is not used.

**storage\_encrypted** Specifies whether the DB instance is encrypted.

**kms\_keyid** If `storage_encrypted` is true, the KMS key identifier for the encrypted DB instance.

**backup\_retention\_period** The number of days for which automated backups are retained.

**preferred\_backup\_window** The daily time range during which automated backups are created if automated backups are enabled.

**port** The port number on which the database accepts connections.

**multi\_az** Specifies if the DB instance is a Multi-AZ deployment. You cannot set the `AvailabilityZone` parameter if the `MultiAZ` parameter is set to true.

**engine\_version** The version number of the database engine to use.

**auto\_minor\_version\_upgrade** Indicates that minor engine upgrades will be applied automatically to the DB instance during the maintenance window.

**license\_model** License model information for this DB instance.

**iops** The amount of Provisioned IOPS (input/output operations per second) to be initially allocated for the DB instance.

**option\_group\_name** Indicates that the DB instance should be associated with the specified option group.

**character\_set\_name** For supported engines, indicates that the DB instance should be associated with the specified `CharacterSet`.

**publicly\_accessible** Specifies the accessibility options for the DB instance. A value of true specifies an Internet-facing instance with a publicly resolvable DNS name, which resolves to a public IP address. A value of false specifies an internal instance with a DNS name that resolves to a private IP address.

**wait\_status** Wait for the RDS instance to reach a desired status before finishing the state. Available states: available, modifying, backing-up

**tags** A dict of tags.

**copy\_tags\_to\_snapshot** Specifies whether tags are copied from the DB instance to snapshots of the DB instance.

**region** Region to connect to.

**domain** The identifier of the Active Directory Domain.

**key** AWS secret key to be used.

**keyid** AWS access key to be used.

**monitoring\_interval** The interval, in seconds, between points when Enhanced Monitoring metrics are collected for the DB instance.

**monitoring\_role\_arn** The ARN for the IAM role that permits RDS to send Enhanced Monitoring metrics to CloudWatch Logs.

**domain\_iam\_role\_name** Specify the name of the IAM role to be used when making API calls to the Directory Service.

**promotion\_tier** A value that specifies the order in which an Aurora Replica is promoted to the primary instance after a failure of the existing primary instance. For more information, see [Fault Tolerance for an Aurora DB Cluster](#).

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```

salt.states.boto_rds.replica_present(name, source, db_instance_class=None,
                                     availability_zone=None, port=None,
                                     auto_minor_version_upgrade=None, iops=None,
                                     option_group_name=None, publicly_accessible=None,
                                     tags=None, region=None, key=None, keyid=None,
                                     profile=None, db_parameter_group_name=None)

```

Ensure RDS replica exists.

```

Ensure myrds replica RDS exists:
boto_rds.create_replica:
- name: myreplica
- source: mydb

```

```
salt.states.boto_rds.subnet_group_present(name, description, subnet_ids=None, subnet_names=None, tags=None, region=None, key=None, keyid=None, profile=None)
```

Ensure DB subnet group exists.

**name** The name for the DB subnet group. This value is stored as a lowercase string.

**subnet\_ids** A list of the EC2 Subnet IDs for the DB subnet group. Either `subnet_ids` or `subnet_names` must be provided.

**subnet\_names** A list of The EC2 Subnet names for the DB subnet group. Either `subnet_ids` or `subnet_names` must be provided.

**description** Subnet group description.

**tags** A dict of tags.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

#### 14.17.41 salt.states.boto\_route53

Manage Route53 records

New in version 2014.7.0.

Create and delete Route53 records. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via `package`, or `pip`.

This module accepts explicit `route53` credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
route53.keyid: GKTADJGHEIQSXMKKRBJ08H
route53.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
  region: us-east-1
```

```
mycnamerecord:
  boto_route53.present:
    - name: test.example.com.
    - value: my-elb.us-east-1.elb.amazonaws.com.
    - zone: example.com.
    - ttl: 60
    - record_type: CNAME
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

```
# Using a profile from pillars
```

```
myarecord:
```

```

boto_route53.present:
  - name: test.example.com.
  - value: 1.1.1.1
  - zone: example.com.
  - ttl: 60
  - record_type: A
  - region: us-east-1
  - profile: myprofile

# Passing in a profile
myarecord:
  boto_route53.present:
    - name: test.example.com.
    - value: 1.1.1.1
    - zone: example.com.
    - ttl: 60
    - record_type: A
    - region: us-east-1
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdfjkgHwupUjasdfkldfklgjsdfjajkghs

```

`salt.states.boto_route53.absent`(*name*, *zone*, *record\_type*, *identifier=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *wait\_for\_sync=True*, *split\_dns=False*, *private\_zone=False*)

Ensure the Route53 record is deleted.

**name** Name of the record.

**zone** The zone to delete the record from.

**record\_type** The record type (A, NS, MX, TXT, etc.)

**identifier** An identifier to match for deletion.

**region** The region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**wait\_for\_sync** Wait for an INSYNC change status from Route53.

**split\_dns** Route53 supports a public and private DNS zone with the same names.

**private\_zone** If using `split_dns`, specify if this is the private zone.

`salt.states.boto_route53.hosted_zone_absent`(*name*, *domain\_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the Route53 Hostes Zone described is absent

**name** The name of the state definition.

**domain\_name** The FQDN (including final period) of the zone you wish absent. If not provided, the value of `name` will be used.

`salt.states.boto_route53.hosted_zone_present`(*name*, *domain\_name=None*, *private\_zone=False*, *comment=''*, *vpc\_id=None*, *vpc\_name=None*, *vpc\_region=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure a hosted zone exists with the given attributes. Note that most things cannot be modified once a zone is created - it must be deleted and re-spun to update these attributes:

- `private_zone` (AWS API limitation).

- comment** (the appropriate call exists in the AWS API and in boto3, but has not, as of this writing, been added to boto2).

- vpc\_id (same story - we really need to rewrite this module with boto3)
- vpc\_name (really just a pointer to vpc\_id anyway).
- vpc\_region (again, supported in boto3 but not boto2).

**name** The name of the state definition. This will be used as the `caller\_ref` param if/when creating the hosted zone.

**domain\_name** The name of the domain. This should be a fully-specified domain, and should terminate with a period. This is the name you have registered with your DNS registrar. It is also the name you will delegate from your registrar to the Amazon Route 53 delegation servers returned in response to this request. Defaults to the value of name if not provided.

**comment** Any comments you want to include about the hosted zone.

**private\_zone** Set True if creating a private hosted zone.

**vpc\_id** When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with vpc\_name. Ignored if passed for a non-private zone.

**vpc\_name** When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with vpc\_id. Ignored if passed for a non-private zone.

**vpc\_region** When creating a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from vpc\_id or vpc\_name, if possible. If this fails, you'll need to provide an explicit value for this option. Ignored if passed for a non-private zone.

`salt.states.boto_route53.present` (*name, value, zone, record\_type, ttl=None, identifier=None, region=None, key=None, keyid=None, profile=None, wait\_for\_sync=True, split\_dns=False, private\_zone=False*)

Ensure the Route53 record is present.

**name** Name of the record.

**value**

**Value of the record. As a special case, you can pass in:** private:<Name tag> to have the function autodetermine the private IP public:<Name tag> to have the function autodetermine the public IP

**zone** The zone to create the record in.

**record\_type** The record type (A, NS, MX, TXT, etc.)

**ttl** The time to live for the record.

**identifier** The unique identifier to use for this record.

**region** The region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**wait\_for\_sync** Wait for an INSYNC change status from Route53.

**split\_dns** Route53 supports a public and private DNS zone with the same names.

**private\_zone** If using split\_dns, specify if this is the private zone.

## 14.17.42 salt.states.boto\_s3\_bucket module

### Manage S3 Buckets

New in version 2016.3.0.

Create and destroy S3 buckets. Be aware that this interacts with Amazon's services, and so may incur charges.

**depends**

- boto
- boto3

The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfklkfjlsdfjajkgghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfjlsdfjajkgghs
  region: us-east-1
```

```
Ensure bucket exists:
  boto_s3_bucket.present:
    - Bucket: mybucket
    - LocationConstraint: EU
    - ACL:
      - GrantRead: "uri=http://acs.amazonaws.com/groups/global/AllUsers"
    - CORSRules:
      - AllowedHeaders: []
        AllowedMethods: ["GET"]
        AllowedOrigins: ["*"]
        ExposeHeaders: []
        MaxAgeSeconds: 123
    - LifecycleConfiguration:
      - Expiration:
          Days: 123
          ID: "idstring"

          ReplaceKeyWith: "string"
  - region: us-east-1
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjakghs

```

`salt.states.boto_s3_bucket.absent` (*name*, *Bucket*, *Force=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure bucket with passed properties is absent.

**name** The name of the state definition.

**Bucket** Name of the bucket.

**Force** Empty the bucket first if necessary - Boolean.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_s3_bucket.present(name, Bucket, LocationConstraint=None, ACL=None,
                                   CORSRules=None, LifecycleConfiguration=None, Logging=None,
                                   NotificationConfiguration=None, Policy=None, Replication=None,
                                   RequestPayment=None, Tagging=None, Versioning=None, Website=None,
                                   region=None, key=None, keyid=None, profile=None)
```

Ensure bucket exists.

**name** The name of the state definition

**Bucket** Name of the bucket.

**LocationConstraint** `EU'|'eu-west-1'|'us-west-1'|'us-west-2'|'ap-southeast-1'|'ap-southeast-2'|'ap-northeast-1'|'sa-east-1'|'cn-north-1'|'eu-central-1'

**ACL** The permissions on a bucket using access control lists (ACL).

**CORSRules** The cors configuration for a bucket.

**LifecycleConfiguration** Lifecycle configuration for your bucket

**Logging** The logging parameters for a bucket and to specify permissions for who can view and modify the logging parameters.

**NotificationConfiguration** notifications of specified events for a bucket

**Policy** Policy on the bucket

**Replication** Replication rules. You can add as many as 1,000 rules. Total replication configuration size can be up to 2 MB

**RequestPayment** The request payment configuration for a bucket. By default, the bucket owner pays for downloads from the bucket. This configuration parameter enables the bucket owner (only) to specify that the person requesting the download will be charged for the download

**Tagging** A dictionary of tags that should be set on the bucket

**Versioning** The versioning state of the bucket

**Website** The website configuration of the bucket

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 14.17.43 salt.states.boto\_secgroup

#### Manage Security Groups

New in version 2014.7.0.

Create and destroy Security Groups. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit EC2 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
secgroup.keyid: GKTADJGHEIQSXMKKRBJ08H
secgroup.key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
  region: us-east-1
```

```
Ensure mysecgroup exists:
  boto_secgroup.present:
    - name: mysecgroup
    - description: My security group
    - vpc_name: myvpc
    - rules:
      - ip_protocol: tcp
        from_port: 80
        to_port: 80
        cidr_ip:
          - 10.0.0.0/8
          - 192.168.0.0/16
      - ip_protocol: tcp
        from_port: 8080
        to_port: 8090
        cidr_ip:
          - 10.0.0.0/8
          - 192.168.0.0/16
      - ip_protocol: icmp
        from_port: -1
        to_port: -1
        source_group_name: mysecgroup
    - rules_egress:
      - ip_protocol: all
        from_port: -1
        to_port: -1
        cidr_ip:
          - 10.0.0.0/8
          - 192.168.0.0/16
    - tags:
      SomeTag: 'My Tag Value'
      SomeOtherTag: 'Other Tag Value'
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs

# Using a profile from pillars
Ensure mysecgroup exists:
  boto_secgroup.present:
    - name: mysecgroup
    - description: My security group
    - profile: myprofile

# Passing in a profile
Ensure mysecgroup exists:
  boto_secgroup.present:
```

```
- name: mysecgroup
- description: My security group
- profile:
  keyid: GKTADJGHEIQSXMKRB08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
  region: us-east-1
```

---

**Note:** When using the `profile` parameter and `region` is set outside of the profile group, `region` is ignored and a default region will be used.

If `region` is missing from the `profile` data set, `us-east-1` will be used as the default region.

---

`salt.states.boto_secgroup.absent` (*name*, *vpc\_id=None*, *vpc\_name=None*, *region=None*,  
*key=None*, *keyid=None*, *profile=None*)

Ensure a security group with the specified name does not exist.

**name** Name of the security group.

**vpc\_id** The ID of the VPC to remove the security group from, if any. Exclusive with `vpc_name`.

**vpc\_name** The name of the VPC to remove the security group from, if any. Exclusive with `vpc_id`.

New in version 2016.3.0.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with `region`, `key` and `keyid`, or a pillar key (string) that contains a dict with `region`, `key` and `keyid`.

New in version 2016.3.0.

`salt.states.boto_secgroup.present` (*name*, *description*, *vpc\_id=None*, *vpc\_name=None*,  
*rules=None*, *rules\_egress=None*, *region=None*, *key=None*,  
*keyid=None*, *profile=None*, *tags=None*)

Ensure the security group exists with the specified rules.

**name** Name of the security group.

**description** A description of this security group.

**vpc\_id** The ID of the VPC to create the security group in, if any. Exclusive with `vpc_name`.

**vpc\_name** The name of the VPC to create the security group in, if any. Exclusive with `vpc_id`.

New in version 2016.3.0.

New in version 2015.8.2.

**rules** A list of ingress rule dicts. If not specified, `rules=None`, the ingress rules will be unmanaged. If set to an empty list, `[]`, then all ingress rules will be removed.

**rules\_egress** A list of egress rule dicts. If not specified, `rules_egress=None`, the egress rules will be unmanaged. If set to an empty list, `[]`, then all egress rules will be removed.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with `region`, `key` and `keyid`, or a pillar key (string) that contains a dict with `region`, `key`, and `keyid`.

**tags** List of key:value pairs of tags to set on the security group

New in version 2016.3.0.

#### 14.17.44 salt.states.boto\_sns

##### Manage SNS Topics

Create and destroy SNS topics. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via `package`, or `pip`.

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
sns.keyid: GKTADJGHEIQSXMKKRBJ08H
sns.key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
  region: us-east-1
```

```
mytopic:
  boto_sns.present:
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs

# Using a profile from pillars
mytopic:
  boto_sns.present:
    - region: us-east-1
    - profile: mysnsprofile

# Passing in a profile
mytopic:
  boto_sns.present:
    - region: us-east-1
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

**salt.states.boto\_sns.absent** (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *unsubscribe=False*)

Ensure the named sns topic is deleted.

**name** Name of the SNS topic.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**unsubscribe** If True, unsubscribe all subscriptions to the SNS topic before deleting the SNS topic

New in version 2016.11.0.

`salt.states.boto_sns.present`(*name*, *subscriptions=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the SNS topic exists.

**name** Name of the SNS topic.

**subscriptions** List of SNS subscriptions.

Each subscription is a dictionary with a protocol and endpoint key:

```
[
  {'protocol': 'https', 'endpoint': 'https://www.example.com/sns-endpoint'},
  {'protocol': 'sqs', 'endpoint': 'arn:aws:sqs:us-west-2:123456789012:MyQueue'}
]
```

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

#### 14.17.45 salt.states.boto\_sqs

Manage SQS Queues

New in version 2014.7.0.

Create and destroy SQS queues. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit SQS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
sqs.keyid: GKTADJGHEIQSXMKKRBJ08H
sqs.key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
  region: us-east-1
```

```
myqueue:
  boto_sqs.present:
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
    - attributes:
        ReceiveMessageWaitTimeSeconds: 20
```

*# Using a profile from pillars*

```
myqueue:
  boto_sqs.present:
    - region: us-east-1
    - profile: mysqsprofile
```

```
# Passing in a profile
myqueue:
  boto_sqs.present:
    - region: us-east-1
    - profile:
        keyid: GKTADJGHEIQSXMKKRBJ08H
        key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

**salt.states.boto\_sqs.absent** (*name, region=None, key=None, keyid=None, profile=None*)

Ensure the named sqs queue is deleted.

**name** Name of the SQS queue.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto\_sqs.present** (*name, attributes=None, region=None, key=None, keyid=None, profile=None*)

Ensure the SQS queue exists.

**name** Name of the SQS queue.

**attributes** A dict of key/value SQS attributes.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

#### 14.17.46 salt.states.boto\_vpc

##### Manage VPCs

New in version 2015.8.0.

##### depends

- boto >= 2.8.0
- boto3 >= 1.2.6

Create and destroy VPCs. Be aware that this interacts with Amazon's services, and so may incur charges.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
```

```
key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
region: us-east-1
```

```
aws:
  region:
    us-east-1:
      profile:
        keyid: GKTADJGHEIQSXMKKRBJ08H
        key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
        region: us-east-1
```

```
Ensure VPC exists:
  boto_vpc.present:
    - name: myvpc
    - cidr_block: 10.10.11.0/24
    - dns_hostnames: True
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs

Ensure subnet exists:
  boto_vpc.subnet_present:
    - name: mysubnet
    - vpc_id: vpc-123456
    - cidr_block: 10.0.0.0/16
    - region: us-east-1
    - profile: myprofile

{% set profile = salt['pillar.get']('aws:region:us-east-1:profile' ) %}
Ensure internet gateway exists:
  boto_vpc.internet_gateway_present:
    - name: myigw
    - vpc_name: myvpc
    - profile: {{ profile }}

Ensure route table exists:
  boto_vpc.route_table_present:
    - name: my_route_table
    - vpc_id: vpc-123456
    - routes:
      - destination_cidr_block: 0.0.0.0/0
        instance_id: i-123456
    - subnet_names:
      - subnet1
      - subnet2
    - region: us-east-1
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

New in version 2016.11.0.

Request, accept and delete VPC peering connections. VPC peering connections can be named allowing the name to be used throughout the state file. Following example shows how to request and accept a VPC peering connection.

```
accept the vpc peering connection:
  boto_vpc.accept_vpc_peering_connection:
```

```

- conn_name: salt_vpc_peering
- region: us-west-2
- require:
  - boto_vpc: request a vpc peering connection

```

```

request a vpc peering connection:
boto_vpc.request_vpc_peering_connection:
  - requester_vpc_id: vpc-4a3d522e
  - peer_vpc_id: vpc-ae81e9ca
  - region: us-west-2
  - conn_name: salt_vpc_peering

```

VPC peering connections need not be named. In this case the VPC peering connection ID should be used in the state file.

```

accept the vpc peering connection:
boto_vpc.accept_vpc_peering_connection:
  - conn_id: pcx-1873c371
  - region: us-west-2

```

VPC peering connections can be deleted, as shown below.

```

delete a named vpc peering connection:
boto_vpc.delete_vpc_peering_connection:
  - conn_name: salt_vpc_peering

```

Delete also accepts a VPC peering connection id.

```

delete a vpc peering connection by id:
boto_vpc.delete_vpc_peering_connection:
  - conn_id: pcx-1873c371

```

**salt.states.boto\_vpc.absent**(*name*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure VPC with passed properties is absent.

**name** Name of the VPC.

**tags** A list of tags. All tags must match.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto\_vpc.accept\_vpc\_peering\_connection**(*name=None*, *conn\_id=None*, *conn\_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Accept a VPC pending requested peering connection between two VPCs.

**name** Name of this state

**conn\_id** The connection ID to accept. Exclusive with *conn\_name*. String type.

**conn\_name** The name of the VPC peering connection to accept. Exclusive with *conn\_id*. String type.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```
boto_vpc.accept_vpc_peering_connection:
  - conn_name: salt_peering_connection

# usage with vpc peering connection id and region
boto_vpc.accept_vpc_peering_connection:
  - conn_id: pbx-1873d472
  - region: us-west-2
```

```
salt.states.boto_vpc.delete_vpc_peering_connection(name, conn_id=None,
                                                    conn_name=None, region=None,
                                                    key=None, keyid=None, profile=None)
```

**name** Name of the state

**conn\_id** ID of the peering connection to delete. Exclusive with `conn_name`.

**conn\_name** The name of the peering connection to delete. Exclusive with `conn_id`.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```
delete a vpc peering connection:
  boto_vpc.delete_vpc_peering_connection:
    - region: us-west-2
    - conn_id: pcx-4613b12e
```

Connection name can be specified (instead of ID). Specifying both `conn_name` and `conn_id` will result in an error.

```
delete a vpc peering connection:
  boto_vpc.delete_vpc_peering_connection:
    - conn_name: salt_vpc_peering
```

```
salt.states.boto_vpc.dhcp_options_absent(name=None, dhcp_options_id=None, re-
                                         gion=None, key=None, keyid=None, pro-
                                         file=None)
```

Ensure a set of DHCP options with the given settings exist.

**name** (string) Name of the DHCP options set.

**dhcp\_options\_id** (string) Id of the DHCP options set.

**region** (string) Region to connect to.

**key** (string) Secret key to be used.

**keyid** (string) Access key to be used.

**profile** (various) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.3.0.

`salt.states.boto_vpc.dhcp_options_present` (*name*, *dhcp\_options\_id=None*, *vpc\_name=None*, *vpc\_id=None*, *domain\_name=None*, *domain\_name\_servers=None*, *ntp\_servers=None*, *netbios\_name\_servers=None*, *netbios\_node\_type=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure a set of DHCP options with the given settings exist. Note that the current implementation only SETS values during option set creation. It is unable to update option sets in place, and thus merely verifies the set exists via the given name and/or `dhcp_options_id` param.

**name** (string) Name of the DHCP options.

**vpc\_name** (string) Name of a VPC to which the options should be associated. Either `vpc_name` or `vpc_id` must be provided.

**vpc\_id** (string) Id of a VPC to which the options should be associated. Either `vpc_name` or `vpc_id` must be provided.

**domain\_name** (string) Domain name to be associated with this option set.

**domain\_name\_servers** (list of strings) The IP address(es) of up to four domain name servers.

**ntp\_servers** (list of strings) The IP address(es) of up to four desired NTP servers.

**netbios\_name\_servers** (list of strings) The IP address(es) of up to four NetBIOS name servers.

**netbios\_node\_type** (string) The NetBIOS node type (1, 2, 4, or 8). For more information about the allowed values, see RFC 2132. The recommended is 2 at this time (broadcast and multicast are currently not supported).

**tags** (dict of key:value pairs) A set of tags to be added.

**region** (string) Region to connect to.

**key** (string) Secret key to be used.

**keyid** (string) Access key to be used.

**profile** (various) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.3.0.

`salt.states.boto_vpc.internet_gateway_absent` (*name*, *detach=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the named internet gateway is absent.

**name** Name of the internet gateway.

**detach** First detach the internet gateway from a VPC, if attached.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_vpc.internet_gateway_present` (*name*, *vpc\_name=None*, *vpc\_id=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure an internet gateway exists.

**name** Name of the internet gateway.

**vpc\_name** Name of the VPC to which the internet gateway should be attached.

**vpc\_id** Id of the VPC to which the internet\_gateway should be attached. Only one of `vpc_name` or `vpc_id` may be provided.

**tags** A list of tags.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_vpc.nat_gateway_absent` (*name=None, subnet\_name=None, subnet\_id=None, region=None, key=None, keyid=None, profile=None, wait\_for\_delete\_retries=0*)

Ensure the nat gateway in the named subnet is absent.

This function requires boto3.

New in version 2016.11.0.

**name** Name of the state.

**subnet\_name** Name of the subnet within which the nat gateway should exist

**subnet\_id** Id of the subnet within which the nat gateway should exist. Either `subnet_name` or `subnet_id` must be provided.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**wait\_for\_delete\_retries** NAT gateway may take some time to be go into deleted or failed state. During the deletion process, subsequent release of elastic IPs may fail; this state will automatically retry this number of times to ensure the NAT gateway is in deleted or failed state before proceeding. Default is set to 0 for backward compatibility.

`salt.states.boto_vpc.nat_gateway_present` (*name, subnet\_name=None, subnet\_id=None, region=None, key=None, keyid=None, profile=None, allocation\_id=None*)

Ensure a nat gateway exists within the specified subnet

This function requires boto3.

New in version 2016.11.0.

Example:

```
boto_vpc.nat_gateway_present:
- subnet_name: my-subnet
```

**name** Name of the state

**subnet\_name** Name of the subnet within which the nat gateway should exist

**subnet\_id** Id of the subnet within which the nat gateway should exist. Either `subnet_name` or `subnet_id` must be provided.

**allocation\_id** If specified, the elastic IP address referenced by the ID is associated with the gateway. Otherwise, a new `allocation_id` is created and used.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_vpc.present` (*name, cidr\_block, instance\_tenancy=None, dns\_support=None, dns\_hostnames=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Ensure VPC exists.

**name** Name of the VPC.

**cidr\_block** The range of IPs in CIDR format, for example: 10.0.0.0/24. Block size must be between /16 and /28 netmask.

**instance\_tenancy** Instances launched in this VPC will be in single-tenant or dedicated hardware.

**dns\_support** Indicates whether the DNS resolution is supported for the VPC.

**dns\_hostnames** Indicates whether the instances launched in the VPC get DNS hostnames.

**tags** A list of tags.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_vpc.request_vpc_peering_connection(name, requester_vpc_id=None,
                                                    requester_vpc_name=None,
                                                    peer_vpc_id=None,
                                                    peer_vpc_name=None,
                                                    conn_name=None,
                                                    peer_owner_id=None, region=None,
                                                    key=None, keyid=None, profile=None)
```

**name** Name of the state

**requester\_vpc\_id** ID of the requesting VPC. Exclusive with requester\_vpc\_name. String type.

**requester\_vpc\_name** Name tag of the requesting VPC. Exclusive with requester\_vpc\_id. String type.

**peer\_vpc\_id** ID of the VPC to create VPC peering connection with. This can be a VPC in another account. Exclusive with peer\_vpc\_name. String type.

**peer\_vpc\_name** Name tag of the VPC to create VPC peering connection with. This can only be a VPC the same account. Exclusive with peer\_vpc\_id. String type.

**conn\_name** The (optional) name to use for this VPC peering connection. String type.

**peer\_owner\_id** ID of the owner of the peer VPC. String type. If this isn't supplied AWS uses your account ID. Required if peering to a different account.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```
request a vpc peering connection:
boto_vpc.request_vpc_peering_connection:
- requester_vpc_id: vpc-4b3522e
- peer_vpc_id: vpc-ae83f9ca
- conn_name: salt_peering_connection
```

```
salt.states.boto_vpc.route_table_absent(name, region=None, key=None, keyid=None, profile=None)
```

Ensure the named route table is absent.

**name** Name of the route table.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_vpc.route_table_present(name, vpc_name=None, vpc_id=None,
                                          routes=None, subnet_ids=None, subnet_names=None,
                                          tags=None, region=None, key=None, keyid=None, profile=None)
```

Ensure route table with routes exists and is associated to a VPC.

This function requires boto3 to be installed if nat gateways are specified.

Example:

```
boto_vpc.route_table_present:
  - name: my_route_table
  - vpc_id: vpc-123456
  - routes:
    - destination_cidr_block: 0.0.0.0/0
      internet_gateway_name: InternetGateway
    - destination_cidr_block: 10.10.11.0/24
      instance_id: i-123456
    - destination_cidr_block: 10.10.12.0/24
      interface_id: eni-123456
    - destination_cidr_block: 10.10.13.0/24
      instance_name: mygatewayserver
  - subnet_names:
    - subnet1
    - subnet2
```

**name** Name of the route table.

**vpc\_name** Name of the VPC with which the route table should be associated.

**vpc\_id** Id of the VPC with which the route table should be associated. Either `vpc_name` or `vpc_id` must be provided.

**routes** A list of routes. Each route has a cidr and a target.

**subnet\_ids** A list of subnet ids to associate

**subnet\_names** A list of subnet names to associate

**tags** A list of tags.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_vpc.subnet_absent` (*name=None, subnet\_id=None, region=None, key=None, keyid=None, profile=None*)

Ensure subnet with passed properties is absent.

**name** Name of the subnet.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_vpc.subnet_present` (*name, cidr\_block, vpc\_name=None, vpc\_id=None, availability\_zone=None, tags=None, region=None, key=None, keyid=None, profile=None, route\_table\_id=None, route\_table\_name=None*)

Ensure a subnet exists.

**name** Name of the subnet.

**cidr\_block** The range of IPs for the subnet, in CIDR format. For example: 10.0.0.0/24. Block size must be between /16 and /28 netmask.

**vpc\_name** Name of the VPC in which the subnet should be placed. Either `vpc_name` or `vpc_id` must be provided.

**vpc\_id** Id of the VPC in which the subnet should be placed. Either `vpc_name` or `vpc_id` must be provided.

**availability\_zone** AZ in which the subnet should be placed.

**tags** A list of tags.

**route\_table\_id** A route table ID to explicitly associate the subnet with. If both `route_table_id` and `route_table_name` are specified, `route_table_id` will take precedence.

New in version 2016.11.0.

**route\_table\_name** A route table name to explicitly associate the subnet with. If both `route_table_id` and `route_table_name` are specified, `route_table_id` will take precedence.

New in version 2016.11.0.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```

salt.states.boto_vpc.vpc_peering_connection_present(name, requester_vpc_id=None,
                                                    requester_vpc_name=None,
                                                    peer_vpc_id=None,
                                                    peer_vpc_name=None,
                                                    conn_name=None,
                                                    peer_owner_id=None, region=None,
                                                    key=None, keyid=None, profile=None)

```

**name** Name of the state

**requester\_vpc\_id** ID of the requesting VPC. Exclusive with `requester_vpc_name`.

**requester\_vpc\_name** Name tag of the requesting VPC. Exclusive with `requester_vpc_id`.

**peer\_vpc\_id** ID of the VPC to create VPC peering connection with. This can be a VPC in another account. Exclusive with `peer_vpc_name`.

**peer\_vpc\_name** Name tag of the VPC to create VPC peering connection with. This can only be a VPC in the same account, else resolving it into a vpc ID will fail. Exclusive with `peer_vpc_id`.

**conn\_name** The name to use for this VPC peering connection.

**peer\_owner\_id** ID of the owner of the peer VPC. Defaults to your account ID, so a value is required if peering with a VPC in a different account.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```

ensure peering twixt local vpc and the other guys:
  boto_vpc.vpc_peering_connection_present:
    - requester_vpc_name: my_local_vpc
    - peer_vpc_name: some_other_guys_vpc
    - conn_name: peering_from_here_to_there
    - peer_owner_id: 012345654321

```

## 14.17.47 salt.states.bower

### Installation of Bower Packages

These states manage the installed packages using Bower. Note that `npm`, `git` and `bower` must be installed for these states to be available, so `bower` states should include `requisites` to `pkg.installed` states for the packages which provide `npm` and `git` (simply `npm` and `git` in most cases), and `npm.installed` state for the package which provides `bower`.

Example:

```
npm:
  pkg.installed
git:
  pkg.installed
bower:
  npm.installed
  require:
    - pkg: npm
    - pkg: git

underscore:
  bower.installed:
    - dir: /path/to/project
    - require:
      - npm: bower
```

`salt.states.bower.bootstrap`(*name*, *user=None*)

Bootstraps a frontend distribution.

Will execute `bower install` on the specified directory.

**user** The user to run Bower with

`salt.states.bower.installed`(*name*, *dir*, *pkgs=None*, *user=None*, *env=None*)

Verify that the given package is installed and is at the correct version (if specified).

```
underscore:
  bower.installed:
    - dir: /path/to/project
    - user: someuser

jquery#2.0:
  bower.installed:
    - dir: /path/to/project
```

**name** The package to install

**dir** The target directory in which to install the package

**pkgs** A list of packages to install with a single Bower invocation; specifying this argument will ignore the name argument

**user** The user to run Bower with

**env** A list of environment variables to be set prior to execution. The format is the same as the `cmd.run` state function.

`salt.states.bower.pruned`(*name*, *user=None*, *env=None*)

New in version 2017.7.0.

Cleans up local bower\_components directory.

Will execute `bower prune` on the specified directory (param: name)

**user** The user to run Bower with

`salt.states.bower.removed`(*name*, *dir*, *user=None*)

Verify that the given package is not installed.

**dir** The target directory in which to install the package

**user** The user to run Bower with

### 14.17.48 salt.states.cabal

#### Installation of Cabal Packages

New in version 2015.8.0.

These states manage the installed packages for Haskell using cabal. Note that cabal-install must be installed for these states to be available, so cabal states should include a requisite to a pkg.installed state for the package which provides cabal (cabal-install in case of Debian based distributions). Example:

```
.. code-block:: yaml
```

```
cabal-install: pkg.installed
ShellCheck:
  cabal.installed:
    - require: - pkg: cabal-install
```

`salt.states.cabal.installed` (*name*, *pkgs=None*, *user=None*, *install\_global=False*, *env=None*)  
Verify that the given package is installed and is at the correct version (if specified).

```
ShellCheck-0.3.5:
  cabal:
    - installed:
```

**name** The package to install

**user** The user to run cabal install with

**install\_global** Install package globally instead of locally

**env** A list of environment variables to be set prior to execution. The format is the same as the `cmd.run` state function.

`salt.states.cabal.removed` (*name*, *user=None*, *env=None*)  
Verify that given package is not installed.

### 14.17.49 salt.states.ceph module

Manage ceph with salt.

New in version 2016.11.0.

`salt.states.ceph.quorum` (*name*, *\*\*kwargs*)

Quorum state

This state checks the mon daemons are in quorum. It does not alter the cluster but can be used in formula as a dependency for many cluster operations.

Example usage in sls file:

```
quorum:
  sesceph.quorum:
    - require:
      - sesceph: mon_running
```

### 14.17.50 salt.states.chef

#### Execute Chef client runs

Run chef-client or chef-solo

```
my-chef-run:
  chef.client:
    - override-runlist: 'demo1,demo2'
    - server: 'https://chef.domain.com'

default-chef-run:
  chef.client: []

my-solo-run:
  chef.solo:
    - environment: dev
```

**salt.states.chef.client**(*name*, *\*\*kwargs*)

**name** Unique identifier for the state. Does not affect the Chef run.

**server** The chef server URL

**client\_key** Set the client key file location

**config** The configuration file to use

**config-file-jail** Directory under which config files are allowed to be loaded (no client.rb or knife.rb outside this path will be loaded).

**environment** Set the Chef Environment on the node

**group** Group to set privilege to

**json-attributes** Load attributes from a JSON file or URL

**localmode** Point chef-client at local repository if True

**log\_level** Set the log level (debug, info, warn, error, fatal)

**logfile** Set the log file location

**node-name** The node name for this client

**override-runlist** Replace current run list with specified items for a single run

**pid** Set the PID file location, defaults to /tmp/chef-client.pid

**run-lock-timeout** Set maximum duration to wait for another client run to finish, default is indefinitely.

**runlist** Permanently replace current run list with specified items

**user** User to set privilege to

**validation\_key** Set the validation key file location, used for registering new clients

**salt.states.chef.solo**(*name*, *\*\*kwargs*)

**name** Unique identifier for the state. Does not affect the Chef run.

**config** The configuration file to use

**environment** Set the Chef Environment on the node

**group** Group to set privilege to

**json-attributes** Load attributes from a JSON file or URL

**log\_level** Set the log level (debug, info, warn, error, fatal)

**logfile** Set the log file location

**node-name** The node name for this client

**override-runlist** Replace current run list with specified items for a single run

**recipe-url** Pull down a remote gzipped tarball of recipes and untar it to the cookbook cache

**run-lock-timeout** Set maximum duration to wait for another client run to finish, default is indefinitely.

**user** User to set privilege to

### 14.17.51 salt.states.chocolatey module

Manage Chocolatey package installs .. versionadded:: 2016.3.0

```
salt.states.chocolatey.installed(name, version=None, source=None, force=False,
                                  pre_versions=False, install_args=None, override_args=False,
                                  force_x86=False, package_args=None, allow_multiple=False)
```

Installs a package if not already installed

#### Parameters

- **name** (*str*) -- The name of the package to be installed. Required.
- **version** (*str*) -- Install a specific version of the package. Defaults to latest version. If the version is different to the one installed then the specified version will be installed. Default is None.
- **source** (*str*) -- Chocolatey repository (directory, share or remote URL, feed). Defaults to the official Chocolatey feed. Default is None.
- **force** (*bool*) -- Reinstall the current version of an existing package. Do not use with `allow_multiple`. Default is False.
- **pre\_versions** (*bool*) -- Include pre-release packages. Default is False.
- **install\_args** (*str*) -- Install arguments you want to pass to the installation process, i.e product key or feature list. Default is None.
- **override\_args** (*bool*) -- Set to True if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False `install_args` will be appended to the end of the default arguments. Default is False.
- **force\_x86** (*bool*) -- Force x86 (32bit) installation on 64 bit systems. Default is False.
- **package\_args** (*str*) -- Arguments you want to pass to the package. Default is None.
- **allow\_multiple** (*bool*) -- Allow multiple versions of the package to be installed. Do not use with `force`. Does not work with all packages. Default is False.

New in version 2017.7.0.

```
Installsomepackage:
  chocolatey.installed:
    - name: packagename
    - version: '12.04'
    - source: 'mychocolatey/source'
    - force: True
```

```
salt.states.chocolatey.uninstalled(name, version=None, uninstall_args=None, override_args=False)
```

Uninstalls a package

**name** The name of the package to be uninstalled

**version** Uninstalls a specific version of the package. Defaults to latest version installed.

**uninstall\_args** A list of uninstall arguments you want to pass to the uninstallation process i.e product key or feature list

**override\_args** Set to true if you want to override the original uninstall arguments ( for the native uninstaller)in the package and use your own. When this is set to False `uninstall_args` will be appended to the end of the default arguments

### 14.17.52 salt.states.chronos\_job module

Configure Chronos jobs via a salt proxy.

```
my_job:
  chronos_job.config:
    - config:
      schedule: "R//PT2S"
      command: "echo 'hi'"
      owner: "me@example.com"
```

New in version 2015.8.2.

`salt.states.chronos_job.absent(name)`

Ensure that the chronos job with the given name is not present.

**Parameters** **name** -- The app name

**Returns** A standard Salt changes dictionary

`salt.states.chronos_job.config(name, config)`

Ensure that the chronos job with the given name is present and is configured to match the given config values.

**Parameters**

- **name** -- The job name

- **config** -- The configuration to apply (dict)

**Returns** A standard Salt changes dictionary

### 14.17.53 salt.states.cisconso

State module for Cisco NSO Proxy minions

For documentation on setting up the cisconso proxy minion look in the documentation for [salt.proxy.cisconso](#).

`salt.states.cisconso.value_present(name, datastore, path, config)`

Ensure a specific value exists at a given path

**Parameters**

- **name** (str) -- The name for this rule

- **datastore** (DatastoreType (str enum).) -- The datastore, e.g. running, operational. One of the NETCONF store IETF types

- **path** (List, str OR tuple) -- The device path to set the value at, a list of element names in order, / separated

- **config** (dict) -- The new value at the given path

Examples:

```
enable pap auth:
  cisconso.config_present:
    - name: enable_pap_auth
    - datastore: running
    - path: devices/device/ex0/config/sys/interfaces/serial/ppp0/authentication
    - config:
      authentication:
        method: pap
        "list-name": foobar
```

### 14.17.54 salt.states.cloud

Using states instead of maps to deploy clouds

New in version 2014.1.0.

Use this minion to spin up a cloud instance:

```
my-ec2-instance:
  cloud.profile:
    my-ec2-config
```

**salt.states.cloud.absent** (*name*, *onlyif=None*, *unless=None*)

Ensure that no instances with the specified names exist.

CAUTION: This is a destructive state, which will search all configured cloud providers for the named instance, and destroy it.

**name** The name of the instance to destroy

**onlyif** Do run the state only if is unless succeed

**unless** Do not run the state at least unless succeed

**salt.states.cloud.present** (*name*, *cloud\_provider*, *onlyif=None*, *unless=None*, *opts=None*, *\*\*kwargs*)

Spin up a single instance on a cloud provider, using salt-cloud. This state does not take a profile argument; rather, it takes the arguments that would normally be configured as part of the state.

Note that while this function does take any configuration argument that would normally be used to create an instance, it will not verify the state of any of those arguments on an existing instance. Stateful properties of an instance should be configured using their own individual state (i.e., `cloud.tagged`, `cloud.untagged`, etc).

**name** The name of the instance to create

**cloud\_provider** The name of the cloud provider to use

**onlyif** Do run the state only if is unless succeed

**unless** Do not run the state at least unless succeed

**opts** Any extra opts that need to be used

**salt.states.cloud.profile** (*name*, *profile*, *onlyif=None*, *unless=None*, *opts=None*, *\*\*kwargs*)

Create a single instance on a cloud provider, using a salt-cloud profile.

Note that while profiles used this function do take any configuration argument that would normally be used to create an instance using a profile, this state will not verify the state of any of those arguments on an existing instance. Stateful properties of an instance should be configured using their own individual state (i.e., `cloud.tagged`, `cloud.untagged`, etc).

**name** The name of the instance to create

**profile** The name of the cloud profile to use

**onlyif** Do run the state only if is unless succeed

**unless** Do not run the state at least unless succeed

**kwargs** Any profile override or addition

**opts** Any extra opts that need to be used

**salt.states.cloud.volume\_absent** (*name*, *provider=None*, *\*\*kwargs*)

Check that a block volume exists.

**salt.states.cloud.volume\_attached** (*name*, *server\_name*, *provider=None*, *\*\*kwargs*)

Check if a block volume is attached.

**salt.states.cloud.volume\_detached** (*name*, *server\_name=None*, *provider=None*, *\*\*kwargs*)

Check if a block volume is attached.

Returns True if server or Volume do not exist.

**salt.states.cloud.volume\_present** (*name*, *provider=None*, *\*\*kwargs*)

Check that a block volume exists.

## 14.17.55 salt.states.cmd

### Execution of arbitrary commands

The cmd state module manages the enforcement of executed commands, this state can tell a command to run under certain circumstances.

A simple example to execute a command:

```
# Store the current date in a file
date > /tmp/salt-run:
  cmd.run
```

Only run if another execution failed, in this case truncate syslog if there is no disk space:

```
> /var/log/messages:
  cmd.run:
    - unless: echo 'foo' > /tmp/.test && rm -f /tmp/.test
```

Only run if the file specified by creates does not exist, in this case touch /tmp/foo if it does not exist:

```
touch /tmp/foo:
  cmd.run:
    - creates: /tmp/foo
```

creates also accepts a list of files:

```
echo 'foo' | tee /tmp/bar > /tmp/baz:
  cmd.run:
    - creates:
      - /tmp/bar
      - /tmp/baz
```

---

**Note:** The creates option was added to version 2014.7.0

---

Sometimes when running a command that starts up a daemon, the init script doesn't return properly which causes Salt to wait indefinitely for a response. In situations like this try the following:

```
run_installer:
  cmd.run:
    - name: /tmp/installer.bin > /dev/null 2>&1
```

Salt determines whether the cmd state is successfully enforced based on the exit code returned by the command. If the command returns a zero exit code, then salt determines that the state was successfully enforced. If the script returns a non-zero exit code, then salt determines that it failed to successfully enforce the state. If a command returns a non-zero exit code but you wish to treat this as a success, then you must place the command in a script and explicitly set the exit code of the script to zero.

Please note that the success or failure of the state is not affected by whether a state change occurred nor the stateful argument.

When executing a command or script, the state (i.e., changed or not) of the command is unknown to Salt's state system. Therefore, by default, the cmd state assumes that any command execution results in a changed state.

This means that if a cmd state is watched by another state then the state that's watching will always be executed due to the *changed* state in the cmd state.

## Using the ``Stateful'' Argument

Many state functions in this module now also accept a `stateful` argument. If `stateful` is specified to be true then it is assumed that the command or script will determine its own state and communicate it back by following a simple protocol described below:

1. **If there's nothing in the stdout of the command, then assume no changes.** Otherwise, the stdout must be either in JSON or its *last* non-empty line must be a string of key=value pairs delimited by spaces (no spaces on either side of =).
2. **If it's JSON then it must be a JSON object (e.g., {}).** If it's key=value pairs then quoting may be used to include spaces. (Python's `shlex` module is used to parse the key=value string)

Two special keys or attributes are recognized in the output:

```
changed: bool (i.e., 'yes', 'no', 'true', 'false', case-insensitive)
comment: str (i.e., any string)
```

So, only if `changed` is `True` then assume the command execution has changed the state, and any other key values or attributes in the output will be set as part of the changes.

3. **If there's a comment then it will be used as the comment of the state.**

Here's an example of how one might write a shell script for use with a stateful command:

```
#!/bin/bash
#
echo "Working hard..."

# writing the state line
echo # an empty line here so the next line will be the last.
echo "changed=yes comment='something has changed' whatever=123"
```

And an example SLS file using this module:

```
Run myscript:
  cmd.run:
    - name: /path/to/myscript
    - cwd: /
    - stateful: True

Run only if myscript changed something:
  cmd.run:
    - name: echo hello
    - cwd: /
    - onchanges:
      - cmd: Run myscript
```

Note that if the second `cmd.run` state also specifies `stateful: True` it can then be watched by some other states as well.

4. **The stateful argument can optionally include a `test_name` parameter.**

This is used to specify a command to run in test mode. This command should return stateful data for changes that would be made by the command in the `name` parameter.

New in version 2015.2.0.

```
Run myscript:
  cmd.run:
```

```
- name: /path/to/myscript
- cwd: /
- stateful:
  - test_name: /path/to/myscript test

Run masterscript:
cmd.script:
- name: masterscript
- source: salt://path/to/masterscript
- cwd: /
- stateful:
  - test_name: masterscript test
```

### Should I use `cmd.run` or `cmd.wait`?

---

**Note:** Use `cmd.run` together with `onchanges` instead of `cmd.wait`.

---

These two states are often confused. The important thing to remember about them is that `cmd.run` states are run each time the SLS file that contains them is applied. If it is more desirable to have a command that only runs after some other state changes, then `cmd.wait` does just that. `cmd.wait` is designed to *watch* other states, and is executed when the state it is watching changes. Example:

```
/usr/local/bin/postinstall.sh:
cmd.wait:
- watch:
  - pkg: mycustompkg
file.managed:
- source: salt://utils/scripts/postinstall.sh

mycustompkg:
pkg.installed:
- require:
  - file: /usr/local/bin/postinstall.sh
```

`cmd.wait` itself does not do anything; all functionality is inside its `mod_watch` function, which is called by `watch` on changes.

`cmd.wait` will be deprecated in future due to the confusion it causes. The preferred format is using the *onchanges Requisite*, which works on `cmd.run` as well as on any other state. The example would then look as follows:

```
/usr/local/bin/postinstall.sh:
cmd.run:
- onchanges:
  - pkg: mycustompkg
file.managed:
- source: salt://utils/scripts/postinstall.sh

mycustompkg:
pkg.installed:
- require:
  - file: /usr/local/bin/postinstall.sh
```

## How do I create an environment from a pillar map?

The map that comes from a pillar can be directly consumed by the `env` option! To use it, one may pass it like this. Example:

```
printenv:
  cmd.run:
    - env: {{ salt['pillar.get']('example:key', {}) }}
```

`salt.states.cmd.call`(*name*, *func*, *args=()*, *kws=None*, *onlyif=None*, *unless=None*, *creates=None*, *output\_loglevel='debug'*, *use\_vt=False*, *\*\*kwargs*)

Invoke a pre-defined Python function with arguments specified in the state declaration. This function is mainly used by the `salt.renderers.pydsl` renderer.

The interpretation of `onlyif` and `unless` arguments are identical to those of `cmd.run`, and all other arguments (`cwd`, `runas`, ...) allowed by `cmd.run` are allowed here, except that their effects apply only to the commands specified in `onlyif` and `unless` rather than to the function to be invoked.

In addition, the `stateful` argument has no effects here.

The return value of the invoked function will be interpreted as follows.

If it's a dictionary then it will be passed through to the state system, which expects it to have the usual structure returned by any salt state function.

Otherwise, the return value (denoted as `result` in the code below) is expected to be a JSON serializable object, and this dictionary is returned:

```
{
  'name': name
  'changes': {'retval': result},
  'result': True if result is None else bool(result),
  'comment': result if isinstance(result, string_types) else ''
}
```

`salt.states.cmd.mod_run_check`(*cmd\_kwargs*, *onlyif*, *unless*, *creates*)

Execute the `onlyif` and `unless` logic. Return a result dict if: \* `onlyif` failed (`onlyif != 0`) \* `unless` succeeded (`unless == 0`) else return True

`salt.states.cmd.mod_watch`(*name*, *\*\*kwargs*)

Execute a `cmd` function based on a `watch` call

`salt.states.cmd.run`(*name*, *onlyif=None*, *unless=None*, *creates=None*, *cwd=None*, *runas=None*, *shell=None*, *env=None*, *stateful=False*, *umask=None*, *output\_loglevel='debug'*, *quiet=False*, *timeout=None*, *ignore\_timeout=False*, *use\_vt=False*, *\*\*kwargs*)

Run a command if certain circumstances are met. Use `cmd.wait` if you want to use the `watch` requisite.

**name** The command to execute, remember that the command will execute with the path and permissions of the salt-minion.

**onlyif** A command to run as a check, run the named command only if the command passed to the `onlyif` option returns true

**unless** A command to run as a check, only run the named command if the command passed to the `unless` option returns false

**cwd** The current working directory to execute the command in, defaults to `/root`

**runas** The user name to run the command as

**shell** The shell to use for execution, defaults to the shell `grain`

**env** A list of environment variables to be set prior to execution. Example:

```
script-foo:
  cmd.run:
```

```
- env:
  - BATCH: 'yes'
```

**Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So `$PATH` in the following example is a literal ``$PATH``:

```
script-bar:
  cmd.run:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing `$PATH` by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

**stateful** The command being executed is expected to return data about executing a state. For more information, see the [Using the ``Stateful'' Argument](#) section.

**umask** The umask (in octal) to use when running the command.

**output\_loglevel** Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: `DEBUG`) regardless, unless `quiet` is used for this value.

**quiet** The command will be executed quietly, meaning no log entries of the actual command or its return data. This is deprecated as of the **2014.1.0** release, and is being replaced with `output_loglevel: quiet`.

**timeout** If the command has not terminated after timeout seconds, send the subprocess `sigterm`, and if `sigterm` is ignored, follow up with `sigkill`

**ignore\_timeout** Ignore the timeout of commands, which is useful for running `nohup` processes.

New in version 2015.8.0.

**creates** Only run if the file or files specified by `creates` do not exist.

New in version 2014.7.0.

**use\_vt** Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

**bg** If `True`, run command in background and do not await or deliver it's results.

New in version 2016.3.6.

**Note:** `cmd.run` supports the usage of `reload_modules`. This functionality allows you to force Salt to reload all modules. You should only use `reload_modules` if your `cmd.run` does some sort of installation (such as `pip`), if you do not reload the modules future items in your state which rely on the software being installed will fail.

```
getpip:
  cmd.run:
    - name: /usr/bin/python /usr/local/sbin/get-pip.py
    - unless: which pip
    - require:
```

```

- pkg: python
- file: /usr/local/sbin/get-pip.py
- reload_modules: True

```

`salt.states.cmd.script`(*name*, *source=None*, *template=None*, *onlyif=None*, *unless=None*, *creates=None*, *cwd=None*, *runas=None*, *shell=None*, *env=None*, *stateful=False*, *umask=None*, *timeout=None*, *use\_vt=False*, *output\_loglevel='debug'*, *defaults=None*, *context=None*, *\*\*kwargs*)

Download a script and execute it with specified arguments.

**source** The location of the script to download. If the file is located on the master in the directory named spam, and is called eggs, the source string is `salt://spam/eggs`

**template** If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported

**name** Either ``cmd arg1 arg2 arg3..`` (cmd is not used) or a source ``salt://...``.

**onlyif** Run the named command only if the command passed to the `onlyif` option returns true

**unless** Run the named command only if the command passed to the `unless` option returns false

**cwd** The current working directory to execute the command in, defaults to `/root`

**runas** The name of the user to run the command as

**shell** The shell to use for execution. The default is set in `grains['shell']`

**env** A list of environment variables to be set prior to execution. Example:

```

salt://scripts/foo.sh:
  cmd.script:
    - env:
      - BATCH: 'yes'

```

**Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So `$PATH` in the following example is a literal ``$PATH``:

```

salt://scripts/bar.sh:
  cmd.script:
    - env: "PATH=/some/path:$PATH"

```

One can still use the existing `$PATH` by using a bit of Jinja:

```

{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}

```

**saltenv** [base] The Salt environment to use

**umask** The umask (in octal) to use when running the command.

**stateful** The command being executed is expected to return data about executing a state. For more information, see the [Using the `Stateful` Argument](#) section.

**timeout** If the command has not terminated after timeout seconds, send the subprocess sigterm, and if sigterm is ignored, follow up with sigkill

**args** String of command line args to pass to the script. Only used if no args are specified as part of the *name*

argument. To pass a string containing spaces in YAML, you will need to doubly-quote it: ``arg1 `arg two' arg3``

**creates** Only run if the file or files specified by `creates` do not exist.

New in version 2014.7.0.

**use\_vt** Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

**context** New in version 2016.3.0.

Overrides default context variables passed to the template.

**defaults** New in version 2016.3.0.

Default context passed to the template.

**output\_loglevel** Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless `quiet` is used for this value.

```
salt.states.cmd.wait(name, onlyif=None, unless=None, creates=None, cwd=None, runas=None,
                    shell=None, env=(), stateful=False, umask=None, output_loglevel='debug',
                    use_vt=False, **kwargs)
```

Run the given command only if the watch statement calls it.

---

**Note:** Use `cmd.run` with `onchange` instead.

---

**name** The command to execute, remember that the command will execute with the path and permissions of the salt-minion.

**onlyif** A command to run as a check, run the named command only if the command passed to the `onlyif` option returns true

**unless** A command to run as a check, only run the named command if the command passed to the `unless` option returns false

**cwd** The current working directory to execute the command in, defaults to `/root`

**runas** The user name to run the command as

**shell** The shell to use for execution, defaults to `/bin/sh`

**env** A list of environment variables to be set prior to execution. Example:

```
script-foo:
  cmd.wait:
    - env:
      - BATCH: 'yes'
```

**Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So `$PATH` in the following example is a literal ``$PATH'`:

```
script-bar:
  cmd.wait:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing `$PATH` by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}
mycommand:
```

```
cmd.run:
- name: ls -l /
- env:
  - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

**umask** The umask (in octal) to use when running the command.

**stateful** The command being executed is expected to return data about executing a state. For more information, see the [Using the ``Stateful'' Argument](#) section.

**creates** Only run if the file or files specified by **creates** do not exist.

New in version 2014.7.0.

**output\_loglevel** Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless **quiet** is used for this value.

**use\_vt** Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

```
salt.states.cmd.wait_script(name, source=None, template=None, onlyif=None, unless=None,
                             cwd=None, runas=None, shell=None, env=None, stateful=False,
                             umask=None, use_vt=False, output_loglevel='debug', **kwargs)
```

Download a script from a remote source and execute it only if a watch statement calls it.

**source** The source script being downloaded to the minion, this source script is hosted on the salt master server. If the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs

**template** If this setting is applied then the named templating engine will be used to render the downloaded file, currently jinja, mako, and wempy are supported

**name** The command to execute, remember that the command will execute with the path and permissions of the salt-minion.

**onlyif** A command to run as a check, run the named command only if the command passed to the **onlyif** option returns true

**unless** A command to run as a check, only run the named command if the command passed to the **unless** option returns false

**cwd** The current working directory to execute the command in, defaults to /root

**runas** The user name to run the command as

**shell** The shell to use for execution, defaults to the shell grain

**env** A list of environment variables to be set prior to execution. Example:

```
salt://scripts/foo.sh:
cmd.wait_script:
- env:
  - BATCH: 'yes'
```

**Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean True and False values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So \$PATH in the following example is a literal ` \$PATH ':

```
salt://scripts/bar.sh:
cmd.wait_script:
- env: "PATH=/some/path:$PATH"
```

One can still use the existing \$PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}
```

```

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}

```

**umask** The umask (in octal) to use when running the command.

**stateful** The command being executed is expected to return data about executing a state. For more information, see the *Using the ``Stateful'' Argument* section.

**use\_vt**

Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

**output\_loglevel** Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless `quiet` is used for this value.

### 14.17.56 salt.states.composer

#### Installation of Composer Packages

These states manage the installed packages for composer for PHP. Note that either composer is installed and accessible via a bin directory or you can pass the location of composer in the state.

```

get-composer:
  cmd.run:
    - name: 'CURL=`which curl`; $CURL -sS https://getcomposer.org/installer | php'
    - unless: test -f /usr/local/bin/composer
    - cwd: /root/

install-composer:
  cmd.wait:
    - name: mv /root/composer.phar /usr/local/bin/composer
    - cwd: /root/
    - watch:
      - cmd: get-composer

/path/to/project:
  composer.installed:
    - no_dev: true
    - require:
      - cmd: install-composer

# Without composer installed in your PATH
# Note: composer.phar must be executable for state to work properly
/path/to/project:
  composer.installed:
    - composer: /path/to/composer.phar
    - php: /usr/local/bin/php
    - no_dev: true

```

```

salt.states.composer.installed(name, composer=None, php=None, user=None, prefer_source=None, prefer_dist=None, no_scripts=None, no_plugins=None, optimize=None, no_dev=None, quiet=False, composer_home='/root', always_check=True)

```

Verify that the correct versions of composer dependencies are present.

**name** Directory location of the `composer.json` file.

**composer** Location of the `composer.phar` file. If not set composer will just execute `composer` as if it is installed globally. (i.e. `/path/to/composer.phar`)

**php** Location of the `php` executable to use with composer. (i.e. `/usr/bin/php`)

**user** Which system user to run composer as.

New in version 2014.1.4.

**prefer\_source** `--prefer-source` option of composer.

**prefer\_dist** `--prefer-dist` option of composer.

**no\_scripts** `--no-scripts` option of composer.

**no\_plugins** `--no-plugins` option of composer.

**optimize** `--optimize-autoloader` option of composer. Recommended for production.

**no\_dev** `--no-dev` option for composer. Recommended for production.

**quiet** `--quiet` option for composer. Whether or not to return output from composer.

**composer\_home** `$COMPOSER_HOME` environment variable

**always\_check** If True, `always` run `composer install` in the directory. This is the default behavior. If False, only run `composer install` if there is no vendor directory present.

```
salt.states.composer.update(name, composer=None, php=None, user=None, prefer_source=None,
                             prefer_dist=None, no_scripts=None, no_plugins=None, opti-
                             mize=None, no_dev=None, quiet=False, composer_home='/root')
```

Composer update the directory to ensure we have the latest versions of all project dependencies.

**name** Directory location of the `composer.json` file.

**composer** Location of the `composer.phar` file. If not set composer will just execute `composer` as if it is installed globally. (i.e. `/path/to/composer.phar`)

**php** Location of the `php` executable to use with composer. (i.e. `/usr/bin/php`)

**user** Which system user to run composer as.

New in version 2014.1.4.

**prefer\_source** `--prefer-source` option of composer.

**prefer\_dist** `--prefer-dist` option of composer.

**no\_scripts** `--no-scripts` option of composer.

**no\_plugins** `--no-plugins` option of composer.

**optimize** `--optimize-autoloader` option of composer. Recommended for production.

**no\_dev** `--no-dev` option for composer. Recommended for production.

**quiet** `--quiet` option for composer. Whether or not to return output from composer.

**composer\_home** `$COMPOSER_HOME` environment variable

### 14.17.57 salt.states.cron

#### Management of cron, the Unix command scheduler

Cron declarations require a number of parameters. The following are the parameters used by Salt to define the various timing values for a cron job:

- minute
- hour
- daymonth
- month
- dayweek (0 to 6 are Sunday through Saturday, 7 can also be used for Sunday)

**Warning:** Any timing arguments not specified take a value of \*. This means that setting hour to 5, while not defining the minute param, will result in Salt adding a job that will execute every minute between 5 and 6 A.M.!

Additionally, the default user for these states is root. Therefore, if the cron job is for another user, it is necessary to specify that user with the user parameter.

A long time ago (before 2014.2), when making changes to an existing cron job, the name declaration is the parameter used to uniquely identify the job, so if an existing cron that looks like this:

```
date > /tmp/crontest:
cron.present:
- user: root
- minute: 5
```

Is changed to this:

```
date > /tmp/crontest:
cron.present:
- user: root
- minute: 7
- hour: 2
```

Then the existing cron will be updated, but if the cron command is changed, then a new cron job will be added to the user's crontab.

The current behavior is still relying on that mechanism, but you can also specify an identifier to identify your crontabs:

```
date > /tmp/crontest:
cron.present:
- identifier: SUPERCRON
- user: root
- minute: 7
- hour: 2
```

New in version 2014.1.2.

And, some months later, you modify it:

```
superscript > /tmp/crontest:
cron.present:
- identifier: SUPERCRON
- user: root
- minute: 3
- hour: 4
```

New in version 2014.1.2.

The old **date > /tmp/crontest** will be replaced by **superscript > /tmp/crontest**.

Additionally, Salt also supports running a cron every x minutes very similarly to the Unix convention of using \*/5 to have a job run every five minutes. In Salt, this looks like:

```
date > /tmp/crontest:
cron.present:
- user: root
- minute: '*/5'
```

The job will now run every 5 minutes.

Additionally, the temporal parameters (minute, hour, etc.) can be randomized by using `random` instead of using a specific value. For example, by using the `random` keyword in the `minute` parameter of a cron state, the same cron job can be pushed to hundreds or thousands of hosts, and they would each use a randomly-generated minute. This can be helpful when the cron job accesses a network resource, and it is not desirable for all hosts to run the job concurrently.

```
/path/to/cron/script:
  cron.present:
    - user: root
    - minute: random
    - hour: 2
```

New in version 0.16.0.

Since Salt assumes a value of `*` for unspecified temporal parameters, adding a parameter to the state and setting it to `random` will change that value from `*` to a randomized numeric value. However, if that field in the cron entry on the minion already contains a numeric value, then using the `random` keyword will not modify it.

Added the opportunity to set a job with a special keyword like `@reboot` or `@hourly`. Quotes must be used, otherwise PyYAML will strip the `@` sign.

```
/path/to/cron/script:
  cron.present:
    - user: root
    - special: '@hourly'
```

The script will be executed every reboot if cron daemon support this option.

```
/path/to/cron/otherscript:
  cron.absent:
    - user: root
    - special: '@daily'
```

This counter part definition will ensure than a job with a special keyword is not set.

`salt.states.cron.absent` (*name*, *user*='root', *identifier*=False, *special*=None, *\*\*kwargs*)

Verifies that the specified cron job is absent for the specified user; only the name is matched when removing a cron job.

**name** The command that should be absent in the user crontab.

**user** The name of the user whose crontab needs to be modified, defaults to the root user

**identifier** Custom-defined identifier for tracking the cron line for future crontab edits. This defaults to the state id

**special** The special keyword used in the job (eg. `@reboot`, `@hourly`...). Quotes must be used, otherwise PyYAML will strip the `@` sign.

`salt.states.cron.env_absent` (*name*, *user*='root')

Verifies that the specified environment variable is absent from the crontab for the specified user

**name** The name of the environment variable to remove from the user crontab

**user** The name of the user whose crontab needs to be modified, defaults to the root user

`salt.states.cron.env_present` (*name*, *value*=None, *user*='root')

Verifies that the specified environment variable is present in the crontab for the specified user.

**name** The name of the environment variable to set in the user crontab

**user** The name of the user whose crontab needs to be modified, defaults to the root user

**value** The value to set for the given environment variable

`salt.states.cron.file`(*name*, *source\_hash*='', *source\_hash\_name*=None, *user*='root', *template*=None, *context*=None, *replace*=True, *defaults*=None, *backup*='', *\*\*kwargs*)

Provides file.managed-like functionality (templating, etc.) for a pre-made crontab file, to be assigned to a given user.

**name** The source file to be used as the crontab. This source file can be hosted on either the salt master server, or on an HTTP or FTP server. For files hosted on the salt file server, if the file is located on the master in the directory named spam, and is called eggs, the source string is `salt://spam/eggs`

If the file is hosted on a HTTP or FTP server then the `source_hash` argument is also required

**source\_hash** This can be either a file which contains a source hash string for the source, or a source hash string. The source hash string is the hash algorithm followed by the hash of the file: `md5=e138491e9d5b97023cea823fe17bac22`

**source\_hash\_name** When `source_hash` refers to a hash file, Salt will try to find the correct hash by matching the filename/URI associated with that hash. By default, Salt will look for the filename being managed. When managing a file at path `/tmp/foo.txt`, then the following line in a hash file would match:

```
acbd18db4cc2f85cedef654fccc4a4d8    foo.txt
```

However, sometimes a hash file will include multiple similar paths:

```
37b51d194a7513e45b56f6524f2d51f2    ./dir1/foo.txt
acbd18db4cc2f85cedef654fccc4a4d8    ./dir2/foo.txt
73feffa4b7f6bb68e44cf984c85f6e88    ./dir3/foo.txt
```

In cases like this, Salt may match the incorrect hash. This argument can be used to tell Salt which filename to match, to ensure that the correct hash is identified. For example:

```
foo_crontab:
  cron.file:
    - name: https://mydomain.tld/dir2/foo.txt
    - source_hash: https://mydomain.tld/hashes
    - source_hash_name: ./dir2/foo.txt
```

**Note:** This argument must contain the full filename entry from the checksum file, as this argument is meant to disambiguate matches for multiple files that have the same basename. So, in the example above, simply using `foo.txt` would not match.

New in version 2016.3.5.

**user** The user to whom the crontab should be assigned. This defaults to root.

**template** If this setting is applied then the named templating engine will be used to render the downloaded file. Currently, jinja and mako are supported.

**context** Overrides default context variables passed to the template.

**replace** If the crontab should be replaced, if False then this command will be ignored if a crontab exists for the specified user. Default is True.

**defaults** Default context passed to the template.

**backup** Overrides the default backup mode for the user's crontab.

`salt.states.cron.present`(*name*, *user*='root', *minute*='\*', *hour*='\*', *daymonth*='\*', *month*='\*', *day-week*='\*', *comment*=None, *commented*=False, *identifier*=False, *special*=None)

Verifies that the specified cron job is present for the specified user. For more advanced information about what exactly can be set in the cron timing parameters, check your cron system's documentation. Most Unix-like systems' cron documentation can be found via the crontab man page: `man 5 crontab`.

**name** The command that should be executed by the cron job.

**user** The name of the user whose crontab needs to be modified, defaults to the root user

**minute** The information to be set into the minute section, this can be any string supported by your cron system's the minute field. Default is \*

**hour** The information to be set in the hour section. Default is \*

**daymonth** The information to be set in the day of month section. Default is \*

**month** The information to be set in the month section. Default is \*

**dayweek** The information to be set in the day of week section. Default is \*

**comment** User comment to be added on line previous the cron job

**commented** The cron job is set commented (prefixed with #DISABLED#). Defaults to False.

New in version 2016.3.0.

**identifier** Custom-defined identifier for tracking the cron line for future crontab edits. This defaults to the state id

**special** A special keyword to specify periodicity (eg. @reboot, @hourly...). Quotes must be used, otherwise PyYAML will strip the '@' sign.

New in version 2016.3.0.

### 14.17.58 salt.states.csf module

`salt.states.csf.nics_skip`(*name, nics, ipv6*)

Alias for `csf.nics_skipped`

`salt.states.csf.nics_skipped`(*name, nics, ipv6=False*)

**name** Meaningless arg, but required for state.

**nics** A list of nics to skip.

**ipv6** Boolean. Set to true if you want to skip the ipv6 interface. Default false (ipv4).

`salt.states.csf.option_present`(*name, value, reload=False*)

Ensure the state of a particular option/setting in csf.

**name** The option name in csf.conf

**value** The value it should be set to.

**reload** Boolean. If set to true, csf will be reloaded after.

`salt.states.csf.ports_open`(*name, ports, proto='tcp', direction='in'*)

Ensure ports are open for a protocol, in a direction. e.g. - proto='tcp', direction='in' would set the values for TCP\_IN in the csf.conf file.

**ports** A list of ports that should be open.

**proto** The protocol. May be one of 'tcp', 'udp', 'tcp6', or 'udp6'.

**direction** Choose 'in', 'out', or both to indicate the port should be opened for inbound traffic, outbound traffic, or both.

`salt.states.csf.rule_absent`(*name, method, port=None, proto='tcp', direction='in', port\_origin='d', ip\_origin='s', ttl=None, reload=False*)

Ensure iptable is not present.

**name** The ip address or CIDR for the rule.

**method** The type of rule. Either 'allow' or 'deny'.

**port** Optional port to be open or closed for the iptables rule.

**proto** The protocol. Either 'tcp', 'udp'. Only applicable if port is specified.

**direction** The direction of traffic to apply the rule to. Either 'in', or 'out'. Only applicable if port is specified.

**port\_origin** Specifies either the source or destination port is relevant for this rule. Only applicable if port is specified. Either 's', or 'd'.

**ip\_origin** Specifies whether the ip in this rule refers to the source or destination ip. Either 's', or 'd'. Only applicable if port is specified.

**ttl** How long the rule should exist. If supplied, `csf.tempallow()` or `csf.tempdeny()` are used.

**reload** Reload the csf service after applying this rule. Default false.

`salt.states.csf.rule_present` (*name, method, port=None, proto='tcp', direction='in', port\_origin='d', ip\_origin='s', ttl=None, comment='', reload=False*)

Ensure iptable rule exists.

**name** The ip address or CIDR for the rule.

**method** The type of rule. Either `allow' or `deny'.

**port** Optional port to be open or closed for the iptables rule.

**proto** The protocol. Either `tcp', or `udp'. Only applicable if port is specified.

**direction** The direction of traffic to apply the rule to. Either `in', or `out'. Only applicable if port is specified.

**port\_origin** Specifies either the source or destination port is relevant for this rule. Only applicable if port is specified. Either `s', or `d'.

**ip\_origin** Specifies whether the ip in this rule refers to the source or destination ip. Either `s', or `d'. Only applicable if port is specified.

**ttl** How long the rule should exist. If supplied, `csf.tempallow()` or `csf.tempdeny()` are used.

**comment** An optional comment to appear after the rule as a `#comment`.

**reload** Reload the csf service after applying this rule. Default false.

`salt.states.csf.testing_off` (*name, reload=False*)

Ensure testing mode is enabled in csf.

**reload** Reload CSF after changing the testing status. Default false.

`salt.states.csf.testing_on` (*name, reload=False*)

Ensure testing mode is enabled in csf.

**reload** Reload CSF after changing the testing status. Default false.

### 14.17.59 salt.states.cyg

Installation of Cygwin packages.

A state module to manage cygwin packages. Packages can be installed or removed.

```
dos2unix:
  cyg.installed
```

**class** `salt.states.cyg.DictDiffer` (*current\_dict, past\_dict*)

Calculate the difference between two dictionaries.

1.items added

2.items removed

3.keys same in both but changed values

4.keys same in both and unchanged values

**added()**

Return a set of additions to `past_dict`.

**changed()**

Return a set of the keys with changed values.

**removed()**

Return a set of things removed from `past_dict`.

**same()**

True if the two dicts are the same.

**unchanged()**

Return a set of the keys with unchanged values.

`salt.states.cyg.installed` (*name, cyg\_arch='x86\_64', mirrors=None*)

Make sure that a package is installed.

**name** The name of the package to install

**cyg\_arch** [x86\_64] The cygwin architecture to install the package into. Current options are x86 and x86\_64

**mirrors** [None] List of mirrors to check. None will use a default mirror (kernel.org)

CLI Example:

```
rsync:
  cyg.installed:
    - mirrors:
      - http://mirror/without/public/key: ""
      - http://mirror/with/public/key: http://url/of/public/key
```

**salt.states.cyg.removed**(*name*, *cyg\_arch*='x86\_64', *mirrors*=None)

Make sure that a package is not installed.

**name** The name of the package to uninstall

**cyg\_arch** [x86\_64] The cygwin architecture to remove the package from. Current options are x86 and x86\_64

**mirrors** [None] List of mirrors to check. None will use a default mirror (kernel.org)

CLI Example:

```
rsync:
  cyg.removed:
    - mirrors:
      - http://mirror/without/public/key: ""
      - http://mirror/with/public/key: http://url/of/public/key
```

**salt.states.cyg.updated**(*name*=None, *cyg\_arch*='x86\_64', *mirrors*=None)

Make sure all packages are up to date.

**name** [None] No affect, salt fails poorly without the arg available

**cyg\_arch** [x86\_64] The cygwin architecture to update. Current options are x86 and x86\_64

**mirrors** [None] List of mirrors to check. None will use a default mirror (kernel.org)

CLI Example:

```
rsync:
  cyg.updated:
    - mirrors:
      - http://mirror/without/public/key: ""
      - http://mirror/with/public/key: http://url/of/public/key
```

## 14.17.60 salt.states.ddns

### Dynamic DNS updates

Ensure a DNS record is present or absent utilizing RFC 2136 type dynamic updates.

**depends**

- [dnspython](#)

---

**Note:** The `dnspython` module is required when managing DDNS using a TSIG key. If you are not using a TSIG key, DDNS is allowed by ACLs based on IP address and the `dnspython` module is not required.

---

Example:

```
webserver:
  ddns.present:
    - zone: example.com
    - ttl: 60
    - data: 111.222.333.444
```

```
- nameserver: 123.234.345.456
- keyfile: /srv/salt/dnspsy_tsig_key.txt
```

`salt.states.ddns.absent` (*name, zone, data=None, rdtype=None, \*\*kwargs*)

Ensures that the named DNS record is absent.

**name** The host portion of the DNS record, e.g., `webserver`. Name and zone are concatenated when the entry is created unless name includes a trailing dot, so make sure that information is not duplicated in these two arguments.

**zone** The zone to check

**data** Data for the DNS record. E.g., the IP address for an A record. If omitted, all records matching name (and rdtype, if provided) will be purged.

**rdtype** DNS resource type. If omitted, all types will be purged.

**\*\*kwargs** Additional arguments the `ddns.update` function may need (e.g. `nameserver`, `keyfile`, `keyname`). Note that the `nsupdate` key file can't be reused by this function, the `keyfile` and other arguments must follow the `dnspython` spec.

`salt.states.ddns.present` (*name, zone, ttl, data, rdtype='A', \*\*kwargs*)

Ensures that the named DNS record is present with the given ttl.

**name** The host portion of the DNS record, e.g., `webserver`. Name and zone are concatenated when the entry is created unless name includes a trailing dot, so make sure that information is not duplicated in these two arguments.

**zone** The zone to check/update

**ttl** TTL for the record

**data** Data for the DNS record. E.g., the IP address for an A record.

**rdtype** DNS resource type. Default `A`.

**\*\*kwargs** Additional arguments the `ddns.update` function may need (e.g. `nameserver`, `keyfile`, `keyname`). Note that the `nsupdate` key file can't be reused by this function, the `keyfile` and other arguments must follow the `dnspython` spec.

## 14.17.61 salt.states.debconfmod

### Management of debconf selections

#### depends

- `debconf-utils` package

The `debconfmod` state module manages the enforcement of debconf selections, this state can set those selections prior to package installation.

### Available Functions

The `debconfmod` state has two functions, the `set` and `set_file` functions

**set** Set debconf selections from the state itself

**set\_file** Set debconf selections from a file

```
nullmailer-debconf:
  debconf.set:
    - name: nullmailer
    - data:
      'shared/mailname': {'type': 'string', 'value': 'server.domain.tld'}
      'nullmailer/relayhost': {'type': 'string', 'value': 'mail.domain.tld'}
ferm-debconf:
```

```

debconf.set:
- name: ferm
- data:
  'ferm/enable': {'type': 'boolean', 'value': True}

```

**Note:** Due to how PyYAML imports nested dicts (see [here](#)), the values in the data dict must be indented four spaces instead of two.

`salt.states.debconfmod.set`(*name*, *data*, *\*\*kwargs*)

Set debconf selections

```

<state_id>:
  debconf.set:
    - name: <name>
    - data:
      <question>: {'type': <type>, 'value': <value>}
      <question>: {'type': <type>, 'value': <value>}

<state_id>:
  debconf.set:
    - name: <name>
    - data:
      <question>: {'type': <type>, 'value': <value>}
      <question>: {'type': <type>, 'value': <value>}

```

**name:** The package name to set answers for.

**data:** A set of questions/answers for debconf. Note that everything under this must be indented twice.

**question:** The question the is being pre-answered

**type:** The type of question that is being asked (string, boolean, select, etc.)

**value:** The answer to the question

`salt.states.debconfmod.set_file`(*name*, *source*, *template=None*, *context=None*, *defaults=None*, *\*\*kwargs*)

Set debconf selections from a file or a template

```

<state_id>:
  debconf.set_file:
    - source: salt://pathto/pkg.selections

<state_id>:
  debconf.set_file:
    - source: salt://pathto/pkg.selections?saltenv=myenvironment

<state_id>:
  debconf.set_file:
    - source: salt://pathto/pkg.selections.jinja2
    - template: jinja
    - context:
      some_value: "false"

```

**source:** The location of the file containing the package selections

**template** If this setting is applied then the named templating engine will be used to render the package selections file, currently jinja, mako, and wempy are supported

**context** Overrides default context variables passed to the template.

**defaults** Default context passed to the template.

### 14.17.62 salt.states.dellchassis

Manage chassis via Salt Proxies.

New in version 2015.8.2.

Below is an example state that sets basic parameters:

```
my-dell-chassis:
  dellchassis.chassis:
    - chassis_name: my-dell-chassis
    - datacenter: dc-1-us
    - location: my-location
    - mode: 2
    - idrac_launch: 1
    - slot_names:
      - server-1: my-slot-name
      - server-2: my-other-slot-name
    - blade_power_states:
      - server-1: on
      - server-2: off
      - server-3: powercycle
```

However, it is possible to place the entire set of chassis configuration data in pillar. Here's an example pillar structure:

```
proxy:
  host: 10.27.20.18
  admin_username: root
  fallback_admin_username: root
  passwords:
    - super-secret
    - old-secret
  proxytype: fx2

chassis:
  name: fx2-1
  username: root
  password: saltstack1
  datacenter: london
  location: rack-1-shelf-3
  management_mode: 2
  idrac_launch: 0
  slot_names:
    - 'server-1': blade1
    - 'server-2': blade2

servers:
  server-1:
    idrac_password: saltstack1
    ipmi_over_lan: True
    ip: 172.17.17.132
    netmask: 255.255.0.0
    gateway: 172.17.17.1
  server-2:
    idrac_password: saltstack1
    ipmi_over_lan: True
    ip: 172.17.17.2
    netmask: 255.255.0.0
    gateway: 172.17.17.1
```

```

server-3:
  idrac_password: saltstack1
  ipmi_over_lan: True
  ip: 172.17.17.20
  netmask: 255.255.0.0
  gateway: 172.17.17.1
server-4:
  idrac_password: saltstack1
  ipmi_over_lan: True
  ip: 172.17.17.2
  netmask: 255.255.0.0
  gateway: 172.17.17.1

switches:
  switch-1:
    ip: 192.168.1.2
    netmask: 255.255.255.0
    gateway: 192.168.1.1
    snmp: nonpublic
    password: saltstack1
  switch-2:
    ip: 192.168.1.3
    netmask: 255.255.255.0
    gateway: 192.168.1.1
    snmp: nonpublic
    password: saltstack1

```

And to go with it, here's an example state that pulls the data from the pillar stated above:

```

{% set details = pillar.get('proxy:chassis', {}) %}
standup-step1:
  dellchassis.chassis:
    - name: {{ details['name'] }}
    - location: {{ details['location'] }}
    - mode: {{ details['management_mode'] }}
    - idrac_launch: {{ details['idrac_launch'] }}
    - slot_names:
      {% for entry details['slot_names'] %}
        - {{ entry.keys()[0] }}: {{ entry[entry.keys()[0]] }}
      {% endfor %}

blade_powercycle:
  dellchassis.chassis:
    - blade_power_states:
      - server-1: powercycle
      - server-2: powercycle
      - server-3: powercycle
      - server-4: powercycle

# Set idrac_passwords for blades. racadm needs them to be called 'server-x'
{% for k, v in details['servers'].iteritems() %}
  {{ k }}:
    dellchassis.blade_idrac:
      - idrac_password: {{ v['idrac_password'] }}
{% endfor %}

# Set management ip addresses, passwords, and snmp strings for switches
{% for k, v in details['switches'].iteritems() %}

```

```

{{ k }}-switch-setup:
  dellchassis.switch:
    - name: {{ k }}
    - ip: {{ v['ip'] }}
    - netmask: {{ v['netmask'] }}
    - gateway: {{ v['gateway'] }}
    - password: {{ v['password'] }}
    - snmp: {{ v['snmp'] }}
{% endfor %}

```

**Note:** This state module relies on the `dracr.py` execution module, which runs `racadm` commands on the chassis, blades, etc. The `racadm` command runs very slowly and, depending on your state, the proxy minion return might timeout before the `racadm` commands have completed. If you are repeatedly seeing minions timeout after state calls, please use the `-t` CLI argument to increase the timeout variable.

For example:

```
salt '*' state.sls my-dell-chasis-state-name -t 60
```

**Note:** The Dell CMC units perform adequately but many iDRACs are **excruciatingly** slow. Some functions can take minutes to execute.

```

salt.states.dellchassis.blade_idrac(name, idrac_password=None, idrac_ipmi=None,
                                   idrac_ip=None, idrac_netmask=None,
                                   idrac_gateway=None, idrac_dnsname=None,
                                   idrac_dhcp=None)

```

Set parameters for iDRAC in a blade.

**Parameters** `idrac_password` -- Password to use to connect to the iDRACs directly (iDRAC IPMI and iDRAC dnsname must be set directly on the iDRAC. They can't be set through the CMC. If this password is present, use it instead of the CMC password) :param `idrac_ipmi`: Enable/Disable IPMI over LAN :param `idrac_ip`: Set IP address for iDRAC :param `idrac_netmask`: Set netmask for iDRAC :param `idrac_gateway`: Set gateway for iDRAC :param `idrac_dhcp`: Turn on DHCP for iDRAC (True turns on, False does nothing

because setting a static IP will disable DHCP).

**Returns** A standard Salt changes dictionary

NOTE: If any of the IP address settings is configured, all of ip, netmask, and gateway must be present

```

salt.states.dellchassis.chassis(name, chassis_name=None, password=None, datacenter=None,
                                location=None, mode=None, idrac_launch=None,
                                slot_names=None, blade_power_states=None)

```

Manage a Dell Chassis.

**chassis\_name** The name of the chassis.

**datacenter** The datacenter in which the chassis is located

**location** The location of the chassis.

**password** Password for the chassis. Note: If this password is set for the chassis, the current implementation of this state will set this password both on the chassis and the iDRAC passwords on any configured blades. If the password for the blades should be distinct, they should be set separately with the `blade_idrac` function.

**mode** The management mode of the chassis. Viable options are:

- 0: None
- 1: Monitor

- 2: Manage and Monitor

**idrac\_launch** The iDRAC launch method of the chassis. Viable options are:

- 0: Disabled (launch iDRAC using IP address)
- 1: Enabled (launch iDRAC using DNS name)

**slot\_names** The names of the slots, provided as a list identified by their slot numbers.

**blade\_power\_states** The power states of a blade server, provided as a list and identified by their server numbers. Viable options are:

- on: Ensure the blade server is powered on.
- off: Ensure the blade server is powered off.
- powercycle: Power cycle the blade server.

Example:

```
my-dell-chassis:
  dellchassis.chassis:
    - chassis_name: my-dell-chassis
    - location: my-location
    - datacenter: london
    - mode: 2
    - idrac_launch: 1
    - slot_names:
      - 1: my-slot-name
      - 2: my-other-slot-name
    - blade_power_states:
      - server-1: on
      - server-2: off
      - server-3: powercycle
```

**salt.states.dellchassis.firmware\_update** (*hosts=None, directory=""*)

State to update the firmware on host using the racadm command

**firmwarefile** filename (string) starting with salt://

**host** string representing the hostname supplied to the racadm command

**directory** Directory name where firmwarefile will be downloaded

```
dell-chassis-firmware-update:
  dellchassis.firmware_update:
    hosts:
      cmc:
        salt://firmware_cmc.exe
      server-1:
        salt://firmware.exe
    directory: /opt/firmwares
```

**salt.states.dellchassis.switch** (*name, ip=None, netmask=None, gateway=None, dhcp=None, password=None, snmp=None*)

Manage switches in a Dell Chassis.

**name** The switch designation (e.g. switch-1, switch-2)

**ip** The Static IP Address of the switch

**netmask** The netmask for the static IP

**gateway** The gateway for the static IP

**dhcp** True: Enable DHCP False: Do not change DHCP setup (disabling DHCP is automatic when a static IP is set)

**password** The access (root) password for the switch

**snmp** The SNMP community string for the switch

Example:

```
my-dell-chassis:  
  dellchassis.switch:  
    - switch: switch-1  
    - ip: 192.168.1.1  
    - netmask: 255.255.255.0  
    - gateway: 192.168.1.254  
    - dhcp: True  
    - password: secret  
    - snmp: public
```

### 14.17.63 salt.states.disk

Disk monitoring state

Monitor the state of disk resources.

The `disk.status` function can be used to report that the used space of a filesystem is within the specified limits.

```
used_space:  
  disk.status:  
    - name: /dev/xda1  
    - maximum: 79%  
    - minimum: 11%
```

It can be used with an `onfail` requisite, for example, to take additional action in response to or in preparation for other states.

```
storage_threshold:  
  disk.status:  
    - name: /dev/xda1  
    - maximum: 97%  
  
clear_cache:  
  cmd.run:  
    - name: rm -r /var/cache/app  
    - onfail:  
      - disk: storage_threshold
```

To use kilobytes (KB) for `minimum` and `maximum` rather than percents, specify the `absolute` flag:

```
used_space:  
  disk.status:  
    - name: /dev/xda1  
    - minimum: 1024 KB  
    - maximum: 1048576 KB  
    - absolute: True
```

**salt.states.disk.status** (*name*, *maximum=None*, *minimum=None*, *absolute=False*)

Return the current disk usage stats for the named mount point

**name** Disk mount with which to check used space

**maximum** The maximum disk utilization

**minimum** The minimum disk utilization

**absolute** By default, the utilization is measured in percentage. Set the *absolute* flag to use kilobytes.

New in version 2016.11.0.

### 14.17.64 salt.states.docker

States to manage Docker containers, images, volumes, and networks

Changed in version 2017.7.0: The legacy Docker state and execution module have been removed, and the new modules (formerly called `dockerng` have taken their places).

---

**Important:** As of the 2017.7.0 release, the states in this module have been separated into the following four state modules:

- `docker_container` - States to manage Docker containers
- `docker_image` - States to manage Docker images
- `docker_volume` - States to manage Docker volumes
- `docker_network` - States to manage Docker networks

The reason for this change was to make states and requisites more clear. For example, imagine this SLS:

```
myuser/appimage:
  docker.image_present:
    - sls: docker.images.appimage

myapp:
  docker.running:
    - image: myuser/appimage
    - require:
      - docker: myuser/appimage
```

The new syntax would be:

```
myuser/appimage:
  docker_image.present:
    - sls: docker.images.appimage

myapp:
  docker_container.running:
    - image: myuser/appimage
    - require:
      - docker_image: myuser/appimage
```

This is similar to how Salt handles MySQL, MongoDB, Zabbix, and other cases where the same execution module is used to manage several different kinds of objects (users, databases, roles, etc.).

The old syntax will continue to work until the **Fluorine** release of Salt.

---

`salt.states.docker.absent` (*name*, *\*\*kwargs*)

Deprecated since version 2017.7.0: This state has been moved to `docker_container.absent`.

`salt.states.docker.image_absent` (*\*\*kwargs*)

Deprecated since version 2017.7.0: This state has been moved to `docker_image.absent`.

`salt.states.docker.image_present` (*name*, *\*\*kwargs*)

Deprecated since version 2017.7.0: This state has been moved to `docker_image.present`.

`salt.states.docker.network_absent` (*name*, *\*\*kwargs*)

Deprecated since version 2017.7.0: This state has been moved to `docker_network.absent`.

`salt.states.docker.network_present(name, **kwargs)`

Deprecated since version 2017.7.0: This state has been moved to `docker_network.present`.

`salt.states.docker.running(name, **kwargs)`

Deprecated since version 2017.7.0: This state has been moved to `docker_container.running`.

`salt.states.docker.stopped(**kwargs)`

Deprecated since version 2017.7.0: This state has been moved to `docker_container.stopped`.

`salt.states.docker.volume_absent(name, driver=None)`

Deprecated since version 2017.7.0: This state has been moved to `docker_volume.absent`.

`salt.states.docker.volume_present(name, driver=None, driver_opts=None, force=False)`

Deprecated since version 2017.7.0: This state has been moved to `docker_volume.present`.

### 14.17.65 salt.states.docker\_container

Management of Docker containers

New in version 2017.7.0.

**depends** `docker` Python module

---

**Note:** Older releases of the Python bindings for Docker were called `docker-py` in PyPI. All releases of `docker`, and releases of `docker-py`  $\geq$  1.6.0 are supported. These python bindings can easily be installed using `pip.install`:

```
salt myminion pip.install docker
```

To upgrade from `docker-py` to `docker`, you must first uninstall `docker-py`, and then install `docker`:

```
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```

---

These states were moved from the `docker` state module (formerly called **dockerng**) in the 2017.7.0 release. When running the `docker_container.running` state for the first time after upgrading to 2017.7.0, your container(s) may be replaced. The changes may show diffs for certain parameters which say that the old value was an empty string, and the new value is `None`. This is due to the fact that in prior releases Salt was passing empty strings for these values when creating the container if they were undefined in the SLS file, where now Salt simply does not pass any arguments not explicitly defined in the SLS file. Subsequent runs of the state should not replace the container if the configuration remains unchanged.

---

**Note:** To pull from a Docker registry, authentication must be configured. See [here](#) for more information on how to configure access to docker registries in `Pillar` data.

---

`salt.states.docker_container.absent(name, force=False)`

Ensure that a container is absent

**name** Name of the container

**force** [False] Set to True to remove the container even if it is running

Usage Examples:

```
mycontainer:
  docker.absent

multiple_containers:
  docker.absent:
```

```

- names:
  - foo
  - bar
  - baz

```

```

salt.states.docker_container.running(name, image=None, skip_translate=None, ignore_collisions=False, validate_ip_addrs=True, force=False, watch_action='force', start=True, shutdown_timeout=10, client_timeout=60, **kwargs)

```

Ensure that a container with a specific configuration is present and running

**name** Name of the container

**image** Image to use for the container. Image names can be specified either using `repo:tag` notation, or just the repo name (in which case a tag of `latest` is assumed).

---

**Note:** This state will pull the image if it is not present. However, if the image needs to be built from a Dockerfile or loaded from a saved image, or if you would like to use requisites to trigger a replacement of the container when the image is updated, then the `docker_image.present` state should be used to manage the image.

---

**skip\_translate** This function translates Salt CLI or SLS input into the format which `docker-py` expects. However, in the event that Salt's translation logic fails (due to potential changes in the Docker Remote API, or to bugs in the translation code), this argument can be used to exert granular control over which arguments are translated and which are not.

Pass this argument as a comma-separated list (or Python list) of arguments, and translation for each passed argument name will be skipped. Alternatively, pass `True` and *all* translation will be skipped.

Skipping translation allows for arguments to be formatted directly in the format which `docker-py` expects. This allows for API changes and other issues to be more easily worked around. An example of using this option to skip translation would be:

For example, imagine that there is an issue with processing the `port_bindings` argument, and the following configuration no longer works as expected:

```

mycontainer:
  docker_container.running:
    - image: 7.3.1611
    - port_bindings:
      - 10.2.9.10:8080:80

```

By using `skip_translate`, you can forego the input translation and configure the port binding in the format `docker-py` needs:

```

mycontainer:
  docker_container.running:
    - image: 7.3.1611
    - skip_translate: port_bindings
    - port_bindings: {8080: [('10.2.9.10', 80)], '4193/udp', 9314}

```

See the following links for more information:

- [docker-py Low-level API](#)
- [Docker Engine API](#)

**ignore\_collisions** [False] Since many of `docker-py`'s arguments differ in name from their CLI counterparts (with which most Docker users are more familiar), Salt detects usage of these and aliases them to the `docker-py` version of that argument so that both CLI and API versions of a given argument are supported. However, if both the alias and the `docker-py` version of the same argument (e.g. `env` and

environment) are used, an error will be raised. Set this argument to `True` to suppress these errors and keep the `docker-py` version of the argument.

**validate\_ip\_addrs** [`True`] For parameters which accept IP addresses as input, IP address validation will be performed. To disable, set this to `False`

**force** [`False`] Set this parameter to `True` to force Salt to re-create the container irrespective of whether or not it is configured as desired.

**watch\_action** [`force`] Control what type of action is taken when this state *watches* another state that has changes. The default action is `force`, which runs the state with `force` set to `True`, triggering a rebuild of the container.

If any other value is passed, it will be assumed to be a kill signal. If the container matches the specified configuration, and is running, then the action will be to send that signal to the container. Kill signals can be either strings or numbers, and are defined in the **Standard Signals** section of the `signal(7)` manpage. Run `man 7 signal` on a Linux host to browse this manpage. For example:

```
mycontainer:
  docker_container.running:
    - image: busybox
    - watch_action: SIGHUP
    - watch:
      - file: some_file
```

---

**Note:** If the container differs from the specified configuration, or is not running, then instead of sending a signal to the container, the container will be re-created/started and no signal will be sent.

---

**start** [`True`] Set to `False` to suppress starting of the container if it exists, matches the desired configuration, but is not running. This is useful for data-only containers, or for non-daemonized container processes, such as the `Django migrate` and `collectstatic` commands. In instances such as this, the container only needs to be started the first time.

**shutdown\_timeout** [`10`] If the container needs to be replaced, the container will be stopped using `docker.stop`. The value of this parameter will be passed to `docker.stop` as the `timeout` value, telling Docker how long to wait for a graceful shutdown before killing the container.

Changed in version 2017.7.0: This option was renamed from `stop_timeout` to `shutdown_timeout` to accommodate the `stop_timeout` container configuration setting.

**client\_timeout** [`60`] Timeout in seconds for the Docker client. This is not a timeout for this function, but for receiving a response from the API.

---

**Note:** This is only used if Salt needs to pull the requested image.

---

## CONTAINER CONFIGURATION PARAMETERS

**auto\_remove** (or *rm*) [`False`] Enable auto-removal of the container on daemon side when the container's process exits (analogous to running a docker container with `--rm` on the CLI).

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - auto_remove: True
```

**binds** Files/directories to bind mount. Each bind mount should be passed in one of the following formats:

- `<host_path>:<container_path>` - `host_path` is mounted within the container as `container_path` with read-write access.
- `<host_path>:<container_path>:<selinux_context>` - `host_path` is mounted within the container as `container_path` with read-write access. Additionally, the specified selinux context will be set within the container.

- `<host_path>:<container_path>:<read_only>` - `host_path` is mounted within the container as `container_path`, with the read-only or read-write setting explicitly defined.
- `<host_path>:<container_path>:<read_only>,<selinux_context>` - `host_path` is mounted within the container as `container_path`, with the read-only or read-write setting explicitly defined. Additionally, the specified selinux context will be set within the container.

`<read_only>` can be either `ro` for read-write access, or `rw` for read-only access. When omitted, it is assumed to be read-write.

`<selinux_context>` can be `z` if the volume is shared between multiple containers, or `Z` if the volume should be private.

---

**Note:** When both `<read_only>` and `<selinux_context>` are specified, there must be a comma before `<selinux_context>`.

---

Binds can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - binds: /srv/www:/var/www:ro,/etc/foo.conf:/usr/local/etc/foo.conf:rw
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - binds:
      - /srv/www:/var/www:ro
      - /home/myuser/conf/foo.conf:/etc/foo.conf:rw
```

However, in cases where both `ro/rw` and an selinux context are combined, the only option is to use a YAML list, like so:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - binds:
      - /srv/www:/var/www:ro,Z
      - /home/myuser/conf/foo.conf:/etc/foo.conf:rw,Z
```

Since the second bind in the previous example is mounted read-write, the `rw` and comma can be dropped. For example:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - binds:
      - /srv/www:/var/www:ro,Z
      - /home/myuser/conf/foo.conf:/etc/foo.conf:Z
```

**blkio\_weight** Block IO weight (relative weight), accepts a weight value between 10 and 1000.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - blkio_weight: 100
```

**blkio\_weight\_device** Block IO weight (relative device weight), specified as a list of expressions in the format PATH:RATE

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - blkio_weight_device: /dev/sda:100
```

**cap\_add** List of capabilities to add within the container. Can be expressed as a comma-separated list or a Python list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cap_add: SYS_ADMIN,MKNOD
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cap_add:
      - SYS_ADMIN
      - MKNOD
```

---

**Note:** This option requires Docker 1.2.0 or newer.

---

**cap\_drop** List of capabilities to drop within the container. Can be expressed as a comma-separated list or a Python list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cap_drop: SYS_ADMIN,MKNOD
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cap_drop:
      - SYS_ADMIN
      - MKNOD
```

---

**Note:** This option requires Docker 1.2.0 or newer.

---

**command (or *cmd*)** Command to run in the container

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - command: bash
```

**cpuset\_cpus (or *cpuset*)** CPUs on which to allow execution, specified as a string containing a range (e.g. 0-3) or a comma-separated list of CPUs (e.g. 0,1).

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cpuset_cpus: "0,1"
```

**cpuset\_mems** Memory nodes on which to allow execution, specified as a string containing a range (e.g. 0-3) or a comma-separated list of MEMs (e.g. 0, 1). Only effective on NUMA systems.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cpuset_mems: "0,1"
```

**cpu\_group** The length of a CPU period in microseconds

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cpu_group: 100000
```

**cpu\_period** Microseconds of CPU time that the container can get in a CPU period

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cpu_period: 50000
```

**cpu\_shares** CPU shares (relative weight), specified as an integer between 2 and 1024.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cpu_shares: 512
```

**detach** [False] If True, run the container's command in the background (daemon mode)

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - detach: True
```

**devices** List of host devices to expose within the container. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices: /dev/net/tun,/dev/xvda1:/dev/xvda1,/dev/xvdb1:/dev/xvdb1:r
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices:
      - /dev/net/tun
      - /dev/xvda1:/dev/xvda1
      - /dev/xvdb1:/dev/xvdb1:r
```

**device\_read\_bps** Limit read rate (bytes per second) from a device, specified as a list of expressions in the format PATH:RATE, where RATE is either an integer number of bytes, or a string ending in kb, mb, or gb. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_bps: /dev/sda:1mb,/dev/sdb:5mb
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_bps:
      - /dev/sda:1mb
      - /dev/sdb:5mb
```

**device\_read\_iops** Limit read rate (I/O per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where `RATE` is a number of I/O operations. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_iops: /dev/sda:1000,/dev/sdb:500
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_iops:
      - /dev/sda:1000
      - /dev/sdb:500
```

**device\_write\_bps** Limit write rate (bytes per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where `RATE` is either an integer number of bytes, or a string ending in kb, mb, or gb. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_write_bps: /dev/sda:1mb,/dev/sdb:5mb
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_write_bps:
      - /dev/sda:1mb
      - /dev/sdb:5mb
```

**device\_read\_iops** Limit write rate (I/O per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where `RATE` is a number of I/O operations. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_iops: /dev/sda:1000,/dev/sdb:500
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_iops:
      - /dev/sda:1000
      - /dev/sdb:500
```

**dns** List of DNS nameservers. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns: 8.8.8.8,8.8.4.4
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns:
      - 8.8.8.8
      - 8.8.4.4
```

---

**Note:** To skip IP address validation, use `validate_ip_addrs=False`

---

**dns\_opt** Additional options to be added to the container's `resolv.conf` file. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns_opt: ndots:9
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns_opt:
      - ndots:9
```

**dns\_search** List of DNS search domains. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns_search: foo1.domain.tld,foo2.domain.tld
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns_search:
      - foo1.domain.tld
      - foo2.domain.tld
```

**domainname** The domain name to use for the container

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - domainname: domain.tld
```

**entrypoint** Entrypoint for the container

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - entrypoint: "mycmd --arg1 --arg2"
```

This argument can also be specified as a list:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - entrypoint:
      - mycmd
      - --arg1
      - --arg2
```

**environment** Either a list of variable/value mappings, or a list of strings in the format `VARNAME=value`. The below three examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - environment:
      - VAR1: value
      - VAR2: value
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - environment: 'VAR1=value,VAR2=value'
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - environment:
      - VAR1=value
      - VAR2=value
```

**extra\_hosts** Additional hosts to add to the container's `/etc/hosts` file. Can be expressed as a comma-separated list or a Python list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - extra_hosts: web1:10.9.8.7,web2:10.9.8.8
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - extra_hosts:
      - web1:10.9.8.7
      - web2:10.9.8.8
```

---

**Note:** To skip IP address validation, use `validate_ip_addrs=False`

---

---

**Note:** This option requires Docker 1.3.0 or newer.

---

**group\_add** List of additional group names and/or IDs that the container process will run as. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - group_add: web,network
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - group_add:
      - web
      - network
```

**hostname** Hostname of the container. If not provided, the value passed as the container's ``name`` will be used for the hostname.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - hostname: web1
```

**Warning:** hostname cannot be set if network\_mode is set to host. The below example will result in an error:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - hostname: web1
    - network_mode: host
```

**interactive (or *stdin\_open*)** [False] Leave stdin open, even if not attached

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - interactive: True
```

**ipc\_mode (or *ipc*)** Set the IPC mode for the container. The default behavior is to create a private IPC namespace for the container, but this option can be used to change that behavior:

- **container:**<container\_name\_or\_id> reuses another container shared memory, semaphores and message queues
- **host:** use the host's shared memory, semaphores and message queues

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ipc_mode: container:foo
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ipc_mode: host
```

**Warning:** Using host gives the container full access to local shared memory and is therefore considered insecure.

**isolation** Specifies the type of isolation technology used by containers

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - isolation: hyperv
```

---

**Note:** The default value on Windows server is `process`, while the default value on Windows client is `hyperv`. On Linux, only `default` is supported.

---

**labels** Add metadata to the container. Labels can be set both with and without values:

#### WITH VALUES

The below three examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - labels: label1=value1,label2=value2
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - labels:
      - label1=value1
      - label2=value2
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - labels:
      - label1: value1
      - label2: value2
```

The labels can also simply be passed as a dictionary, though this can be error-prone due to some *idiosyncrasies* with how PyYAML loads nested data structures:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - labels:
      label1: value1
      label2: value2
```

#### WITHOUT VALUES

The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - labels: label1,label2
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
```

```
- labels:
  - label1
  - label2
```

**links** Link this container to another. Links can be specified as a list of mappings or a comma-separated or Python list of expressions in the format <container\_name\_or\_id>:<link\_alias>. The below three examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - links:
      - web1: link1
      - web2: link2
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - links: web1:link1,web2:link2
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - links:
      - web1:link1
      - web2:link2
```

**log\_driver and log\_opt** Set container's logging driver and options to configure that driver. Requires Docker 1.6 or newer.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - log_driver: syslog
    - log_opt:
      - syslog-address: tcp://192.168.0.42
      - syslog-facility: daemon
```

The `log_opt` can also be expressed as a comma-separated or YAML list of key=value pairs. The below two examples are equivalent to the above one:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - log_driver: syslog
    - log_opt: "syslog-address=tcp://192.168.0.42,syslog-facility=daemon"
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - log_driver: syslog
    - log_opt:
      - syslog-address=tcp://192.168.0.42
      - syslog-facility=daemon
```

**Note:** The logging driver feature was improved in Docker 1.13 introducing option name changes.

Please see Docker's [Configure logging drivers](#) documentation for more information.

---

**lxc\_conf** Additional LXC configuration parameters to set before starting the container. Either a list of variable/value mappings, or a list of strings in the format `VARNAME=value`. The below three examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - lxc_conf:
      - lxc.utsname: docker
      - lxc.arch: x86_64
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - lxc_conf: lxc.utsname=docker,lxc.arch=x86_64
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - lxc_conf:
      - lxc.utsname=docker
      - lxc.arch=x86_64
```

---

**Note:** These LXC configuration parameters will only have the desired effect if the container is using the LXC execution driver, which has been deprecated for some time.

---

**mac\_address** MAC address to use for the container. If not specified, a random MAC address will be used.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - mac_address: 01:23:45:67:89:0a
```

**mem\_limit (or *memory*)** [0] Memory limit. Can be specified in bytes or using single-letter units (i.e. 512M, 2G, etc.). A value of 0 (the default) means no memory limit.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - mem_limit: 512M
```

**mem\_swappiness** Tune a container's memory swappiness behavior. Accepts an integer between 0 and 100.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - mem_swappiness: 60
```

**memswap\_limit (or *memory\_swap*)** [-1] Total memory limit (memory plus swap). Set to -1 to disable swap. A value of 0 means no swap limit.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - memswap_limit: 1G
```

**network\_disabled** [False] If True, networking will be disabled within the container

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - network_disabled: True
```

**network\_mode** [bridge] One of the following:

- **bridge** - Creates a new network stack for the container on the docker bridge
- **none** - No networking (equivalent of the Docker CLI argument `--net=none`). Not to be confused with Python's None.
- **container:<name\_or\_id>** - Reuses another container's network stack
- **host** - Use the host's network stack inside the container
- Any name that identifies an existing network that might be created with `docker.network_present`.

**Warning:** Using host mode gives the container full access to the hosts system's services (such as D-bus), and is therefore considered insecure.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - network_mode: "none"
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - network_mode: container:web1
```

**oom\_kill\_disable** Whether to disable OOM killer

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - oom_kill_disable: False
```

**oom\_score\_adj** An integer value containing the score given to the container in order to tune OOM killer preferences

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - oom_score_adj: 500
```

**pid\_mode** Set to host to use the host container's PID namespace within the container. Requires Docker 1.5.0 or newer.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - pid_mode: host
```

---

**Note:** This option requires Docker 1.5.0 or newer.

---

**pids\_limit** Set the container's PID limit. Set to `-1` for unlimited.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - pids_limit: 2000
```

**port\_bindings (or *publish*)** Bind exposed ports. Port bindings should be passed in the same way as the `--publish` argument to the `docker run` CLI command:

- `ip:hostPort:containerPort` - Bind a specific IP and port on the host to a specific port within the container.
- `ip::containerPort` - Bind a specific IP and an ephemeral port to a specific port within the container.
- `hostPort:containerPort` - Bind a specific port on all of the host's interfaces to a specific port within the container.
- `containerPort` - Bind an ephemeral port on all of the host's interfaces to a specific port within the container.

Multiple bindings can be separated by commas, or expressed as a YAML list, and port ranges can be defined using dashes. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - port_bindings: "4505-4506:14505-14506,2123:2123/udp,8080"
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - port_bindings:
      - 4505-4506:14505-14506
      - 2123:2123/udp
      - 8080
```

---

**Note:** When specifying a protocol, it must be passed in the `containerPort` value, as seen in the examples above.

---

**ports** A list of ports to expose on the container. Can either be a comma-separated list or a YAML list. If the protocol is omitted, the port will be assumed to be a TCP port. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ports: 1111,2222/udp
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ports:
      - 1111
      - 2222/udp
```

**privileged** [False] If True, runs the exec process with extended privileges

**publish\_all\_ports (or *publish\_all*)** [False] Publish all ports to the host

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ports: 8080
```

```
- publish_all_ports: True
```

**read\_only** [False] If True, mount the container's root filesystem as read only

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - read_only: True
```

**restart\_policy (or *restart*)** Set a restart policy for the container. Must be passed as a string in the format `policy[:retry_count]` where `policy` is one of `always`, `unless-stopped`, or `on-failure`, and `retry_count` is an optional limit to the number of retries. The retry count is ignored when using the `always` or `unless-stopped` restart policy.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - restart_policy: on-failure:5

bar:
  docker_container.running:
    - image: bar/baz:latest
    - restart_policy: always
```

**security\_opt (or *security\_opts*)**: Security configuration for MLS systems such as SELinux and AppArmor. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - security_opt: apparmor:unconfined
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - security_opt:
      - apparmor:unconfined
```

---

**Important:** Some security options can contain commas. In these cases, this argument *must* be passed as a Python list, as splitting by comma will result in an invalid configuration.

---

---

**Note:** See the documentation for `security_opt` at <https://docs.docker.com/engine/reference/run/#security-configuration>

---

**shm\_size** Size of `/dev/shm`

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - shm_size: 128M
```

**stop\_signal** Specify the signal docker will send to the container when stopping. Useful when running `systemd` as PID 1 inside the container.

```
foo:
  docker_container.running:
```

```
- image: bar/baz:latest
- stop_signal: SIGRTMIN+3
```

---

**Note:** This option requires Docker 1.9.0 or newer and docker-py 1.7.0 or newer.

---

New in version 2016.11.0.

**stop\_timeout** Timeout to stop the container, in seconds

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - stop_timeout: 5
```

---

**Note:** In releases prior to 2017.7.0, this option was not set in the container configuration, but rather this timeout was enforced only when shutting down an existing container to replace it. To remove the ambiguity, and to allow for the shutdown to have a stop timeout set for it, the old `stop_timeout` argument has been renamed to `shutdown_timeout`, while `stop_timeout` now refer's to the container's configured stop timeout.

---

**storage\_opt** Storage driver options for the container. Can be either a list of strings in the format `option=value`, or a list of mappings between option and value. The below three examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - storage_opt:
      - dm.basesize: 40G
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - storage_opt: dm.basesize=40G
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - storage_opt:
      - dm.basesize=40G
```

**sysctls (or *sysctl*)** Set sysctl options for the container. Can be either a list of strings in the format `option=value`, or a list of mappings between option and value. The below three examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - sysctls:
      - fs.nr_open: 1048576
      - kernel.pid_max: 32768
```

```
foo:
  docker_container.running:
```

```
- image: bar/baz:latest
- sysctls: fs.nr_open=1048576,kernel.pid_max=32768
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - sysctls:
      - fs.nr_open=1048576
      - kernel.pid_max=32768
```

**tmpfs** A map of container directories which should be replaced by tmpfs mounts and their corresponding mount options.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - tmpfs:
      - /run: rw,noexec,nosuid,size=65536k
```

**tty** [False] Attach TTYs

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - tty: True
```

**ulimits** List of ulimits. These limits should be passed in the format `<ulimit_name>:<soft_limit>:<hard_limit>`, with the hard limit being optional. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - ulimits: nofile=1024:1024,nproc=60
```

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - ulimits:
      - nofile=1024:1024
      - nproc=60
```

**user** User under which to run exec process

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - user: foo
```

**usersns\_mode** (or *user\_ns\_mode*) Sets the user namespace mode, when the user namespace remapping option is enabled

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - usersns_mode: host
```

**volumes** (or *\*volume*) List of directories to expose as volumes. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - volumes: /mnt/vol1,/mnt/vol2
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - volumes:
      - /mnt/vol1
      - /mnt/vol2
```

**volumes\_from** Container names or IDs from which the container will get volumes. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - volumes_from: foo
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - volumes_from:
      - foo
```

**volume\_driver** sets the container's volume driver

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - volume_driver: foobar
```

**working\_dir (or *workdir*)** Working directory inside the container

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - working_dir: /var/log/nginx
```

**salt.states.docker\_container.stopped**(*name=None, containers=None, shutdown\_timeout=10, unpause=False, error\_on\_absent=True*)

Ensure that a container (or containers) is stopped

**name** Name or ID of the container

**containers** Run this state on more than one container at a time. The following two examples accomplish the same thing:

```
stopped_containers:
  docker.stopped:
    - names:
      - foo
      - bar
      - baz
```

```
stopped_containers:
  docker.stopped:
    - containers:
      - foo
```

```
- bar
- baz
```

However, the second example will be a bit quicker since Salt will stop all specified containers in a single run, rather than executing the state separately on each image (as it would in the first example).

**shutdown\_timeout** [10] Timeout for graceful shutdown of the container. If this timeout is exceeded, the container will be killed.

**unpause** [False] Set to `True` to unpause any paused containers before stopping. If unset, then an error will be raised for any container that was paused.

**error\_on\_absent** [True] By default, this state will return an error if any of the specified containers are absent. Set this to `False` to suppress that error.

### 14.17.66 salt.states.docker\_image

Management of Docker images

New in version 2017.7.0.

**depends** `docker` Python module

**Note:** Older releases of the Python bindings for Docker were called `docker-py` in PyPI. All releases of `docker`, and releases of `docker-py`  $\geq$  1.6.0 are supported. These python bindings can easily be installed using `pip.install`:

```
salt myminion pip.install docker
```

To upgrade from `docker-py` to `docker`, you must first uninstall `docker-py`, and then install `docker`:

```
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```

These states were moved from the `docker` state module (formerly called **dockerng**) in the 2017.7.0 release.

**Note:** To pull from a Docker registry, authentication must be configured. See [here](#) for more information on how to configure access to docker registries in *Pillar* data.

`salt.states.docker_image.absent` (*name=None, images=None, force=False*)

Ensure that an image is absent from the Minion. Image names can be specified either using `repo:tag` notation, or just the repo name (in which case a tag of `latest` is assumed).

**images** Run this state on more than one image at a time. The following two examples accomplish the same thing:

```
remove_images:
  docker_image.absent:
    - names:
      - busybox
      - centos:6
      - nginx
```

```
remove_images:
  docker_image.absent:
    - images:
      - busybox
```

```
- centos:6
- nginx
```

However, the second example will be a bit quicker since Salt will do all the deletions in a single run, rather than executing the state separately on each image (as it would in the first example).

**force** [False] Salt will fail to remove any images currently in use by a container. Set this option to true to remove the image even if it is already present.

**Note:** This option can also be overridden by Pillar data. If the Minion has a pillar variable named `docker.running.force` which is set to `True`, it will turn on this option. This pillar variable can even be set at runtime. For example:

```
salt myminion state.sls docker_stuff pillar="{docker.force: True}"
```

If this pillar variable is present and set to `False`, then it will turn off this option.

For more granular control, setting a pillar variable named `docker.force.image_name` will affect only the named image.

```
salt.states.docker_image.present(name, build=None, load=None, force=False, insecure_registry=False, client_timeout=60, dockerfile=None, sls=None, base='opensuse/python', saltenv='base', **kwargs)
```

Ensure that an image is present. The image can either be pulled from a Docker registry, built from a Dockerfile, or loaded from a saved image. Image names can be specified either using `repo:tag` notation, or just the repo name (in which case a tag of `latest` is assumed). Repo identifier is mandatory, we don't assume the default repository is docker hub.

If neither of the `build` or `load` arguments are used, then Salt will pull from the *configured registries*. If the specified image already exists, it will not be pulled unless `force` is set to `True`. Here is an example of a state that will pull an image from the Docker Hub:

```
myuser/myimage:mytag:
  docker_image.present
```

**build** Path to directory on the Minion containing a Dockerfile

```
myuser/myimage:mytag:
  docker_image.present:
    - build: /home/myuser/docker/myimage

myuser/myimage:mytag:
  docker_image.present:
    - build: /home/myuser/docker/myimage
    - dockerfile: Dockerfile.alternative
```

New in version 2016.11.0.

The image will be built using *docker.build* and the specified image name and tag will be applied to it.

**load** Loads a tar archive created with *docker.load* (or the `docker load` Docker CLI command), and assigns it the specified repo and tag.

```
myuser/myimage:mytag:
  docker_image.present:
    - load: salt://path/to/image.tar
```

**force** [False] Set this parameter to `True` to force Salt to pull/build/load the image even if it is already present.  
**client\_timeout** Timeout in seconds for the Docker client. This is not a timeout for the state, but for receiving a response from the API.

**dockerfile** Allows for an alternative Dockerfile to be specified. Path to alternative Dockerfile is relative to the build path for the Docker container.

New in version 2016.11.0.

**sls** Allow for building of image with `docker.sls_build` by specifying the SLS files with which to build. This can be a list or comma-separated string.

```
myuser/myimage:mytag:
  docker_image.present:
    - sls:
      - webapp1
      - webapp2
    - base: centos
    - saltenv: base
```

**base** Base image with which to start `docker.sls_build`

**saltenv** Environment from which to pull SLS files for `docker.sls_build`

### 14.17.67 salt.states.docker\_network

Management of Docker networks

New in version 2017.7.0.

**depends** `docker` Python module

**Note:** Older releases of the Python bindings for Docker were called `docker-py` in PyPI. All releases of `docker`, and releases of `docker-py`  $\geq$  1.6.0 are supported. These python bindings can easily be installed using `pip.install`:

```
salt myminion pip.install docker
```

To upgrade from `docker-py` to `docker`, you must first uninstall `docker-py`, and then install `docker`:

```
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```

These states were moved from the `docker` state module (formerly called `dockerng`) in the 2017.7.0 release.

`salt.states.docker_network.absent` (*name*, *driver=None*)

Ensure that a network is absent.

**name** Name of the network

Usage Examples:

```
network_foo:
  docker_network.absent
```

`salt.states.docker_network.present` (*name*, *driver=None*, *containers=None*)

Ensure that a network is present.

**name** Name of the network

**driver** Type of driver for that network.

**containers:** List of container names that should be part of this network

Usage Examples:

```
network_foo:
  docker_network.present
```

```
network_bar:
  docker_network.present
  - name: bar
  - containers:
    - cont1
    - cont2
```

### 14.17.68 salt.states.docker\_volume

Management of Docker volumes

New in version 2017.7.0.

**depends** `docker` Python module

---

**Note:** Older releases of the Python bindings for Docker were called `docker-py` in PyPI. All releases of `docker`, and releases of `docker-py`  $\geq$  1.6.0 are supported. These python bindings can easily be installed using `pip.install`:

```
salt myminion pip.install docker
```

To upgrade from `docker-py` to `docker`, you must first uninstall `docker-py`, and then install `docker`:

```
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```

---

These states were moved from the `docker` state module (formerly called `dockerng`) in the 2017.7.0 release.

`salt.states.docker_volume.absent` (*name*, *driver=None*)

Ensure that a volume is absent.

New in version 2015.8.4.

Changed in version 2017.7.0: This state was renamed from `docker.volume_absent` to `docker_volume.absent`

**name** Name of the volume

Usage Examples:

```
volume_foo:
  docker_volume.absent
```

`salt.states.docker_volume.present` (*name*, *driver=None*, *driver\_opts=None*, *force=False*)

Ensure that a volume is present.

New in version 2015.8.4.

Changed in version 2015.8.6: This state no longer deletes and re-creates a volume if the existing volume's driver does not match the `driver` parameter (unless the `force` parameter is set to `True`).

Changed in version 2017.7.0: This state was renamed from `docker.volume_present` to `docker_volume.present`

**name** Name of the volume

**driver** Type of driver for that volume. If `None` and the volume does not yet exist, the volume will be created using Docker's default driver. If `None` and the volume does exist, this function does nothing, even if the existing volume's driver is not the Docker default driver. (To ensure that an existing volume's driver matches the Docker default, you must explicitly name Docker's default driver here.)

**driver\_opts** Options for the volume driver

**force** [`False`] If the volume already exists but the existing volume's driver does not match the driver specified by the `driver` parameter, this parameter controls whether the function errors out (if `False`) or deletes and re-creates the volume (if `True`).

New in version 2015.8.6.

Usage Examples:

```
volume_foo:
  docker_volume.present
```

```
volume_bar:
  docker_volume.present
  - name: bar
  - driver: local
  - driver_opts:
    foo: bar
```

```
volume_bar:
  docker_volume.present
  - name: bar
  - driver: local
  - driver_opts:
    - foo: bar
    - option: value
```

### 14.17.69 salt.states.drac

Management of Dell DRAC

The DRAC module is used to create and manage DRAC cards on Dell servers

Ensure the user damian is present

```
damian:
  drac.present:
    - name: damian
    - password: secret
    - permission: login,test_alerts,clear_logs
```

Ensure the user damian does not exist

```
damian:
  drac.absent:
    - name: damian
```

Ensure DRAC network is in a consistent state

```
my_network:
  drac.network:
    - ip: 10.225.108.29
    - netmask: 255.255.255.224
    - gateway: 10.225.108.1
```

```
salt.states.drac.absent(name)
```

Ensure a user does not exist on the Dell DRAC

**name:** The users username

```
salt.states.drac.network(ip, netmask, gateway)
```

Ensure the DRAC network settings are consistent

```
salt.states.drac.present(name, password, permission)
```

Ensure the user exists on the Dell DRAC

**name:** The users username

**password** The password used to authenticate

**permission** The permissions that should be assigned to a user

### 14.17.70 salt.states.elasticsearch

State module to manage Elasticsearch.

New in version 2017.7.0.

```
salt.states.elasticsearch.alias_absent(name, index)
```

Ensure that the index alias is absent.

**name** Name of the index alias to remove

**index** Name of the index for the alias

```
salt.states.elasticsearch.alias_present(name, index, definition=None)
```

Ensure that the named index alias is present.

**name** Name of the alias

**index** Name of the index

**definition** Optional dict for filters as per <https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-aliases.html>

**Example:**

```
mytestalias:
  elasticsearch.alias_present:
    - index: testindex
    - definition:
        filter:
          term:
            user: kimchy
```

```
salt.states.elasticsearch.index_absent(name)
```

Ensure that the named index is absent.

**name** Name of the index to remove

```
salt.states.elasticsearch.index_present(name, definition=None)
```

Ensure that the named index is present.

**name** Name of the index to add

**definition** Optional dict for creation parameters as per <https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-create-index.html>

**Example:**

```
# Default settings
mytestindex:
  elasticsearch_index.present

# Extra settings
```

```
mytestindex2:
  elasticsearch_index.present:
    - definition:
        settings:
          index:
            number_of_shards: 10
```

`salt.states.elasticsearch.index_template_absent`(*name*)

Ensure that the named index template is absent.

**name** Name of the index to remove

`salt.states.elasticsearch.index_template_present`(*name*, *definition*)

Ensure that the named index template is present.

**name** Name of the index to add

**definition** Required dict for creation parameters as per <https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-templates.html>

**Example:**

```
mytestindex2_template:
  elasticsearch_index_template.present:
    - definition:
        template: logstash-*
        order: 1
        settings:
          number_of_shards: 1
```

`salt.states.elasticsearch.pipeline_absent`(*name*)

Ensure that the named pipeline is absent

**name** Name of the pipeline to remove

`salt.states.elasticsearch.pipeline_present`(*name*, *definition*)

Ensure that the named pipeline is present.

**name** Name of the index to add

**definition** Required dict for creation parameters as per <https://www.elastic.co/guide/en/elasticsearch/reference/master/pipeline.html>

**Example:**

```
test_pipeline:
  elasticsearch_pipeline.present:
    - definition:
        description: example pipeline
        processors:
          - set:
              field: collector_timestamp_millis
              value: '{{ '{{' }}_ingest.timestamp{{ '}}' }}'
```

`salt.states.elasticsearch.search_template_absent`(*name*)

Ensure that the search template is absent

**name** Name of the search template to remove

`salt.states.elasticsearch.search_template_present`(*name*, *definition*)

Ensure that the named search template is present.

**name** Name of the search template to add

**definition** Required dict for creation parameters as per <http://www.elastic.co/guide/en/elasticsearch/reference/current/search-template.html>

**Example:**

```
test_pipeline:
  elasticsearch.search_template_present:
    - definition:
        inline:
          size: 10
```

### 14.17.71 salt.states.elasticsearch\_index

State module to manage Elasticsearch indices

New in version 2015.8.0.

Deprecated since version 2017.7.0: Use elasticsearch state instead

`salt.states.elasticsearch_index.absent(name)`

Ensure that the named index is absent.

**name** Name of the index to remove

`salt.states.elasticsearch_index.present(name, definition=None)`

New in version 2015.8.0.

Changed in version 2017.3.0: Marked definition as optional.

Ensure that the named index is present.

**name** Name of the index to add

**definition** Optional dict for creation parameters as per <https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-create-index.html>

**Example:**

### 14.17.72 salt.states.elasticsearch\_index\_template

State module to manage Elasticsearch index templates

New in version 2015.8.0.

Deprecated since version 2017.7.0: Use elasticsearch state instead

`salt.states.elasticsearch_index_template.absent(name)`

Ensure that the named index template is absent.

**name** Name of the index to remove

`salt.states.elasticsearch_index_template.present(name, definition)`

New in version 2015.8.0.

Changed in version 2017.3.0: Marked definition as required.

Ensure that the named index template is present.

**name** Name of the index to add

**definition** Required dict for creation parameters as per <https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-templates.html>

**Example:**

### 14.17.73 salt.states.envron

Support for getting and setting the environment variables of the current salt process.

`salt.states.envIRON.setenv`(*name*, *value*, *false\_unsets=False*, *clear\_all=False*, *update\_minion=False*, *permanent=False*)

Set the salt process environment variables.

**name** The environment key to set. Must be a string.

**value** Either a string or dict. When string, it will be the value set for the environment key of `name` above. When a dict, each key/value pair represents an environment variable to set.

**false\_unsets** If a key's value is False and `false_unsets` is True, then the key will be removed from the salt processes environment dict entirely. If a key's value is False and `false_unsets` is not True, then the key's value will be set to an empty string. Default: False

**clear\_all** USE WITH CAUTION! This option can unset environment variables needed for salt to function properly. If `clear_all` is True, then any environment variables not defined in the `environ` dict will be deleted. Default: False

**update\_minion** If True, apply these `environ` changes to the main salt-minion process. If False, the `environ` changes will only affect the current salt subprocess. Default: False

**permanent** On Windows minions this will set the environment variable in the registry so that it is always added as a environment variable when applications open. If you want to set the variable to HKLM instead of HKCU just pass in ``HKLM`` for this parameter. On all other minion types this will be ignored. Note: This will only take affect on applications opened after this has been set.

Example:

```
a_string_env:
  environ.setenv:
    - name: foo
    - value: bar
    - update_minion: True

a_dict_env:
  environ.setenv:
    - name: does_not_matter
    - value:
        foo: bar
        baz: quux
```

#### 14.17.74 salt.states.eselect

##### Management of Gentoo configuration using eselect

A state module to manage Gentoo configuration via eselect

```
profile:
  eselect.set:
    target: hardened/linux/amd64
```

`salt.states.eselect.set`(*name*, *target*, *module\_parameter=None*, *action\_parameter=None*)

Verify that the given module is set to the given target

**name** The name of the module

**target** The target to be set for this module

**module\_parameter** additional params passed to the defined module

**action\_parameter** additional params passed to the defined action

### 14.17.75 salt.states.etcd\_mod

#### Manage etcd Keys

New in version 2015.8.0.

##### depends

- python-etcd

This state module supports setting and removing keys from etcd.

#### Configuration

To work with an etcd server you must configure an etcd profile. The etcd config can be set in either the Salt Minion configuration file or in pillar:

```
my_etcd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

It is technically possible to configure etcd without using a profile, but this is not considered to be a best practice, especially when multiple etcd servers or clusters are available.

```
etcd.host: 127.0.0.1
etcd.port: 4001
```

---

**Note:** The etcd configuration can also be set in the Salt Master config file, but in order to use any etcd configurations defined in the Salt Master config, the *pillar\_opts* must be set to True.

Be aware that setting *pillar\_opts* to True has security implications as this makes all master configuration settings available in all minion's pillars.

---

#### Available Functions

- set

This will set a value to a key in etcd. Changes will be returned if the key has been created or the value of the key has been updated. This means you can watch these states for changes.

```
/foo/bar/baz:
  etcd.set:
    - value: foo
    - profile: my_etcd_config
```

- wait\_set

Performs the same functionality as *set* but only if a watch requisite is True.

```
/some/file.txt:
  file.managed:
    - source: salt://file.txt

/foo/bar/baz:
  etcd.wait_set:
```

```
- value: foo
- profile: my_etcd_config
- watch:
  - file: /some/file.txt
```

- **rm**

This will delete a key from etcd. If the key exists then changes will be returned and thus you can watch for changes on the state, if the key does not exist then no changes will occur.

```
/foo/bar/baz:
  etcd.rm:
    - profile: my_etcd_config
```

- **wait\_rm**

Performs the same functionality as `rm` but only if a watch requisite is `True`.

```
/some/file.txt:
  file.managed:
    - source: salt://file.txt

/foo/bar/baz:
  etcd.wait_rm:
    - profile: my_etcd_config
    - watch:
      - file: /some/file.txt
```

`salt.states.etcd_mod.mod_watch(name, **kwargs)`  
Execute a etcd function based on a watch call requisite.

`salt.states.etcd_mod.rm(name, recurse=False, profile=None)`

Deletes a key from etcd. This function is also aliased as `rm`.

**name** The etcd key name to remove, for example `/foo/bar/baz`.

**recurse** Optional, defaults to `False`. If `True` performs a recursive delete.

**profile** Optional, defaults to `NONE`. Sets the etcd profile to use which has been defined in the Salt Master config.

`salt.states.etcd_mod.set(name, value, profile=None)`

Set a key in etcd and can be called as `set`.

**name** The etcd key name, for example: `/foo/bar/baz`.

**value** The value the key should contain.

**profile** Optional, defaults to `NONE`. Sets the etcd profile to use which has been defined in the Salt Master config.

`salt.states.etcd_mod.wait_rm(name, recurse=False, profile=None)`

Deletes a key from etcd only if the watch statement calls it. This function is also aliased as `wait_rm`.

**name** The etcd key name to remove, for example `/foo/bar/baz`.

**recurse** Optional, defaults to `False`. If `True` performs a recursive delete, see: <https://python-etcd.readthedocs.io/en/latest/#delete-a-key>.

**profile** Optional, defaults to `NONE`. Sets the etcd profile to use which has been defined in the Salt Master config.

`salt.states.etcd_mod.wait_set(name, value, profile=None)`

Set a key in etcd only if the watch statement calls it. This function is also aliased as `wait_set`.

**name** The etcd key name, for example: `/foo/bar/baz`.

**value** The value the key should contain.

**profile** The etcd profile to use that has been configured on the Salt Master, this is optional and defaults to None.

### 14.17.76 salt.states.ethtool module

Configuration of network device

New in version 2016.11.0.

**codeauthor** Krzysztof Pawlowski <msciciel@msciciel.eu>

**maturity** new

**depends** python-ethtool

**platform** linux

```
eth0:
  ethtool.coalesce:
    - name: eth0
    - rx_usecs: 24
    - tx_usecs: 48

eth0:
  ethtool.ring:
    - name: eth0
    - rx: 1024
    - tx: 1024

eth0:
  ethtool.offload:
    - name: eth0
    - tcp_segmentation_offload: on
```

**salt.states.ethtool.coalesce**(*name*, *\*\*kwargs*)

Manage coalescing settings of network device

**name** Interface name to apply coalescing settings

```
eth0:
  ethtool.coalesce:
    - name: eth0
    - adaptive_rx: on
    - adaptive_tx: on
    - rx_usecs: 24
    - rx_frame: 0
    - rx_usecs_irq: 0
    - rx_frames_irq: 0
    - tx_usecs: 48
    - tx_frames: 0
    - tx_usecs_irq: 0
    - tx_frames_irq: 0
    - stats_block_usecs: 0
    - pkt_rate_low: 0
    - rx_usecs_low: 0
    - rx_frames_low: 0
    - tx_usecs_low: 0
    - tx_frames_low: 0
    - pkt_rate_high: 0
    - rx_usecs_high: 0
```

```
- rx_frames_high: 0
- tx_usecs_high: 0
- tx_frames_high: 0
- sample_interval: 0
```

**salt.states.ethtool.offload**(*name*, *\*\*kwargs*)

Manage protocol offload and other features of network device

**name** Interface name to apply coalescing settings

```
eth0:
  ethtool.offload:
    - name: eth0
    - tcp_segmentation_offload: on
```

**salt.states.ethtool.ring**(*name*, *\*\*kwargs*)

Manage rx/tx ring parameters of network device

Use `max` word to set with factory maximum

**name** Interface name to apply ring parameters

```
eth0:
  ethtool.ring:
    - name: eth0
    - rx: 1024
    - rx_mini: 0
    - rx_jumbo: 0
    - tx: max
```

### 14.17.77 salt.states.esxi

Manage VMware ESXi Hosts.

New in version 2015.8.4.

#### Dependencies

- pyVmomi Python Module
- ESXCLI

#### pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

---

**Note:** Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.6, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See [Issue #29537](#) for more information.

---

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original ESXi State Module was developed against.

## ESXCLI

Currently, about a third of the functions used in the vSphere Execution Module require the ESXCLI package be installed on the machine running the Proxy Minion process.

The ESXCLI package is also referred to as the VMware vSphere CLI, or vCLI. VMware provides vCLI package installation instructions for [vSphere 5.5](#) and [vSphere 6.0](#).

Once all of the required dependencies are in place and the vCLI package is installed, you can check to see if you can connect to your ESXi host or vCenter server by running the following command:

```
esxcli -s <host-location> -u <username> -p <password> system syslog config get
```

If the connection was successful, ESXCLI was successfully installed on your system. You should see output related to the ESXi host's syslog configuration.

---

**Note:** Be aware that some functionality in this state module may depend on the type of license attached to the ESXi host.

For example, certain services are only available to manipulate service state or policies with a VMware vSphere Enterprise or Enterprise Plus license, while others are available with a Standard license. The ntpd service is restricted to an Enterprise Plus license, while ssh is available via the Standard license.

Please see the [vSphere Comparison](#) page for more information.

---

## About

This state module was written to be used in conjunction with Salt's *ESXi Proxy Minion*. For a tutorial on how to use Salt's ESXi Proxy Minion, please refer to the [ESXi Proxy Minion Tutorial](#) for configuration examples, dependency installation instructions, how to run remote execution functions against ESXi hosts via a Salt Proxy Minion, and a larger state example.

```
salt.states.esxi.coredump_configured(name, enabled, dump_ip, host_vnic='vmk0',
                                     dump_port=6500)
```

Ensures a host's core dump configuration.

**name** Name of the state.

**enabled** Sets whether or not ESXi core dump collection should be enabled. This is a boolean value set to True or False to enable or disable core dumps.

Note that ESXi requires that the core dump must be enabled before any other parameters may be set. This also affects the changes results in the state return dictionary. If enabled is False, we can't obtain any previous settings to compare other state variables, resulting in many old references returning None.

Once enabled is True the changes dictionary comparisons will be more accurate. This is due to the way the system coredump network configuration command returns data.

**dump\_ip** The IP address of host that will accept the dump.

**host\_vnic** Host VNic port through which to communicate. Defaults to vmk0.

**dump\_port** TCP port to use for the dump. Defaults to 6500.

Example:

```
configure-host-coredump:
  esxi.coredump_configured:
    - enabled: True
    - dump_ip: 'my-coredump-ip.example.com'
```

**salt.states.esxi.ntp\_configured**(*name, service\_running, ntp\_servers=None, service\_policy=None, service\_restart=False, update\_datetime=False*)

Ensures a host's NTP server configuration such as setting NTP servers, ensuring the NTP daemon is running or stopped, or restarting the NTP daemon for the ESXi host.

**name** Name of the state.

**service\_running** Ensures the running state of the ntp daemon for the host. Boolean value where True indicates that ntpd should be running and False indicates that it should be stopped.

**ntp\_servers** A list of servers that should be added to the ESXi host's NTP configuration.

**service\_policy** The policy to set for the NTP service.

---

**Note:** When setting the service policy to off or on, you *must* quote the setting. If you don't, the yaml parser will set the string to a boolean, which will cause trouble checking for stateful changes and will error when trying to set the policy on the ESXi host.

---

**service\_restart** If set to True, the ntp daemon will be restarted, regardless of its previous running state. Default is False.

**update\_datetime** If set to True, the date/time on the given host will be updated to UTC. Default setting is False. This option should be used with caution since network delays and execution delays can result in time skews.

Example:

```
configure-host-ntp:
  esxi.ntp_configured:
    - service_running: True
    - ntp_servers:
      - 192.174.1.100
      - 192.174.1.200
    - service_policy: 'on'
    - service_restart: True
```

**salt.states.esxi.password\_present**(*name, password*)

Ensures the given password is set on the ESXi host. Passwords cannot be obtained from host, so if a password is set in this state, the `vsphere.update_host_password` function will always run (except when using `test=True` functionality) and the state's changes dictionary will always be populated.

The username for which the password will change is the same username that is used to authenticate against the ESXi host via the Proxy Minion. For example, if the pillar definition for the proxy username is defined as `root`, then the username that the password will be updated for via this state is `root`.

**name** Name of the state.

**password** The new password to change on the host.

Example:

```
configure-host-password:
  esxi.password_present:
    - password: 'new-bad-password'
```

```
salt.states.esxi.ssh_configured(name, service_running, ssh_key=None, ssh_key_file=None,
                               service_policy=None, service_restart=False, certificate_verify=False)
```

Manage the SSH configuration for a host including whether or not SSH is running or the presence of a given SSH key. Note: Only one ssh key can be uploaded for root. Uploading a second key will replace any existing key.

**name** Name of the state.

**service\_running** Ensures whether or not the SSH service should be running on a host. Represented as a boolean value where `True` indicates that SSH should be running and `False` indicates that SSH should be stopped.

In order to update SSH keys, the SSH service must be running.

**ssh\_key** Public SSH key to be added to the `authorized_keys` file on the ESXi host. You can use `ssh_key` or `ssh_key_file`, but not both.

**ssh\_key\_file** File containing the public SSH key to be added to the `authorized_keys` file on the ESXi host. You can use `ssh_key_file` or `ssh_key`, but not both.

**service\_policy** The policy to set for the NTP service.

---

**Note:** When setting the service policy to `off` or `on`, you *must* quote the setting. If you don't, the `yaml` parser will set the string to a boolean, which will cause trouble checking for stateful changes and will error when trying to set the policy on the ESXi host.

---

**service\_restart** If set to `True`, the SSH service will be restarted, regardless of its previous running state. Default is `False`.

**certificate\_verify** If set to `True`, the SSL connection must present a valid certificate. Default is `False`.

Example:

```
configure-host-ssh:
  esxi.ssh_configured:
    - service_running: True
    - ssh_key_file: /etc/salt/ssh_keys/my_key.pub
    - service_policy: 'on'
    - service_restart: True
    - certificate_verify: True
```

```
salt.states.esxi.syslog_configured(name, syslog_configs, firewall=True, reset_service=True, reset_syslog_config=False, reset_configs=None)
```

Ensures the specified syslog configuration parameters. By default, this state will reset the syslog service after any new or changed parameters are set successfully.

**name** Name of the state.

**syslog\_configs** Name of parameter to set (corresponds to the command line switch for `esxcli` without the double dashes (--))

Valid `syslog_config` values are `logdir`, `loghost`, `logdir-unique`, `default-rotate`, `default-size`, and `default-timeout`.

Each `syslog_config` option also needs a configuration value to set. For example, `loghost` requires URLs or IP addresses to use for logging. Multiple log servers can be specified by listing them, comma-separated, but without spaces before or after commas

(reference: <https://blogs.vmware.com/vsphere/2012/04/configuring-multiple-syslog-servers-for-esxi-5.html>)

**firewall** Enable the firewall rule set for syslog. Defaults to `True`.

**reset\_service** After a successful parameter set, reset the service. Defaults to `True`.

**reset\_syslog\_config** Resets the syslog service to its default settings. Defaults to `False`. If set to `True`, default settings defined by the list of `syslog_configs` in `reset_configs` will be reset before running

any other syslog settings.

**reset\_configs** A comma-delimited list of parameters to reset. Only runs if `reset_syslog_config` is set to `True`. If `reset_syslog_config` is set to `True`, but no syslog configs are listed in `reset_configs`, then `reset_configs` will be set to `all` by default.

See `syslog_configs` parameter above for a list of valid options.

Example:

```
configure-host-syslog:
  esxi.syslog_configured:
    - syslog_configs:
        loghost: ssl://localhost:5432,tcp://10.1.0.1:1514
        default-timeout: 120
    - firewall: True
    - reset_service: True
    - reset_syslog_config: True
    - reset_configs: loghost,default-timeout
```

`salt.states.esxi.vmotion_configured` (*name, enabled, device='vmk0'*)

Configures a host's VMotion properties such as enabling VMotion and setting the device VirtualNic that VMotion will use.

**name** Name of the state.

**enabled** Ensures whether or not VMotion should be enabled on a host as a boolean value where `True` indicates that VMotion should be enabled and `False` indicates that VMotion should be disabled.

**device** The device that uniquely identifies the VirtualNic that will be used for VMotion for the host. Defaults to `vmk0`.

Example:

```
configure-vmotion:
  esxi.vmotion_configured:
    - enabled: True
    - device: sample-device
```

`salt.states.esxi.vsan_configured` (*name, enabled, add\_disks\_to\_vsan=False*)

Configures a host's VSAN properties such as enabling or disabling VSAN, or adding VSAN-eligible disks to the VSAN system for the host.

**name** Name of the state.

**enabled** Ensures whether or not VSAN should be enabled on a host as a boolean value where `True` indicates that VSAN should be enabled and `False` indicates that VSAN should be disabled.

**add\_disks\_to\_vsan** If set to `True`, any VSAN-eligible disks for the given host will be added to the host's VSAN system. Default is `False`.

Example:

```
configure-host-vsan:
  esxi.vsan_configured:
    - enabled: True
    - add_disks_to_vsan: True
```

### 14.17.78 salt.states.event

Send events through Salt's event system during state runs

`salt.states.event.send` (*name, data=None, preload=None, with\_env=False, with\_grains=False, with\_pillar=False, \*\*kwargs*)

Send an event to the Salt Master

New in version 2014.7.0.

Accepts the same arguments as the *event.send* execution module of the same name.

Example:

```
# ...snip bunch of states above

mycompany/mystaterun/status/update:
  event.send:
    - data:
      status: "Half-way through the state run!"

# ...snip bunch of states below
```

`salt.states.event.wait`(*name*, *sfun=None*)

Fire an event on the Salt master event bus if called from a watch statement

New in version 2014.7.0.

Example:

```
# Stand up a new web server.
apache:
  pkg:
    - installed
    - name: httpd
  service:
    - running
    - enable: True
    - name: httpd

# Notify the load balancer to update the pool once Apache is running.
refresh_pool:
  event:
    - wait
    - name: mycompany/loadbalancer/pool/update
    - data:
      new_web_server_ip: {{ grains['ipv4'] | first() }}
    - watch:
      - pkg: apache
```

## 14.17.79 salt.states.file

### Operations on regular files, special files, directories, and symlinks

Salt States can aggressively manipulate files on a system. There are a number of ways in which files can be managed.

Regular files can be enforced with the *file.managed* state. This state downloads files from the salt master and places them on the target system. Managed files can be rendered as a jinja, mako, or wemy template, adding a dynamic component to file management. An example of *file.managed* which makes use of the jinja templating system would look like this:

```
/etc/http/conf/http.conf:
  file.managed:
    - source: salt://apache/http.conf
    - user: root
    - group: root
```

```

- mode: 644
- template: jinja
- defaults:
  custom_var: "default value"
  other_var: 123
{% if grains['os'] == 'Ubuntu' %}
  - context:
    custom_var: "override"
{% endif %}

```

It is also possible to use the *py renderer* as a templating option. The template would be a Python script which would need to contain a function called `run()`, which returns a string. All arguments to the state will be made available to the Python script as globals. The returned string will be the contents of the managed file. For example:

```

def run():
    lines = ['foo', 'bar', 'baz']
    lines.extend([source, name, user, context]) # Arguments as globals
    return '\n\n'.join(lines)

```

**Note:** The `defaults` and `context` arguments require extra indentation (four spaces instead of the normal two) in order to create a nested dictionary. *More information.*

If using a template, any user-defined template variables in the file defined in `source` must be passed in using the `defaults` and/or `context` arguments. The general best practice is to place default values in `defaults`, with conditional overrides going into `context`, as seen above.

The template will receive a variable `custom_var`, which would be accessed in the template using `{{ custom_var }}`. If the operating system is Ubuntu, the value of the variable `custom_var` would be *override*, otherwise it is the default *default value*.

The `source` parameter can be specified as a list. If this is done, then the first file to be matched will be the one that is used. This allows you to have a default file on which to fall back if the desired file does not exist on the salt fileserver. Here's an example:

```

/etc/foo.conf:
  file.managed:
    - source:
      - salt://foo.conf.{{ grains['fqdn'] }}
      - salt://foo.conf.fallback
    - user: foo
    - group: users
    - mode: 644
    - backup: minion

```

**Note:** Salt supports backing up managed files via the `backup` option. For more details on this functionality please review the *backup\_mode documentation*.

The `source` parameter can also specify a file in another Salt environment. In this example `foo.conf` in the `dev` environment will be used instead.

```

/etc/foo.conf:
  file.managed:
    - source:
      - salt://foo.conf?saltenv=dev

```

```
- user: foo
- group: users
- mode: '0644'
```

**Warning:** When using a mode that includes a leading zero you must wrap the value in single quotes. If the value is not wrapped in quotes it will be read by YAML as an integer and evaluated as an octal.

The `names` parameter, which is part of the state compiler, can be used to expand the contents of a single state declaration into multiple, single state declarations. Each item in the `names` list receives its own individual state name and is converted into its own low-data structure. This is a convenient way to manage several files with similar attributes.

There is more documentation about this feature in the *Names declaration* section of the *Highstate docs*.

Special files can be managed via the `mknod` function. This function will create and enforce the permissions on a special file. The function supports the creation of character devices, block devices, and FIFO pipes. The function will create the directory structure up to the special file if it is needed on the minion. The function will not overwrite or operate on (change major/minor numbers) existing special files with the exception of user, group, and permissions. In most cases the creation of some special files require root permissions on the minion. This would require that the minion to be run as the root user. Here is an example of a character device:

```
/var/named/chroot/dev/random:
  file.mknod:
    - ntype: c
    - major: 1
    - minor: 8
    - user: named
    - group: named
    - mode: 660
```

Here is an example of a block device:

```
/var/named/chroot/dev/loop0:
  file.mknod:
    - ntype: b
    - major: 7
    - minor: 0
    - user: named
    - group: named
    - mode: 660
```

Here is an example of a fifo pipe:

```
/var/named/chroot/var/log/logfifo:
  file.mknod:
    - ntype: p
    - user: named
    - group: named
    - mode: 660
```

Directories can be managed via the `directory` function. This function can create and enforce the permissions on a directory. A directory statement will look like this:

```
/srv/stuff/substuf:
  file.directory:
    - user: fred
    - group: users
    - mode: 755
    - makedirs: True
```

If you need to enforce user and/or group ownership or permissions recursively on the directory's contents, you can do so by adding a `recurse` directive:

```
/srv/stuff/substuf:
  file.directory:
    - user: fred
    - group: users
    - mode: 755
    - makedirs: True
    - recurse:
      - user
      - group
      - mode
```

As a default, `mode` will resolve to `dir_mode` and `file_mode`, to specify both directory and file permissions, use this form:

```
/srv/stuff/substuf:
  file.directory:
    - user: fred
    - group: users
    - file_mode: 744
    - dir_mode: 755
    - makedirs: True
    - recurse:
      - user
      - group
      - mode
```

Symlinks can be easily created; the `symlink` function is very simple and only takes a few arguments:

```
/etc/grub.conf:
  file.symlink:
    - target: /boot/grub/grub.conf
```

Recursive directory management can also be set via the `recurse` function. Recursive directory management allows for a directory on the salt master to be recursively copied down to the minion. This is a great tool for deploying large code and configuration systems. A state using `recurse` would look something like this:

```
/opt/code/flask:
  file.recurse:
    - source: salt://code/flask
    - include_empty: True
```

A more complex `recurse` example:

```
{% set site_user = 'testuser' %}
{% set site_name = 'test_site' %}
{% set project_name = 'test_proj' %}
{% set sites_dir = 'test_dir' %}
```

```

django-project:
  file.recurse:
    - name: {{ sites_dir }}/{{ site_name }}/{{ project_name }}
    - user: {{ site_user }}
    - dir_mode: 2775
    - file_mode: '0644'
    - template: jinja
    - source: salt://project/templates_dir
    - include_empty: True

```

Retention scheduling can be applied to manage contents of backup directories. For example:

```

/var/backups/example_directory:
  file.retention_schedule:
    - strptime_format: example_name_%Y%m%dT%H%M%S.tar.bz2
    - retain:
        most_recent: 5
        first_of_hour: 4
        first_of_day: 14
        first_of_week: 6
        first_of_month: 6
        first_of_year: all

```

#### `salt.states.file.absent`(*name*)

Make sure that the named file or directory is absent. If it exists, it will be deleted. This will work to reverse any of the functions in the file state module. If a directory is supplied, it will be recursively deleted.

**name** The path which should be deleted

#### `salt.states.file.accumulated`(*name, filename, text, \*\*kwargs*)

Prepare accumulator which can be used in template in file.managed state. Accumulator dictionary becomes available in template. It can also be used in file.blockreplace.

**name** Accumulator name

**filename** Filename which would receive this accumulator (see file.managed state documentation about name)

**text** String or list for adding in accumulator

**require\_in / watch\_in** One of them required for sure we fill up accumulator before we manage the file. Probably the same as filename

Example:

Given the following:

```

animals_doing_things:
  file.accumulated:
    - filename: /tmp/animal_file.txt
    - text: ' jumps over the lazy dog.'
    - require_in:
        - file: animal_file

animal_file:
  file.managed:
    - name: /tmp/animal_file.txt
    - source: salt://animal_file.txt
    - template: jinja

```

One might write a template for `animal_file.txt` like the following:

```
The quick brown fox{% for animal in accumulator['animals_doing_things'] %}{{
↳animal }}{% endfor %}
```

Collectively, the above states and template file will produce:

```
The quick brown fox jumps over the lazy dog.
```

Multiple accumulators can be ``chained`` together.

**Note:** The `accumulator` data structure is a Python dictionary. Do not expect any loop over the keys in a deterministic order!

```
salt.states.file.append(name, text=None, makedirs=False, source=None, source_hash=None, tem-
                        plate='jinja', sources=None, source_hashes=None, defaults=None, con-
                        text=None, ignore_whitespace=True)
```

Ensure that some text appears at the end of a file.

The text will not be appended if it already exists in the file. A single string of text or a list of strings may be appended.

**name** The location of the file to append to.

**text** The text to be appended, which can be a single string or a list of strings.

**makedirs** If the file is located in a path without a parent directory, then the state will fail. If makedirs is set to True, then the parent directories will be created to facilitate the creation of the named file. Defaults to False.

**source** A single source file to append. This source file can be hosted on either the salt master server, or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials (see [s3.get](#) state documentation). File retrieval from Openstack Swift object storage is supported via `swift://container/object_path` URLs (see [swift.get](#) documentation).

For files hosted on the salt file server, if the file is located on the master in the directory named spam, and is called eggs, the source string is `salt://spam/eggs`.

If the file is hosted on an HTTP or FTP server, the `source_hash` argument is also required.

**source\_hash**

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

Type	Length
sha512	128
sha384	96
sha256	64
sha224	56
sha1	40
md5	32

See the `source_hash` parameter description for [file.managed](#) function for more details and examples.

**template** The named templating engine will be used to render the appended-to file. Defaults to `jinja`. The following templates are supported:

- [cheetah](#)

- *genshi*
- *jinja*
- *mako*
- *py*
- *wempy*

**sources** A list of source files to append. If the files are hosted on an HTTP or FTP server, the `source_hashes` argument is also required.

**source\_hashes** A list of `source_hashes` corresponding to the sources list specified in the `sources` argument.

**defaults** Default context passed to the template.

**context** Overrides default context variables passed to the template.

**ignore\_whitespace** New in version 2015.8.4.

Spaces and Tabs in text are ignored by default, when searching for the appending content, one space or multiple tabs are the same for salt. Set this option to `False` if you want to change this behavior.

Multi-line example:

```
/etc/motd:
file.append:
- text: |
    Thou hadst better eat salt with the Philosophers of Greece,
    than sugar with the Courtiers of Italy.
- Benjamin Franklin
```

Multiple lines of text:

```
/etc/motd:
file.append:
- text:
- Trust no one unless you have eaten much salt with him.
- "Salt is born of the purest of parents: the sun and the sea."
```

Gather text from multiple template files:

```
/etc/motd:
file:
- append
- template: jinja
- sources:
- salt://motd/devops-messages.tpl
- salt://motd/hr-messages.tpl
- salt://motd/general-messages.tpl
```

New in version 0.9.5.

`salt.states.file.blockreplace`(*name*, *marker\_start*='#-- start managed zone --', *marker\_end*='#-- end managed zone --', *source*=None, *source\_hash*=None, *template*='jinja', *sources*=None, *source\_hashes*=None, *defaults*=None, *context*=None, *content*='', *append\_if\_not\_found*=False, *prepend\_if\_not\_found*=False, *backup*='.bak', *show\_changes*=True)

Maintain an edit in a file in a zone delimited by two line markers

New in version 2014.1.0.

A block of content delimited by comments can help you manage several lines entries without worrying about old entries removal. This can help you maintaining an un-managed file containing manual edits. Note: this function will store two copies of the file in-memory (the original version and the edited version) in order to detect changes and only edit the targeted file if necessary.

**name** Filesystem path to the file to be edited

**marker\_start** The line content identifying a line as the start of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output

**marker\_end** The line content identifying a line as the end of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output. Note: you can use `file.accumulated` and target this state. All accumulated data dictionaries content will be added as new lines in the content

**content** The content to be used between the two lines identified by `marker_start` and `marker_end`

**source** The source file to download to the minion, this source file can be hosted on either the salt master server, or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials. (see `s3.get` state documentation) File retrieval from Openstack Swift object storage is supported via `swift://container/object_path` URLs, see `swift.get` documentation. For files hosted on the salt file server, if the file is located on the master in the directory named `spam`, and is called `eggs`, the source string is `salt://spam/eggs`. If source is left blank or `None` (use `~` in YAML), the file will be created as an empty file and the content will not be managed. This is also the case when a file already exists and the source is undefined; the contents of the file will not be changed or managed.

If the file is hosted on a HTTP or FTP server then the `source_hash` argument is also required.

A list of sources can also be passed in to provide a default source and a set of fallbacks. The first source in the list that is found to exist will be used and subsequent entries in the list will be ignored.

```
file_override_example:
  file.blockreplace:
    - name: /etc/example.conf
    - source:
      - salt://file_that_does_not_exist
      - salt://file_that_exists
```

**source\_hash**

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

Type	Length
sha512	128
sha384	96
sha256	64
sha224	56
sha1	40
md5	32

See the `source_hash` parameter description for `file.managed` function for more details and examples.

**template** The named templating engine will be used to render the downloaded file. Defaults to `jinja`. The following templates are supported:

- `cheetah`
- `genshi`
- `jinja`
- `mako`
- `py`
- `wempy`

**context** Overrides default context variables passed to the template.

**defaults** Default context passed to the template.

**append\_if\_not\_found** If markers are not found and set to True then the markers and content will be appended to the file. Default is False

**prepend\_if\_not\_found** If markers are not found and set to True then the markers and content will be prepended to the file. Default is False

**backup** The file extension to use for a backup of the file if any edit is made. Set this to False to skip making a backup.

**dry\_run** Don't make any edits to the file

**show\_changes** Output a unified diff of the old file and the new file. If False return a boolean if any changes were made

Example of usage with an accumulator and with a variable:

```
{% set myvar = 42 %}
hosts-config-block-{{ myvar }}:
  file.blockreplace:
    - name: /etc/hosts
    - marker_start: "# START managed zone {{ myvar }} -DO-NOT-EDIT-"
    - marker_end: "# END managed zone {{ myvar }} --"
    - content: 'First line of content'
    - append_if_not_found: True
    - backup: '.bak'
    - show_changes: True

hosts-config-block-{{ myvar }}-accumulated1:
  file.accumulated:
    - filename: /etc/hosts
    - name: my-accumulator-{{ myvar }}
    - text: "text 2"
    - require_in:
      - file: hosts-config-block-{{ myvar }}

hosts-config-block-{{ myvar }}-accumulated2:
  file.accumulated:
    - filename: /etc/hosts
    - name: my-accumulator-{{ myvar }}
    - text: |
      text 3
      text 4
    - require_in:
      - file: hosts-config-block-{{ myvar }}
```

will generate and maintain a block of content in /etc/hosts:

```
# START managed zone 42 -DO-NOT-EDIT-
First line of content
text 2
text 3
text 4
# END managed zone 42 --
```

`salt.states.file.cached`(*name*, *source\_hash*='', *source\_hash\_name*=None, *skip\_verify*=False, *saltenv*='base')

New in version 2017.7.3.

Ensures that a file is saved to the minion's cache. This state is primarily invoked by other states to ensure that we do not re-download a source file if we do not need to.

**name** The URL of the file to be cached. To cache a file from an environment other than base, either use the `saltenv` argument or include the `saltenv` in the URL (e.g.

`salt://path/to/file.conf?saltenv=dev`).

---

**Note:** A list of URLs is not supported, this must be a single URL. If a local file is passed here, then the state will obviously not try to download anything, but it will compare a hash if one is specified.

---

**source\_hash** See the documentation for this same argument in the *file.managed* state.

---

**Note:** For remote files not originating from the `salt://` fileserver, such as http(s) or ftp servers, this state will not re-download the file if the locally-cached copy matches this hash. This is done to prevent unnecessary downloading on repeated runs of this state. To update the cached copy of a file, it is necessary to update this hash.

---

**source\_hash\_name** See the documentation for this same argument in the *file.managed* state.

**skip\_verify** See the documentation for this same argument in the *file.managed* state.

---

**Note:** Setting this to True will result in a copy of the file being downloaded from a remote (http(s), ftp, etc.) source each time the state is run.

---

**saltenv** Used to specify the environment from which to download a file from the Salt fileserver (i.e. those with `salt://` URL).

This state will in most cases not be useful in SLS files, but it is useful when writing a state or remote-execution module that needs to make sure that a file at a given URL has been downloaded to the cachedir. One example of this is in the `archive.extracted` state:

```
result = __states__['file.cached'](source_match,
                                   source_hash=source_hash,
                                   source_hash_name=source_hash_name,
                                   skip_verify=skip_verify,
                                   saltenv=__env__)
```

This will return a dictionary containing the state's return data, including a `result` key which will state whether or not the state was successful. Note that this will not catch exceptions, so it is best used within a `try/except`.

Once this state has been run from within another state or remote-execution module, the actual location of the cached file can be obtained using `cp.is_cached`:

```
cached = __salt__['cp.is_cached'](source_match)
```

This function will return the cached path of the file, or an empty string if the file is not present in the minion cache.

This state will in most cases not be useful in SLS files, but it is useful when writing a state or remote-execution module that needs to make sure that a file at a given URL has been downloaded to the cachedir. One example of this is in the `archive.extracted` state:

```
result = __states__['file.cached'](source_match,
                                   source_hash=source_hash,
                                   source_hash_name=source_hash_name,
                                   skip_verify=skip_verify,
                                   saltenv=__env__)
```

This will return a dictionary containing the state's return data, including a `result` key which will state whether or not the state was successful. Note that this will not catch exceptions, so it is best used within a `try/except`.

Once this state has been run from within another state or remote-execution module, the actual location of the cached file can be obtained using `cp.is_cached`:

```
cached = __salt__['cp.is_cached'](source_match)
```

This function will return the cached path of the file, or an empty string if the file is not present in the minion cache.

`salt.states.file.comment`(*name, regex, char='#, backup='.bak'*)

Comment out specified lines in a file.

**name** The full path to the file to be edited

**regex** A regular expression used to find the lines that are to be commented; this pattern will be wrapped in parenthesis and will move any preceding/trailing `^` or `$` characters outside the parenthesis (e.g., the pattern `^foo$` will be rewritten as `^(foo)$`) Note that you *need* the leading `^`, otherwise each time you run highstate, another comment char will be inserted.

**char** [#] The character to be inserted at the beginning of a line in order to comment it out

**backup** [.bak] The file will be backed up before edit with this file extension

**Warning:** This backup will be overwritten each time `sed / comment / uncomment` is called. Meaning the backup will only be useful after the first invocation.

Set to `False/None` to not keep a backup.

Usage:

```
/etc/fstab:
file.comment:
- regex: ^bind 127.0.0.1
```

New in version 0.9.5.

`salt.states.file.copy`(*name, source, force=False, makedirs=False, preserve=False, user=None, group=None, mode=None, subdir=False, \*\*kwargs*)

If the source file exists on the system, copy it to the named file. The named file will not be overwritten if it already exists unless the `force` option is set to `True`.

**name** The location of the file to copy to

**source** The location of the file to copy to the location specified with `name`

**force** If the target location is present then the file will not be moved, specify `force: True` to overwrite the target file

**makedirs** If the target subdirectories don't exist create them

**preserve** New in version 2015.5.0.

Set `preserve: True` to preserve user/group ownership and mode after copying. Default is `False`. If `preserve` is set to `True`, then user/group/mode attributes will be ignored.

**user** New in version 2015.5.0.

The user to own the copied file, this defaults to the user salt is running as on the minion. If `preserve` is set to `True`, then this will be ignored

**group** New in version 2015.5.0.

The group to own the copied file, this defaults to the group salt is running as on the minion. If `preserve` is set to `True` or on Windows this will be ignored

**mode** New in version 2015.5.0.

The permissions to set on the copied file, aka `644`, `'0775'`, `'4664'`. If `preserve` is set to `True`, then this will be ignored. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

**subdir** New in version 2015.5.0.

If the name is a directory then place the file inside the named directory

**Note:** The copy function accepts paths that are local to the Salt minion. This function does not support salt://, http://, or the other additional file paths that are supported by *states.file.managed* and *states.file.recurse*.

`salt.states.file.decode`(*name*, *encoded\_data=None*, *contents\_pillar=None*, *encoding\_type='base64'*, *checksum='md5'*)

Decode an encoded file and write it to disk

New in version 2016.3.0.

**name** Path of the file to be written.

**encoded\_data** The encoded file. Either this option or *contents\_pillar* must be specified.

**contents\_pillar** A Pillar path to the encoded file. Uses the same path syntax as *pillar.get*. The *hashutil.base64\_encodefile* function can load encoded content into Pillar. Either this option or *encoded\_data* must be specified.

**encoding\_type** [base64] The type of encoding.

**checksum** [md5] The hashing algorithm to use to generate checksums. Wraps the *hashutil.digest* execution function.

Usage:

```
write_base64_encoded_string_to_a_file:
  file.decode:
    - name: /tmp/new_file
    - encoding_type: base64
    - contents_pillar: mypillar:thefile

# or

write_base64_encoded_string_to_a_file:
  file.decode:
    - name: /tmp/new_file
    - encoding_type: base64
    - encoded_data: |
      Z2V0IHNhbHRlZAo=
```

Be careful with multi-line strings that the YAML indentation is correct. E.g.,

```
write_base64_encoded_string_to_a_file:
  file.decode:
    - name: /tmp/new_file
    - encoding_type: base64
    - encoded_data: |
      {{ salt.pillar.get('path:to:data') | indent(8) }}
```

`salt.states.file.directory`(*name*, *user=None*, *group=None*, *recurse=None*, *max\_depth=None*, *dir\_mode=None*, *file\_mode=None*, *makedirs=False*, *clean=False*, *re-quire=None*, *exclude\_pat=None*, *follow\_symlinks=False*, *force=False*, *backupname=None*, *allow\_symlink=True*, *children\_only=False*, *win\_owner=None*, *win\_perms=None*, *win\_deny\_perms=None*, *win\_inheritance=True*, *\*\*kwargs*)

Ensure that a named directory is present and has the right perms

**name** The location to create or manage a directory, as an absolute path

- user** The user to own the directory; this defaults to the user salt is running as on the minion
- group** The group ownership set for the directory; this defaults to the group salt is running as on the minion. On Windows, this is ignored
- recurse** Enforce user/group ownership and mode of directory recursively. Accepts a list of strings representing what you would like to recurse. If `mode` is defined, will recurse on both `file_mode` and `dir_mode` if they are defined. If `ignore_files` or `ignore_dirs` is included, files or directories will be left unchanged respectively. Example:

```
/var/log/httpd:
  file.directory:
    - user: root
    - group: root
    - dir_mode: 755
    - file_mode: 644
    - recurse:
      - user
      - group
      - mode
```

Leave files or directories unchanged:

```
/var/log/httpd:
  file.directory:
    - user: root
    - group: root
    - dir_mode: 755
    - file_mode: 644
    - recurse:
      - user
      - group
      - mode
      - ignore_dirs
```

New in version 2015.5.0.

- max\_depth** Limit the recursion depth. The default is no limit=None. ``max_depth'` and ``clean'` are mutually exclusive.

New in version 2016.11.0.

- dir\_mode / mode** The permissions mode to set any directories created. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

- file\_mode** The permissions mode to set any files created if ``mode'` is run in ``recurse'`. This defaults to `dir_mode`. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

- makedirs** If the directory is located in a path without a parent directory, then the state will fail. If `makedirs` is set to True, then the parent directories will be created to facilitate the creation of the named file.

- clean** Make sure that only files that are set up by salt and required by this function are kept. If this option is set then everything in this directory will be deleted unless it is required. ``clean'` and ``max_depth'` are mutually exclusive.

- require** Require other resources such as packages or files

- exclude\_pat** When ``clean'` is set to True, exclude this pattern from removal list and preserve in the destination.

- follow\_symlinks** [False] If the desired path is a symlink (or `recurse` is defined and a symlink is encountered while recursing), follow it and check the permissions of the directory/file to which the symlink points.

New in version 2014.1.4.

**force** If the name of the directory exists and is not a directory and force is set to False, the state will fail. If force is set to True, the file in the way of the directory will be deleted to make room for the directory, unless backupname is set, then it will be renamed.

New in version 2014.7.0.

**backupname** If the name of the directory exists and is not a directory, it will be renamed to the backupname. If the backupname already exists and force is False, the state will fail. Otherwise, the backupname will be removed first.

New in version 2014.7.0.

**allow\_symlink** [True] If allow\_symlink is True and the specified path is a symlink, it will be allowed to remain if it points to a directory. If allow\_symlink is False then the state will fail, unless force is also set to True, in which case it will be removed or renamed, depending on the value of the backupname argument.

New in version 2014.7.0.

**children\_only** [False] If children\_only is True the base of a path is excluded when performing a recursive operation. In case of /path/to/base, base will be ignored while all of /path/to/base/\* are still operated on.

**win\_owner** [None] The owner of the directory. If this is not passed, user will be used. If user is not passed, the account under which Salt is running will be used.

New in version 2017.7.0.

**win\_perms** [None] A dictionary containing permissions to grant and their propagation. For example: {'Administrators': {'perms': 'full\_control', 'applies\_to': 'this\_folder\_only'}} Can be a single basic perm or a list of advanced perms. perms must be specified. applies\_to is optional and defaults to this\_folder\_subfoler\_files.

New in version 2017.7.0.

**win\_deny\_perms** [None] A dictionary containing permissions to deny and their propagation. For example: {'Administrators': {'perms': 'full\_control', 'applies\_to': 'this\_folder\_only'}} Can be a single basic perm or a list of advanced perms.

New in version 2017.7.0.

**win\_inheritance** [True] True to inherit permissions from the parent directory, False not to inherit permission.

New in version 2017.7.0.

Here's an example using the above win\_\* parameters:

```
create_config_dir:
  file.directory:
    - name: C:\config\
    - win_owner: Administrators
    - win_perms:
      # Basic Permissions
      dev_ops:
        perms: full_control
      # List of advanced permissions
      appuser:
        perms:
          - read_attributes
          - read_ea
          - create_folders
          - read_permissions
        applies_to: this_folder_only
      joe_snuffy:
        perms: read
        applies_to: this_folder_files
    - win_deny_perms:
      fred_snuffy:
```

```
perms: full_control
- win_inheritance: False
```

`salt.states.file.exists`(*name*)

Verify that the named file or directory is present or exists. Ensures pre-requisites outside of Salt's purview (e.g., keytabs, private keys, etc.) have been previously satisfied before deployment.

**name** Absolute path which must exist

`salt.states.file.line`(*name*, *content=None*, *match=None*, *mode=None*, *location=None*, *before=None*, *after=None*, *show\_changes=True*, *backup=False*, *quiet=False*, *indent=True*, *create=False*, *user=None*, *group=None*, *file\_mode=None*)

Line-based editing of a file.

New in version 2015.8.0.

**name** Filesystem path to the file to be edited.

**content** Content of the line. Allowed to be empty if mode=delete.

**match** Match the target line for an action by a fragment of a string or regular expression.

If neither `before` nor `after` are provided, and `match` is also `None`, `match` becomes the `content` value.

**mode** Defines how to edit a line. One of the following options is required:

- **ensure** If line does not exist, it will be added.
- **replace** If line already exists, it will be replaced.
- **delete** Delete the line, once found.
- **insert** Insert a line.

---

**Note:** If `mode=insert` is used, at least one of the following options must also be defined: `location`, `before`, or `after`. If `location` is used, it takes precedence over the other two options.

---

**location** Defines where to place content in the line. Note this option is only used when `mode=insert` is specified. If a location is passed in, it takes precedence over both the `before` and `after` kwargs. Valid locations are:

- **start** Place the content at the beginning of the file.
- **end** Place the content at the end of the file.

**before** Regular expression or an exact case-sensitive fragment of the string. This option is only used when either the `ensure` or `insert` mode is defined.

**after** Regular expression or an exact case-sensitive fragment of the string. This option is only used when either the `ensure` or `insert` mode is defined.

**show\_changes** Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made. Default is `True`

---

**Note:** Using this option will store two copies of the file in-memory (the original version and the edited version) in order to generate the diff.

---

**backup** Create a backup of the original file with the extension: ``Year-Month-Day-Hour-Minutes-Seconds``.

**quiet** Do not raise any exceptions. E.g. ignore the fact that the file that is tried to be edited does not exist and nothing really happened.

**indent** Keep indentation with the previous line. This option is not considered when the `delete` mode is specified.

#### Parameters

- **create** -- Create an empty file if doesn't exists.

New in version 2016.11.0.

- **user** -- The user to own the file, this defaults to the user salt is running as on the minion.

New in version 2016.11.0.

- **group** -- The group ownership set for the file, this defaults to the group salt is running as on the minion. On Windows, this is ignored.

New in version 2016.11.0.

- **file\_mode** -- The permissions to set on this file, aka 644, 0775, 4664. Not supported on Windows.

New in version 2016.11.0.

If an equal sign (=) appears in an argument to a Salt command, it is interpreted as a keyword argument in the format of `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt.states.file.managed(name, source=None, source_hash='', source_hash_name=None,
                        keep_source=True, user=None, group=None, mode=None, template=None,
                        makedirs=False, dir_mode=None, context=None, replace=True, defaults=None,
                        backup='', show_changes=True, create=True, contents=None, tmp_ext='',
                        contents_pillar=None, contents_grains=None, contents_newline=True,
                        contents_delimiter=';', encoding=None, encoding_errors='strict',
                        allow_empty=True, follow_symlinks=True, check_cmd=None, skip_verify=False,
                        win_owner=None, win_perms=None, win_deny_perms=None, win_inheritance=True,
                        **kwargs)
```

Manage a given file, this function allows for a file to be downloaded from the salt master and potentially run through a templating system.

**name** The location of the file to manage, as an absolute path.

**source** The source file to download to the minion, this source file can be hosted on either the salt master server (`salt://`), the salt minion local file system (`/`), or on an HTTP or FTP server (`http(s)://`, `ftp://`).

Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials. (see `s3.get` state documentation) File retrieval from Openstack Swift object storage is supported via `swift://container/object_path` URLs, see `swift.get` documentation. For files hosted on the salt file server, if the file is located on the master in the directory named `spam`, and is called `eggs`, the source string is `salt://spam/eggs`. If source is left blank or `None` (use `~` in YAML), the file will be created as an empty file and the content will not be managed. This is also the case when a file already exists and the source is undefined; the contents of the file will not be changed or managed.

If the file is hosted on a HTTP or FTP server then the `source_hash` argument is also required.

A list of sources can also be passed in to provide a default source and a set of fallbacks. The first source in the list that is found to exist will be used and subsequent entries in the list will be ignored. Source list functionality only supports local files and remote files hosted on the salt master server or retrievable via HTTP, HTTPS, or FTP.

```
file_override_example:
  file.managed:
    - source:
      - salt://file_that_does_not_exist
      - salt://file_that_exists
```

**source\_hash**

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

Type	Length
=====	=====
sha512	128
sha384	96
sha256	64
sha224	56
sha1	40
md5	32

**Using a Source Hash File** The file can contain several checksums for several files. Each line must contain both the file name and the hash. If no file name is matched, the first hash encountered will be used, otherwise the most secure hash with the correct source file name will be used.

When using a source hash file the `source_hash` argument needs to be a url, the standard download urls are supported, ftp, http, salt etc:

Example:

```
tomdroid-src-0.7.3.tar.gz:
  file.managed:
    - name: /tmp/tomdroid-src-0.7.3.tar.gz
    - source: https://launchpad.net/tomdroid/beta/0.7.3/+download/
      ↪tomdroid-src-0.7.3.tar.gz
    - source_hash: https://launchpad.net/tomdroid/beta/0.7.3/+download/
      ↪tomdroid-src-0.7.3.hash
```

The following lines are all supported formats:

```
/etc/rc.conf ef6e82e4006dee563d98ada2a2a80a27
sha254c8525aee419eb649f0233be91c151178b30f0dff8ebbdcc8de71b1d5c8bcc06a /
↪etc/resolv.conf
ead48423703509d37c4a90e6a0d53e143b6fc268
```

Debian file type `*.dsc` files are also supported.

### Inserting the Source Hash in the SLS Data

The `source_hash` can be specified as a simple checksum, like so:

```
tomdroid-src-0.7.3.tar.gz:
  file.managed:
    - name: /tmp/tomdroid-src-0.7.3.tar.gz
    - source: https://launchpad.net/tomdroid/beta/0.7.3/+download/tomdroid-
      ↪src-0.7.3.tar.gz
    - source_hash: 79eef25f9b0b2c642c62b7f737d4f53f
```

**Note:** Releases prior to 2016.11.0 must also include the hash type, like in the below example:

```
tomdroid-src-0.7.3.tar.gz:
  file.managed:
    - name: /tmp/tomdroid-src-0.7.3.tar.gz
    - source: https://launchpad.net/tomdroid/beta/0.7.3/+download/tomdroid-
      ↪src-0.7.3.tar.gz
    - source_hash: md5=79eef25f9b0b2c642c62b7f737d4f53f
```

**Known issues:** If the remote server URL has the hash file as an apparent sub-directory of the source file, the module will discover that it has already cached a directory where a file should be cached.

For example:

```
tomdroid-src-0.7.3.tar.gz:
  file.managed:
    - name: /tmp/tomdroid-src-0.7.3.tar.gz
    - source: https://launchpad.net/tomdroid/beta/0.7.3/+download/
    ↪tomdroid-src-0.7.3.tar.gz
    - source_hash: https://launchpad.net/tomdroid/beta/0.7.3/+download/
    ↪tomdroid-src-0.7.3.tar.gz/+md5
```

**source\_hash\_name** When `source_hash` refers to a hash file, Salt will try to find the correct hash by matching the filename/URI associated with that hash. By default, Salt will look for the filename being managed. When managing a file at path `/tmp/foo.txt`, then the following line in a hash file would match:

```
acbd18db4cc2f85cedef654fccc4a4d8    foo.txt
```

However, sometimes a hash file will include multiple similar paths:

```
37b51d194a7513e45b56f6524f2d51f2    ./dir1/foo.txt
acbd18db4cc2f85cedef654fccc4a4d8    ./dir2/foo.txt
73feffa4b7f6bb68e44cf984c85f6e88    ./dir3/foo.txt
```

In cases like this, Salt may match the incorrect hash. This argument can be used to tell Salt which filename to match, to ensure that the correct hash is identified. For example:

```
/tmp/foo.txt:
  file.managed:
    - source: https://mydomain.tld/dir2/foo.txt
    - source_hash: https://mydomain.tld/ashes
    - source_hash_name: ./dir2/foo.txt
```

---

**Note:** This argument must contain the full filename entry from the checksum file, as this argument is meant to disambiguate matches for multiple files that have the same basename. So, in the example above, simply using `foo.txt` would not match.

---

New in version 2016.3.5.

**keep\_source** [True] Set to `False` to discard the cached copy of the source file once the state completes. This can be useful for larger files to keep them from taking up space in minion cache. However, keep in mind that discarding the source file will result in the state needing to re-download the source file if the state is run again.

New in version 2017.7.3.

**user** The user to own the file, this defaults to the user salt is running as on the minion

**group** The group ownership set for the file, this defaults to the group salt is running as on the minion. On Windows, this is ignored

**mode** The permissions to set on this file, e.g. `644`, `0775`, or `4664`.

The default mode for new files and directories corresponds to the `umask` of the salt process. The mode of existing files and directories will only be changed if `mode` is specified.

---

**Note:** This option is **not** supported on Windows.

---

Changed in version 2016.11.0: This option can be set to `keep`, and Salt will keep the mode from the Salt fileserver. This is only supported when the `source` URL begins with `salt://`, or for files local

to the minion. Because the `source` option cannot be used with any of the `contents` options, setting the mode to `keep` is also incompatible with the `contents` options.

---

**Note:** `keep` does not work with `salt-ssh`.

As a consequence of how the files are transferred to the minion, and the inability to connect back to the master with `salt-ssh`, salt is unable to `stat` the file as it exists on the fileserver and thus cannot mirror the mode on the `salt-ssh` minion

---

**template** If this setting is applied, the named templating engine will be used to render the downloaded file. The following templates are supported:

- `cheetah`
- `genshi`
- `jinja`
- `mako`
- `py`
- `wempy`

**makedirs** [False] If set to `True`, then the parent directories will be created to facilitate the creation of the named file. If `False`, and the parent directory of the destination file doesn't exist, the state will fail.

**dir\_mode** If directories are to be created, passing this option specifies the permissions for those directories. If this is not set, directories will be assigned permissions by adding the execute bit to the mode of the files.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

**replace** [True] If set to `False` and the file already exists, the file will not be modified even if changes would otherwise be made. Permissions and ownership will still be enforced, however.

**context** Overrides default context variables passed to the template.

**defaults** Default context passed to the template.

**backup** Overrides the default backup mode for this specific file. See [backup\\_mode documentation](#) for more details.

**show\_changes** Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made.

**create** [True] If set to `False`, then the file will only be managed if the file already exists on the system.

**contents** Specify the contents of the file. Cannot be used in combination with `source`. Ignores hashes and does not use a templating engine.

This value can be either a single string, a multiline YAML string or a list of strings. If a list of strings, then the strings will be joined together with newlines in the resulting file. For example, the below two example states would result in identical file contents:

```
/path/to/file1:
  file.managed:
    - contents:
      - This is line 1
      - This is line 2

/path/to/file2:
  file.managed:
    - contents: |
      This is line 1
      This is line 2
```

**contents\_pillar** New in version 0.17.0.

Operates like `contents`, but draws from a value stored in pillar, using the pillar path syntax used in [pillar.get](#). This is useful when the pillar value contains newlines, as referencing a pillar vari-

able using a jinja/mako template can result in YAML formatting issues due to the newlines causing indentation mismatches.

For example, the following could be used to deploy an SSH private key:

```
/home/deployer/.ssh/id_rsa:
  file.managed:
    - user: deployer
    - group: deployer
    - mode: 600
    - contents_pillar: userdata:deployer:id_rsa
```

This would populate `/home/deployer/.ssh/id_rsa` with the contents of `pillar['userdata']['deployer']['id_rsa']`. An example of this pillar setup would be like so:

```
userdata:
  deployer:
    id_rsa: |
      -----BEGIN RSA PRIVATE KEY-----
      MIIIEowIBAAKCAQEAAoQiwO3JhBquPAalQF9qP1LLZNXVjYMIswrMe2HcWUVBgh+vY
      U7sCwx/dH6+VvNwmCoqmNnP+8gTPKGL1vgA0bJAnMT623dMXjVKwnEagZPRJixDy
      B/HaAre9euNiY3LvIzBTWRSeMfT+rWvIKVBpvwlgGrfgz70m0ppqxu+UyFbAGLin+
      GpxzZAMaFpZw4sSbIlRuissXZj/sHpQb8p9M5Ie04Z3rjkCP1cxI
      -----END RSA PRIVATE KEY-----
```

**Note:** The private key above is shortened to keep the example brief, but shows how to do multiline string in YAML. The key is followed by a pipe character, and the multiline string is indented two more spaces.

To avoid the hassle of creating an indented multiline YAML string, the *file\_tree external pillar* can be used instead. However, this will not work for binary files in Salt releases before 2015.8.4.

**contents\_grains** New in version 2014.7.0.

Operates like `contents`, but draws from a value stored in grains, using the grains path syntax used in *grains.get*. This functionality works similarly to `contents_pillar`, but with grains.

For example, the following could be used to deploy a "message of the day" file:

```
write_motd:
  file.managed:
    - name: /etc/motd
    - contents_grains: motd
```

This would populate `/etc/motd` file with the contents of the `motd` grain. The `motd` grain is not a default grain, and would need to be set prior to running the state:

```
salt '*' grains.set motd 'Welcome! This system is managed by Salt.'
```

**contents\_newline** [True] New in version 2014.7.0.

Changed in version 2015.8.4: This option is now ignored if the contents being deployed contain binary data.

If `True`, files managed using `contents`, `contents_pillar`, or `contents_grains` will have a newline added to the end of the file if one is not present. Setting this option to `False` will omit this final newline.

**contents\_delimiter** New in version 2015.8.4.

Can be used to specify an alternate delimiter for `contents_pillar` or `contents_grains`. This delimiter will be passed through to `pillar.get` or `grains.get` when retrieving the contents.

**encoding** Encoding used for the file, e.g. ``UTF-8``, ``base64``. Default is `None`, which means `str()` will be applied to contents to ensure an ascii encoded file and backwards compatibility. See <https://docs.python.org/3/library/codecs.html#standard-encodings> for available encodings.

New in version 2017.7.0.

**encoding\_errors** [``strict``] Error encoding scheme. Default is ``strict``. See <https://docs.python.org/2/library/codecs.html#codec-base-classes> for the list of available schemes.

New in version 2017.7.0.

**allow\_empty** [`True`] New in version 2015.8.4.

If set to `False`, then the state will fail if the contents specified by `contents_pillar` or `contents_grains` are empty.

**follow\_symlinks** [`True`] New in version 2014.7.0.

If the desired path is a symlink follow it and make changes to the file to which the symlink points.

**check\_cmd** New in version 2014.7.0.

The specified command will be run with an appended argument of a *temporary* file containing the new managed contents. If the command exits with a zero status the new managed contents will be written to the managed destination. If the command exits with a nonzero exit code, the state will fail and no changes will be made to the file.

For example, the following could be used to verify sudoers before making changes:

```
/etc/sudoers:
  file.managed:
    - user: root
    - group: root
    - mode: 0440
    - source: salt://sudoers/files/sudoers.jinja
    - template: jinja
    - check_cmd: /usr/sbin/visudo -c -f
```

**NOTE:** This `check_cmd` functions differently than the requisite `check_cmd`.

**tmp\_ext** Suffix for temp file created by `check_cmd`. Useful for checkers dependent on config file extension (e.g. the `init-checkconf` upstart config checker).

```
/etc/init/test.conf:
  file.managed:
    - user: root
    - group: root
    - mode: 0440
    - tmp_ext: '.conf'
    - contents:
      - 'description "Salt Minion"'
      - 'start on started mountall'
      - 'stop on shutdown'
      - 'respawn'
      - 'exec salt-minion'
    - check_cmd: init-checkconf -f
```

**skip\_verify** [`False`] If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.3.0.

**win\_owner** [None] The owner of the directory. If this is not passed, user will be used. If user is not passed, the account under which Salt is running will be used.

New in version 2017.7.0.

**win\_perms** [None] A dictionary containing permissions to grant and their propagation. For example: {'Administrators': {'perms': 'full\_control'}} Can be a single basic perm or a list of advanced perms. perms must be specified. applies\_to does not apply to file objects.

New in version 2017.7.0.

**win\_deny\_perms** [None] A dictionary containing permissions to deny and their propagation. For example: {'Administrators': {'perms': 'full\_control'}} Can be a single basic perm or a list of advanced perms. perms must be specified. applies\_to does not apply to file objects.

New in version 2017.7.0.

**win\_inheritance** [True] True to inherit permissions from the parent directory, False not to inherit permission.

New in version 2017.7.0.

Here's an example using the above win\_\* parameters:

```
create_config_file:
  file.managed:
    - name: C:\config\settings.cfg
    - source: salt://settings.cfg
    - win_owner: Administrators
    - win_perms:
      # Basic Permissions
      dev_ops:
        perms: full_control
      # List of advanced permissions
      appuser:
        perms:
          - read_attributes
          - read_ea
          - create_folders
          - read_permissions
      joe_snuffy:
        perms: read
    - win_deny_perms:
      fred_snuffy:
        perms: full_control
    - win_inheritance: False
```

**salt.states.file.missing**(name)

Verify that the named file or directory is missing, this returns True only if the named file is missing but does not remove the file if it is present.

**name** Absolute path which must NOT exist

**salt.states.file.mknod**(name, ntype, major=0, minor=0, user=None, group=None, mode='0600')

Create a special file similar to the ``nix mknod` command. The supported device types are `p` (fifo pipe), `c` (character device), and `b` (block device). Provide the major and minor numbers when specifying a character device or block device. A fifo pipe does not require this information. The command will create the necessary dirs if needed. If a file of the same name not of the same type/major/minor exists, it will not be overwritten or unlinked (deleted). This is logically in place as a safety measure because you can really shoot yourself in the foot here and it is the behavior of ``nix mknod`. It is also important to note that not just anyone can create special devices. Usually this is only done as root. If the state is executed as none other than root on a minion, you may receive a permission error.

**name** name of the file

**ntype** node type ``p'` (fifo pipe), ``c'` (character device), or ``b'` (block device)

**major** major number of the device does not apply to a fifo pipe

**minor** minor number of the device does not apply to a fifo pipe

**user** owning user of the device/pipe

**group** owning group of the device/pipe

**mode** permissions on the device/pipe

Usage:

```
/dev/chr:
  file.mknod:
    - ntype: c
    - major: 180
    - minor: 31
    - user: root
    - group: root
    - mode: 660

/dev/blk:
  file.mknod:
    - ntype: b
    - major: 8
    - minor: 999
    - user: root
    - group: root
    - mode: 660

/dev/fifo:
  file.mknod:
    - ntype: p
    - user: root
    - group: root
    - mode: 660
```

New in version 0.17.0.

`salt.states.file.mod_run_check_cmd(cmd, filename, **check_cmd_opts)`

Execute the check\_cmd logic.

Return a result dict if check\_cmd succeeds (check\_cmd == 0) otherwise return True

`salt.states.file.not_cached(name, saltenv='base')`

Ensures that a file is saved to the minion's cache. This state is primarily invoked by other states to ensure that we do not re-download a source file if we do not need to.

**name** The URL of the file to be cached. To cache a file from an environment other than base, either use the saltenv argument or include the saltenv in the URL (e.g. salt://path/to/file.conf?saltenv=dev).

---

**Note:** A list of URLs is not supported, this must be a single URL. If a local file is passed here, the state will take no action.

---

**saltenv** Used to specify the environment from which to download a file from the Salt fileserver (i.e. those with salt:// URL).

`salt.states.file.patch(name, source=None, options='', dry_run_first=True, **kwargs)`

Apply a patch to a file or directory.

---

**Note:** A suitable patch executable must be available on the minion when using this state function.

---

- name** The file or directory to which the patch will be applied.
- source** The source patch to download to the minion, this source file must be hosted on the salt master server. If the file is located in the directory named spam, and is called eggs, the source string is salt://spam/eggs. A source is required.
- hash** The hash of the patched file. If the hash of the target file matches this value then the patch is assumed to have been applied. For versions 2016.11.4 and newer, the hash can be specified without an accompanying hash type (e.g. e138491e9d5b97023cea823fe17bac22), but for earlier releases it is necessary to also specify the hash type in the format <hash\_type>:<hash\_value> (e.g. md5:e138491e9d5b97023cea823fe17bac22).
- options** Extra options to pass to patch.
- dry\_run\_first** [True] Run patch with --dry-run first to check if it will apply cleanly.
- saltenv** Specify the environment from which to retrieve the patch file indicated by the source parameter. If not provided, this defaults to the environment from which the state is being executed.

**Usage:**

```
# Equivalent to ``patch --forward /opt/file.txt file.patch``
/opt/file.txt:
  file.patch:
    - source: salt://file.patch
    - hash: e138491e9d5b97023cea823fe17bac22
```

**Note:** For minions running version 2016.11.3 or older, the hash in the example above would need to be specified with the hash type (i.e. md5:e138491e9d5b97023cea823fe17bac22).

**salt.states.file.prepend**(name, text=None, makedirs=False, source=None, source\_hash=None, template='jinja', sources=None, source\_hashes=None, defaults=None, context=None, header=None)

Ensure that some text appears at the beginning of a file

The text will not be prepended again if it already exists in the file. You may specify a single line of text or a list of lines to append.

Multi-line example:

```
/etc/motd:
  file.prepend:
    - text: |
      Thou hadst better eat salt with the Philosophers of Greece,
      than sugar with the Courtiers of Italy.
    - Benjamin Franklin
```

Multiple lines of text:

```
/etc/motd:
  file.prepend:
    - text:
      - Trust no one unless you have eaten much salt with him.
      - "Salt is born of the purest of parents: the sun and the sea."
```

Optionally, require the text to appear exactly as specified (order and position). Combine with multi-line or multiple lines of input.

```
/etc/motd:
  file.prepend:
    - header: True
```

- ```
- text:
- This will be the very first line in the file.
- The 2nd line, regardless of duplicates elsewhere in the file.
- These will be written anew if they do not appear verbatim.
```

Gather text from multiple template files:

```
/etc/motd:
  file:
    - prepend
    - template: jinja
    - sources:
      - salt://motd/devops-messages.tpl
      - salt://motd/hr-messages.tpl
      - salt://motd/general-messages.tpl
```

New in version 2014.7.0.

`salt.states.file.recurse`(*name*, *source*, *keep\_source=True*, *clean=False*, *require=None*, *user=None*, *group=None*, *dir\_mode=None*, *file\_mode=None*, *sym\_mode=None*, *template=None*, *context=None*, *defaults=None*, *include\_empty=False*, *backup=''*, *include\_pat=None*, *exclude\_pat=None*, *maxdepth=None*, *keep\_symlinks=False*, *force\_symlinks=False*, *\*\*kwargs*)

Recurse through a subdirectory on the master and copy said subdirectory over to the specified path.

**name** The directory to set the recursion in

**source** The source directory, this directory is located on the salt master file server and is specified with the salt:// protocol. If the directory is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs

**keep\_source** [True] Set to False to discard the cached copy of the source file once the state completes. This can be useful for larger files to keep them from taking up space in minion cache. However, keep in mind that discarding the source file will result in the state needing to re-download the source file if the state is run again.

New in version 2017.7.3.

**clean** Make sure that only files that are set up by salt and required by this function are kept. If this option is set then everything in this directory will be deleted unless it is required.

**require** Require other resources such as packages or files

**user** The user to own the directory. This defaults to the user salt is running as on the minion

**group** The group ownership set for the directory. This defaults to the group salt is running as on the minion. On Windows, this is ignored

**dir\_mode** The permissions mode to set on any directories created.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

---

**Note:** This option is **not** supported on Windows.

---

**file\_mode** The permissions mode to set on any files created.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

---

**Note:** This option is **not** supported on Windows.

---

Changed in version 2016.11.0: This option can be set to keep, and Salt will keep the mode from the

Salt fileserver. This is only supported when the source URL begins with `salt://`, or for files local to the minion. Because the `source` option cannot be used with any of the `contents` options, setting the mode to `keep` is also incompatible with the `contents` options.

**sym\_mode** The permissions mode to set on any symlink created.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

---

**Note:** This option is **not** supported on Windows.

---

**template** If this setting is applied, the named templating engine will be used to render the downloaded file. The following templates are supported:

- *cheetah*
- *genshi*
- *jinja*
- *mako*
- *py*
- *wempy*

---

**Note:** The template option is required when recursively applying templates.

---

**context** Overrides default context variables passed to the template.

**defaults** Default context passed to the template.

**include\_empty** Set this to True if empty directories should also be created (default is False)

**backup** Overrides the default backup mode for all replaced files. See [backup\\_mode documentation](#) for more details.

**include\_pat** When copying, include only this pattern from the source. Default is glob match; if prefixed with ``E@'`, then regexp match. Example:

```
- include_pat: hello*           :: glob matches 'hello01', 'hello02'
                               ... but not 'otherhello'
- include_pat: E@hello         :: regexp matches 'otherhello',
                               'hello01' ...
```

**exclude\_pat** Exclude this pattern from the source when copying. If both `include_pat` and `exclude_pat` are supplied, then it will apply conditions cumulatively. i.e. first select based on `include_pat`, and then within that result apply `exclude_pat`.

Also, when ``clean=True'`, exclude this pattern from the removal list and preserve in the destination. Example:

```
- exclude_pat: APPDATA*         :: glob matches APPDATA.01,
                               APPDATA.02,.. for exclusion
- exclude_pat: E@(APPDATA)|(TEMPDATA) :: regexp matches APPDATA
                                       or TEMPDATA for exclusion
```

**maxdepth** When copying, only copy paths which are of depth `maxdepth` from the source path. Example:

```
- maxdepth: 0           :: Only include files located in the source
                        directory
- maxdepth: 1           :: Only include files located in the source
                        or immediate subdirectories
```

**keep\_symlinks** Keep symlinks when copying from the source. This option will cause the copy operation to terminate at the symlink. If desire behavior similar to `rsync`, then set this to True.

**force\_symlinks** Force symlink creation. This option will force the symlink creation. If a file or directory is obstructing symlink creation it will be recursively removed so that symlink creation can proceed. This option is usually not needed except in special circumstances.

`salt.states.file.rename`(*name*, *source*, *force=False*, *makedirs=False*)

If the source file exists on the system, rename it to the named file. The named file will not be overwritten if it already exists unless the force option is set to True.

**name** The location of the file to rename to

**source** The location of the file to move to the location specified with name

**force** If the target location is present then the file will not be moved, specify ``force: True`` to overwrite the target file

**makedirs** If the target subdirectories don't exist create them

`salt.states.file.replace`(*name*, *pattern*, *repl*, *count=0*, *flags=8*, *bufsize=1*, *append\_if\_not\_found=False*, *prepend\_if\_not\_found=False*, *not\_found\_content=None*, *backup='.bak'*, *show\_changes=True*, *ignore\_if\_missing=False*, *backslash\_literal=False*)

Maintain an edit in a file.

New in version 0.17.0.

**name** Filesystem path to the file to be edited. If a symlink is specified, it will be resolved to its target.

**pattern** A regular expression, to be matched using Python's `search()`.

---

**Note:** If you need to match a literal string that contains regex special characters, you may want to use salt's custom Jinja filter, `escape_regex`.

```
>{{ 'http://example.com?foo=bar%20baz' | escape_regex }}
```

---

**repl** The replacement text

**count** Maximum number of pattern occurrences to be replaced. Defaults to 0. If count is a positive integer n, no more than n occurrences will be replaced, otherwise all occurrences will be replaced.

**flags** A list of flags defined in the [re module documentation](#). Each list item should be a string that will correlate to the human-friendly flag name. E.g., [ 'IGNORECASE', 'MULTILINE' ]. Optionally, flags may be an int, with a value corresponding to the XOR (|) of all the desired flags. Defaults to 8 (which equates to [ 'MULTILINE' ]).

---

**Note:** `file.replace` reads the entire file as a string to support multiline regex patterns. Therefore, when using anchors such as `^` or `$` in the pattern, those anchors may be relative to the line OR relative to the file. The default for `file.replace` is to treat anchors as relative to the line, which is implemented by setting the default value of `flags` to [ 'MULTILINE' ]. When overriding the default value for `flags`, if 'MULTILINE' is not present then anchors will be relative to the file. If the desired behavior is for anchors to be relative to the line, then simply add 'MULTILINE' to the list of flags.

---

**bufsize** How much of the file to buffer into memory at once. The default value 1 processes one line at a time.

The special value `file` may be specified which will read the entire file into memory before processing.

**append\_if\_not\_found** [False] If set to True, and pattern is not found, then the content will be appended to the file.

New in version 2014.7.0.

**prepend\_if\_not\_found** [False] If set to True and pattern is not found, then the content will be prepended to the file.

New in version 2014.7.0.

**not\_found\_content** Content to use for append/prepend if not found. If None (default), uses `repl`. Useful when `repl` uses references to group in pattern.

New in version 2014.7.0.

**backup** The file extension to use for a backup of the file before editing. Set to False to skip making a backup.

**show\_changes** [True] Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made. Returns a boolean or a string.

**ignore\_if\_missing** [False] New in version 2016.3.4.

Controls what to do if the file is missing. If set to `False`, the state will display an error raised by the execution module. If set to `True`, the state will simply report no changes.

**backslash\_literal** [False] New in version 2016.11.7.

Interpret backslashes as literal backslashes for the `repl` and not escape characters. This will help when using `append/prepend` so that the backslashes are not interpreted for the `repl` on the second run of the state.

For complex regex patterns, it can be useful to avoid the need for complex quoting and escape sequences by making use of YAML's multiline string syntax.

```
complex_search_and_replace:
  file.replace:
    # <...snip...>
    - pattern: |
        CentOS \((2.6.32[^\n]+\n\s+root[^\n]+\n\))+
```

**Note:** When using YAML multiline string syntax in `pattern:`, make sure to also use that syntax in the `repl:` part, or you might lose line feeds.

`salt.states.file.retention_schedule` (*name*, *retain*, *strptime\_format=None*, *timezone=None*)

Apply retention scheduling to backup storage directory.

New in version 2016.11.0.

#### Parameters

- **name** -- The filesystem path to the directory containing backups to be managed.
- **retain** -- Delete the backups, except for the ones we want to keep. The `N` below should be an integer but may also be the special value of `all`, which keeps all files matching the criteria. All of the retain options default to `None`, which means to not keep files based on this criteria.
  - most\_recent** `N` Keep the most recent `N` files.
  - first\_of\_hour** `N` For the last `N` hours from now, keep the first file after the hour.
  - first\_of\_day** `N` For the last `N` days from now, keep the first file after midnight. See also `timezone`.
  - first\_of\_week** `N` For the last `N` weeks from now, keep the first file after Sunday midnight.
  - first\_of\_month** `N` For the last `N` months from now, keep the first file after the start of the month.
  - first\_of\_year** `N` For the last `N` years from now, keep the first file after the start of the year.
- **strptime\_format** -- A python `strptime` format string used to first match the filenames of backups and then parse the filename to determine the date-time of the file. <https://docs.python.org/2/library/datetime.html#datetime.datetime.strptime> Defaults to `None`, which considers all files in the directory to be backups eligible for deletion and uses `os.path.getmtime()` to determine the datetime.
- **timezone** -- The timezone to use when determining midnight. This is only used when `datetime` is pulled from `os.path.getmtime()`. Defaults to `None` which uses the timezone from the locale.

```
salt.states.file.serialize(name, dataset=None, dataset_pillar=None, user=None, group=None,
                          mode=None, backup=' ', makedirs=False, show_diff=None,
                          show_changes=True, create=True, merge_if_exists=False, encod-
                          ing=None, encoding_errors='strict', **kwargs)
```

Serializes dataset and store it into managed file. Useful for sharing simple configuration files.

**name** The location of the file to create

**dataset** The dataset that will be serialized

**dataset\_pillar** Operates like `dataset`, but draws from a value stored in pillar, using the pillar path syntax used in `pillar.get`. This is useful when the pillar value contains newlines, as referencing a pillar variable using a jinja/mako template can result in YAML formatting issues due to the newlines causing indentation mismatches.

New in version 2015.8.0.

**formatter** Write the data as this format. See the list of `serializer` modules for supported output formats.

**encoding** Encoding used for the file, e.g. `'UTF-8'`, `'base64'`. Default is `None`, which means `str()` will be applied to contents to ensure an ascii encoded file. See <https://docs.python.org/3/library/codecs.html#standard-encodings> for available encodings.

New in version 2017.7.0.

**encoding\_errors** [`'strict'`] Error encoding scheme. Default is `'strict'`. See <https://docs.python.org/2/library/codecs.html#codec-base-classes> for the list of available schemes.

New in version 2017.7.0.

**user** The user to own the directory, this defaults to the user salt is running as on the minion

**group** The group ownership set for the directory, this defaults to the group salt is running as on the minion

**mode** The permissions to set on this file, e.g. `644`, `0775`, or `4664`.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

---

**Note:** This option is **not** supported on Windows.

---

**backup** Overrides the default backup mode for this specific file.

**makedirs** Create parent directories for destination file.

New in version 2014.1.3.

**show\_diff** DEPRECATED: Please use `show_changes`.

If set to `False`, the diff will not be shown in the return data if changes are made.

**show\_changes** Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made.

**create** Default is `True`, if `create` is set to `False` then the file will only be managed if the file already exists on the system.

**merge\_if\_exists** Default is `False`, if `merge_if_exists` is `True` then the existing file will be parsed and the dataset passed in will be merged with the existing content

New in version 2014.7.0.

For example, this state:

```
/etc/dummy/package.json:
file.serialize:
- dataset:
  name: naive
  description: A package using naive versioning
  author: A confused individual <iam@confused.com>
  dependencies:
    express: >= 1.2.0
```

```

    optimist: >= 0.1.0
    engine: node 0.4.1
  - formatter: json

```

will manage the file `/etc/dummy/package.json`:

```

{
  "author": "A confused individual <iam@confused.com>",
  "dependencies": {
    "express": ">= 1.2.0",
    "optimist": ">= 0.1.0"
  },
  "description": "A package using naive versioning",
  "engine": "node 0.4.1",
  "name": "naive"
}

```

`salt.states.file.shortcut`(*name*, *target*, *arguments=None*, *working\_dir=None*, *description=None*, *icon\_location=None*, *force=False*, *backupname=None*, *makedirs=False*, *user=None*, *\*\*kwargs*)

Create a Windows shortcut

If the file already exists and is a shortcut pointing to any location other than the specified target, the shortcut will be replaced. If it is a regular file or directory then the state will return False. If the regular file or directory is desired to be replaced with a shortcut pass `force: True`, if it is to be renamed, pass a `backupname`.

**name** The location of the shortcut to create. Must end with either `".lnk"` or `".url"`

**target** The location that the shortcut points to

**arguments** Any arguments to pass in the shortcut

**working\_dir** Working directory in which to execute target

**description** Description to set on shortcut

**icon\_location** Location of shortcut's icon

**force** If the name of the shortcut exists and is not a file and `force` is set to `False`, the state will fail. If `force` is set to `True`, the link or directory in the way of the shortcut file will be deleted to make room for the shortcut, unless `backupname` is set, when it will be renamed

**backupname** If the name of the shortcut exists and is not a file, it will be renamed to the `backupname`. If the `backupname` already exists and `force` is `False`, the state will fail. Otherwise, the `backupname` will be removed first.

**makedirs** If the location of the shortcut does not already have a parent directory then the state will fail, setting `makedirs` to `True` will allow Salt to create the parent directory. Setting this to `True` will also create the parent for `backupname` if necessary.

**user** The user to own the file, this defaults to the user salt is running as on the minion

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

`salt.states.file.symlink`(*name*, *target*, *force=False*, *backupname=None*, *makedirs=False*, *user=None*, *group=None*, *mode=None*, *\*\*kwargs*)

Create a symbolic link (symlink, soft link)

If the file already exists and is a symlink pointing to any location other than the specified target, the symlink will be replaced. If the symlink is a regular file or directory then the state will return False. If the regular file or directory is desired to be replaced with a symlink pass `force: True`, if it is to be renamed, pass a `backupname`.

**name** The location of the symlink to create

**target** The location that the symlink points to

**force** If the name of the symlink exists and is not a symlink and `force` is set to `False`, the state will fail. If `force` is set to `True`, the file or directory in the way of the symlink file will be deleted to make room for the symlink, unless `backupname` is set, when it will be renamed

**backupname** If the name of the symlink exists and is not a symlink, it will be renamed to the backupname. If the backupname already exists and force is False, the state will fail. Otherwise, the backupname will be removed first.

**makedirs** If the location of the symlink does not already have a parent directory then the state will fail, setting makedirs to True will allow Salt to create the parent directory

**user** The user to own the file, this defaults to the user salt is running as on the minion

**group** The group ownership set for the file, this defaults to the group salt is running as on the minion. On Windows, this is ignored

**mode** The permissions to set on this file, aka 644, 0775, 4664. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

`salt.states.file.touch` (*name*, *atime=None*, *mtime=None*, *makedirs=False*)

Replicate the `nix` ``touch`` command to create a new empty file or update the atime and mtime of an existing file.

Note that if you just want to create a file and don't care about atime or mtime, you should use `file.managed` instead, as it is more feature-complete. (Just leave out the `source/template/contents` arguments, and it will just create the file and/or check its permissions, without messing with contents)

**name** name of the file

**atime** atime of the file

**mtime** mtime of the file

**makedirs** whether we should create the parent directory/directories in order to touch the file

Usage:

```
/var/log/httpd/logrotate.empty:
  file.touch
```

New in version 0.9.5.

`salt.states.file.uncomment` (*name*, *regex*, *char='#'*, *backup='.bak'*)

Uncomment specified commented lines in a file

**name** The full path to the file to be edited

**regex** A regular expression used to find the lines that are to be uncommented. This regex should not include the comment character. A leading `^` character will be stripped for convenience (for easily switching between `comment()` and `uncomment()`). The regex will be searched for from the beginning of the line, ignoring leading spaces (we prepend `^[ t]*`)

**char** [#] The character to remove in order to uncomment a line

**backup** [.bak] The file will be backed up before edit with this file extension;

**Warning:** This backup will be overwritten each time `sed / comment / uncomment` is called. Meaning the backup will only be useful after the first invocation.

Set to False/None to not keep a backup.

Usage:

```
/etc/adduser.conf:
  file.uncomment:
    - regex: EXTRA_GROUPS
```

New in version 0.9.5.

### 14.17.80 salt.states.firewall module

State to check firewall configurations .. versionadded:: 2016.3.0

`salt.states.firewall.check`(*name*, *port=None*, *\*\*kwargs*)

Checks if there is an open connection from the minion to the defined host on a specific port.

**name** host name or ip address to test connection to

**port** The port to test the connection on

**\*\*kwargs**

Additional parameters, parameters allowed are: proto (tcp or udp) family (ipv4 or ipv6) timeout

```
testgoogle:
  firewall.check:
    - name: 'google.com'
    - port: 80
    - proto: 'tcp'
```

### 14.17.81 salt.states.firewalld

Management of firewalld

New in version 2015.8.0.

The following example applies changes to the public zone, blocks echo-reply and echo-request packets, does not set the zone to be the default, enables masquerading, and allows ports 22/tcp and 25/tcp. It will be applied permanently and directly before restart/reload.

```
public:
  firewalld.present:
    - name: public
    - block_icmp:
      - echo-reply
      - echo-request
    - default: False
    - masquerade: True
    - ports:
      - 22/tcp
      - 25/tcp
```

The following example applies changes to the public zone, enables masquerading and configures port forwarding TCP traffic from port 22 to 2222, and forwards TCP traffic from port 80 to 443 at 192.168.0.1.

```
my_zone:
  firewalld.present:
    - name: public
    - masquerade: True
    - port_fwd:
      - 22:2222:tcp
      - 80:443:tcp:192.168.0.1
```

The following example binds the public zone to interface eth0 and to all packets coming from the 192.168.1.0/24 subnet. It also removes the zone from all other interfaces or sources.

```
public:
  firewalld.present:
    - name: public
    - interfaces:
```

```
- eth0
- sources:
  - 192.168.1.0/24
```

Here, we define a new service that encompasses TCP ports 4505 4506:

```
saltmaster:
  firewalld.service:
    - name: saltmaster
    - ports:
      - 4505/tcp
      - 4506/tcp
```

To make this new service available in a zone, the following can be used, which would allow access to the salt master from the 10.0.0.0/8 subnet:

```
saltzone:
  firewalld.present:
    - name: saltzone
    - services:
      - saltmaster
    - sources:
      - 10.0.0.0/8
```

**class** `salt.states.firewalld.ForwardingMapping`(*srcport, destport, protocol, destaddr*)

Represents a port forwarding statement mapping a local port to a remote port for a specific protocol (TCP or UDP)

**todict**()

Returns a pretty dictionary meant for command line output.

**salt.states.firewalld.present**(*name, block\_icmp=None, default=None, masquerade=False, ports=None, port\_fwd=None, services=None, prune\_services=True, interfaces=None, sources=None, rich\_rules=None*)

Ensure a zone has specific attributes.

**salt.states.firewalld.service**(*name, ports=None, protocols=None*)

Ensure the service exists and encompasses the specified ports and protocols.

New in version 2016.11.0.

## 14.17.82 salt.states.gem

### Installation of Ruby modules packaged as gems

A state module to manage rubygems. Gems can be set up to be installed or removed. This module will use RVM or rbenv if they are installed. In that case, you can specify what ruby version and gemset to target.

```
addressable:
  gem.installed:
    - user: rvm
    - ruby: jruby@jgemset
```

**salt.states.gem.installed**(*name, ruby=None, gem\_bin=None, user=None, version=None, rdoc=False, ri=False, pre\_releases=False, proxy=None, source=None*)

Make sure that a gem is installed.

**name** The name of the gem to install

**ruby:** **None** Only for RVM or rbenv installations: the ruby version and gemset to target.  
**gem\_bin:** **None** Custom gem command to run instead of the default. Use this to install gems to a non-default ruby install. If you are using rvm or rbenv use the ruby argument instead.  
**user:** **None** The user under which to run the gem command

New in version 0.17.0.

**version** [None] Specify the version to install for the gem. Doesn't play nice with multiple gems at once  
**rdoc** [False] Generate RDoc documentation for the gem(s).  
**ri** [False] Generate RI documentation for the gem(s).  
**pre\_releases** [False] Install pre-release version of gem(s) if available.  
**proxy** [None] Use the specified HTTP proxy server for all outgoing traffic. Format: [http://hostname\[{}:port\]](http://hostname[{}:port])  
**source** [None] Use the specified HTTP gem source server to download gem. Format: [http://hostname\[{}:port\]](http://hostname[{}:port])

`salt.states.gem.removed` (*name*, *ruby=None*, *user=None*, *gem\_bin=None*)

Make sure that a gem is not installed.

**name** The name of the gem to uninstall

**gem\_bin** [None] Full path to gem binary to use.

**ruby** [None] If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.

**user:** **None** The user under which to run the gem command

New in version 0.17.0.

`salt.states.gem.sources_add` (*name*, *ruby=None*, *user=None*)

Make sure that a gem source is added.

**name** The URL of the gem source to be added

**ruby:** **None** For RVM or rbenv installations: the ruby version and gemset to target.

**user:** **None** The user under which to run the gem command

New in version 0.17.0.

`salt.states.gem.sources_remove` (*name*, *ruby=None*, *user=None*)

Make sure that a gem source is removed.

**name** The URL of the gem source to be removed

**ruby:** **None** For RVM or rbenv installations: the ruby version and gemset to target.

**user:** **None** The user under which to run the gem command

New in version 0.17.0.

### 14.17.83 salt.states.git

States to manage git repositories and git configuration

---

**Important:** Before using git over ssh, make sure your remote host fingerprint exists in your `~/.ssh/known_hosts` file.

---

Changed in version 2015.8.8: This state module now requires git 1.6.5 (released 10 October 2009) or newer.

`salt.states.git.config_set` (*name*, *value=None*, *multivar=None*, *repo=None*, *user=None*, *password=None*, *\*\*kwargs*)

New in version 2014.7.0.

Changed in version 2015.8.0: Renamed from `git.config` to `git.config_set`. For earlier versions, use `git.config`.

Ensure that a config value is set to the desired value(s)

**name** Name of the git config value to set

**value** Set a single value for the config item  
**multivar** Set multiple values for the config item

---

**Note:** The order matters here, if the same parameters are set but in a different order, they will be removed and replaced in the order specified.

---

New in version 2015.8.0.

**repo** Location of the git repository for which the config value should be set. Required unless `global` is set to `True`.

**user** User under which to run git commands. By default, the commands are run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**global** [False] If True, this will set a global git config option

**Local Config Example:**

```
# Single value
mylocalrepo:
  git.config_set:
    - name: user.email
    - value: foo@bar.net
    - repo: /path/to/repo

# Multiple values
mylocalrepo:
  git.config_set:
    - name: mysection.myattribute
    - multivar:
      - foo
      - bar
      - baz
    - repo: /path/to/repo
```

**Global Config Example (User ``foo``):**

```
mylocalrepo:
  git.config_set:
    - name: user.name
    - value: Foo Bar
    - user: foo
    - global: True
```

`salt.states.git.config_unset`(*name*, *value\_regex=None*, *repo=None*, *user=None*, *password=None*, *\*\*kwargs*)

New in version 2015.8.0.

Ensure that the named config key is not present

**name** The name of the configuration key to unset. This value can be a regex, but the regex must match the entire key name. For example, `foo\.` would not match all keys in the `foo` section, it would be necessary to use `foo\..+` to do so.

**value\_regex** Regex indicating the values to unset for the matching key(s)

---

**Note:** This option behaves differently depending on whether or not `all` is set to `True`. If it is, then all

values matching the regex will be deleted (this is the only way to delete multiple values from a multivar). If `all` is set to `False`, then this state will fail if the regex matches more than one value in a multivar.

**all** [False] If `True`, unset all matches

**repo** Location of the git repository for which the config value should be set. Required unless `global` is set to `True`.

**user** User under which to run git commands. By default, commands are run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**global** [False] If `True`, this will set a global git config option

**Examples:**

```
# Value matching 'baz'
mylocalrepo:
  git.config_unset:
    - name: foo.bar
    - value_regex: 'baz'
    - repo: /path/to/repo

# Ensure entire multivar is unset
mylocalrepo:
  git.config_unset:
    - name: foo.bar
    - all: True

# Ensure all variables in 'foo' section are unset, including multivars
mylocalrepo:
  git.config_unset:
    - name: 'foo\..+'
    - all: True

# Ensure that global config value is unset
mylocalrepo:
  git.config_unset:
    - name: foo.bar
    - global: True
```

`salt.states.git.detached`(*name*, *rev*, *target=None*, *remote='origin'*, *user=None*, *password=None*, *force\_clone=False*, *force\_checkout=False*, *fetch\_remote=True*, *hard\_reset=False*, *submodules=False*, *identity=None*, *https\_user=None*, *https\_pass=None*, *onlyif=False*, *unless=False*, *\*\*kwargs*)

New in version 2016.3.0.

Make sure a repository is cloned to the given target directory and is a detached HEAD checkout of the commit ID resolved from `ref`.

**name** Address of the remote repository.

**rev** The branch, tag, or commit ID to checkout after clone. If a branch or tag is specified it will be resolved to a commit ID and checked out.

**ref** Deprecated since version 2017.7.0: Use `rev` instead.

**target** Name of the target directory where repository is about to be cloned.

**remote** [origin] Git remote to use. If this state needs to clone the repo, it will clone it using this value as the initial remote name. If the repository already exists, and a remote by this name is not present, one will be added.

**user** User under which to run git commands. By default, commands are run by the user under which the

minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**force\_clone** [False] If the `target` directory exists and is not a git repository, then this state will fail. Set this argument to `True` to remove the contents of the target directory and clone the repo into it.

**force\_checkout** [False] When checking out the revision ID, the state will fail if there are unwritten changes. Set this argument to `True` to discard unwritten changes when checking out.

**fetch\_remote** [True] If `False` a fetch will not be performed and only local refs will be reachable.

**hard\_reset** [False] If `True` a hard reset will be performed before the checkout and any uncommitted modifications to the working directory will be discarded. Untracked files will remain in place.

---

**Note:** Changes resulting from a hard reset will not trigger requisites.

---

**submodules** [False] Update submodules

**identity** A path on the minion (or a SaltStack fileserver URL, e.g. `salt://path/to/identity_file`) to a private key to use for SSH authentication.

**https\_user** HTTP Basic Auth username for HTTPS (only) clones

**https\_pass** HTTP Basic Auth password for HTTPS (only) clones

**onlyif** A command to run as a check, run the named command only if the command passed to the `onlyif` option returns true

**unless** A command to run as a check, only run the named command if the command passed to the `unless` option returns false

`salt.states.git.latest`(*name*, *rev*='HEAD', *target*=None, *branch*=None, *user*=None, *password*=None, *update\_head*=True, *force\_checkout*=False, *force\_clone*=False, *force\_fetch*=False, *force\_reset*=False, *submodules*=False, *bare*=False, *mirror*=False, *remote*='origin', *fetch\_tags*=True, *depth*=None, *identity*=None, *https\_user*=None, *https\_pass*=None, *onlyif*=False, *unless*=False, *refspec\_branch*='\*', *refspec\_tag*='\*', *\*\*kwargs*)

Make sure the repository is cloned to the given directory and is up-to-date.

**name** Address of the remote repository, as passed to `git clone`

---

**Note:** From the [Git documentation](#), there are two URL formats supported for SSH authentication. The below two examples are equivalent:

```
# ssh:// URL
ssh://user@server/project.git

# SCP-like syntax
user@server:project.git
```

A common mistake is to use an `ssh:// URL`, but with a colon after the domain instead of a slash. This is invalid syntax in Git, and will therefore not work in Salt. When in doubt, confirm that a `git clone` works for the URL before using it in Salt.

It has been reported by some users that SCP-like syntax is incompatible with git repos hosted on [Atlassian Stash/BitBucket Server](#). In these cases, it may be necessary to use `ssh://` URLs for SSH authentication.

---

**rev** [HEAD] The remote branch, tag, or revision ID to checkout after clone / before update. If specified, then Salt will also ensure that the tracking branch is set to `<remote>/<rev>`, unless `rev` refers to a tag or SHA1, in which case Salt will ensure that the tracking branch is unset.

If `rev` is not specified, it will be assumed to be HEAD, and Salt will not manage the tracking branch at all.

Changed in version 2015.8.0: If not specified, `rev` now defaults to the remote repository's HEAD.

**target** Name of the target directory where repository is about to be cloned

**branch** Name of the local branch into which to checkout the specified rev. If not specified, then Salt will not care what branch is being used locally and will just use whatever branch is currently there.

New in version 2015.8.0.

---

**Note:** If this argument is not specified, this means that Salt will not change the local branch if the repository is reset to another branch/tag/SHA1. For example, assume that the following state was run initially:

```
foo_app:
  git.latest:
    - name: https://mydomain.tld/apps/foo.git
    - target: /var/www/foo
    - user: www
```

This would have cloned the HEAD of that repo (since a `rev` wasn't specified), and because `branch` is not specified, the branch in the local clone at `/var/www/foo` would be whatever the default branch is on the remote repository (usually `master`, but not always). Now, assume that it becomes necessary to switch this checkout to the `dev` branch. This would require `rev` to be set, and probably would also require `force_reset` to be enabled:

```
foo_app:
  git.latest:
    - name: https://mydomain.tld/apps/foo.git
    - target: /var/www/foo
    - user: www
    - rev: dev
    - force_reset: True
```

The result of this state would be to perform a hard-reset to `origin/dev`. Since `branch` was not specified though, while `/var/www/foo` would reflect the contents of the remote repo's `dev` branch, the local branch would still remain whatever it was when it was cloned. To make the local branch match the remote one, set `branch` as well, like so:

```
foo_app:
  git.latest:
    - name: https://mydomain.tld/apps/foo.git
    - target: /var/www/foo
    - user: www
    - rev: dev
    - branch: dev
    - force_reset: True
```

This may seem redundant, but Salt tries to support a wide variety of use cases, and doing it this way allows for the use case where the local branch doesn't need to be strictly managed.

---

**user** Local system user under which to run git commands. By default, commands are run by the user under which the minion is running.

---

**Note:** This is not to be confused with the username for http(s)/SSH authentication.

---

New in version 0.17.0.

**password** Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**update\_head** [True] If set to `False`, then the remote repository will be fetched (if necessary) to ensure that the commit to which `rev` points exists in the local checkout, but no changes will be made to the local HEAD.

New in version 2015.8.3.

**force\_checkout** [False] When checking out the local branch, the state will fail if there are unwritten changes. Set this argument to `True` to discard unwritten changes when checking out.

**force\_clone** [False] If the `target` directory exists and is not a git repository, then this state will fail. Set this argument to `True` to remove the contents of the target directory and clone the repo into it.

**force\_fetch** [False] If a fetch needs to be performed, non-fast-forward fetches will cause this state to fail. Set this argument to `True` to force the fetch even if it is a non-fast-forward update.

New in version 2015.8.0.

**force\_reset** [False] If the update is not a fast-forward, this state will fail. Set this argument to `True` to force a hard-reset to the remote revision in these cases.

**submodules** [False] Update submodules on clone or branch change

**bare** [False] Set to `True` if the repository is to be a bare clone of the remote repository.

**mirror** Set to `True` if the repository is to be a mirror of the remote repository. This implies that `bare` set to `True`, and thus is incompatible with `rev`.

**remote** [origin] Git remote to use. If this state needs to clone the repo, it will clone it using this value as the initial remote name. If the repository already exists, and a remote by this name is not present, one will be added.

**fetch\_tags** [True] If `True`, then when a fetch is performed all tags will be fetched, even those which are not reachable by any branch on the remote.

**depth** Defines depth in history when git a clone is needed in order to ensure latest. E.g. `depth: 1` is useful when deploying from a repository with a long history. Use `rev` to specify branch. This is not compatible with tags or revision IDs.

**identity** Path to a private key to use for ssh URLs. This can be either a single string, or a list of strings. For example:

```
# Single key
git@github.com:user/repo.git:
  git.latest:
    - user: deployer
    - identity: /home/deployer/.ssh/id_rsa

# Two keys
git@github.com:user/repo.git:
  git.latest:
    - user: deployer
    - identity:
      - /home/deployer/.ssh/id_rsa
      - /home/deployer/.ssh/id_rsa_alternate
```

If multiple keys are specified, they will be tried one-by-one in order for each git command which needs to authenticate.

**Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Changed in version 2016.3.0: Key can now be specified as a SaltStack fileserver URL (e.g. `salt://path/to/identity_file`).

**https\_user** HTTP Basic Auth username for HTTPS (only) clones

New in version 2015.5.0.

**https\_pass** HTTP Basic Auth password for HTTPS (only) clones

New in version 2015.5.0.

**onlyif** A command to run as a check, run the named command only if the command passed to the `onlyif` option returns true

**unless** A command to run as a check, only run the named command if the command passed to the `unless` option returns false

**refspec\_branch** [\*] A glob expression defining which branches to retrieve when fetching. See `git-fetch(1)` for more information on how refsspecs work.

New in version 2017.7.0.

**refspec\_tag** [\*] A glob expression defining which tags to retrieve when fetching. See `git-fetch(1)` for more information on how refsspecs work.

New in version 2017.7.0.

**Note:** Clashing ID declarations can be avoided when including different branches from the same git repository in the same SLS file by using the `name` argument. The example below checks out the `gh-pages` and `gh-pages-prod` branches from the same repository into separate directories. The example also sets up the `ssh_known_hosts` ssh key required to perform the git checkout.

Also, it has been reported that the SCP-like syntax for

```
gitlab.example.com:
  ssh_known_hosts:
    - present
    - user: root
    - enc: ecdsa
    - fingerprint: 4e:94:b0:54:c1:5b:29:a2:70:0e:e1:a3:51:ee:ee:e3

git-website-staging:
  git.latest:
    - name: git@gitlab.example.com:user/website.git
    - rev: gh-pages
    - target: /usr/share/nginx/staging
    - identity: /root/.ssh/website_id_rsa
    - require:
      - pkg: git
      - ssh_known_hosts: gitlab.example.com

git-website-staging:
  git.latest:
    - name: git@gitlab.example.com:user/website.git
    - rev: gh-pages
    - target: /usr/share/nginx/staging
    - identity: salt://website/id_rsa
    - require:
      - pkg: git
      - ssh_known_hosts: gitlab.example.com

git-website-prod:
```

```
git.latest:
- name: git@gitlab.example.com:user/website.git
- rev: gh-pages-prod
- target: /usr/share/nginx/prod
- identity: /root/.ssh/website_id_rsa
- require:
  - pkg: git
  - ssh_known_hosts: gitlab.example.com
```

`salt.states.git.mod_run_check`(*cmd\_kwargs*, *onlyif*, *unless*)

Execute the *onlyif* and *unless* logic. Return a result dict if:

- *onlyif* failed (*onlyif* != 0)
- *unless* succeeded (*unless* == 0)

Otherwise, returns True

`salt.states.git.present`(*name*, *force=False*, *bare=True*, *template=None*, *separate\_git\_dir=None*, *shared=None*, *user=None*, *password=None*)

Ensure that a repository exists in the given directory

**Warning:** If the minion has Git 2.5 or later installed, *name* points to a [worktree](#), and *force* is set to True, then the worktree will be deleted. This has been corrected in Salt 2015.8.0.

**name** Path to the directory

Changed in version 2015.8.0: This path must now be absolute

**force** [False] If True, and if *name* points to an existing directory which does not contain a git repository, then the contents of that directory will be recursively removed and a new repository will be initialized in its place.

**bare** [True] If True, and a repository must be initialized, then the repository will be a bare repository.

---

**Note:** This differs from the default behavior of `git.init`, make sure to set this value to False if a bare repo is not desired.

---

**template** If a new repository is initialized, this argument will specify an alternate `'template directory' _`

New in version 2015.8.0.

**separate\_git\_dir** If a new repository is initialized, this argument will specify an alternate \$GIT\_DIR

New in version 2015.8.0.

**shared** Set sharing permissions on git repo. See `git-init(1)` for more details.

New in version 2015.5.0.

**user** User under which to run git commands. By default, commands are run by the user under which the minion is running.

New in version 0.17.0.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

## 14.17.84 salt.states.github module

GitHub User State Module

New in version 2016.3.0..

This state is used to ensure presence of users in the Organization.

```
ensure user test is present in github:
  github.present:
    - name: 'Example TestUser1'
    - email: example@domain.com
    - username: 'gitexample'
```

**salt.states.github.absent** (*name, profile='github', \*\*kwargs*)  
Ensure a github user is absent

```
ensure user test is absent in github:
  github.absent:
    - name: 'Example TestUser1'
    - email: example@domain.com
    - username: 'gitexample'
```

The following parameters are required:  
**name** Github handle of the user in organization

**salt.states.github.present** (*name, profile='github', \*\*kwargs*)  
Ensure a user is present

```
ensure user test is present in github:
  github.present:
    - name: 'gitexample'
```

The following parameters are required:  
**name** This is the github handle of the user in the organization

**salt.states.github.repo\_absent** (*name, profile='github', \*\*kwargs*)  
Ensure a repo is absent.

Example:

```
ensure repo test is absent in github:
  github.repo_absent:
    - name: 'test'
```

The following parameters are required:  
**name** This is the name of the repository in the organization.  
New in version 2016.11.0.

**salt.states.github.repo\_present** (*name, description=None, homepage=None, private=None, has\_issues=None, has\_wiki=None, has\_downloads=None, auto\_init=False, gitignore\_template=None, license\_template=None, teams=None, profile='github', \*\*kwargs*)

Ensure a repository is present  
**name** This is the name of the repository.  
**description** The description of the repository.  
**homepage** The URL with more information about the repository.  
**private** The visibility of the repository. Note that private repositories require a paid GitHub account.  
**has\_issues** Whether to enable issues for this repository.  
**has\_wiki** Whether to enable the wiki for this repository.  
**has\_downloads** Whether to enable downloads for this repository.  
**auto\_init** Whether to create an initial commit with an empty README.  
**gitignore\_template** The desired language or platform for a .gitignore, e.g ``Haskell``.

**license\_template** The desired LICENSE template to apply, e.g. ``mit`` or ``mozilla``.

**teams** The teams for which this repo should belong to, specified as a dict of team name to permission (``pull``, ``push`` or ``admin``).

New in version 2017.7.0.

Example:

```
Ensure repo my-repo is present in github:
github.repo_present:
  - name: 'my-repo'
  - description: 'My very important repository'
```

New in version 2016.11.0.

`salt.states.github.team_absent`(*name*, *profile*='github', *\*\*kwargs*)

Ensure a team is absent.

Example:

```
ensure team test is present in github:
github.team_absent:
  - name: 'test'
```

The following parameters are required:

**name** This is the name of the team in the organization.

New in version 2016.11.0.

`salt.states.github.team_present`(*name*, *description*=None, *repo\_names*=None, *privacy*='secret', *permission*='pull', *members*=None, *enforce\_mfa*=False, *no\_mfa\_grace\_seconds*=0, *profile*='github', *\*\*kwargs*)

Ensure a team is present

**name** This is the name of the team in the organization.

**description** The description of the team.

**repo\_names** The names of repositories to add the team to.

**privacy** The level of privacy for the team, can be ``secret`` or ``closed``. Defaults to secret.

**permission** The default permission for new repositories added to the team, can be ``pull``, ``push`` or ``admin``. Defaults to pull.

**members** The members belonging to the team, specified as a dict of member name to optional configuration. Options include ``enforce\_mfa\_from`` and ``mfa\_exempt``.

**enforce\_mfa** Whether to enforce MFA requirements on members of the team. If True then all members without *mfa\_exempt*: True configured will be removed from the team. Note that *no\_mfa\_grace\_seconds* may be set to allow members a grace period.

**no\_mfa\_grace\_seconds** The number of seconds of grace time that a member will have to enable MFA before being removed from the team. The grace period will begin from *enforce\_mfa\_from* on the member configuration, which defaults to 1970/01/01.

Example:

```
Ensure team test is present in github:
github.team_present:
  - name: 'test'
  - members:
      user1: {}
      user2: {}

Ensure team test_mfa is present in github:
github.team_present:
  - name: 'test_mfa'
  - members:
```

```

user1:
  enforce_mfa_from: 2016/06/15
  - enforce_mfa: True

```

New in version 2016.11.0.

### 14.17.85 salt.states.glance

#### Managing Images in OpenStack Glance

**salt.states.glance.image\_present** (*name, visibility='public', protected=None, checksum=None, location=None, disk\_format='raw', wait\_for=None, timeout=30*)

Checks if given image is present with properties set as specified.

An image should go through the stages 'queued', 'saving' before becoming 'active'. The attribute 'checksum' can only be checked once the image is active. If you don't specify 'wait\_for' but 'checksum' the function will wait for the image to become active before comparing checksums. If you don't specify checksum either the function will return when the image reached 'saving'. The default timeout for both is 30 seconds.

#### Supported properties:

- visibility ('public' or 'private')
- protected (bool)
- checksum (string, md5sum)
- location (URL, to copy from)
- disk\_format ('raw' (default), 'vhd', 'vhdx', 'vmdk', 'vdi', 'iso', 'qcow2', 'aki', 'ari' or 'ami')

### 14.17.86 salt.states.glusterfs

Manage GlusterFS pool.

**salt.states.glusterfs.add\_volume\_bricks** (*name, bricks*)

Add brick(s) to an existing volume

**name** Volume name

**bricks** List of bricks to add to the volume

```

myvolume:
  glusterfs.add_volume_bricks:
    - bricks:
      - host1:/srv/gluster/drive1
      - host2:/srv/gluster/drive2

Replicated Volume:
  glusterfs.add_volume_bricks:
    - name: volume2
    - bricks:
      - host1:/srv/gluster/drive2
      - host2:/srv/gluster/drive3

```

**salt.states.glusterfs.peered** (*name*)

Check if node is peered.

**name** The remote host with which to peer.

```

peer-cluster:
  glusterfs.peered:
    - name: two

```

```
peer-clusters:
  glusterfs.peered:
    - names:
      - one
      - two
      - three
      - four
```

`salt.states.glusterfs.started(name)`

Check if volume has been started

**name** name of the volume

```
mycluster:
  glusterfs.started: []
```

`salt.states.glusterfs.volume_present(name, bricks, stripe=False, replica=False, device_vg=False, transport='tcp', start=False, force=False)`

Ensure that the volume exists

**name** name of the volume

**bricks** list of brick paths

**start** ensure that the volume is also started

```
myvolume:
  glusterfs.volume_present:
    - bricks:
      - host1:/srv/gluster/drive1
      - host2:/srv/gluster/drive2

Replicated Volume:
  glusterfs.volume_present:
    - name: volume2
    - bricks:
      - host1:/srv/gluster/drive2
      - host2:/srv/gluster/drive3
    - replica: 2
    - start: True
```

## 14.17.87 salt.states.gnomedesktop

### Configuration of the GNOME desktop

Control the GNOME settings

```
localdesktop_wm_prefs:
  gnomedesktop.wm_preferences:
    - user: username
    - audible_bell: false
    - action_double_click_titlebar: 'toggle-maximize'
    - visual_bell: true
    - num_workspaces: 6
localdesktop_lockdown:
  gnomedesktop.desktop_lockdown:
    - user: username
    - disable_user_switching: true
```

```

localdesktop_interface:
  gnomedesktop.desktop_interface:
    - user: username
    - clock_show_date: true
    - clock_format: 12h

```

```

salt.states.gnomedesktop.desktop_interface(name, user=None, auto-
    automatic_mnemonics=None,
    buttons_have_icons=None,
    can_change_accels=None,
    clock_format=None, clock_show_date=None,
    clock_show_seconds=None, cursor
    cursor_blink=None, cursor_blink_time=None,
    cursor_blink_timeout=None, cursor
    cursor_size=None, cursor_theme=None,
    document_font_name=None,
    enable_animations=None,
    font_name=None, gtk_color_palette=None,
    gtk_color_scheme=None,
    gtk_im_module=None,
    gtk_im_preedit_style=None,
    gtk_im_status_style=None,
    gtk_key_theme=None, gtk_theme=None,
    gtk_timeout_initial=None,
    gtk_timeout_repeat=None,
    icon_theme=None, menubar_accel=None,
    menubar_detachable=None,
    menus_have_icons=None,
    menus_have_tearoff=None,
    monospace_font_name=None,
    show_input_method_menu=None,
    show_unicode_menu=None,
    text_scaling_factor=None, toolbar
    bar_detachable=None, toolbar
    bar_icons_size=None, toolbar_style=None,
    toolkit_accessibility=None, **kwargs)

```

desktop\_interface: sets values in the org.gnome.desktop.interface schema

```

salt.states.gnomedesktop.desktop_lockdown(name, user=None, dis-
    able_application_handlers=None,
    disable_command_line=None, dis-
    able_lock_screen=None, dis-
    able_log_out=None, disable_print_setup=None,
    disable_printing=None, dis-
    able_save_to_disk=None, dis-
    able_user_switching=None,
    user_administration_disabled=None, **kwargs)

```

desktop\_lockdown: sets values in the org.gnome.desktop.lockdown schema

```

salt.states.gnomedesktop.wm_preferences(name, user=None, action_double_click_titlebar=None, action_middle_click_titlebar=None, action_right_click_titlebar=None, application_based=None, audible_bell=None, auto_raise=None, auto_raise_delay=None, button_layout=None, disable_workarounds=None, focus_mode=None, focus_new_windows=None, mouse_button_modifier=None, num_workspaces=None, raise_on_click=None, resize_with_right_button=None, theme=None, titlebar_font=None, titlebar_uses_system_font=None, visual_bell=None, visual_bell_type=None, workspace_names=None, **kwargs)

```

### 14.17.88 salt.states.gpg module

#### Management of the GPG keychains

New in version 2016.3.0.

```

salt.states.gpg.absent(name, keys=None, user=None, gnupghome=None, **kwargs)

```

Ensure GPG public key is absent in keychain

**name** The unique name or keyid for the GPG public key.

**keys** The keyId or keyIds to add to the GPG keychain.

**user** Add GPG keys to the user's keychain

**gnupghome** Override GNUPG Home directory

```

salt.states.gpg.present(name, keys=None, user=None, keyserver=None, gnupghome=None, trust=None, **kwargs)

```

Ensure GPG public key is present in keychain

**name** The unique name or keyid for the GPG public key.

**keys** The keyId or keyIds to add to the GPG keychain.

**user** Add GPG keys to the user's keychain

**keyserver** The keyserver to retrieve the keys from.

**gnupghome** Override GNUPG Home directory

**trust** Trust level for the key in the keychain, ignored by default. Valid trust levels: expired, unknown, not\_trusted, marginally, fully, ultimately

### 14.17.89 salt.states.grafana

Manage Grafana Dashboards

This module uses `elasticsearch`, which can be installed via package, or pip.

You can specify `elasticsearch` hosts directly to the module, or you can use an `elasticsearch` profile via pillars:

```

mygrafanaprofile:
  hosts:
    - es1.example.com:9200
    - es2.example.com:9200
  index: grafana-dash

```

```
# Basic usage (uses default pillar profile key 'grafana')
Ensure myservice dashboard is managed:
grafana.dashboard_present:
  - name: myservice
  - dashboard_from_pillar: default
  - rows_from_pillar:
    - systemhealth
    - requests

# Passing hosts in
Ensure myservice dashboard is managed:
grafana.dashboard_present:
  - name: myservice
  - dashboard_from_pillar: default
  - rows:
    - collapse: false
      editable: true
      height: 150px
      title: System Health
      panels:
        - aliasColors: {}
          id: 200000
          annotate:
            enable: false
          bars: false
          datasource: null
          editable: true
          error: false
          fill: 7
          grid:
            leftMax: 100
            leftMin: null
            rightMax: null
            rightMin: null
            threshold1: 60
            threshold1Color: rgb(216, 27, 27)
            threshold2: null
            threshold2Color: rgba(234, 112, 112, 0.22)
          leftYAxisLabel: ''
          legend:
            avg: false
            current: false
            max: false
            min: false
            show: false
            total: false
            values: false
          lines: true
          linewidth: 1
          nullPointMode: connected
          percentage: false
          pointradius: 5
          points: false
          renderer: flot
          resolution: 100
          scale: 1
          seriesOverrides: []
          span: 4
```

```
stack: false
steppedLine: false
targets:
  - target: cloudwatch.aws.ec2.mysrv.cpuutilization.average
title: CPU (asg average)
tooltip:
  query_as_alias: true
  shared: false
  value_type: cumulative
type: graph
x-axis: true
y-axis: true
y_formats:
  - short
  - short

  hosts:
    - es1.example.com:9200
    - es2.example.com:9200
  index: grafana-dash
```

#### *# Using a profile from pillars*

Ensure myservice dashboard is managed:

```
grafana.dashboard_present:
  - name: myservice
  - dashboard:
      annotations:
        enable: true
        list: []
      editable: true
      hideAllLegends: false
      hideControls: false
      nav:
        - collapse: false
          enable: true
          notice: false
          now: true
          refresh_intervals:
            - 10s
            - 30s
            - 1m
            - 5m
            - 15m
            - 30m
            - 1h
            - 2h
            - 1d
      status: Stable
      time_options:
        - 5m
        - 15m
        - 1h
        - 2h
        - 3h
```

```

    - 4h
    - 6h
    - 12h
    - 1d
    - 2d
    - 4d
    - 7d
    - 16d
    - 30d
    type: timepicker
    originalTitle: dockerregistry
    refresh: 1m
    rows: []
    sharedCrosshair: false
    style: dark
    tags: []
    templating:
      enable: true
      list: []
    time:
      from: now-2h
      to: now
      timezone: browser
  - rows_from_pillars:
    - systemhealth
    - requests
  - profile: mygrafanaprofile

```

The behavior of this module is to create dashboards if they do not exist, to add rows if they do not exist in existing dashboards, and to update rows if they exist in dashboards. The module will not manage rows that are not defined, allowing users to manage their own custom rows.

**salt.states.grafana.dashboard\_absent** (*name, hosts=None, profile='grafana'*)

Ensure the named grafana dashboard is deleted.

**name** Name of the grafana dashboard.

**profile** A pillar key or dict that contains a list of hosts and an elasticsearch index to use.

**salt.states.grafana.dashboard\_present** (*name, dashboard=None, dashboard\_from\_pillar=None, rows=None, rows\_from\_pillar=None, profile='grafana'*)

Ensure the grafana dashboard exists and is managed.

**name** Name of the grafana dashboard.

**dashboard** A dict that defines a dashboard that should be managed.

**dashboard\_from\_pillar** A pillar key that contains a grafana dashboard dict. Mutually exclusive with dashboard.

**rows** A list of grafana rows.

**rows\_from\_pillar** A list of pillar keys that contain lists of grafana dashboard rows. Rows defined in the pillars will be appended to the rows defined in the state.

**profile** A pillar key or dict that contains a list of hosts and an elasticsearch index to use.

### 14.17.90 salt.states.grafana4\_dashboard module

Manage Grafana v4.0 Dashboards

New in version 2017.7.0.

```
grafana:
  grafana_timeout: 3
  grafana_token: qwertyuiop
  grafana_url: 'https://url.com'
```

```
Ensure minimum dashboard is managed:
grafana_dashboard.present:
  - name: insightful-dashboard
  - base_dashboards_from_pillar:
    - default_dashboard
  - base_rows_from_pillar:
    - default_row
  - base_panels_from_pillar:
    - default_panel
  - dashboard:
    rows:
      - title: Usage
    panels:
      - targets:
          - target: alias(constantLine(50), 'max')
            title: Imaginary
            type: graph
```

The behavior of this module is to create dashboards if they do not exist, to add rows if they do not exist in existing dashboards, and to update rows if they exist in dashboards. The module will not manage rows that are not defined, allowing users to manage their own custom rows.

`salt.states.grafana4_dashboard.absent` (*name*, *orgname=None*, *profile='grafana'*)

Ensure the named grafana dashboard is absent.

**name** Name of the grafana dashboard.

**orgname** Name of the organization in which the dashboard should be present.

**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.

`salt.states.grafana4_dashboard.present` (*name*, *base\_dashboards\_from\_pillar=None*,  
*base\_panels\_from\_pillar=None*,  
*base\_rows\_from\_pillar=None*, *dashboard=None*,  
*orgname=None*, *profile='grafana'*)

Ensure the grafana dashboard exists and is managed.

**name** Name of the grafana dashboard.

**base\_dashboards\_from\_pillar** A pillar key that contains a list of dashboards to inherit from

**base\_panels\_from\_pillar** A pillar key that contains a list of panels to inherit from

**base\_rows\_from\_pillar** A pillar key that contains a list of rows to inherit from

**dashboard** A dict that defines a dashboard that should be managed.

**orgname** Name of the organization in which the dashboard should be present.

**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.

### 14.17.91 salt.states.grafana4\_datasource module

Manage Grafana v4.0 data sources

New in version 2017.7.0.

Token auth setup

```
grafana_version: 4
grafana:
```

```
grafana_timeout: 5
grafana_token: qwertyuiop
grafana_url: 'https://url.com'
```

#### Basic auth setup

```
grafana_version: 4
grafana:
  grafana_timeout: 5
  grafana_user: grafana
  grafana_password: qwertyuiop
  grafana_url: 'https://url.com'
```

```
Ensure influxdb data source is present:
grafana_datasource.present:
- name: influxdb
- type: influxdb
- url: http://localhost:8086
- access: proxy
- basic_auth: true
- basic_auth_user: myuser
- basic_auth_password: mypass
- is_default: true
```

`salt.states.grafana4_datasource.absent` (*name*, *orgname=None*, *profile='grafana'*)

Ensure that a data source is present.

**name** Name of the data source to remove.

**orgname** Name of the organization from which the data source should be absent.

**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.

`salt.states.grafana4_datasource.present` (*name*, *type*, *url*, *access=None*, *user=None*, *password=None*, *database=None*, *basic\_auth=None*, *basic\_auth\_user=None*, *basic\_auth\_password=None*, *tls\_auth=None*, *json\_data=None*, *is\_default=None*, *with\_credentials=None*, *type\_logo\_url=None*, *orgname=None*, *profile='grafana'*)

Ensure that a data source is present.

**name** Name of the data source.

**type** Type of the datasource (`graphite`, `influxdb` etc.).

**access** Use proxy or direct. Default: proxy

**url** The URL to the data source API.

**user** Optional - user to authenticate with the data source.

**password** Optional - password to authenticate with the data source.

**database** Optional - database to use with the data source.

**basic\_auth** Optional - set to True to use HTTP basic auth to authenticate with the data source.

**basic\_auth\_user** Optional - HTTP basic auth username.

**basic\_auth\_password** Optional - HTTP basic auth password.

**json\_data** Optional - additional json data to post (eg. ``timeInterval``).

**is\_default** Optional - set data source as default.

**with\_credentials** Optional - Whether credentials such as cookies or auth headers should be sent with cross-site requests.

**type\_logo\_url** Optional - Logo to use for this datasource.

**orgname** Name of the organization in which the data source should be present.

**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.

## 14.17.92 salt.states.grafana4\_org module

Manage Grafana v4.0 orgs

New in version 2017.7.0.

Token auth setup

```
grafana_version: 4
grafana:
  grafana_timeout: 5
  grafana_token: qwertyuiop
  grafana_url: 'https://url.com'
```

Basic auth setup

```
grafana_version: 4
grafana:
  grafana_timeout: 5
  grafana_org: grafana
  grafana_password: qwertyuiop
  grafana_url: 'https://url.com'
```

Ensure foobar org is present:

```
grafana4_org.present:
- name: foobar
- theme: ""
- home_dashboard_id: 0
- timezone: "utc"
- address1: ""
- address2: ""
- city: ""
- zip_code: ""
- state: ""
- country: ""
```

**salt.states.grafana4\_org.absent**(*name*, *profile*='grafana')

Ensure that a org is present.

**name** Name of the org to remove.

**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.

**salt.states.grafana4\_org.present**(*name*, *users*=None, *theme*=None, *home\_dashboard\_id*=None, *timezone*=None, *address1*=None, *address2*=None, *city*=None, *zip\_code*=None, *address\_state*=None, *country*=None, *profile*='grafana')

Ensure that an organization is present.

**name** Name of the org.

**users** Optional - Dict of user/role associated with the org. Example: users:  
foo: Viewer bar: Editor

**theme** Optional - Selected theme for the org.

**home\_dashboard\_id** Optional - Home dashboard for the org.

**timezone** Optional - Timezone for the org (one of: ``browser``, ``utc``, or ````).

**address1** Optional - address1 of the org.

**address2** Optional - address2 of the org.

**city** Optional - city of the org.

**zip\_code** Optional - zip\_code of the org.

**address\_state** Optional - state of the org.

**country** Optional - country of the org.

**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.

### 14.17.93 salt.states.grafana4\_user module

Manage Grafana v4.0 users

New in version 2017.7.0.

Token auth setup

```
grafana_version: 4
grafana:
  grafana_timeout: 5
  grafana_token: qwertyuiop
  grafana_url: 'https://url.com'
```

Basic auth setup

```
grafana_version: 4
grafana:
  grafana_timeout: 5
  grafana_user: grafana
  grafana_password: qwertyuiop
  grafana_url: 'https://url.com'
```

```
Ensure foobar user is present:
grafana4_user.present:
- name: foobar
- password: mypass
- email: "foobar@localhost"
- fullname: Foo Bar
- is_admin: true
```

**salt.states.grafana4\_user.absent**(*name, profile='grafana'*)

Ensure that a user is present.

**name** Name of the user to remove.

**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.

**salt.states.grafana4\_user.present**(*name, password, email, is\_admin=False, fullname=None, theme=None, profile='grafana'*)

Ensure that a user is present.

**name** Name of the user.

**password** Password of the user.

**email** Email of the user.

**is\_admin** Optional - Set user as admin user. Default: False

**fullname** Optional - Full name of the user.

**theme** Optional - Selected theme of the user.

**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.

### 14.17.94 salt.states.grafana\_dashboard module

Manage Grafana v2.0 Dashboards

New in version 2016.3.0.

```
grafana:
  grafana_timeout: 3
  grafana_token: qwertyuiop
  grafana_url: 'https://url.com'
```

```
Ensure minimum dashboard is managed:
grafana_dashboard.present:
  - name: insightful-dashboard
  - base_dashboards_from_pillar:
    - default_dashboard
  - base_rows_from_pillar:
    - default_row
  - base_panels_from_pillar:
    - default_panel
  - dashboard:
    rows:
      - title: Usage
    panels:
      - targets:
          - target: alias(constantLine(50), 'max')
            title: Imaginary
            type: graph
```

The behavior of this module is to create dashboards if they do not exist, to add rows if they do not exist in existing dashboards, and to update rows if they exist in dashboards. The module will not manage rows that are not defined, allowing users to manage their own custom rows.

`salt.states.grafana_dashboard.absent` (*name*, *profile*='grafana')

Ensure the named grafana dashboard is absent.

**name** Name of the grafana dashboard.

**profile** A pillar key or dict that contains grafana information

`salt.states.grafana_dashboard.present` (*name*, *base\_dashboards\_from\_pillar*=None, *base\_panels\_from\_pillar*=None, *base\_rows\_from\_pillar*=None, *dashboard*=None, *profile*='grafana')

Ensure the grafana dashboard exists and is managed.

**name** Name of the grafana dashboard.

**base\_dashboards\_from\_pillar** A pillar key that contains a list of dashboards to inherit from

**base\_panels\_from\_pillar** A pillar key that contains a list of panels to inherit from

**base\_rows\_from\_pillar** A pillar key that contains a list of rows to inherit from

**dashboard** A dict that defines a dashboard that should be managed.

**profile** A pillar key or dict that contains grafana information

### 14.17.95 salt.states.grafana\_datasource module

Manage Grafana v2.0 data sources

New in version 2016.3.0.

```
grafana:
  grafana_timeout: 3
  grafana_token: qwertyuiop
  grafana_url: 'https://url.com'
```

```

Ensure influxdb data source is present:
grafana_datasource.present:
- name: influxdb
- type: influxdb
- url: http://localhost:8086
- access: proxy
- basic_auth: true
- basic_auth_user: myuser
- basic_auth_password: mypass
- is_default: true

```

`salt.states.grafana_datasource.absent` (*name*, *profile*='grafana')

Ensure that a data source is present.

**name** Name of the data source to remove.

`salt.states.grafana_datasource.present` (*name*, *type*, *url*, *access*='proxy', *user*='', *password*='', *database*='', *basic\_auth*=False, *basic\_auth\_user*='', *basic\_auth\_password*='', *is\_default*=False, *json\_data*=None, *profile*='grafana')

Ensure that a data source is present.

**name** Name of the data source.

**type** Which type of data source it is ('graphite', 'influxdb' etc.).

**url** The URL to the data source API.

**user** Optional - user to authenticate with the data source

**password** Optional - password to authenticate with the data source

**basic\_auth** Optional - set to True to use HTTP basic auth to authenticate with the data source.

**basic\_auth\_user** Optional - HTTP basic auth username.

**basic\_auth\_password** Optional - HTTP basic auth password.

**is\_default** Default: False

## 14.17.96 salt.states.grains

### Manage grains on the minion

This state allows for grains to be set. Grains set or altered this way are stored in the 'grains' file on the minions, by default at: /etc/salt/grains

Note: This does NOT override any grains set in the minion file.

`salt.states.grains.absent` (*name*, *destructive*=False, *delimiter*=':', *force*=False)

New in version 2014.7.0.

Delete a grain from the grains config file

**name** The grain name

**destructive** If destructive is True, delete the entire grain. If destructive is False, set the grain's value to None. Defaults to False.

**force** If force is True, the existing grain will be overwritten regardless of its existing or provided value type. Defaults to False

New in version v2015.8.2.

**delimiter** A delimiter different from the default can be provided.

New in version v2015.8.2.

Changed in version v2015.8.2.

This state now support nested grains and complex values. It is also more conservative: if a grain has a value that is a list or a dict, it will not be removed unless the *force* parameter is True.

```
grain_name:
  grains.absent: []
```

`salt.states.grains.append`(*name*, *value*, *convert=False*, *delimiter=''*)

New in version 2014.7.0.

Append a value to a list in the grains config file. The grain that is being appended to (*name*) must exist before the new value can be added.

**name** The grain name

**value** The value to append

**convert** If *convert* is True, convert non-list contents into a list. If *convert* is False and the grain contains non-list contents, an error is given. Defaults to False.

**delimiter** A delimiter different from the default can be provided.

New in version v2015.8.2.

```
grain_name:
  grains.append:
    - value: to_be_appended
```

`salt.states.grains.exists`(*name*, *delimiter=''*)

Ensure that a grain is set

**name** The grain name

**delimiter** A delimiter different from the default can be provided.

Check whether a grain exists. Does not attempt to check or set the value.

`salt.states.grains.list_absent`(*name*, *value*, *delimiter=''*)

Delete a value from a grain formed as a list.

New in version 2014.1.0.

**name** The grain name.

**value** The value to delete from the grain list.

**delimiter** A delimiter different from the default : can be provided.

New in version v2015.8.2.

The grain should be [list type](#)

```
roles:
  grains.list_absent:
    - value: db
```

For multiple grains, the syntax looks like:

```
roles:
  grains.list_absent:
    - value:
      - web
      - dev
```

`salt.states.grains.list_present`(*name*, *value*, *delimiter=''*)

New in version 2014.1.0.

Ensure the value is present in the list-type grain. Note: If the grain that is provided in *name* is not present on the system, this new grain will be created with the corresponding provided value.

**name** The grain name.

**value** The value is present in the list type grain.

**delimiter** A delimiter different from the default : can be provided.

New in version v2015.8.2.

The grain should be `list` type

```
roles:
  grains.list_present:
    - value: web
```

For multiple grains, the syntax looks like:

```
roles:
  grains.list_present:
    - value:
      - web
      - dev
```

`salt.states.grains.present` (*name, value, delimiter=':', force=False*)

Ensure that a grain is set

Changed in version v2015.8.2.

**name** The grain name

**value** The value to set on the grain

**force** If force is True, the existing grain will be overwritten regardless of its existing or provided value type. Defaults to False

New in version v2015.8.2.

**delimiter** A delimiter different from the default can be provided.

New in version v2015.8.2.

It is now capable to set a grain to a complex value (ie. lists and dicts) and supports nested grains as well.

If the grain does not yet exist, a new grain is set to the given value. For a nested grain, the necessary keys are created if they don't exist. If a given key is an existing value, it will be converted, but an existing value different from the given key will fail the state.

If the grain with the given name exists, its value is updated to the new value unless its existing or provided value is complex (list or dict). Use *force: True* to overwrite.

```
cheese:
  grains.present:
    - value: edam

nested_grain_with_complex_value:
  grains.present:
    - name: icinga:Apache SSL
    - value:
      - command: check_https
      - params: -H localhost -p 443 -S

with,a,custom,delimiter:
  grains.present:
    - value: yay
    - delimiter: ,
```

## 14.17.97 salt.states.group

### Management of user groups

The group module is used to create and manage group settings, groups can be either present or absent. User/Group names can be passed to the `adduser`, `deluser`, and `members` parameters. `adduser` and `deluser` can be

used together but not with members.

In Windows, if no domain is specified in the user or group name (ie: *DOMAINusername*) the module will assume a local user or group.

```
cheese:
  group.present:
    - gid: 7648
    - system: True
    - addusers:
      - user1
      - users2
    - delusers:
      - foo
```

```
cheese:
  group.present:
    - gid: 7648
    - system: True
    - members:
      - foo
      - bar
      - user1
      - user2
```

#### `salt.states.group.absent`(*name*)

Ensure that the named group is absent

**Parameters** *name* (*str*) -- The name of the group to remove

Example:

```
# Removes the local group `db_admin`
db_admin:
  group.absent
```

#### `salt.states.group.present`(*name*, *gid=None*, *system=False*, *addusers=None*, *delusers=None*, *members=None*)

Ensure that a group is present

**Parameters**

- **name** (*str*) -- The name of the group to manage
- **gid** (*str*) -- The group id to assign to the named group; if left empty, then the next available group id will be assigned. Ignored on Windows
- **system** (*bool*) -- Whether or not the named group is a system group. This is essentially the `-r` option of `groupadd`. Ignored on Windows
- **addusers** (*list*) -- List of additional users to be added as a group members. Cannot conflict with names in `delusers`. Cannot be used in conjunction with `members`.
- **delusers** (*list*) -- Ensure these user are removed from the group membership. Cannot conflict with names in `addusers`. Cannot be used in conjunction with `members`.
- **members** (*list*) -- Replace existing group members with a list of new members. Cannot be used in conjunction with `addusers` or `delusers`.

Example:

```
# Adds DOMAIN\db_admins and Administrators to the local db_admin group
# Removes Users
db_admin:
  group.present:
    - addusers:
```

```

- DOMAIN\db_admins
- Administrators
- delusers:
  - Users

# Ensures only DOMAIN\domain_admins and the local Administrator are
# members of the local Administrators group. All other users are
# removed
Administrators:
  group.present:
    - members:
      - DOMAIN\domain_admins
      - Administrator

```

### 14.17.98 salt.states.heat module

#### Management of Heat

New in version 2017.7.0.

##### depends

- heat Python module

**configuration** See *salt.modules.heat* for setup instructions.

The heat module is used to create, show, list and delete Heat staks. Stack can be set as either absent or deploy.

```

heat.deployed:
- name:
- template: #Required
- enviroment:
- params: {}
- poll: 5
- rollback: False
- timeout: 60

heat.absent:
- name:
- poll: 5

```

#### mysql:

##### heat.deployed:

- template: salt://templates/mysql.heat.yaml
- params: image: Debian 7
- rollback: True

**salt.states.heat.absent** (*name, poll=5, timeout=60, profile=None*)

Ensure that the named stack is absent

**name** The name of the stack to remove

**poll** Poll(in sec.) and report events until stack complete

**timeout** Stack creation timeout in minutes

**profile** Profile to use

`salt.states.heat.deployed`(*name*, *template=None*, *enviroment=None*, *params=None*, *poll=5*, *rollback=False*, *timeout=60*, *update=False*, *profile=None*, *\*\*connection\_args*)

Deploy stack with the specified properties

**name** The name of the stack

**template** File of template

**enviroment** File of enviroment

**params** Parameter dict used to create the stack

**poll** Poll(in sec.) and report events until stack complete

**rollback** Enable rollback on create failure

**timeout** Stack creation timeout in minutes

**profile** Profile to use

### 14.17.99 salt.states.hg

#### Interaction with Mercurial repositories

Before using hg over ssh, make sure the remote host fingerprint already exists in `~/.ssh/known_hosts`, and the remote host has this host's public key.

```
https://bitbucket.org/example_user/example_repo:
hg.latest:
  - rev: tip
  - target: /tmp/example_repo
```

`salt.states.hg.latest`(*name*, *rev=None*, *target=None*, *clean=False*, *user=None*, *identity=None*, *force=False*, *opts=False*, *update\_head=True*)

Make sure the repository is cloned to the given directory and is up to date

**name** Address of the remote repository as passed to `hg clone`

**rev** The remote branch, tag, or revision hash to clone/pull

**target** Target destination directory path on minion to clone into

**clean** Force a clean update with `-C` (Default: False)

**user** Name of the user performing repository management operations

New in version 0.17.0.

**identity** Private SSH key on the minion server for authentication (ssh://)

New in version 2015.5.0.

**force** Force hg to clone into pre-existing directories (deletes contents)

**opts** Include additional arguments and options to the hg command line

**update\_head** Should we update the head if new changes are found? Defaults to True

New in version 2017.7.0.

### 14.17.100 salt.states.hipchat

#### Send a message to Hipchat

This state is useful for sending messages to Hipchat during state runs.

The property `api_url` is optional. By default will use the public HipChat API at <https://api.hipchat.com>

New in version 2015.5.0.

```
hipchat-message:
  hipchat.send_message:
```

```

- room_id: 123456
- from_name: SuperAdmin
- message: 'This state was executed successfully.'
- api_url: https://hipchat.myteam.com
- api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
- api_version: v1

```

The api key can be specified in the master or minion configuration like below:

```

hipchat:
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
  api_version: v1

```

`salt.states.hipchat.send_message`(*name*, *room\_id*, *from\_name*, *message*, *api\_url=None*, *api\_key=None*, *api\_version=None*, *message\_color='yellow'*, *notify=False*)

Send a message to a Hipchat room.

```

hipchat-message:
  hipchat.send_message:
    - room_id: 123456
    - from_name: SuperAdmin
    - message: 'This state was executed successfully.'
    - api_url: https://hipchat.myteam.com
    - api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
    - api_version: v1
    - color: green
    - notify: True

```

The following parameters are required:

**name** The unique name for this event.

**room\_id** The room to send the message to. Can either be the ID or the name.

**from\_name** The name of that is to be shown in the ``from" field. If not specified, defaults to.

**message** The message that is to be sent to the Hipchat room.

The following parameters are optional:

**api\_url** The API URI to be used. If not specified here or in the configuration options of master or minion, will use the public HipChat API: <https://api.hipchat.com>

**api\_key** The api key for Hipchat to use for authentication, if not specified in the configuration options of master or minion.

**api\_version** The api version for Hipchat to use, if not specified in the configuration options of master or minion.

**color** The color the Hipchat message should be displayed in. One of the following, default: yellow ``yellow'', ``red'', ``green'', ``purple'', ``gray'', or ``random''.

**notify** Should a notification in the room be raised.

### 14.17.101 salt.states.host

#### Management of addresses and names in hosts file

The `/etc/hosts` file can be managed to contain definitions for specific hosts:

```

salt-master:
  host.present:
    - ip: 192.168.0.42

```

Or using the `names` directive, you can put several names for the same IP. (Do not try one name with space-separated values).

```
server1:
  host.present:
    - ip: 192.168.0.42
    - names:
      - server1
      - florida
```

---

**Note:** Changing the names in `host.present` does not cause an update to remove the old entry.

---

```
server1:
  host.present:
    - ip:
      - 192.168.0.42
      - 192.168.0.43
      - 192.168.0.44
    - names:
      - server1
```

You can replace all existing names for a particular IP address:

```
127.0.1.1:
  host.only:
    - hostnames:
      - foo.example.com
      - foo
```

Or delete all existing names for an address:

```
203.0.113.25:
  host.only:
    - hostnames: []
```

`salt.states.host.absent` (*name*, *ip*)

Ensure that the named host is absent

**name** The host to remove

**ip** The ip addr(s) of the host to remove

`salt.states.host.only` (*name*, *hostnames*)

Ensure that only the given hostnames are associated with the given IP address.

New in version 2016.3.0.

**name** The IP address to associate with the given hostnames.

**hostnames** Either a single hostname or a list of hostnames to associate with the given IP address in the given order. Any other hostname associated with the IP address is removed. If no hostnames are specified, all hostnames associated with the given IP address are removed.

`salt.states.host.present` (*name*, *ip*)

Ensures that the named host is present with the given ip

**name** The host to assign an ip to

**ip** The ip addr(s) to apply to the host

### 14.17.102 salt.states.htpasswd

Support for htpasswd module. Requires the apache2-utils package for Debian-based distros.

New in version 2014.7.0.

```
username:
  webutil.user_exists:
    - password: secr3t
    - htpasswd_file: /etc/nginx/htpasswd
    - options: d
    - force: true
```

`salt.states.htpasswd.user_absent`(*name*, *htpasswd\_file=None*, *runas=None*)

Make sure the user is not in the specified htpasswd file

**name** User name

**htpasswd\_file** Path to the htpasswd file

**runas** The system user to run htpasswd command with

`salt.states.htpasswd.user_exists`(*name*, *password=None*, *htpasswd\_file=None*, *options=''*, *force=False*, *runas=None*, *update=False*)

Make sure the user is inside the specified htpasswd file

**name** User name

**password** User password

**htpasswd\_file** Path to the htpasswd file

**options** See [salt.modules.htpasswd.useradd](#)

**force** Touch the file even if user already created

**runas** The system user to run htpasswd command with

**update** Update an existing user's password if it's different from what's in the htpasswd file (unlike force, which updates regardless)

### 14.17.103 salt.states.http

HTTP monitoring states

Perform an HTTP query and statefully return the result

New in version 2015.5.0.

`salt.states.http.query`(*name*, *match=None*, *match\_type='string'*, *status=None*, *wait\_for=None*, *\*\*kwargs*)

Perform an HTTP query and statefully return the result

New in version 2015.5.0.

**name** The name of the query.

**match** Specifies a pattern to look for in the return text. By default, this will perform a string comparison of looking for the value of match in the return text.

**match\_type** Specifies the type of pattern matching to use. Default is `string`, but can also be set to `pcpre` to use regular expression matching if a more complex pattern matching is required.

---

**Note:** Despite the name of `match_type` for this argument, this setting actually uses Python's `re.search()` function rather than Python's `re.match()` function.

---

**status** The status code for a URL for which to be checked. Can be used instead of or in addition to the `match` setting.

If both `match` and `status` options are set, both settings will be checked. However, note that if only one option is `True` and the other is `False`, then `False` will be returned. If this case is reached, the comments in the return data will contain troubleshooting information.

For more information about the `http.query` state, refer to the [HTTP Tutorial](#).

```
query_example:
  http.query:
    - name: 'http://example.com/'
    - status: 200
```

`salt.states.http.wait_for_successful_query` (*name*, *wait\_for=300*, *\*\*kwargs*)

Like `query` but, repeat and wait until `match/match_type` or `status` is fulfilled. State returns result from last query state in case of success or if no successful query was made within `wait_for` timeout.

**request\_interval** Optional interval to delay requests by N seconds to reduce the number of requests sent.

### 14.17.104 salt.states.icinga2 module

#### Icinga2 state

New in version 2017.7.0.

##### depends

- Icinga2 Python module

**configuration** See `salt.modules.icinga2` for setup instructions.

The `icinga2` module is used to execute commands. Its output may be stored in a file or in a grain.

```
command_id:
  icinga2.generate_ticket
    - name: domain.tld
    - output: "/tmp/query_id.txt"
```

`salt.states.icinga2.generate_cert` (*name*)

Generate an icinga2 certificate and key on the client.

**name** The domain name for which this certificate and key will be generated

`salt.states.icinga2.generate_ticket` (*name*, *output=None*, *grain=None*, *key=None*, *overwrite=True*)

Generate an icinga2 ticket on the master.

**name** The domain name for which this ticket will be generated

**output** grain: output in a grain other: the file to store results None: output to the result comment (default)

**grain** grain to store the output (need `output=grain`)

**key**: the specified grain will be treated as a dictionary, the result of this state will be stored under the specified key.

**overwrite**: The file or grain will be overwritten if it already exists (default)

`salt.states.icinga2.node_setup` (*name*, *master*, *ticket*)

Setup the icinga2 node.

**name** The domain name for which this certificate will be saved

**master** Icinga2 master node for which this certificate will be saved

**ticket** Authentication ticket generated on icinga2 master

`salt.states.icinga2.request_cert` (*name*, *master*, *ticket*, *port='5665'*)

Request CA certificate from master icinga2 node.

**name** The domain name for which this certificate will be saved

**master** Icinga2 master node for which this certificate will be saved  
**ticket** Authentication ticket generated on icinga2 master  
**port** Icinga2 port, defaults to 5665

`salt.states.icinga2.save_cert`(*name, master*)

Save the certificate on master icinga2 node.

**name** The domain name for which this certificate will be saved

**master** Icinga2 master node for which this certificate will be saved

### 14.17.105 salt.states.ifttt

#### Trigger an event in IFTTT

This state is useful for triggering events in IFTTT.

New in version 2015.8.0.

```
ifttt-event:
  ifttt.trigger_event:
    - event: TestEvent
    - value1: 'This state was executed successfully.'
    - value2: 'Another value we can send.'
    - value3: 'A third value we can send.'
```

The api key can be specified in the master or minion configuration like below: .. code-block:: yaml

```
ifttt: secret_key: bzMRb-KKIAaNOwKEEw792J7Eb-B3z7muhdhYblJn4V6
```

`salt.states.ifttt.trigger_event`(*name, event, value1=None, value2=None, value3=None*)

Trigger an event in IFTTT

```
ifttt-event:
  ifttt.trigger_event:
    - event: TestEvent
    - value1: 'A value that we want to send.'
    - value2: 'A second value that we want to send.'
    - value3: 'A third value that we want to send.'
```

The following parameters are required:

**name** The unique name for this event.

**event** The name of the event to trigger in IFTTT.

The following parameters are optional:

**value1** One of the values that we can send to IFTT.

**value2** One of the values that we can send to IFTT.

**value3** One of the values that we can send to IFTT.

### 14.17.106 salt.states.incron

#### Management of incron, the inotify cron

The incron state module allows for user incrontabs to be cleanly managed.

Incron declarations require a number of parameters. The parameters needed to be declared: `path`, `mask`, and `cmd`. The `user` whose incrontab is to be edited also needs to be defined.

When making changes to an existing incron job, the path declaration is the unique factor, so if an existing cron that looks like this:

```
Watch for modifications in /home/user:
  incron.present:
    - user: root
    - path: /home/user
    - mask:
      - IN_MODIFY
    - cmd: 'echo "$$ $@"'
```

Is changed to this:

```
Watch for modifications and access in /home/user:
  incron.present:
    - user: root
    - path: /home/user
    - mask:
      - IN_MODIFY
      - IN_ACCESS
    - cmd: 'echo "$$ $@"'
```

Then the existing cron will be updated, but if the cron command is changed, then a new cron job will be added to the user's crontab.

New in version 0.17.0.

`salt.states.incron.absent` (*name, path, mask, cmd, user='root'*)

Verifies that the specified incron job is absent for the specified user; only the name is matched when removing a incron job.

**name** Unique comment describing the entry

**path** The path that should be watched

**user** The name of the user who's crontab needs to be modified, defaults to the root user

**mask** The mask of events that should be monitored for

**cmd** The cmd that should be executed

`salt.states.incron.present` (*name, path, mask, cmd, user='root'*)

Verifies that the specified incron job is present for the specified user. For more advanced information about what exactly can be set in the cron timing parameters, check your incron system's documentation. Most Unix-like systems' incron documentation can be found via the incrontab man page: `man 5 incrontab`.

**name** Unique comment describing the entry

**path** The path that should be watched

**user** The name of the user who's crontab needs to be modified, defaults to the root user

**mask** The mask of events that should be monitored for

**cmd** The cmd that should be executed

### 14.17.107 salt.states.influxdb08\_database module

#### Management of Influxdb 0.8 databases

(compatible with InfluxDB version 0.5-0.8)

New in version 2014.7.0.

`salt.states.influxdb08_database.absent` (*name, user=None, password=None, host=None, port=None*)

Ensure that the named database is absent

**name** The name of the database to remove  
**user** The user to connect as (must be able to remove the database)  
**password** The password of the user  
**host** The host to connect to  
**port** The port to connect to

`salt.states.influxdb08_database.present`(*name*, *user=None*, *password=None*, *host=None*,  
*port=None*)

Ensure that the named database is present

**name** The name of the database to create  
**user** The user to connect as (must be able to remove the database)  
**password** The password of the user  
**host** The host to connect to  
**port** The port to connect to

### 14.17.108 salt.states.influxdb08\_user module

#### Management of InfluxDB 0.8 users

(compatible with InfluxDB version 0.5-0.8)

New in version 2014.7.0.

`salt.states.influxdb08_user.absent`(*name*, *database=None*, *user=None*, *password=None*,  
*host=None*, *port=None*)

Ensure that the named cluster admin or database user is absent.

**name** The name of the user to remove  
**database** The database to remove the user from  
**user** The user to connect as (must be able to remove the user)  
**password** The password of the user  
**host** The host to connect to  
**port** The port to connect to

`salt.states.influxdb08_user.present`(*name*, *passwd*, *database=None*, *user=None*, *pass-*  
*word=None*, *host=None*, *port=None*)

Ensure that the cluster admin or database user is present.

**name** The name of the user to manage  
**passwd** The password of the user  
**database** The database to create the user in  
**user** The user to connect as (must be able to create the user)  
**password** The password of the user  
**host** The host to connect to  
**port** The port to connect to

### 14.17.109 salt.states.influxdb\_continuous\_query module

#### Management of Influxdb continuous queries

New in version 2017.7.0.

(compatible with InfluxDB version 0.9+)

`salt.states.influxdb_continuous_query.absent`(*name*, *database*, *\*\*client\_args*)

Ensure that given continuous query is absent.

**name** Name of the continuous query to remove.

**database** Name of the database that the continuous query was defined on.

`salt.states.influxdb_continuous_query.present`(*name*, *database*, *query*, *resample\_time*=None, *coverage\_period*=None, *\*\*client\_args*)

Ensure that given continuous query is present.

**name** Name of the continuous query to create.

**database** Database to create continuous query on.

**query** The query content

**resample\_time** [None] Duration between continuous query resampling.

**coverage\_period** [None] Duration specifying time period per sample.

### 14.17.110 salt.states.influxdb\_database

#### Management of Influxdb databases

(compatible with InfluxDB version 0.9+)

`salt.states.influxdb_database.absent`(*name*, *\*\*client\_args*)

Ensure that given database is absent.

**name** Name of the database to remove.

`salt.states.influxdb_database.present`(*name*, *\*\*client\_args*)

Ensure that given database is present.

**name** Name of the database to create.

### 14.17.111 salt.states.influxdb\_retention\_policy module

#### Management of Influxdb retention policies

New in version 2017.7.0.

(compatible with InfluxDB version 0.9+)

`salt.states.influxdb_retention_policy.absent`(*name*, *database*, *\*\*client\_args*)

Ensure that given retention policy is absent.

**name** Name of the retention policy to remove.

**database** Name of the database that the retention policy was defined on.

`salt.states.influxdb_retention_policy.present`(*name*, *database*, *duration*='7d', *replication*=1, *default*=False, *\*\*client\_args*)

Ensure that given retention policy is present.

**name** Name of the retention policy to create.

**database** Database to create retention policy on.

### 14.17.112 salt.states.influxdb\_user

#### Management of InfluxDB users

(compatible with InfluxDB version 0.9+)

`salt.states.influxdb_user.absent`(*name*, *\*\*client\_args*)

Ensure that given user is absent.

**name** The name of the user to manage

`salt.states.influxdb_user.present` (*name, password, admin=False, grants=None, \*\*client\_args*)

Ensure that given user is present.

**name** Name of the user to manage

**password** Password of the user

**admin** [False] Whether the user should have cluster administration privileges or not.

**grants** Optional - Dict of database:privilege items associated with the user. Example:

**grants:** foo\_db: read bar\_db: all

### 14.17.113 salt.states.infoblox module

states for infoblox stuff

ensures a record is either present or absent in an Infoblox DNS system

New in version 2016.3.0.

`salt.states.infoblox.absent` (*name, record\_type, dns\_view, infoblox\_server=None, infoblox\_user=None, infoblox\_password=None, infoblox\_api\_version='v1.4.2', sslVerify=True*)

Ensure a record does not exist

**name** Name of the record

**record\_type** record type (host, a, cname, etc)

**dns\_view** DNS View

**infoblox\_server** infoblox server to connect to (will try pillar if not specified)

**infoblox\_user** username to use to connect to infoblox (will try pillar if not specified)

**infoblox\_password** password to use to connect to infoblox (will try pillar if not specified)

**verify\_ssl** verify SSL certificates

Example:

```
some-state:
  infoblox.absent:
    - name: some.dns.record
    - record_type: host
    - dns_view: MyView
    - sslVerify: False
```

`salt.states.infoblox.present` (*name, value, record\_type, dns\_view, infoblox\_server=None, infoblox\_user=None, infoblox\_password=None, infoblox\_api\_version='v1.4.2', sslVerify=True*)

Ensure a record exists

**name** Name of the record

**value** Value of the record

**record\_type** record type (host, a, cname, etc)

**dns\_view** DNS View

**infoblox\_server** infoblox server to connect to (will try pillar if not specified)

**infoblox\_user** username to use to connect to infoblox (will try pillar if not specified)

**infoblox\_password** password to use to connect to infoblox (will try pillar if not specified)

**verify\_ssl** verify SSL certificates

Example:

```
some-state:
  infoblox.present:
    - name: some.dns.record
    - value: 10.1.1.3
    - record_type: host
    - sslVerify: False
```

### 14.17.114 salt.states.ini\_manage

#### Manage ini files

**maintainer** <akilesh1597@gmail.com>

**maturity** new

**depends** re

**platform** all

`salt.states.ini_manage.options_absent`(*name, sections=None, separator='='*)

```
/home/saltminion/api-paste.ini:
ini.options_absent:
  - separator: '='
  - sections:
    test:
      - testkey
      - secondoption
    test1:
      - testkey1
```

options present in file and not specified in sections dict will be untouched

changes dict will contain the list of changes made

`salt.states.ini_manage.options_present`(*name, sections=None, separator='=', strict=False*)

```
/home/saltminion/api-paste.ini:
ini.options_present:
  - separator: '='
  - strict: True
  - sections:
    test:
      testkey: 'testval'
      secondoption: 'secondvalue'
    test1:
      testkey1: 'testval121'
```

options present in file and not specified in sections dict will be untouched, unless *strict: True* flag is used

changes dict will contain the list of changes made

`salt.states.ini_manage.sections_absent`(*name, sections=None, separator='='*)

```
/home/saltminion/api-paste.ini:
ini.sections_absent:
  - separator: '='
  - sections:
    - test
    - test1
```

options present in file and not specified in sections will be deleted changes dict will contain the sections that changed

`salt.states.ini_manage.sections_present` (*name*, *sections=None*, *separator='='*)

```
/home/saltminion/api-paste.ini:
ini.sections_present:
- separator: '='
- sections:
  - section_one
  - section_two
```

This will only create empty sections. To also create options, use `options_present` state

options present in file and not specified in sections will be deleted changes dict will contain the sections that changed

### 14.17.115 salt.states.ipmi

#### Manage IPMI devices over LAN

The following configuration defaults can be defined in the minion, master config or pillar:

```
ipmi.config:
  api_host: 127.0.0.1
  api_user: admin
  api_pass: apassword
  api_port: 623
  api_kg: None
```

Every call can override the config defaults:

```
ensure myipmi system is set to network boot:
  ipmi.boot_device:
    - name: network
    - api_host: myipmi.hostname.com
    - api_user: root
    - api_pass: apassword
    - api_kg: None

ensure myipmi system is powered on:
  ipmi.power:
    - name: boot
    - api_host: myipmi.hostname.com
    - api_user: root
    - api_pass: apassword
```

`salt.states.ipmi.boot_device` (*name='default'*, *\*\*kwargs*)

Request power state change

**name = default**

- network -- Request network boot
- hd -- Boot from hard drive
- safe -- Boot from hard drive, requesting `safe mode`
- optical -- boot from CD/DVD/BD drive
- setup -- Boot into setup utility
- default -- remove any IPMI directed boot device request

**kwargs**

- api\_host=localhost

- api\_user=admin
- api\_pass=
- api\_port=623
- api\_kg=None

`salt.states.ipmi.power` (*name='power\_on', wait=300, \*\*kwargs*)

Request power state change

**name**

Ensure power state one of:

- power\_on -- system turn on
- power\_off -- system turn off (without waiting for OS)
- shutdown -- request OS proper shutdown
- reset -- reset (without waiting for OS)
- boot -- If system is off, then `on`, else `reset`

**wait** wait X seconds for the job to complete before forcing. (defaults to 300 seconds)

**kwargs**

- api\_host=localhost
- api\_user=admin
- api\_pass=
- api\_port=623
- api\_kg=None

`salt.states.ipmi.user_absent` (*name, channel=14, \*\*kwargs*)

Remove user Delete all user (uid) records having the matching name.

**name** string name of user to delete

**channel** channel to remove user access from defaults to 14 for auto.

**kwargs**

- api\_host=localhost
- api\_user=admin
- api\_pass=
- api\_port=623
- api\_kg=None

`salt.states.ipmi.user_present` (*name, uid, password, channel=14, callback=False, link\_auth=True, ipmi\_msg=True, privilege\_level='administrator', \*\*kwargs*)

Ensure IPMI user and user privileges.

**name** name of user (limit 16 bytes)

**uid** user id number (1 to 7)

**password** user password (limit 16 bytes)

**channel** ipmi channel defaults to 14 for auto

**callback** User Restricted to Callback

**False** = User Privilege Limit is determined by the User Privilege Limit parameter `privilege_level`, for both callback and non-callback connections.

**True** = User Privilege Limit is determined by the `privilege_level` parameter for callback connections, but is restricted to Callback level for non-callback connections. Thus, a user can only initiate a Callback when they `call in` to the BMC, but once the callback connection has been made, the user could potentially establish a session as an Operator.

**link\_auth** User Link authentication True/False user name and password information will be used for link authentication, e.g. PPP CHAP) for the given channel. Link authentication itself is a global setting for the channel and is enabled/disabled via the serial/modem configuration parameters.

**ipmi\_msg** User IPMI Messaging True/False user name and password information will be used for IPMI Messaging. In this case, `IPMI Messaging` refers to the ability to execute generic IPMI commands that are not associated with a particular payload type. For example, if IPMI Messaging is disabled for a user, but that user is enabled for activating the SOL payload type, then IPMI commands associated with SOL and session management, such as Get SOL Configuration Parameters and Close Session are available, but generic IPMI commands such as Get SEL Time are unavailable.) `ipmi_msg`

**privilege\_level**

- callback
- user
- operator
- administrator
- proprietary
- no\_access

**kwargs**

- api\_host=localhost
- api\_user=admin
- api\_pass=
- api\_port=623
- api\_key=None

**14.17.116 salt.states.ipset****Management of ipsets**

This is an ipset-specific module designed to manage IPsets for use in IPTables Firewalls.

```

setname:
  ipset.set_present:
    - set_type: bitmap:ip
    - range: 192.168.0.0/16
    - comment: True

setname:
  ipset.set_absent:
    - set_type: bitmap:ip
    - range: 192.168.0.0/16
    - comment: True

setname_entries:
  ipset.present:
    - set_name: setname
    - entry: 192.168.0.3
    - comment: Hello
    - require:
      - ipset: baz

setname_entries:
  ipset.present:

  - ipset: baz

setname:
  ipset.flush:
```

**salt.states.ipset.absent**(*name*, *entry=None*, *entries=None*, *family='ipv4'*, *\*\*kwargs*)

New in version 2014.7.0.

Remove a entry or entries from a chain

**name** A user-defined name to call this entry by in another part of a state or formula. This should not be an actual entry.

**family** Network family, ipv4 or ipv6.

**salt.states.ipset.flush**(*name*, *family='ipv4'*, *\*\*kwargs*)

New in version 2014.7.0.

Flush current ipset set

**family** Networking family, either ipv4 or ipv6

**salt.states.ipset.present**(*name*, *entry=None*, *family='ipv4'*, *\*\*kwargs*)

New in version 2014.7.0.

Append a entry to a set

**name** A user-defined name to call this entry by in another part of a state or formula. This should not be an actual entry.

**entry** A single entry to add to a set or a list of entries to add to a set

**family** Network family, ipv4 or ipv6.

**salt.states.ipset.set\_absent**(*name*, *family='ipv4'*, *\*\*kwargs*)

New in version 2014.7.0.

Verify the set is absent.

**family** Networking family, either ipv4 or ipv6

**salt.states.ipset.set\_present**(*name*, *set\_type*, *family='ipv4'*, *\*\*kwargs*)

New in version 2014.7.0.

Verify the set exists.

**name** A user-defined set name.

**set\_type** The type for the set.

**family** Networking family, either ipv4 or ipv6

## 14.17.117 salt.states.iptables

### Management of iptables

This is an iptables-specific module designed to manage Linux firewalls. It is expected that this state module, and other system-specific firewall states, may at some point be deprecated in favor of a more generic `firewall` state.

```
httpd:
  iptables.append:
    - table: filter
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
```

```
- dport: 80
- proto: tcp
- sport: 1025:65535
- save: True

httpd:
  iptables.append:
    - table: filter
    - chain: INPUT
    - jump: ACCEPT
    - match:
      - state
      - comment
    - comment: "Allow HTTP"
    - connstate: NEW
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True

httpd:
  iptables.append:
    - table: filter
    - chain: INPUT
    - jump: ACCEPT
    - match:
      - state
      - comment
    - comment: "Allow HTTP"
    - connstate: NEW
    - source: '127.0.0.1'
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True

.. Invert Rule
httpd:
  iptables.append:
    - table: filter
    - chain: INPUT
    - jump: ACCEPT
    - match:
      - state
      - comment
    - comment: "Allow HTTP"
    - connstate: NEW
    - source: '! 127.0.0.1'
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True

httpd:
  iptables.append:
    - table: filter
    - chain: INPUT
    - jump: ACCEPT
```

- match:
  - state
  - comment
- comment: "Allow HTTP"
- connstate: NEW
- source: 'not 127.0.0.1'
- dport: 80
- proto: tcp
- sport: 1025:65535
- save: True

httpd:

- iptables.append:
  - table: filter
  - family: ipv6
  - chain: INPUT
  - jump: ACCEPT
  - match: state
  - connstate: NEW
  - dport: 80
  - proto: tcp
  - sport: 1025:65535
  - save: True

httpd:

- iptables.append:
  - table: filter
  - family: ipv4
  - chain: INPUT
  - jump: ACCEPT
  - match: state
  - connstate: NEW
  - dports:
    - 80
    - 443
  - proto: tcp
  - sport: 1025:65535
  - save: True

httpd:

- iptables.insert:
  - position: 1
  - table: filter
  - chain: INPUT
  - jump: ACCEPT
  - match: state
  - connstate: NEW
  - dport: 80
  - proto: tcp
  - sport: 1025:65535
  - save: True

httpd:

- iptables.insert:
  - position: 1
  - table: filter
  - family: ipv6
  - chain: INPUT

```

- jump: ACCEPT
- match: state
- connstate: NEW
- dport: 80
- proto: tcp
- sport: 1025:65535
- save: True

```

httpd:

```

iptables.delete:
- table: filter
- chain: INPUT
- jump: ACCEPT
- match: state
- connstate: NEW
- dport: 80
- proto: tcp
- sport: 1025:65535
- save: True

```

httpd:

```

iptables.delete:
- position: 1
- table: filter
- chain: INPUT
- jump: ACCEPT
- match: state
- connstate: NEW
- dport: 80
- proto: tcp
- sport: 1025:65535
- save: True

```

httpd:

```

iptables.delete:
- table: filter
- family: ipv6
- chain: INPUT
- jump: ACCEPT
- match: state
- connstate: NEW
- dport: 80
- proto: tcp
- sport: 1025:65535
- save: True

```

default to accept:

```

iptables.set_policy:
- chain: INPUT
- policy: ACCEPT

```

---

**Note:** Various functions of the `iptables` module use the `--check` option. If the version of `iptables` on the target system does not include this option, an alternate version of this check will be performed using the output of `iptables-save`. This may have unintended consequences on legacy releases of `iptables`.

---

```

salt.states.iptables.append(name, table='filter', family='ipv4', **kwargs)

```

New in version 0.17.0.

Add a rule to the end of the specified chain.

**name** A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

**table** The table that owns the chain which should be modified

**family** Network family, ipv4 or ipv6.

All other arguments are passed in with the same name as the long option that would normally be used for iptables, with one exception: `--state` is specified as `connstate` instead of `state` (not to be confused with `ctstate`).

Jump options that doesn't take arguments should be passed in with an empty string.

`salt.states.iptables.chain_absent(name, table='filter', family='ipv4')`

New in version 2014.1.0.

Verify the chain is absent.

**table** The table to remove the chain from

**family** Networking family, either ipv4 or ipv6

`salt.states.iptables.chain_present(name, table='filter', family='ipv4')`

New in version 2014.1.0.

Verify the chain is exist.

**name** A user-defined chain name.

**table** The table to own the chain.

**family** Networking family, either ipv4 or ipv6

`salt.states.iptables.delete(name, table='filter', family='ipv4', **kwargs)`

New in version 2014.1.0.

Delete a rule to a chain

**name** A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

**table** The table that owns the chain that should be modified

**family** Networking family, either ipv4 or ipv6

All other arguments are passed in with the same name as the long option that would normally be used for iptables, with one exception: `--state` is specified as `connstate` instead of `state` (not to be confused with `ctstate`).

Jump options that doesn't take arguments should be passed in with an empty string.

`salt.states.iptables.flush(name, table='filter', family='ipv4', **kwargs)`

New in version 2014.1.0.

Flush current iptables state

**table** The table that owns the chain that should be modified

**family** Networking family, either ipv4 or ipv6

`salt.states.iptables.insert(name, table='filter', family='ipv4', **kwargs)`

New in version 2014.1.0.

Insert a rule into a chain

**name** A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

**table** The table that owns the chain that should be modified

**family** Networking family, either ipv4 or ipv6

**position** The numerical representation of where the rule should be inserted into the chain. Note that `-1` is not a supported position value.

All other arguments are passed in with the same name as the long option that would normally be used for iptables, with one exception: `--state` is specified as `connstate` instead of `state` (not to be confused with `ctstate`).

Jump options that doesn't take arguments should be passed in with an empty string.

`salt.states.iptables.mod_aggregate`(*low, chunks, running*)

The `mod_aggregate` function which looks up all rules in the available low chunks and merges them into a single rules ref in the present low data

`salt.states.iptables.set_policy`(*name, table='filter', family='ipv4', \*\*kwargs*)

New in version 2014.1.0.

Sets the default policy for iptables firewall tables

**table** The table that owns the chain that should be modified

**family** Networking family, either ipv4 or ipv6

**policy** The requested table policy

### 14.17.118 salt.states.jboss7

Manage JBoss 7 Application Server via CLI interface

New in version 2015.5.0.

This state uses the `jboss-cli.sh` script from a JBoss or Wildfly installation and parses its output to determine the execution result.

In order to run each state, a `jboss_config` dictionary with the following properties must be passed:

```
jboss:
  cli_path: '/opt/jboss/jboss-7.0/bin/jboss-cli.sh'
  controller: 10.11.12.13:9999
  cli_user: 'jbossadm'
  cli_password: 'jbossadm'
```

If the controller doesn't require a password, then the `cli_user` and `cli_password` parameters are optional.

Since same dictionary with configuration will be used in all the states, it may be more convenient to move JBoss configuration and other properties to the pillar.

Example of application deployment from local filesystem:

```
application_deployed:
  jboss7.deployed:
    - salt_source:
        target_file: '/tmp/webapp.war'
    - jboss_config: {{ pillar['jboss'] }}
```

For the sake of brevity, examples for each state assume that `jboss_config` is contained in the pillar.

`salt.states.jboss7.bindings_exist`(*name, jboss\_config, bindings, profile=None*)

Ensures that given JNDI binding are present on the server. If a binding doesn't exist on the server it will be created. If it already exists its value will be changed.

**jboss\_config**: Dict with connection properties (see state description)

**bindings**: Dict with bindings to set.

**profile**: The profile name (domain mode only)

Example:

```
jndi_entries_created:
  jboss7.bindings_exist:
    - bindings:
      'java:global/sampleapp/environment': 'DEV'
      'java:global/sampleapp/configurationFile': '/var/opt/sampleapp/config.
↳ properties'
    - jboss_config: {{ pillar['jboss'] }}
```

`salt.states.jboss7.datasource_exists`(*name*, *jboss\_config*, *datasource\_properties*, *recreate=False*, *profile=None*)

Ensures that a datasource with given properties exist on the jboss instance. If datasource doesn't exist, it is created, otherwise only the properties that are different will be updated.

**name** Datasource property name

**jboss\_config** Dict with connection properties (see state description)

**datasource\_properties** Dict with datasource properties

**recreate** [False] If set to True and datasource exists it will be removed and created again. However, if there are deployments that depend on the datasource, it will not be possible to remove it.

**profile** [None] The profile name for this datasource (domain mode only)

Example:

```
sampleDS:
  jboss7.datasource_exists:
    - recreate: False
    - datasource_properties:
      driver-name: mysql
      connection-url: 'jdbc:mysql://localhost:3306/sampleDatabase'
      jndi-name: 'java:jboss/datasources/sampleDS'
      user-name: sampleuser
      password: secret
      min-pool-size: 3
      use-java-context: True
    - jboss_config: {{ pillar['jboss'] }}
    - profile: full-ha
```

`salt.states.jboss7.deployed`(*name*, *jboss\_config*, *salt\_source=None*)

Ensures that the given application is deployed on server.

**jboss\_config**: Dict with connection properties (see state description)

**salt\_source**:

**How to find the artifact to be deployed.**

**target\_file**: Where to look in the minion's file system for the artifact to be deployed (e.g. `/tmp/application-web-0.39.war`). When source is specified, also specifies where to save the retrieved file.

**source**: (optional) File on salt master (e.g. `salt://application-web-0.39.war`). If absent, no files will be retrieved and the artifact in `target_file` will be used for the deployment.

**undeploy**: (optional) Regular expression to match against existing deployments. When present, if there is a deployment that matches the regular expression, it will be undeployed before the new artifact is deployed.

Examples:

Deployment of a file from minion's local file system:

```
application_deployed:
  jboss7.deployed:
    - salt_source:
      target_file: '/tmp/webapp.war'
    - jboss_config: {{ pillar['jboss'] }}
```

It is assumed that /tmp/webapp.war was made available by some other means. No applications will be undeployed; if an existing deployment that shares that name exists, then it will be replaced with the updated version.

Deployment of a file from the Salt master's file system:

```
application_deployed:
  jboss7.deployed:
    - salt_source:
        source: salt://application-web-0.39.war
        target_file: '/tmp/application-web-0.39.war'
        undeploy: 'application-web-.*'
    - jboss_config: {{ pillar['jboss'] }}
```

Here, application-web-0.39.war file is downloaded from Salt file system to /tmp/application-web-0.39.war file on minion. Existing deployments are checked if any of them matches `application-web-.\*` regular expression, and if so then it is undeployed before deploying the application. This is useful to automate deployment of new application versions.

If the source parameter of salt\_source is specified, it can use any protocol that the file states use. This includes not only downloading from the master but also HTTP, HTTPS, FTP, Amazon S3, and OpenStack Swift.

**salt.states.jboss7.reloaded** (*name, jboss\_config, timeout=60, interval=5*)

Reloads configuration of jboss server.

**jboss\_config**: Dict with connection properties (see state description)

**timeout**: Time to wait until jboss is back in running state. Default timeout is 60s.

**interval**: Interval between state checks. Default interval is 5s. Decreasing the interval may slightly decrease waiting time but be aware that every status check is a call to jboss-cli which is a java process. If interval is smaller than process cleanup time it may easily lead to excessive resource consumption.

This step performs the following operations:

- Ensures that server is in running or reload-required state (by reading server-state attribute)
- Reloads configuration
- Waits for server to reload and be in running state

Example:

```
configuration_reloaded:
  jboss7.reloaded:
    - jboss_config: {{ pillar['jboss'] }}
```

### 14.17.119 salt.states.jenkins module

#### Management of Jenkins

New in version 2016.3.0.

**salt.states.jenkins.absent** (*name, \*\*kwargs*)

Ensure the job is absent from the Jenkins configured jobs

**name** The name of the Jenkins job to remove

**salt.states.jenkins.present** (*name, config=None, \*\*kwargs*)

Ensure the job is present in the Jenkins configured jobs

**name** The unique name for the Jenkins job

**config** The Salt URL for the file to use for configuring the job

### 14.17.120 salt.states.junos module

State modules to interact with Junos devices.

maturity new

dependencies junos-eznc, jxmlease

---

**Note:** Those who wish to use junos-eznc (PyEZ) version  $\geq$  2.1.0, must use the latest salt code from github until the next release.

---

Refer to *junos* for information on connecting to junos proxy.

`salt.states.junos.cli` (*name*, *format='text'*, *\*\*kwargs*)

Executes the CLI commands and returns the text output.

```
show version:
  junos:
    - cli
    - format: xml
```

#### Parameters

- **Required** --
  - `command`: The command that need to be executed on Junos CLI. (default = None)
- **Optional** --
  - `format`: Format in which to get the CLI output. (text or xml, default = `text`)
  - `kwargs`: **Keyworded arguments which can be provided like-**
    - \* `timeout`: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
    - \* `dest`: The destination file where the CLI output can be stored. (default = None)

`salt.states.junos.commit` (*name*, *\*\*kwargs*)

Commits the changes loaded into the candidate configuration.

```
commit the changes:
  junos:
    - commit
    - confirm: 10
```

#### Parameters **Optional** --

- `kwargs`: **Keyworded arguments which can be provided like-**
  - `timeout`: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
  - `comment`: Provide a comment to the commit. (default = None)
  - `confirm`: Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolledback in the given time unless the commit is confirmed.
  - `sync`: On dual control plane systems, requests that the candidate configuration on one control plane be copied to the other control plane, checked for correct syntax, and committed on both Routing Engines. (default = False)
  - `force_sync`: On dual control plane systems, force the candidate configuration on one control plane to be copied to the other control plane.

- full: When set to True requires all the daemons to check and evaluate the new configuration.
- detail: When true return commit detail.

`salt.states.junos.commit_check(name)`  
Perform a commit check on the configuration.

```
perform commit check:
junos.commit_check
```

`salt.states.junos.diff(name, d_id)`  
Gets the difference between the candidate and the current configuration.

```
get the diff:
junos:
- diff
- id: 10
```

**Parameters Optional --**

- id: The rollback id value [0-49]. (default = 0)

`salt.states.junos.file_copy(name, dest=None, **kwargs)`  
Copies the file from the local device to the junos device.

```
/home/m2/info.txt:
junos:
- file_copy
- dest: info_copy.txt
```

**Parameters Required --**

- src: The source path where the file is kept.
- dest: The destination path where the file will be copied.

`salt.states.junos.install_config(name, **kwargs)`  
Loads and commits the configuration provided.

```
Install the mentioned config:
junos:
- install_config
- path: salt//configs/interface.set
- timeout: 100
- diffs_file: 'var/log/diff'
```

```
Install the mentioned config:
junos:
- install_config
- template_path: salt//configs/interface.set
- timeout: 100
- template_vars:
  interface_name: lo0
  description: Creating interface via SaltStack.
```

**Parameters**

• **Required --**

- name: Path where the configuration/template file is present. If the file has a `.conf` extension, the content is treated as text format. If the file has a `.xml` extension, the content is treated as XML format. If the file has a `.set` extension, the content is treated as Junos OS `set` commands.(default = None)

- **Optional** --
  - **kwargs**: **Keyworded arguments which can be provided like-**
    - \* **template\_vars**: The dictionary of data for the jinja variables present in the jinja template
    - \* **timeout**: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
    - \* **overwrite**: Set to True if you want this file is to completely replace the configuration file. (default = False)
    - \* **replace**: Specify whether the configuration file uses ``replace`` statements. Those statements under the `replace` tag will only be changed. (default = False)
    - \* **comment**: Provide a comment to the commit. (default = None)
    - \* **confirm**: Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the given time unless the commit is confirmed.
    - \* **diffs\_file**: Path to the file where the diff (difference in old configuration and the committed configuration) will be stored.(default = None) Note that the file will be stored on the proxy minion. To push the files to the master use the salt's following execution module: [cp.push](#)

`salt.states.junos.install_os(name, **kwargs)`

Installs the given image on the device. After the installation is complete the device is rebooted, if `reboot=True` is given as a keyworded argument.

```
salt://images/junos_image.tgz:
  junos:
    - install_os
    - timeout: 100
    - reboot: True
```

#### Parameters

- **Required** --
  - **path**: Path where the image file is present on the proxy minion.
- **Optional** --
  - **kwargs**: **keyworded arguments to be given such as timeout, reboot etc**
    - \* **timeout**: Set NETCONF RPC timeout. Can be used to RPCs which take a while to execute. (default = 30 seconds)
    - \* **reboot**: Whether to reboot after installation (default = False)
    - \* **no\_copy**: When True the software package will not be SCP'd to the device. (default = False)

`salt.states.junos.load(name, **kwargs)`

Loads the configuration provided onto the junos device.

```
Install the mentioned config:
  junos:
    - load
    - path: salt//configs/interface.set
```

```
Install the mentioned config:
  junos:
    - load
    - template_path: salt//configs/interface.set
    - template_vars:
        interface_name: lo0
```

```
description: Creating interface via SaltStack.
```

#### Parameters

- **Required** --
  - name: Path where the configuration/template file is present. If the file has a `.conf` extension, the content is treated as text format. If the file has a `.xml` extension, the content is treated as XML format. If the file has a `.set` extension, the content is treated as Junos OS `set` commands. (default = None)
- **Optional** --
  - kwarg: **Keyworded arguments which can be provided like-**
    - \* `overwrite`: Set to True if you want this file is to completely replace the configuration file. (default = False)
    - \* `replace`: Specify whether the configuration file uses `replace:` statements. Those statements under the `replace` tag will only be changed. (default = False)
    - \* `format`: Determines the format of the contents.
    - \* `update`: Compare a complete loaded configuration against the candidate configuration. For each hierarchy level or configuration object that is different in the two configurations, the version in the loaded configuration replaces the version in the candidate configuration. When the configuration is later committed, only system processes that are affected by the changed configuration elements parse the new configuration. This action is supported from PyEZ 2.1 (default = False)
    - \* `template_vars`: Variables to be passed into the template processing engine in addition to those present in `__pillar__`, `__opts__`, `__grains__`, etc. You may reference these variables in your template like so: `{{ template_vars["var_name"] }}`

`salt.states.junos.lock`(*name*)

Attempts an exclusive lock on the candidate configuration. This is a non-blocking call.

---

**Note:** Any user who wishes to use lock, must necessarily unlock the configuration too. Ensure `unlock` is called in the same orchestration run in which the lock is called.

---

```
lock the config:
  junos.lock
```

`salt.states.junos.rollback`(*name*, *id*, *\*\*kwargs*)

Rollbacks the committed changes.

```
rollback the changes:
  junos:
    - rollback
    - id: 5
```

#### Parameters **Optional** --

- `id`: The rollback id value [0-49]. (default = 0)
- **kwarg: Keyworded arguments which can be provided like-**
  - `timeout`: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
  - `comment`: Provide a comment to the commit. (default = None)
  - `confirm`: Provide time in minutes for commit confirmation. If this option

is specified, the commit will be rolled back in the given time unless the commit is confirmed.

- `diffs_file`: Path to the file where any diffs will be written. (default = None)

`salt.states.junos.rpc` (*name*, *dest=None*, *format='xml'*, *args=None*, *\*\*kwargs*)

Executes the given rpc. The returned data can be stored in a file by specifying the destination path with `dest` as an argument

```
get-interface-information:
  junos:
    - rpc
    - dest: /home/user/rpc.log
    - interface_name: lo0
```

#### Parameters

- **Required** --
  - `cmd`: The rpc to be executed. (default = None)
- **Optional** --
  - `dest`: Destination file where the rpc output is stored. (default = None) Note that the file will be stored on the proxy minion. To push the files to the master use the salt's following execution module: [cp.push](#)
  - `format`: The format in which the rpc reply must be stored in file specified in the `dest` (used only when `dest` is specified) (default = xml)
  - `kwargs`: **keyworded arguments taken by rpc call like-**
    - \* `timeout`: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default= 30 seconds)
    - \* `filter`: Only to be used with 'get-config' rpc to get specific configuration.
    - \* `terse`: Amount of information you want.
    - \* `interface_name`: Name of the interface whose information you want.

`salt.states.junos.set_hostname` (*name*, *\*\*kwargs*)

Changes the hostname of the device.

```
device_name:
  junos:
    - set_hostname
    - comment: "Host-name set via saltstack."
```

#### Parameters

- **Required** --
  - `hostname`: The name to be set. (default = None)
- **Optional** --
  - `kwargs`: **Keyworded arguments which can be provided like-**
    - \* `timeout`: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
    - \* `comment`: Provide a comment to the commit. (default = None)
    - \* `confirm`: Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the given time unless the commit is confirmed.

`salt.states.junos.shutdown` (*name*, *\*\*kwargs*)

Shuts down the device.

```
shut the device:
  junos:
```

- ```
- shutdown
- in_min: 10
```

**Parameters Optional --**

- **kwargs:**
  - **reboot:** Whether to reboot instead of shutdown. (default=False)
  - **at:** Specify time for reboot. (To be used only if reboot=yes)
  - **in\_min:** Specify delay in minutes for shutdown

`salt.states.junos.unlock(name)`  
 Unlocks the candidate configuration.

```
unlock the config:
  junos.unlock
```

`salt.states.junos.zeroize(name)`  
 Resets the device to default factory settings.

```
reset my device:
  junos.zeroize
```

name: can be anything

### 14.17.121 salt.states.k8s

Manage Kubernetes

New in version 2016.3.0.

```
kube_label_1:
  k8s.label_present:
    - name: mylabel
    - value: myvalue
    - node: myothernodename
    - apiserver: http://mykubeapiserver:8080

kube_label_2:
  k8s.label_absent:
    - name: mylabel
    - node: myothernodename
    - apiserver: http://mykubeapiserver:8080

kube_label_3:
  k8s.label_folder_present:
    - name: mylabel
    - node: myothernodename
    - apiserver: http://mykubeapiserver:8080
```

`salt.states.k8s.label_absent(name, node=None, apiserver=None)`

Deprecated since version 2017.7.0: This state has been moved to `kubernetes.node_label_absent` <`salt.states.kubernetes.node_label_absent()`.

Ensure the label doesn't exist on the kube node.

**name** Name of the label.

**node** Override node ID.

**apiserver** K8S apiserver URL.

`salt.states.k8s.label_folder_absent` (*name*, *node=None*, *apiserver=None*)

Deprecated since version 2017.7.0: This state has been moved to `kubernetes.node_label_folder_absent` <`salt.states.kubernetes.node_label_folder_absent`()>.

Ensure the label folder doesn't exist on the kube node.

**name** Name of the label folder.

**node** Override node ID.

**apiserver** K8S apiserver URL.

`salt.states.k8s.label_present` (*name*, *value*, *node=None*, *apiserver=None*)

Deprecated since version 2017.7.0: This state has been moved to `kubernetes.node_label_present` <`salt.states.kubernetes.node_label_present`()>.

Ensure the label exists on the kube node.

**name** Name of the label.

**value** Value of the label.

**node** Override node ID.

**apiserver** K8S apiserver URL.

### 14.17.122 salt.states.kapacitor module

Kapacitor state module.

**configuration** This module accepts connection configuration details either as parameters or as configuration settings in `/etc/salt/minion` on the relevant minions:

```
kapacitor.host: 'localhost'
kapacitor.port: 9092
```

This data can also be passed into pillar. Options passed into `opts` will overwrite options passed into pillar.

New in version 2016.11.0.

`salt.states.kapacitor.task_absent` (*name*)

Ensure that a task is absent from Kapacitor.

**name** Name of the task.

`salt.states.kapacitor.task_present` (*name*, *tick\_script*, *task\_type='stream'*, *database=None*, *retention\_policy='default'*, *enable=True*)

Ensure that a task is present and up-to-date in Kapacitor.

**name** Name of the task.

**tick\_script** Path to the TICK script for the task. Can be a `salt://` source.

**task\_type** Task type. Defaults to `'stream'`

**database** Which database to fetch data from. Defaults to `None`, which will use the default database in InfluxDB.

**retention\_policy** Which retention policy to fetch data from. Defaults to `'default'`.

**enable** Whether to enable the task or not. Defaults to `True`.

### 14.17.123 salt.states.keyboard

#### Management of keyboard layouts

The keyboard layout can be managed for the system:

```
us:
  keyboard.system
```

Or it can be managed for XOrg:

```
us:
  keyboard.xorg
```

`salt.states.keyboard.system`(*name*)

Set the keyboard layout for the system

**name** The keyboard layout to use

`salt.states.keyboard.xorg`(*name*)

Set the keyboard layout for XOrg

**layout** The keyboard layout to use

### 14.17.124 salt.states.keystone

#### Management of Keystone users

##### depends

- keystoneclient Python module

**configuration** See `salt.modules.keystone` for setup instructions.

```
Keystone tenants:
  keystone.tenant_present:
    - names:
      - admin
      - demo
      - service

Keystone roles:
  keystone.role_present:
    - names:
      - admin
      - Member

admin:
  keystone.user_present:
    - password: R00T_4CC3SS
    - email: admin@domain.com
    - roles:
      admin: # tenants
        - admin # roles
      service:
        - admin
        - Member
    - require:
      - keystone: Keystone tenants
      - keystone: Keystone roles

nova:
  keystone.user_present:
    - password: '$up3rn0v4'
    - email: nova@domain.com
```

```

- tenant: service
- roles:
  service:
    - admin
- require:
  - keystone: Keystone tenants
  - keystone: Keystone roles

demo:
  keystone.user_present:
    - password: 'd3m0n$trati0n'
    - email: demo@domain.com
    - tenant: demo
    - roles:
      demo:
        - Member
    - require:
      - keystone: Keystone tenants
      - keystone: Keystone roles

nova service:
  keystone.service_present:
    - name: nova
    - service_type: compute
    - description: OpenStack Compute Service

```

`salt.states.keystone.endpoint_absent`(*name*, *region=None*, *profile=None*, *interface=None*, *\*\*connection\_args*)

Ensure that the endpoint for a service doesn't exist in Keystone catalog

**name** The name of the service whose endpoints should not exist

**region (optional)** The region of the endpoint. Defaults to RegionOne.

**interface** The interface type, which describes the visibility of the endpoint. (for V3 API)

`salt.states.keystone.endpoint_present`(*name*, *publicurl=None*, *internalurl=None*, *adminurl=None*, *region=None*, *profile=None*, *url=None*, *interface=None*, *\*\*connection\_args*)

Ensure the specified endpoints exists for service

**name** The Service name

**publicurl** The public url of service endpoint (for V2 API)

**internalurl** The internal url of service endpoint (for V2 API)

**adminurl** The admin url of the service endpoint (for V2 API)

**region** The region of the endpoint

**url** The endpoint URL (for V3 API)

**interface** The interface type, which describes the visibility of the endpoint. (for V3 API)

`salt.states.keystone.project_absent`(*name*, *profile=None*, *\*\*connection\_args*)

Ensure that the keystone project is absent. Alias for `tenant_absent` from V2 API to fulfill V3 API naming convention.

New in version 2016.11.0.

**name** The name of the project that should not exist

```

delete_nova:
  keystone.project_absent:
    - name: nova

```

`salt.states.keystone.project_present`(*name*, *description=None*, *enabled=True*, *profile=None*, *\*\*connection\_args*)

Ensures that the keystone project exists Alias for tenant\_present from V2 API to fulfill V3 API naming convention.

New in version 2016.11.0.

**name** The name of the project to manage

**description** The description to use for this project

**enabled** Availability state for this project

```
nova:
  keystone.project_present:
    - enabled: True
    - description: 'Nova Compute Service'
```

`salt.states.keystone.role_absent`(*name*, *profile=None*, *\*\*connection\_args*)

Ensure that the keystone role is absent.

**name** The name of the role that should not exist

`salt.states.keystone.role_present`(*name*, *profile=None*, *\*\*connection\_args*)

Ensures that the keystone role exists

**name** The name of the role that should be present

`salt.states.keystone.service_absent`(*name*, *profile=None*, *\*\*connection\_args*)

Ensure that the service doesn't exist in Keystone catalog

**name** The name of the service that should not exist

`salt.states.keystone.service_present`(*name*, *service\_type*, *description=None*, *profile=None*, *\*\*connection\_args*)

Ensure service present in Keystone catalog

**name** The name of the service

**service\_type** The type of Openstack Service

**description (optional)** Description of the service

`salt.states.keystone.tenant_absent`(*name*, *profile=None*, *\*\*connection\_args*)

Ensure that the keystone tenant is absent.

**name** The name of the tenant that should not exist

`salt.states.keystone.tenant_present`(*name*, *description=None*, *enabled=True*, *profile=None*, *\*\*connection\_args*)

Ensures that the keystone tenant exists

**name** The name of the tenant to manage

**description** The description to use for this tenant

**enabled** Availability state for this tenant

`salt.states.keystone.user_absent`(*name*, *profile=None*, *\*\*connection\_args*)

Ensure that the keystone user is absent.

**name** The name of the user that should not exist

`salt.states.keystone.user_present`(*name*, *password*, *email*, *tenant=None*, *enabled=True*, *roles=None*, *profile=None*, *password\_reset=True*, *project=None*, *\*\*connection\_args*)

Ensure that the keystone user is present with the specified properties.

**name** The name of the user to manage

**password** The password to use for this user.

---

**Note:** If the user already exists and a different password was set for the user than the one specified here, the password for the user will be updated. Please set the `password_reset` option to `False` if this is not the desired behavior.

---

**password\_reset** Whether or not to reset password after initial set. Defaults to True.

**email** The email address for this user

**tenant** The tenant (name) for this user

**project** The project (name) for this user (overrides tenant in api v3)

**enabled** Availability state for this user

**roles** The roles the user should have under given tenants. Passed as a dictionary mapping tenant names to a list of roles in this tenant, i.e.:

```
roles:
  admin:  # tenant
    - admin # role
  service:
    - admin
    - Member
```

### 14.17.125 salt.states.kmod

#### Loading and unloading of kernel modules

The Kernel modules on a system can be managed cleanly with the kmod state module:

```
add_kvm:
  kmod.present:
    - name: kvm_amd
remove_beep:
  kmod.absent:
    - name: pcspkr
```

Multiple modules can be specified for both kmod.present and kmod.absent.

```
add_sound:
  kmod.present:
    - mods:
      - snd_hda_codec_hdmi
      - snd_hda_codec
      - snd_hwdep
      - snd_hda_core
      - snd_pcm
      - snd_timer
      - snd
```

**salt.states.kmod.absent** (*name, persist=False, comment=True, mods=None*)

Verify that the named kernel module is not loaded

**name** The name of the kernel module to verify is not loaded

**persist** Remove module from `/etc/modules`

**comment** Comment out module in `/etc/modules` rather than remove it

**mods** A list of modules to verify are unloaded. If this argument is used, the `name` argument, although still required, is not used, and becomes a placeholder

New in version 2016.3.0.

**salt.states.kmod.present** (*name, persist=False, mods=None*)

Ensure that the specified kernel module is loaded

**name** The name of the kernel module to verify is loaded

**persist** Also add module to `/etc/modules`

**mods** A list of modules to verify are loaded. If this argument is used, the name argument, although still required, is not used, and becomes a placeholder

New in version 2016.3.0.

### 14.17.126 salt.states.kubernetes

#### Manage kubernetes resources as salt states

NOTE: This module requires the proper pillar values set. See salt.modules.kubernetes for more information.

The kubernetes module is used to manage different kubernetes resources.

```
my-nginx:
  kubernetes.deployment_present:
    - namespace: default
      metadata:
        app: frontend
      spec:
        replicas: 1
        template:
          metadata:
            labels:
              run: my-nginx
          spec:
            containers:
              - name: my-nginx
                image: nginx
                ports:
                  - containerPort: 80

my-mariadb:
  kubernetes.deployment_absent:
    - namespace: default

# kubernetes deployment as specified inside of
# a file containing the definition of the the
# deployment using the official kubernetes format
redis-master-deployment:
  kubernetes.deployment_present:
    - name: redis-master
      source: salt://k8s/redis-master-deployment.yml
  require:
    - pip: kubernetes-python-module

# kubernetes service as specified inside of
# a file containing the definition of the the
# service using the official kubernetes format
redis-master-service:
  kubernetes.service_present:
    - name: redis-master
      source: salt://k8s/redis-master-service.yml
  require:
    - kubernetes.deployment_present: redis-master

# kubernetes deployment as specified inside of
# a file containing the definition of the the
# deployment using the official kubernetes format
```

```
# plus some jinja directives
nginx-source-template:
  kubernetes.deployment_present:
    - source: salt://k8s/nginx.yml.jinja
    - template: jinja
  require:
    - pip: kubernetes-python-module

# Kubernetes secret
k8s-secret:
  kubernetes.secret_present:
    - name: top-secret
      data:
        key1: value1
        key2: value2
        key3: value3
```

`salt.states.kubernetes.configmap_absent` (*name*, *namespace='default'*, *\*\*kwargs*)

Ensures that the named configmap is absent from the given namespace.

**name** The name of the configmap

**namespace** The name of the namespace

`salt.states.kubernetes.configmap_present` (*name*, *namespace='default'*, *data=None*, *source=''*, *template=''*, *\*\*kwargs*)

Ensures that the named configmap is present inside of the specified namespace with the given data. If the configmap exists it will be replaced.

**name** The name of the configmap.

**namespace** The namespace holding the configmap. The `default` one is going to be used unless a different one is specified.

**data** The dictionary holding the configmaps.

**source** A file containing the data of the configmap in plain format.

**template** Template engine to be used to render the source file.

`salt.states.kubernetes.deployment_absent` (*name*, *namespace='default'*, *\*\*kwargs*)

Ensures that the named deployment is absent from the given namespace.

**name** The name of the deployment

**namespace** The name of the namespace

`salt.states.kubernetes.deployment_present` (*name*, *namespace='default'*, *metadata=None*, *spec=None*, *source=''*, *template=''*, *\*\*kwargs*)

Ensures that the named deployment is present inside of the specified namespace with the given metadata and spec. If the deployment exists it will be replaced.

**name** The name of the deployment.

**namespace** The namespace holding the deployment. The `default` one is going to be used unless a different one is specified.

**metadata** The metadata of the deployment object.

**spec** The spec of the deployment object.

**source** A file containing the definition of the deployment (metadata and spec) in the official kubernetes format.

**template** Template engine to be used to render the source file.

`salt.states.kubernetes.namespace_absent` (*name*, *\*\*kwargs*)

Ensures that the named namespace is absent.

**name** The name of the namespace

`salt.states.kubernetes.namespace_present` (*name*, *\*\*kwargs*)

Ensures that the named namespace is present.

**name** The name of the deployment.

`salt.states.kubernetes.node_label_absent`(*name*, *node*, *\*\*kwargs*)

Ensures that the named label is absent from the node.

**name** The name of the label

**node** The name of the node

`salt.states.kubernetes.node_label_folder_absent`(*name*, *node*, *\*\*kwargs*)

Ensures the label folder doesn't exist on the specified node.

**name** The name of label folder

**node** The name of the node

`salt.states.kubernetes.node_label_present`(*name*, *node*, *value*, *\*\*kwargs*)

Ensures that the named label is set on the named node with the given value. If the label exists it will be replaced.

**name** The name of the label.

**value** Value of the label.

**node** Node to change.

`salt.states.kubernetes.pod_absent`(*name*, *namespace='default'*, *\*\*kwargs*)

Ensures that the named pod is absent from the given namespace.

**name** The name of the pod

**namespace** The name of the namespace

`salt.states.kubernetes.pod_present`(*name*, *namespace='default'*, *metadata=None*, *spec=None*, *source=''*, *template=''*, *\*\*kwargs*)

Ensures that the named pod is present inside of the specified namespace with the given metadata and spec. If the pod exists it will be replaced.

**name** The name of the pod.

**namespace** The namespace holding the pod. The `default` one is going to be used unless a different one is specified.

**metadata** The metadata of the pod object.

**spec** The spec of the pod object.

**source** A file containing the definition of the pod (metadata and spec) in the official kubernetes format.

**template** Template engine to be used to render the source file.

`salt.states.kubernetes.secret_absent`(*name*, *namespace='default'*, *\*\*kwargs*)

Ensures that the named secret is absent from the given namespace.

**name** The name of the secret

**namespace** The name of the namespace

`salt.states.kubernetes.secret_present`(*name*, *namespace='default'*, *data=None*, *source=''*, *template=''*, *\*\*kwargs*)

Ensures that the named secret is present inside of the specified namespace with the given data. If the secret exists it will be replaced.

**name** The name of the secret.

**namespace** The namespace holding the secret. The `default` one is going to be used unless a different one is specified.

**data** The dictionary holding the secrets.

**source** A file containing the data of the secret in plain format.

**template** Template engine to be used to render the source file.

`salt.states.kubernetes.service_absent`(*name*, *namespace='default'*, *\*\*kwargs*)

Ensures that the named service is absent from the given namespace.

**name** The name of the service

**namespace** The name of the namespace

`salt.states.kubernetes.service_present` (*name*, *namespace='default'*, *metadata=None*, *spec=None*, *source=''*, *template=''*, *\*\*kwargs*)

Ensures that the named service is present inside of the specified namespace with the given metadata and spec. If the deployment exists it will be replaced.

**name** The name of the service.

**namespace** The namespace holding the service. The `default` one is going to be used unless a different one is specified.

**metadata** The metadata of the service object.

**spec** The spec of the service object.

**source** A file containing the definition of the service (metadata and spec) in the official kubernetes format.

**template** Template engine to be used to render the source file.

### 14.17.127 salt.states.layman

#### Management of Gentoo Overlays using layman

A state module to manage Gentoo package overlays via layman

```
sunrise:
  layman.present
```

`salt.states.layman.absent` (*name*)

Verify that the overlay is absent

**name** The name of the overlay to delete

`salt.states.layman.present` (*name*)

Verify that the overlay is present

**name** The name of the overlay to add

### 14.17.128 salt.states.ldap

#### Manage entries in an LDAP database

New in version 2016.3.0.

The `states.ldap` state module allows you to manage LDAP entries and their attributes.

`salt.states.ldap.managed` (*name*, *entries*, *connect\_spec=None*)

Ensure the existence (or not) of LDAP entries and their attributes

Example:

```
ldapi:///:
  ldap.managed:
    - connect_spec:
        bind:
          method: sasl

    - entries:

      # make sure the entry doesn't exist
      - cn=foo,ou=users,dc=example,dc=com:
          - delete_others: True

      # make sure the entry exists with only the specified
```

```

# attribute values
- cn=admin,dc=example,dc=com:
  - delete_others: True
  - replace:
    cn:
      - admin
    description:
      - LDAP administrator
    objectClass:
      - simpleSecurityObject
      - organizationalRole
    userPassword:
      - {{pillar.ldap_admin_password}}

# make sure the entry exists, its olcRootDN attribute
# has only the specified value, the olcRootDN attribute
# doesn't exist, and all other attributes are ignored
- 'olcDatabase={1}hdb,cn=config':
  - replace:
    olcRootDN:
      - cn=admin,dc=example,dc=com
      # the admin entry has its own password attribute
    olcRootPW: []

# note the use of 'default'. also note how you don't
# have to use list syntax if there is only one attribute
# value
- cn=foo,ou=users,dc=example,dc=com:
  - delete_others: True
  - default:
    userPassword: changeme
    shadowLastChange: 0
    # keep sshPublicKey if present, but don't create
    # the attribute if it is missing
    sshPublicKey: []
  - replace:
    cn: foo
    uid: foo
    uidNumber: 1000
    gidNumber: 1000
    gecos: Foo Bar
    givenName: Foo
    sn: Bar
    homeDirectory: /home/foo
    loginShell: /bin/bash
    objectClass:
      - inetOrgPerson
      - posixAccount
      - top
      - ldapPublicKey
      - shadowAccount

```

#### Parameters

- **name** -- The URL of the LDAP server. This is ignored if `connect_spec` is either a connection object or a dict with a `'url'` entry.
- **entries** -- A description of the desired state of zero or more LDAP entries.  
`entries` is an iterable of dicts. Each of these dict's keys are the distinguished names

(DNs) of LDAP entries to manage. Each of these dicts is processed in order. A later dict can reference an LDAP entry that was already mentioned in an earlier dict, which makes it possible for later dicts to enhance or alter the desired state of an LDAP entry.

The DN's are mapped to a description of the LDAP entry's desired state. These LDAP entry descriptions are themselves iterables of dicts. Each dict in the iterable is processed in order. They contain directives controlling the entry's state. The key names the directive type and the value is state information for the directive. The specific structure of the state information depends on the directive type.

The structure of `entries` looks like this:

```
[{dn1: [{directive1: directive1_state,
        directive2: directive2_state},
        {directive3: directive3_state}],
  dn2: [{directive4: directive4_state,
        directive5: directive5_state}]},
 {dn3: [{directive6: directive6_state}]}]
```

These are the directives:

- **'delete\_others'** Boolean indicating whether to delete attributes not mentioned in this dict or any of the other directive dicts for this DN. Defaults to `False`.

If you don't want to delete an attribute if present, but you also don't want to add it if it is missing or modify it if it is present, you can use either the `'default'` directive or the `'add'` directive with an empty value list.

- **'default'** A dict mapping an attribute name to an iterable of default values for that attribute. If the attribute already exists, it is left alone. If not, it is created using the given list of values.

An empty value list is useful when you don't want to create an attribute if it is missing but you do want to preserve it if the `'delete_others'` key is `True`.

- **'add'** Attribute values to add to the entry. This is a dict mapping an attribute name to an iterable of values to add.

An empty value list is useful when you don't want to create an attribute if it is missing but you do want to preserve it if the `'delete_others'` key is `True`.

- **'delete'** Attribute values to remove from the entry. This is a dict mapping an attribute name to an iterable of values to delete from the attribute. If the iterable is empty, all of the attribute's values are deleted.
- **'replace'** Attributes to replace. This is a dict mapping an attribute name to an iterable of values. Any existing values for the attribute are deleted, then the given values are added. The iterable may be empty.

In the above directives, the iterables of attribute values may instead be `None`, in which case an empty list is used, or a scalar such as a string or number, in which case a new list containing the scalar is used.

Note that if all attribute values are removed from an entry, the entire entry is deleted.

- **connect\_spec** -- See the description of the `connect_spec` parameter of the `ldap3.connect` function in the `ldap3` execution module. If this is a dict and the `'url'` entry is not specified, the `'url'` entry is set to the value of the name parameter.

#### Returns

A dict with the following keys:

- **'name'** This is the same object passed to the `name` parameter.
- **'changes'** This is a dict describing the changes made (or, in test mode, the changes that would have been attempted). If no changes were made (or no changes would have been attempted), then this dict is empty. Only successful changes are included.

Each key is a DN of an entry that was changed (or would have been changed). Entries that were not changed (or would not have been changed) are not included. The value is a dict with two keys:

- **'old'** The state of the entry before modification. If the entry did not previously exist, this key maps to `None`. Otherwise, the value is a dict mapping each of the old entry's attributes to a list of its values before any modifications were made. Unchanged attributes are excluded from this dict.
- **'new'** The state of the entry after modification. If the entry was deleted, this key maps to `None`. Otherwise, the value is a dict mapping each of the entry's attributes to a list of its values after the modifications were made. Unchanged attributes are excluded from this dict.

Example `'changes'` dict where a new entry was created with a single attribute containing two values:

```
{'dn1': {'old': None,
         'new': {'attr1': ['val1', 'val2']}}}
```

Example `'changes'` dict where a new attribute was added to an existing entry:

```
{'dn1': {'old': {},
         'new': {'attr2': ['val3']}}}
```

- **'result'** One of the following values:
  - `True` if no changes were necessary or if all changes were applied successfully.
  - `False` if at least one change was unable to be applied.
  - `None` if changes would be applied but it is in test mode.

### 14.17.129 salt.states.libcloud\_dns module

Manage DNS records and zones using libcloud

**codeauthor** :email:`Anthony Shaw <anthonyshaw@apache.org>`

New in version 2016.11.0.

Create and delete DNS records or zones through Libcloud. Libcloud's DNS system supports over 20 DNS providers including Amazon, Google, GoDaddy, Softlayer

This module uses `libcloud`, which can be installed via package, or pip.

**configuration** This module uses a configuration profile for one or multiple DNS providers

```
libcloud_dns:
  profile1:
    driver: godaddy
    key: 2orgk34kgk34g
  profile2:
    driver: route53
```

```
key: blah
secret: blah
```

Example:

```
webservers:
  libcloud_dns.zone_present:
    name: mywebsite.com
    profile: profile1
  libcloud_dns.record_present:
    name: www
    zone: mywebsite.com
    type: A
    data: 12.34.32.3
    profile: profile1
```

**depends** apache-libcloud

**salt.states.libcloud\_dns.record\_absent**(*name, zone, type, data, profile*)

Ensures a record is absent.

**Parameters**

- **name** (str) -- Record name without the domain name (e.g. www). Note: If you want to create a record for a base domain name, you should specify empty string (``) for this argument.
- **zone** (str) -- Zone where the requested record is created, the domain name
- **type** (str) -- DNS record type (A, AAAA, ...).
- **data** (str) -- Data for the record (depends on the record type).
- **profile** (str) -- The profile key

**salt.states.libcloud\_dns.record\_present**(*name, zone, type, data, profile*)

Ensures a record is present.

**Parameters**

- **name** (str) -- Record name without the domain name (e.g. www). Note: If you want to create a record for a base domain name, you should specify empty string (``) for this argument.
- **zone** (str) -- Zone where the requested record is created, the domain name
- **type** (str) -- DNS record type (A, AAAA, ...).
- **data** (str) -- Data for the record (depends on the record type).
- **profile** (str) -- The profile key

**salt.states.libcloud\_dns.state\_result**(*result, message*)

**salt.states.libcloud\_dns.zone\_absent**(*domain, profile*)

Ensures a record is absent.

**Parameters**

- **domain** (str) -- Zone name, i.e. the domain name
- **profile** (str) -- The profile key

**salt.states.libcloud\_dns.zone\_present**(*domain, type, profile*)

Ensures a record is present.

**Parameters**

- **domain** (str) -- Zone name, i.e. the domain name
- **type** (str) -- Zone type (master / slave), defaults to master
- **profile** (str) -- The profile key

### 14.17.130 salt.states.linux\_acl

Linux File Access Control Lists

The Linux ACL state module requires the *getfacl* and *setfacl* binaries.

Ensure a Linux ACL is present

```

root:
  acl.present:
    - name: /root
    - acl_type: user
    - acl_name: damian
    - perms: rwx

```

Ensure a Linux ACL does not exist

```

root:
  acl.absent:
    - name: /root
    - acl_type: user
    - acl_name: damian
    - perms: rwx

```

`salt.states.linux_acl.absent(name, acl_type, acl_name='', perms='', recurse=False)`

Ensure a Linux ACL does not exist

`salt.states.linux_acl.present(name, acl_type, acl_name='', perms='', recurse=False)`

Ensure a Linux ACL is present

### 14.17.131 salt.states.locale

#### Management of languages/locales

Manage the available locales and the system default:

```

us_locale:
  locale.present:
    - name: en_US.UTF-8

default_locale:
  locale.system:
    - name: en_US.UTF-8
    - require:
      - locale: us_locale

```

`salt.states.locale.present(name)`

Generate a locale if it is not present

New in version 2014.7.0.

**name** The name of the locale to be present. Some distributions require the charmap to be specified as part of the locale at this point.

`salt.states.locale.system(name)`

Set the locale for the system

**name** The name of the locale to use

### 14.17.132 salt.states.logrotate module

Module for managing logrotate.

New in version 2017.7.0.

`salt.states.logrotate.set`(*name*, *key*, *value*, *setting=None*, *conf\_file='/etc/logrotate.conf'*)

Set a new value for a specific configuration line.

#### Parameters

- **key** (*str*) -- The command or block to configure.
- **value** (*str*) -- The command value or command of the block specified by the key parameter.
- **setting** (*str*) -- The command value for the command specified by the value parameter.
- **conf\_file** (*str*) -- The logrotate configuration file.

Example of usage with only the required arguments:

```
logrotate-rotate:
  logrotate.set:
    - key: rotate
    - value: 2
```

Example of usage specifying all available arguments:

```
logrotate-wtmp-rotate:
  logrotate.set:
    - key: /var/log/wtmp
    - value: rotate
    - setting: 2
    - conf_file: /etc/logrotate.conf
```

### 14.17.133 salt.states.loop module

Loop state

Allows for looping over execution modules.

New in version 2017.7.0.

```
wait_for_service_to_be_healthy:
  loop.until:
    - name: boto_elb.get_instance_health
    - condition: m_ret[0]['state'] == 'InService'
    - period: 5
    - timeout: 20
    - m_args:
      - {{ elb }}
    - m_kwargs:
      keyid: {{ access_key }}
      key: {{ secret_key }}
      instances: "{{ instance }}"
```

**Warning:** This state allows arbitrary python code to be executed through the condition parameter which is literally evaluated within the state. Please use caution.

**salt.states.loop.until**(*name*, *m\_args=None*, *m\_kwargs=None*, *condition=None*, *period=0*, *timeout=604800*)

Loop over an execution module until a condition is met.

**name** The name of the execution module

**m\_args** The execution module's positional arguments

**m\_kwargs** The execution module's keyword arguments

**condition** The condition which must be met for the loop to break. This should contain `m_ret` which is the return from the execution module.

**period** The number of seconds to wait between executions

**timeout** The timeout in seconds

### 14.17.134 salt.states.lvm

#### Management of Linux logical volumes

A state module to manage LVMs

```
/dev/sda:
  lvm.pv_present

my_vg:
  lvm.vg_present:
    - devices: /dev/sda

lvroot:
  lvm.lv_present:
    - vname: my_vg
    - size: 10G
    - stripes: 5
    - stripesize: 8K
```

**salt.states.lvm.lv\_absent**(*name*, *vgname=None*)

Remove a given existing logical volume from a named existing volume group

**name** The logical volume to remove

**vgname** The volume group name

**salt.states.lvm.lv\_present**(*name*, *vgname=None*, *size=None*, *extents=None*, *snapshot=None*, *pv=''*, *thinvolume=False*, *thinpool=False*, *\*\*kwargs*)

Create a new logical volume

**name** The name of the logical volume

**vgname** The volume group name for this logical volume

**size** The initial size of the logical volume

**extents** The number of logical extents to allocate

**snapshot** The name of the snapshot

**pv** The physical volume to use

**kwargs** Any supported options to `lvcreate`. See [linux\\_lvm](#) for more details.

New in version to\_complete.

**thinvolume** Logical volume is thinly provisioned

**thinpool** Logical volume is a thin pool

**salt.states.lvm.pv\_absent**(*name*)

Ensure that a Physical Device is not being used by lvm

**name** The device name to initialize.

**salt.states.lvm.pv\_present**(*name*, *\*\*kwargs*)

Set a physical device to be used as an LVM physical volume

**name** The device name to initialize.  
**kwargs** Any supported options to pvcreate. See [linux\\_lvm](#) for more details.

`salt.states.lvm.vg_absent(name)`

Remove an LVM volume group  
**name** The volume group to remove

`salt.states.lvm.vg_present(name, devices=None, **kwargs)`

Create an LVM volume group  
**name** The volume group name to create  
**devices** A list of devices that will be added to the volume group  
**kwargs** Any supported options to vgcreate. See [linux\\_lvm](#) for more details.

### 14.17.135 salt.states.lvs\_server

#### Management of LVS (Linux Virtual Server) Real Server

`salt.states.lvs_server.absent(name, protocol=None, service_address=None, server_address=None)`

Ensure the LVS Real Server in specified service is absent.  
**name** The name of the LVS server.  
**protocol** The service protocol(only support tcp, udp and fwmark service).  
**service\_address** The LVS service address.  
**server\_address** The LVS real server address.

`salt.states.lvs_server.present(name, protocol=None, service_address=None, server_address=None, packet_forward_method='dr', weight=1)`

Ensure that the named service is present.  
**name** The LVS server name  
**protocol** The service protocol  
**service\_address** The LVS service address  
**server\_address** The real server address.  
**packet\_forward\_method** The LVS packet forwarding method(dr for direct routing, tunnel for tunneling, nat for network access translation).  
**weight** The capacity of a server relative to the others in the pool.

```
lvsrs:
  lvs_server.present:
    - protocol: tcp
    - service_address: 1.1.1.1:80
    - server_address: 192.168.0.11:8080
    - packet_forward_method: dr
    - weight: 10
```

### 14.17.136 salt.states.lvs\_service

#### Management of LVS (Linux Virtual Server) Service

`salt.states.lvs_service.absent(name, protocol=None, service_address=None)`

Ensure the LVS service is absent.  
**name** The name of the LVS service  
**protocol** The service protocol  
**service\_address** The LVS service address

`salt.states.lvs_service.present` (*name*, *protocol=None*, *service\_address=None*, *scheduler='wlc'*)

Ensure that the named service is present.

**name** The LVS service name

**protocol** The service protocol

**service\_address** The LVS service address

**scheduler** Algorithm for allocating TCP connections and UDP datagrams to real servers.

```
lvstest:
  lvs_service.present:
    - service_address: 1.1.1.1:80
    - protocol: tcp
    - scheduler: rr
```

### 14.17.137 salt.states.lxc

#### Manage Linux Containers

`salt.states.lxc.absent` (*name*, *stop=False*, *path=None*)

Ensure a container is not present, destroying it if present

**name** Name of the container to destroy

**stop** stop before destroying default: false

New in version 2015.5.2.

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
web01:
  lxc.absent
```

`salt.states.lxc.edited_conf` (*name*, *lxc\_conf=None*, *lxc\_conf\_unset=None*)

**Warning:** This state is unsuitable for setting parameters that appear more than once in an LXC config file, or parameters which must appear in a certain order (such as when configuring more than one network interface). It is slated to be replaced, and as of version 2015.5.0 it is deprecated.

Edit LXC configuration options

Deprecated since version 2015.5.0.

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
setconf:
  lxc.edited_conf:
    - name: ubuntu
    - lxc_conf:
      - network.ipv4.ip: 10.0.3.6
    - lxc_conf_unset:
      - lxc.utsname
```

`salt.states.lxc.frozen` (*name*, *start=True*, *path=None*)

New in version 2015.5.0.

Ensure that a container is frozen

---

**Note:** This state does not enforce the existence of the named container, it just freezes the container if it is running. To ensure that the named container exists, use `lxc.present`.

---

**name** The name of the container

**path** path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

**start** [True] Start container first, if necessary. If `False`, then this state will fail if the container is not running.

```
web01:
  lxc.frozen

web02:
  lxc.frozen:
    - start: False
```

`salt.states.lxc.present`(*name*, *running=None*, *clone\_from=None*, *snapshot=False*, *profile=None*, *network\_profile=None*, *template=None*, *options=None*, *image=None*, *config=None*, *fstype=None*, *size=None*, *backing=None*, *vgname=None*, *lvname=None*, *thinpool=None*, *path=None*)

Changed in version 2015.8.0: The `lxc.created` state has been renamed to `lxc.present`, and the `lxc.cloned` state has been merged into this state.

Create the named container if it does not exist

**name** The name of the container to be created

**path** path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

**running** [False]

- If `True`, ensure that the container is running
- If `False`, ensure that the container is stopped
- If `None`, do nothing with regards to the running state of the container

New in version 2015.8.0.

**clone\_from** Create named container as a clone of the specified container

**snapshot** [False] Use Copy On Write snapshots (LVM). Only supported with `clone_from`.

**profile** Profile to use in container creation (see the LXC Tutorial for more information). Values in a profile will be overridden by the parameters listed below.

**network\_profile** Network Profile to use in container creation (see the LXC Tutorial for more information). Values in a profile will be overridden by the parameters listed below.

New in version 2015.5.2.

#### Container Creation Arguments

**template** The template to use. For example, `ubuntu` or `fedora`. For a full list of available templates, check out the `lxc.templates` function.

Conflicts with the `image` argument.

---

**Note:** The `download` template requires the following three parameters to be defined in `options`:

- **dist** - The name of the distribution
- **release** - Release name/version
- **arch** - Architecture of the container

The available images can be listed using the `lxc.images` function.

---

options

New in version 2015.5.0.

Template-specific options to pass to the `lxc-create` command. These correspond to the long options (ones beginning with two dashes) that the template script accepts. For example:

```
web01:
  lxc.present:
    - template: download
    - options:
      dist: centos
      release: 6
      arch: amd64
```

Remember to double-indent the options, due to [how PyYAML works](#).

For available template options, refer to the `lxc` template scripts which are usually located under `/usr/share/lxc/templates`, or run `lxc-create -t <template> -h`.

**image** A tar archive to use as the rootfs for the container. Conflicts with the `template` argument.

**backing** The type of storage to use. Set to `lvm` to use an LVM group. Defaults to filesystem within `/var/lib/lxc`.

**fstype** Filesystem type to use on LVM logical volume

**size** Size of the volume to create. Only applicable if `backing` is set to `lvm`.

**vgname** [`lxc`] Name of the LVM volume group in which to create the volume for this container. Only applicable if `backing` is set to `lvm`.

**lvname** Name of the LVM logical volume in which to create the volume for this container. Only applicable if `backing` is set to `lvm`.

**thinpool** Name of a pool volume that will be used for thin-provisioning this container. Only applicable if `backing` is set to `lvm`.

`salt.states.lxc.running`(*name*, *restart=False*, *path=None*)

Changed in version 2015.5.0: The `lxc.started` state has been renamed to `lxc.running`

Ensure that a container is running

---

**Note:** This state does not enforce the existence of the named container, it just starts the container if it is not running. To ensure that the named container exists, use `lxc.present`.

---

**name** The name of the container

**path** path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

**restart** [`False`] Restart container if it is already running

```
web01:
  lxc.running

web02:
  lxc.running:
    - restart: True
```

`salt.states.lxc.set_pass`(*name*, *\*\*kwargs*)

Deprecated since version 2015.5.0.

This state function has been disabled, as it did not conform to design guidelines. Specifically, due to the fact that `lxc.set_password` uses `chpasswd(8)` to set the password, there was no method to make this action idempotent (in other words, the password would be changed every time). This makes this state redundant, since the following state will do the same thing:

```
setpass:
  module.run:
    - name: set_pass
    - m_name: root
    - password: secret
```

`salt.states.lxc.stopped` (*name*, *kill=False*, *path=None*)  
Ensure that a container is stopped

---

**Note:** This state does not enforce the existence of the named container, it just stops the container if it running or frozen. To ensure that the named container exists, use `lxc.present`, or use the `lxc.absent` state to ensure that the container does not exist.

---

**name** The name of the container

**path** path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

**kill** [False] Do not wait for the container to stop, kill all tasks in the container. Older LXC versions will stop containers like this irrespective of this argument.

New in version 2015.5.0.

```
web01:
  lxc.stopped
```

### 14.17.138 salt.states.mac\_assistive module

Allows you to manage assistive access on macOS minions with 10.9+

Install, enable and disable assistive access on macOS minions

```
/usr/bin/osascript:
  assistive.installed:
    - enabled: True
```

`salt.states.mac_assistive.installed` (*name*, *enabled=True*)

Make sure that we have the given bundle ID or path to command installed in the assistive access panel.

**name** The bundle ID or path to command

**enable** Should assistive access be enabled on this application?

### 14.17.139 salt.states.mac\_defaults module

Writing/reading defaults from a macOS minion

`salt.states.mac_defaults.absent` (*name*, *domain*, *user=None*)

Make sure the defaults value is absent

**name** The key of the given domain to remove

**domain** The name of the domain to remove from

**user** The user to write the defaults to

`salt.states.mac_defaults.write` (*name*, *domain*, *value*, *vtype='string'*, *user=None*)

Write a default to the system

**name** The key of the given domain to write to

**domain** The name of the domain to write to  
**value** The value to write to the given key  
**vtype** The type of value to be written, valid types are string, data, int[eger], float, bool[ean], date, array, array-add, dict, dict-add  
**user** The user to write the defaults to

### 14.17.140 salt.states.mac\_keychain module

#### Installing of certificates to the keychain

Install certificats to the macOS keychain

```
/mnt/test.p12:
  keychain.installed:
    - password: test123
```

`salt.states.mac_keychain.default_keychain`(*name*, *domain*='user', *user*=None)

Set the default keychain to use

**name** The chain in which to use as the default

**domain** The domain to use valid values are user|system|common|dynamic, the default is user

**user** The user to run as

`salt.states.mac_keychain.installed`(*name*, *password*, *keychain*='/Library/Keychains/System.keychain', *\*\*kwargs*)

Install a p12 certificate file into the macOS keychain

**name** The certificate to install

**password** The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section

**keychain** The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain

**allow\_any** Allow any application to access the imported certificate without warning

**keychain\_password** If your keychain is likely to be locked pass the password and it will be unlocked before running the import

`salt.states.mac_keychain.uninstalled`(*name*, *password*, *keychain*='/Library/Keychains/System.keychain', *keychain\_password*=None)

Uninstall a p12 certificate file from the macOS keychain

**name** The certificate to uninstall, this can be a path for a .p12 or the friendly name

**password** The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section

**cert\_name** The friendly name of the certificate, this can be used instead of giving a certificate

**keychain** The keychain to remove the certificate from, this defaults to /Library/Keychains/System.keychain

**keychain\_password** If your keychain is likely to be locked pass the password and it will be unlocked before running the import

### 14.17.141 salt.states.mac\_package module

#### Installing of mac pkg files

Install any kind of pkg, dmg or app file on macOS:

```
/mnt/test.pkg:
  macpackage.installed:
    - store: True
```

```

/mnt/test.dmg:
  macpackage.installed:
    - dmg: True

/mnt/xcode.dmg:
  macpackage.installed:
    - dmg: True
    - app: True
    - target: /Applications/Xcode.app
    - version_check: xcodebuild -version=Xcode 7.1

```

.7B91b

```

salt.states.mac_package.installed(name, target='LocalSystem', dmg=False, store=False,
                                   app=False, mpkg=False, user=None, onlyif=None, un-
                                   less=None, force=False, allow_untrusted=False, ver-
                                   sion_check=None)

```

Install a Mac OS Package from a pkg or dmg file, if given a dmg file it will first be mounted in a temporary location

**name** The pkg or dmg file to install

**target** The location in which to install the package. This can be a path or LocalSystem

**dmg** Is the given file a dmg file?

**store** Should the pkg be installed as if it was from the Mac OS Store?

**app** Is the file a .app? If so then we'll just copy that to /Applications/ or the given target

**mpkg** Is the file a .mpkg? If so then we'll check all of the .pkg files found are installed

**user** Name of the user performing the unless or onlyif checks

**onlyif** A command to run as a check, run the named command only if the command passed to the `onlyif` option returns true

**unless** A command to run as a check, only run the named command if the command passed to the `unless` option returns false

**force** Force the package to be installed even if its already been found installed

**allow\_untrusted** Allow the installation of untrusted packages

**version\_check** The command and version that we want to check against, the version number can use regex.

### 14.17.142 salt.states.mac\_xattr module

**Allows you to manage extended attributes on files or directories**

Install, enable and disable assistive access on macOS minions

```

/path/to/file:
  xattr.exists:
    - attributes:
      - com.file.attr=test
      - com.apple.quarantine=0x00001111

```

```

salt.states.mac_xattr.delete(name, attributes)

```

Make sure the given attributes are deleted from the file/directory

**name** The path to the file/directory

**attributes** The attributes that should be removed from the file/directory, this is accepted as an array.

```

salt.states.mac_xattr.exists(name, attributes)

```

Make sure the given attributes exist on the file/directory

**name** The path to the file/directory

**attributes** The attributes that should exist on the file/directory, this is accepted as an array, with key and value split with an equals sign, if you want to specify a hex value then add 0x to the beginning of the value.

### 14.17.143 salt.states.makeconf

#### Management of Gentoo make.conf

A state module to manage Gentoo's make.conf file

```
makeopts:
  makeconf.present:
    - value: '-j3'
```

**salt.states.makeconf.absent**(*name*)

Verify that the variable is not in the make.conf.

**name** The variable name. This will automatically be converted to upper case since variables in make.conf are in upper case

**salt.states.makeconf.present**(*name*, *value=None*, *contains=None*, *excludes=None*)

Verify that the variable is in the make.conf and has the provided settings. If value is set, contains and excludes will be ignored.

**name** The variable name. This will automatically be converted to upper case since variables in make.conf are in upper case

**value** Enforce that the value of the variable is set to the provided value

**contains** Enforce that the value of the variable contains the provided value

**excludes** Enforce that the value of the variable does not contain the provided value.

### 14.17.144 salt.states.marathon\_app module

Configure Marathon apps via a salt proxy.

```
my_app:
  marathon_app.config:
    - config:
      cmd: "while [ true ] ; do echo 'Hello Marathon' ; sleep 5 ; done"
      cpus: 0.1
      mem: 10
      instances: 3
```

New in version 2015.8.2.

**salt.states.marathon\_app.absent**(*name*)

Ensure that the marathon app with the given id is not present.

**Parameters** **name** -- The app name/id

**Returns** A standard Salt changes dictionary

**salt.states.marathon\_app.config**(*name*, *config*)

Ensure that the marathon app with the given id is present and is configured to match the given config values.

**Parameters**

- **name** -- The app name/id

- **config** -- The configuration to apply (dict)

**Returns** A standard Salt changes dictionary

`salt.states.marathon_app.running`(*name*, *restart=False*, *force=True*)  
Ensure that the marathon app with the given id is present and restart if set.

**Parameters**

- **name** -- The app name/id
- **restart** -- Restart the app
- **force** -- Override the current deployment

**Returns** A standard Salt changes dictionary

### 14.17.145 `salt.states.mdadm`

#### Managing software RAID with mdadm

A state module for creating or destroying software RAID devices.

```
/dev/md0:  
raid.present:  
- level: 5  
- devices:  
  - /dev/xvdd  
  - /dev/xvde  
  - /dev/xvdf  
- chunk: 256  
- run: True
```

`salt.states.mdadm.absent`(*name*)

Verify that the raid is absent

**name** The name of raid device to be destroyed

```
/dev/md0:  
raid:  
- absent
```

`salt.states.mdadm.present`(*name*, *level*, *devices*, *\*\*kwargs*)

Verify that the raid is present

Changed in version 2014.7.0.

**name** The name of raid device to be created

**level** The RAID level to use when creating the raid.

**devices** A list of devices used to build the array.

**kwargs** Optional arguments to be passed to mdadm.

Example:

```
/dev/md0:  
raid.present:  
- level: 5  
- devices:  
  - /dev/xvdd  
  - /dev/xvde  
  - /dev/xvdf  
- chunk: 256  
- run: True
```

### 14.17.146 salt.states.memcached

#### States for Management of Memcached Keys

New in version 2014.1.0.

`salt.states.memcached.absent`(*name*, *value=None*, *host='127.0.0.1'*, *port=11211*, *time=0*)

Ensure that a memcached key is not present.

**name** The key

**value** [None] If specified, only ensure that the key is absent if it matches the specified value.

**host** The memcached server IP address

**port** The memcached server port

```
foo:
  memcached.absent

bar:
  memcached.absent:
    - host: 10.0.0.1
```

`salt.states.memcached.managed`(*name*, *value=None*, *host='127.0.0.1'*, *port=11211*, *time=0*, *min\_compress\_len=0*)

Manage a memcached key.

**name** The key to manage

**value** The value to set for that key

**host** The memcached server IP address

**port** The memcached server port

```
foo:
  memcached.managed:
    - value: bar
```

### 14.17.147 salt.states.modjk

State to control Apache modjk

`salt.states.modjk.worker_activated`(*name*, *workers=None*, *profile='default'*)

Activate all the workers in the modjk load balancer

Example:

```
loadbalancer:
  modjk.worker_activated:
    - workers:
      - app1
      - app2
```

`salt.states.modjk.worker_disabled`(*name*, *workers=None*, *profile='default'*)

Disable all the workers in the modjk load balancer

Example:

```
loadbalancer:
  modjk.worker_disabled:
    - workers:
      - app1
      - app2
```

`salt.states.modjk.worker_recover` (*name*, *workers=None*, *profile='default'*)

Recover all the workers in the modjk load balancer

Example:

```
loadbalancer:
  modjk.worker_recover:
    - workers:
      - app1
      - app2
```

`salt.states.modjk.worker_stopped` (*name*, *workers=None*, *profile='default'*)

Stop all the workers in the modjk load balancer

Example:

```
loadbalancer:
  modjk.worker_stopped:
    - workers:
      - app1
      - app2
```

### 14.17.148 salt.states.modjk\_worker

#### Manage modjk workers

Send commands to a **modjk** load balancer via the peer system.

This module can be used with the *prereq* requisite to remove/add the worker from the load balancer before deploying/restarting service.

Mandatory Settings:

- The minion needs to have permission to publish the **modjk.\*** functions (see [here](#) for information on configuring peer publishing permissions)
- The modjk load balancer must be configured as stated in the **modjk** execution module [documentation](#)

`salt.states.modjk_worker.activate` (*name*, *lbn*, *target*, *profile='default'*, *tgt\_type='glob'*,  
*expr\_form=None*)

Changed in version 2017.7.0: The *expr\_form* argument has been renamed to *tgt\_type*, earlier releases must use *expr\_form*.

Activate the named worker from the lbn load balancers at the targeted minions

Example:

```
disable-before-deploy:
  modjk_worker.activate:
    - name: {{ grains['id'] }}
    - lbn: application
    - target: 'roles:balancer'
    - tgt_type: grain
```

`salt.states.modjk_worker.disable` (*name*, *lbn*, *target*, *profile='default'*, *tgt\_type='glob'*,  
*expr\_form=None*)

Changed in version 2017.7.0: The *expr\_form* argument has been renamed to *tgt\_type*, earlier releases must use *expr\_form*.

Disable the named worker from the lbn load balancers at the targeted minions. The worker will get traffic only for current sessions and won't get new ones.

Example:

```
disable-before-deploy:
  modjk_worker.disable:
    - name: {{ grains['id'] }}
    - lbn: application
    - target: 'roles:balancer'
    - tgt_type: grain
```

`salt.states.modjk_worker.stop`(*name*, *lbn*, *target*, *profile*='default', *tgt\_type*='glob', *expr\_form*=None)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Stop the named worker from the lbn load balancers at the targeted minions The worker won't get any traffic from the lbn

Example:

```
disable-before-deploy:
  modjk_worker.stop:
    - name: {{ grains['id'] }}
    - lbn: application
    - target: 'roles:balancer'
    - tgt_type: grain
```

## 14.17.149 salt.states.module

### Execution of Salt modules from within states

With `module.run` these states allow individual execution module calls to be made via states. To call a single module function use a `module.run` state:

```
mine.send:
  module.run:
    - network.interfaces
```

Note that this example is probably unnecessary to use in practice, since the `mine_functions` and `mine_interval` config parameters can be used to schedule updates for the mine (see [here](#) for more info).

It is sometimes desirable to trigger a function call after a state is executed, for this the `module.wait` state can be used:

```
fetch_out_of_band:
  module.run:
    git.fetch:
      - cwd: /path/to/my/repo
      - user: myuser
      - opts: '--all'
```

Another example:

```
mine.send:
  module.run:
```

```
network.ip_addrs:
  - interface: eth0
```

And more complex example:

```
eventsviewer:
  module.run:
    task.create_task:
      - name: events-viewer
      - user_name: System
      - action_type: Execute
      - cmd: 'c:\netops\scripts\events_viewer.bat'
      - trigger_type: 'Daily'
      - start_date: '2017-1-20'
      - start_time: '11:59PM'
```

Please note, this is a new behaviour of *module.run* function.

With the previous *module.run* there are several differences:

- The need of *name* keyword
- The need of *m\_* prefix
- No way to call more than one function at once

For example:

```
mine.send:
  module.wait:
    - name: network.interfaces
    - watch:
      - file: /etc/network/interfaces
```

All arguments that the *module* state does not consume are passed through to the execution module function being executed:

```
fetch_out_of_band:
  module.run:
    - name: git.fetch
    - cwd: /path/to/my/repo
    - user: myuser
    - opts: '--all'
```

Due to how the state system works, if a module function accepts an argument called, *name*, then *m\_name* must be used to specify that argument, to avoid a collision with the *name* argument.

Here is a list of keywords hidden by the state system, which must be prefixed with *m\_*:

- fun
- name
- names
- state
- saltenv

For example:

```

disable_nfs:
  module.run:
    - name: service.disable
    - m_name: nfs

```

Note that some modules read all or some of the arguments from a list of keyword arguments. For example:

```

mine.send:
  module.run:
    - func: network.ip_addrs
    - kwargs:
      interface: eth0

```

```

cloud.create:
  module.run:
    - func: cloud.create
    - provider: test-provider
    - m_names:
      - test-vlad
    - kwargs: {
      ssh_username: 'ubuntu',
      image: 'ami-8d6d9daa',
      securitygroup: 'default',
      size: 'c3.large',
      location: 'ap-northeast-1',
      delvol_on_destroy: 'True'
    }

```

Another example that creates a recurring task that runs a batch file on a Windows system:

```

eventsviewer:
  module.run:
    - name: task.create_task
    - m_name: 'events-viewer'
    - user_name: System
    - kwargs: {
      action_type: 'Execute',
      cmd: 'c:\netops\scripts\events_viewer.bat',
      trigger_type: 'Daily',
      start_date: '2017-1-20',
      start_time: '11:59PM'
    }

```

Another option is to use the new version of *module.run*. With which you can call one (or more!) functions at once the following way:

```

call_something:
  module.run:
    git.fetch:
      - cwd: /path/to/my/repo
      - user: myuser
      - opts: '--all'

```

By default this behaviour is not turned on. In order to do so, please add the following configuration to the minion:

```

use_superseded:
  - module.run

```

`salt.states.module.wait`(*name*, *\*\*kwargs*)

Run a single module function only if the watch statement calls it

**name** The module function to execute

**\*\*kwargs** Pass any arguments needed to execute the function

---

**Note:** Like the `cmd.run` state, this state will return True but not actually execute, unless one of the following two things happens:

- 1.The state has a `watch requisite`, and the state which it is watching changes.
  - 2.Another state has a `watch_in requisite` which references this state, and the state with the `watch_in` changes.
- 

### 14.17.150 `salt.states.mongodb_database`

Management of MongoDB databases

Only deletion is supported, creation doesn't make sense and can be done using `mongodb_user.present`

`salt.states.mongodb_database.absent`(*name*, *user=None*, *password=None*, *host=None*,  
*port=None*, *authdb=None*)

Ensure that the named database is absent

**name** The name of the database to remove

**user** The user to connect as (must be able to create the user)

**password** The password of the user

**host** The host to connect to

**port** The port to connect to

**authdb** The database in which to authenticate

### 14.17.151 `salt.states.mongodb_user`

Management of MongoDB users

---

**Note:** This module requires PyMongo to be installed.

---

`salt.states.mongodb_user.absent`(*name*, *user=None*, *password=None*, *host=None*, *port=None*,  
*database='admin'*, *authdb=None*)

Ensure that the named user is absent

**name** The name of the user to remove

**user** MongoDB user with sufficient privilege to create the user

**password** Password for the admin user specified by the `user` parameter

**host** The hostname/IP address of the MongoDB server

**port** The port on which MongoDB is listening

**database** The database from which to remove the user specified by the `name` parameter

**authdb** The database in which to authenticate

`salt.states.mongodb_user.present`(*name*, *passwd*, *database='admin'*, *user=None*, *password=None*,  
*host='localhost'*, *port=27017*, *authdb=None*, *roles=None*)

Ensure that the user is present with the specified properties

**name** The name of the user to manage

**passwd** The password of the user to manage

**user** MongoDB user with sufficient privilege to create the user

**password** Password for the admin user specified with the `user` parameter

**host** The hostname/IP address of the MongoDB server  
**port** The port on which MongoDB is listening  
**database** The database in which to create the user

---

**Note:** If the database doesn't exist, it will be created.

---

**authdb** The database in which to authenticate  
**roles** The roles assigned to user specified with the name parameter  
 Example:

```

mongouser-myapp:
  mongodb_user.present:
    - name: myapp
    - passwd: password-of-myapp
    - database: admin
    # Connect as admin:sekrit
    - user: admin
    - password: sekret
    - roles:
      - readWrite
      - userAdmin
      - dbOwner
  
```

### 14.17.152 salt.states.monit

#### Monit state

Manage monit states

```
monit_enable_service_monitoring:
```

```
  monit.monitor:
```

- name: service

```
monit_disable_service_monitoring:
```

```
  monit.unmonitor:
```

- name: service

---

**Note:** Use of these states require that the *monit* execution module is available.

---

**salt.states.monit.monitor** (*name*)

Get the summary from module monit and try to see if service is being monitored. If not then monitor the service.

**salt.states.monit.unmonitor** (*name*)

Get the summary from module monit and try to see if service is being monitored. If it is then stop monitoring the service.

## 14.17.153 salt.states.mount

### Mounting of filesystems

Mount any type of mountable filesystem with the mounted function:

```
/mnt/sdb:
  mount.mounted:
    - device: /dev/sdb1
    - fstype: ext4
    - mkmnt: True
    - opts:
      - defaults

/srv/bigdata:
  mount.mounted:
    - device: UUID=066e0200-2867-4ebe-b9e6-f30026ca2314
    - fstype: xfs
    - opts: nobootwait,noatime,nodiratime,nobarrier,logbufs=8
    - dump: 0
    - pass_num: 2
    - persist: True
    - mkmnt: True
```

**salt.states.mount.mod\_watch** (*name*, *user=None*, *\*\*kwargs*)

The mounted watcher, called to invoke the watch command.

**name** The name of the mount point

**salt.states.mount.mounted** (*name*, *device*, *fstype*, *mkmnt=False*, *opts='defaults'*, *dump=0*, *pass\_num=0*, *config='/etc/fstab'*, *persist=True*, *mount=True*, *user=None*, *match\_on='auto'*, *device\_name\_regex=None*, *extra\_mount\_invisible\_options=None*, *extra\_mount\_invisible\_keys=None*, *extra\_mount\_ignore\_fs\_keys=None*, *extra\_mount\_translate\_options=None*, *hidden\_opts=None*)

Verify that a device is mounted

**name** The path to the location where the device is to be mounted

**device** The device name, typically the device node, such as `/dev/sdb1` or `UUID=066e0200-2867-4ebe-b9e6-f30026ca2314` or `LABEL=DATA`

**fstype** The filesystem type, this will be `xfs`, `ext2/3/4` in the case of classic filesystems, `fuse` in the case of fuse mounts, and `nfs` in the case of nfs mounts

**mkmnt** If the mount point is not present then the state will fail, set `mkmnt: True` to create the mount point if it is otherwise not present

**opts** A list object of options or a comma delimited list

**dump** The dump value to be passed into the fstab, Default is 0

**pass\_num** The pass value to be passed into the fstab, Default is 0

**config** Set an alternative location for the fstab, Default is `/etc/fstab`

**persist** Set if the mount should be saved in the fstab, Default is `True`

**mount** Set if the mount should be mounted immediately, Default is `True`

**user** The account used to execute the mount; this defaults to the user salt is running as on the minion

**match\_on** A name or list of fstab properties on which this state should be applied. Default is `auto`, a special value indicating to guess based on fstype. In general, `auto` matches on name for recognized special devices and device otherwise.

**device\_name\_regex** A list of device exact names or regular expressions which should not force a remount. For example, `glusterfs` may be mounted with a comma-separated list of servers in fstab, but the `/proc/self/mountinfo` will show only the first available server.

```
{% set glusterfs_ip_list = ['10.0.0.1', '10.0.0.2', '10.0.0.3'] %}

mount glusterfs volume:
  mount.mounted:
    - name: /mnt/glusterfs_mount_point
    - device: {{ glusterfs_ip_list|join(',') }}:/volume_name
    - fstype: glusterfs
    - opts: _netdev,rw,defaults,direct-io-mode=disable
    - mkmnt: True
    - persist: True
    - dump: 0
    - pass_num: 0
    - device_name_regex:
      - ({{ glusterfs_ip_list|join('|') }}):/volume_name
```

New in version 2016.11.0.

**extra\_mount\_invisible\_options** A list of extra options that are not visible through the `/proc/self/mountinfo` interface.

If a option is not visible through this interface it will always remount the device. This option extends the builtin `mount_invisible_options` list.

**extra\_mount\_invisible\_keys** A list of extra key options that are not visible through the `/proc/self/mountinfo` interface.

If a key option is not visible through this interface it will always remount the device. This option extends the builtin `mount_invisible_keys` list.

A good example for a key option is the password option:

```
password=badsecret
```

**extra\_mount\_ignore\_fs\_keys** A dict of filesystem options which should not force a remount. This will update the internal dictionary. The dict should look like this:

```
{
  'ramfs': ['size']
}
```

**extra\_mount\_translate\_options** A dict of mount options that gets translated when mounted. To prevent a remount add additional options to the default dictionary. This will update the internal dictionary. The dictionary should look like this:

```
{
  'tcp': 'proto=tcp',
  'udp': 'proto=udp'
}
```

**hidden\_opts** A list of mount options that will be ignored when considering a remount as part of the state application

New in version 2015.8.2.

`salt.states.mount.swap` (*name*, *persist=True*, *config='/etc/fstab'*)

Activates a swap device

```
/root/swapfile:
  mount.swap
```

---

**Note:** swap does not currently support LABEL

---

`salt.states.mount.unmounted` (*name, device=None, config='/etc/fstab', persist=False, user=None*)  
New in version 0.17.0.

Verify that a device is not mounted

**name** The path to the location where the device is to be unmounted from

**device** The device to be unmounted. This is optional because the device could be mounted in multiple places.

New in version 2015.5.0.

**config** Set an alternative location for the fstab, Default is `/etc/fstab`

**persist** Set if the mount should be purged from the fstab, Default is `False`

**user** The user to own the mount; this defaults to the user salt is running as on the minion

### 14.17.154 `salt.states.msteams` module

#### Send a message card to Microsoft Teams

This state is useful for sending messages to Teams during state runs. .. versionadded:: 2017.7.0 .. code-block:: yaml

```
teams-message:
```

```
  msteams.post_card:
```

- message: `This state was executed successfully!`
- hook\_url: <https://outlook.office.com/webhook/837>

The hook\_url can be specified in the master or minion configuration like below: .. code-block:: yaml

```
msteams: hook_url: https://outlook.office.com/webhook/837
```

`salt.states.msteams.post_card` (*name, message, hook\_url=None, title=None, theme\_color=None*)

Send a message to a Microsoft Teams channel. .. code-block:: yaml

```
send-msteams-message:
```

```
  msteams.post_card:
```

- message: `This state was executed successfully!`
- hook\_url: <https://outlook.office.com/webhook/837>

The following parameters are required: message

The message that is to be sent to the MS Teams channel.

The following parameters are optional: hook\_url

The webhook URL given configured in Teams interface, if not specified in the configuration options of master or minion.

**title** The title for the card posted to the channel

**theme\_color** A hex code for the desired highlight color

### 14.17.155 `salt.states.mysql_database`

#### Management of MySQL databases (schemas)

**depends**

- MySQLdb Python module

**configuration** See `salt.modules.mysql` for setup instructions.

The `mysql_database` module is used to create and manage MySQL databases. Databases can be set as either absent or present.

```
frank:
  mysql_database.present
```

`salt.states.mysql_database.absent` (*name*, *\*\*connection\_args*)

Ensure that the named database is absent

**name** The name of the database to remove

`salt.states.mysql_database.present` (*name*, *character\_set=None*, *collate=None*, *\*\*connection\_args*)

Ensure that the named database is present with the specified properties

**name** The name of the database to manage

### 14.17.156 salt.states.mysql\_grants

#### Management of MySQL grants (user permissions)

##### depends

- MySQLdb Python module

**configuration** See `salt.modules.mysql` for setup instructions.

The `mysql_grants` module is used to grant and revoke MySQL permissions.

The name you pass in purely symbolic and does not have anything to do with the grant itself.

The database parameter needs to specify a `'priv_level'` in the same specification as defined in the MySQL documentation:

- \*
- \*.\*
- db\_name.\*
- db\_name.tbl\_name
- etc...

This state is not able to set password for the permission from the specified host. See `salt.states.mysql_user` for further instructions.

```
frank_exempledb:
  mysql_grants.present:
    - grant: select,insert,update
    - database: exempledb.*
    - user: frank
    - host: localhost

frank_otherdb:
  mysql_grants.present:
    - grant: all privileges
    - database: otherdb.*
    - user: frank

restricted_singletable:
  mysql_grants.present:
    - grant: select
```

```
- database: somedb.sometable
- user: joe
```

`salt.states.mysql_grants.absent` (*name*, *grant=None*, *database=None*, *user=None*, *host='localhost'*, *grant\_option=False*, *escape=True*, *\*\*connection\_args*)

Ensure that the grant is absent

**name** The name (key) of the grant to add

**grant** The grant *priv\_type* (i.e. select,insert,update OR all privileges)

**database** The database *priv\_level* (i.e. db.tbl OR db.\*)

**user** The user to apply the grant to

**host** The network/host that the grant should apply to

`salt.states.mysql_grants.present` (*name*, *grant=None*, *database=None*, *user=None*, *host='localhost'*, *grant\_option=False*, *escape=True*, *revoke\_first=False*, *ssl\_option=False*, *\*\*connection\_args*)

Ensure that the grant is present with the specified properties

**name** The name (key) of the grant to add

**grant** The grant *priv\_type* (i.e. select,insert,update OR all privileges)

**database** The database *priv\_level* (i.e. db.tbl OR db.\*)

**user** The user to apply the grant to

**host** The network/host that the grant should apply to

**grant\_option** Adds the WITH GRANT OPTION to the defined grant. Default is `False`

**escape** Defines if the database value gets escaped or not. Default is `True`

**revoke\_first** By default, MySQL will not do anything if you issue a command to grant privileges that are more restrictive than what's already in place. This effectively means that you cannot downgrade permissions without first revoking permissions applied to a db.table/user pair first.

To have Salt forcibly revoke perms before applying a new grant, enable the `revoke_first` options.

WARNING: This will *remove* permissions for a database before attempting to apply new permissions. There is no guarantee that new permissions will be applied correctly which can leave your database security in an unknown and potentially dangerous state. Use with caution!

Default is `False`

**ssl\_option** Adds the specified ssl options for the connecting user as requirements for this grant. Value is a list of single-element dicts corresponding to the list of ssl options to use.

Possible key/value pairings for the dicts in the value:

```
- SSL: True
- X509: True
- SUBJECT: <subject>
- ISSUER: <issuer>
- CIPHER: <cipher>
```

The non-boolean ssl options take a string as their values, which should be an appropriate value as specified by the MySQL documentation for these options.

Default is `False` (no ssl options will be used)

## 14.17.157 salt.states.mysql\_query

### Execution of MySQL queries

New in version 2014.7.0.

**depends**

- MySQLdb Python module

**configuration** See `salt.modules.mysql` for setup instructions.

The `mysql_query` module is used to execute queries on MySQL databases. Its output may be stored in a file or in a grain.

```
query_id:
  mysql_query.run
  - database: my_database
  - query: "SELECT * FROM table;"
  - output: "/tmp/query_id.txt"
```

`salt.states.mysql_query.run`(*name*, *database*, *query*, *output=None*, *grain=None*, *key=None*, *overwrite=True*, *\*\*connection\_args*)

Execute an arbitrary query on the specified database

**name** Used only as an ID

**database** The name of the database to execute the query on

**query** The query to execute

**output** grain: output in a grain other: the file to store results None: output to the result comment (default)

**grain:** grain to store the output (need output=grain)

**key:** the specified grain will be treated as a dictionary, the result of this state will be stored under the specified key.

**overwrite:** The file or grain will be overwritten if it already exists (default)

`salt.states.mysql_query.run_file`(*name*, *database*, *query\_file=None*, *output=None*, *grain=None*, *key=None*, *overwrite=True*, *\*\*connection\_args*)

Execute an arbitrary query on the specified database

**name** Used only as an ID

**database** The name of the database to execute the query\_file on

**query\_file** The file of mysql commands to run

**output** grain: output in a grain other: the file to store results None: output to the result comment (default)

**grain:** grain to store the output (need output=grain)

**key:** the specified grain will be treated as a dictionary, the result of this state will be stored under the specified key.

**overwrite:** The file or grain will be overwritten if it already exists (default)

New in version 2017.7.0.

### 14.17.158 salt.states.mysql\_user

#### Management of MySQL users

**depends**

- MySQLdb Python module

**configuration** See `salt.modules.mysql` for setup instructions.

```
frank:
  mysql_user.present:
  - host: localhost
  - password: bobcat
```

New in version 0.16.2: Authentication overrides have been added.

The MySQL authentication information specified in the minion config file can be overridden in states using the following arguments: `connection_host`, `connection_port`, `connection_user`, `connec-`

tion\_pass, connection\_db, connection\_unix\_socket, connection\_default\_file and connection\_charset.

```
frank:
  mysql_user.present:
    - host: localhost
    - password: "bob@cat"
    - connection_user: someuser
    - connection_pass: somepass
    - connection_charset: utf8
    - saltenv:
      - LC_ALL: "en_US.utf8"
```

This state is not able to grant permissions for the user. See `salt.states.mysql_grants` for further instructions.

`salt.states.mysql_user.absent` (*name*, *host*='localhost', *\*\*connection\_args*)

Ensure that the named user is absent  
**name** The name of the user to remove

`salt.states.mysql_user.present` (*name*, *host*='localhost', *password*=None, *password\_hash*=None, *allow\_passwordless*=False, *unix\_socket*=False, *password\_column*=None, *\*\*connection\_args*)

Ensure that the named user is present with the specified properties. A passwordless user can be configured by omitting password and password\_hash, and setting allow\_passwordless to True.

**name** The name of the user to manage

**host** Host for which this user/password combo applies

**password** The password to use for this user. Will take precedence over the password\_hash option if both are specified.

**password\_hash** The password in hashed form. Be sure to quote the password because YAML doesn't like the \*. A password hash can be obtained from the mysql command-line client like so:

```
mysql> SELECT PASSWORD('mypass');
+-----+
| PASSWORD('mypass') |
+-----+
| *6C8989366EAF75BB670AD8EA7A7FC1176A95CEF4 |
+-----+
1 row in set (0.00 sec)
```

**allow\_passwordless** If True, then password and password\_hash can be omitted to permit a passwordless login.

New in version 0.16.2.

**unix\_socket** If True and allow\_passwordless is True, the unix\_socket auth plugin will be used.

### 14.17.159 salt.states.netacl

#### Network ACL

Manage the firewall configuration on the network device managed through NAPALM. The firewall configuration is generated by `Capirca`.

New in version 2017.7.0.

**codeauthor** Mircea Ulinic <mircea@cloudflare.com>

**maturity** new

**depends** capirca, napalm

**platform** unix

## Dependencies

Capirca: `pip install -e git+git@github.com:google/capirca.git#egg=aclgen`

To be able to load configuration on network devices, it requires [NAPALM](#) library to be installed: `pip install napalm`. Please check [Installation](#) for complete details.

`salt.states.netacl.filter` (*name*, *filter\_name*, *filter\_options=None*, *terms=None*, *prepend=True*, *pillar\_key='acl'*, *pillarenv=None*, *saltenv=None*, *merge\_pillar=False*, *only\_lower\_merge=False*, *revision\_id=None*, *revision\_no=None*, *revision\_date=True*, *revision\_date\_format='%Y/%m/%d'*, *test=False*, *commit=True*, *debug=False*)

Generate and load the configuration of a policy filter.

**filter\_name** The name of the policy filter.

**filter\_options** Additional filter options. These options are platform-specific. See the complete list of [options](#).

**terms** Dictionary of terms for this policy filter. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.

**prepend: True** When `merge_pillar` is set as `True`, the final list of terms generated by merging the terms from `terms` with those defined in the pillar (if any): new terms are prepended at the beginning, while existing ones will preserve the position. To add the new terms at the end of the list, set this argument to `False`.

**pillar\_key: acl** The key in the pillar containing the default attributes values. Default: `acl`.

**pillarenv** Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv** Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

**merge\_pillar: False** Merge terms with the corresponding value from the pillar. Default: `False`.

---

**Note:** By default this state does not merge, to avoid any unexpected behaviours.

The merge logic depends on the `prepend` argument.

The terms specified through the `terms` argument have higher priority than the pillar.

---

**only\_lower\_merge: False** Specify if it should merge only the terms fields. Otherwise it will try to merge also filters fields. Default: `False`. This option requires `merge_pillar`, otherwise it is ignored.

**revision\_id** Add a comment in the filter config having the description for the changes applied.

**revision\_no** The revision count.

**revision\_date: True** Boolean flag: display the date when the filter configuration was generated. Default: `True`.

**revision\_date\_format: %Y/%m/%d** The date format to be used when generating the performce data. Default: `%Y/%m/%d` (<year>/<month>/<day>).

**test: False** Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit: True** Commit? Default: `True`.

**debug: False** Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

CLI Example:

```
salt 'edge01.flw01' state.sls router.acl test=True
```

Output Example:

```

edge01.flw01:
-----
      ID: my-filter
Function: netacl.filter
  Result: None
Comment: Testing mode: Configuration discarded.
Started: 12:24:40.598232
Duration: 2437.139 ms
Changes:

ipv6 access-list my-filter
  remark $Id: my-filter_state $
  remark $Revision: 5 $
  remark my-other-term
  permit tcp any range 5678 5680 any
exit

Summary for edge01.flw01
-----
Succeeded: 1 (unchanged=1, changed=1)
Failed:    0
-----
Total states run:    1
Total run time:    2.437 s

```

#### Pillar example:

```

acl:
- my-filter:
  options:
  - inet6
  terms:
  - my-term:
    source_port: [1234, 1235]
    protocol:
    - tcp
    - udp
    source_address: 1.2.3.4
    action: reject
  - my-other-term:
    source_port:
    - [5678, 5680]

```

```
protocol: tcp
action: accept
```

State SLS Example:

```
{%- set filter_name = 'my-filter' -%}
{%- set my_filter_cfg = salt.netacl.get_filter_pillar(filter_name, pillar_key=
↳'firewall') -%}
my_first_filter_state:
  netacl.filter:
    - filter_name: {{ filter_name }}
    - options: {{ my_filter_cfg['options'] | json }}
    - terms: {{ my_filter_cfg['terms'] | json }}
    - revision_date: false
    - revision_no: 5
    - debug: true
```

Or:

```
my_first_filter_state:
  netacl.filter:
    - filter_name: my-filter
    - merge_pillar: true
    - pillar_key: firewall
    - revision_date: false
    - revision_no: 5
    - debug: true
```

In the example above, as `inet6` has been specified in the `filter_options`, the configuration chunk referring to `my-term` has been ignored as it referred to IPv4 only (from `source_address` field).

---

**Note:** The first method allows the user to eventually apply complex manipulation and / or retrieve the data from external services before passing the data to the state. The second one is more straightforward, for less complex cases when loading the data directly from the pillar is sufficient.

---

---

**Note:** When passing retrieved pillar data into the state file, it is strongly recommended to use the json serializer explicitly (``| json``), instead of relying on the default Python serializer.

---

```
salt.states.netacl.managed(name, filters=None, prepend=True, pillar_key='acl', pillarenv=None,
saltenv=None, merge_pillar=False, only_lower_merge=False, revision_id=None, revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d', test=False, commit=True, debug=False)
```

Manage the whole firewall configuration.

**filters** Dictionary of filters for this policy. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.

**prepend: True** When `merge_pillar` is set as `True`, the final list of filters generated by merging the filters from `filters` with those defined in the pillar (if any): new filters are prepended at the beginning, while existing ones will preserve the position. To add the new filters at the end of the list, set this argument to `False`.

**pillar\_key: acl** The key in the pillar containing the default attributes values. Default: `acl`.

**pillarenv** Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv** Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

**merge\_pillar: False** Merge the filters with the corresponding values from the pillar. Default: False.

---

**Note:** By default this state does not merge, to avoid any unexpected behaviours.

The merge logic depends on the `prepend` argument.

The filters specified through the `filters` argument have higher priority than the pillar.

---

**only\_lower\_merge: False** Specify if it should merge only the filters and terms fields. Otherwise it will try to merge everything at the policy level. Default: False. This option requires `merge_pillar`, otherwise it is ignored.

**test: False** Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.

**revision\_id** Add a comment in the policy config having the description for the changes applied.

**revision\_no** The revision count.

**revision\_date: True** Boolean flag: display the date when the policy configuration was generated. Default: True.

**revision\_date\_format: %Y/%m/%d** The date format to be used when generating the perforce data. Default: %Y/%m/%d (<year>/<month>/<day>).

**commit: True** Commit? Default: True.

**debug: False** Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

CLI Example:

```
salt 'edge01.bjm01' state.sls router.acl test=True
```

Output Example:

```
edge01.bjm01:
-----
      ID: netacl_example
      Function: netacl.managed
      Result: None

            }
        }
        term my-other-term {
            from {
                protocol tcp;
                source-port 5678-5680;
            }
        }
    }
}

```

```
- icmp
action: reject
```

Example SLS file:

```
{%- set fw_filters = pillar.get('firewall', {}) -%}
netacl_example:
  netacl.managed:
    - filters: {{ fw_filters | json }}
    - revision_no: 2
    - debug: true
```

Or:

```
netacl_example:
  netacl.managed:
    - pillar_key: firewall
    - merge_pillar: true
    - revision_no: 2
    - debug: true
```

---

**Note:** The first method allows the user to eventually apply complex manipulation and / or retrieve the data from external services before passing the data to the state. The second one is more straightforward, for less complex cases when loading the data directly from the pillar is sufficient.

---

---

**Note:** When passing retrieved pillar data into the state file, it is strongly recommended to use the json serializer explicitly (``| json``), instead of relying on the default Python serializer.

---

`salt.states.netacl.term`(*name*, *filter\_name*, *term\_name*, *filter\_options*=None, *pillar\_key*='acl', *pillarenv*=None, *saltenv*=None, *merge\_pillar*=False, *revision\_id*=None, *revision\_no*=None, *revision\_date*=True, *revision\_date\_format*='%Y/%m/%d', *test*=False, *commit*=True, *debug*=False, *source\_service*=None, *destination\_service*=None, *\*\*term\_fields*)

Manage the configuration of a specific policy term.

**filter\_name** The name of the policy filter.

**term\_name** The name of the term.

**filter\_options** Additional filter options. These options are platform-specific. See the complete list of [options](#).

**pillar\_key: acl** The key in the pillar containing the default attributes values. Default: `acl`.

**pillarenv** Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv** Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

**merge\_pillar: False** Merge the CLI variables with the pillar. Default: `False`.

The properties specified through the state arguments have higher priority than the pillar.

**revision\_id** Add a comment in the term config having the description for the changes applied.

**revision\_no** The revision count.

**revision\_date: True** Boolean flag: display the date when the term configuration was generated. Default: `True`.

**revision\_date\_format: %Y/%m/%d** The date format to be used when generating the performe data. Default: `%Y/%m/%d` (<year>/<month>/<day>).

**test: False** Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit: True** Commit? Default: `True`.

**debug:** **False** Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

**source\_service** A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a `source_port` and protocol.

As this module is available on Unix platforms only, it reads the [IANA](#) port assignment from `/etc/services`.

If the user requires additional shortcuts to be referenced, they can add entries under `/etc/services`, which can be managed using the *file state*.

**destination\_service** A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a `destination_port` and protocol. Allows the same options as `source_service`.

**\*\*term\_fields** Term attributes. To see what fields are supported, please consult the list of supported [keywords](#). Some platforms have few other [optional](#) keywords.

---

**Note:** The following fields are accepted:

- action
- address
- address\_exclude
- comment
- counter
- expiration
- destination\_address
- destination\_address\_exclude
- destination\_port
- destination\_prefix
- forwarding\_class
- forwarding\_class\_except
- logging
- log\_name
- loss\_priority
- option
- policer
- port
- precedence
- principals
- protocol
- protocol\_except
- qos
- pan\_application
- routing\_instance
- source\_address
- source\_address\_exclude
- source\_port
- source\_prefix
- verbatim
- packet\_length
- fragment\_offset
- hop\_limit
- icmp\_type
- ether\_type
- traffic\_class\_count
- traffic\_type
- translated
- dscp\_set

- dscp\_match
  - dscp\_except
  - next\_ip
  - flexible\_match\_range
  - source\_prefix\_except
  - destination\_prefix\_except
  - vpn
  - source\_tag
  - destination\_tag
  - source\_interface
  - destination\_interface
  - flattened
  - flattened\_addr
  - flattened\_saddr
  - flattened\_daddr
- 

**Note:** The following fields can be also a single value and a list of values:

- action
- address
- address\_exclude
- comment
- destination\_address
- destination\_address\_exclude
- destination\_port
- destination\_prefix
- forwarding\_class
- forwarding\_class\_except
- logging
- option
- port
- precedence
- principals
- protocol
- protocol\_except
- pan\_application
- source\_address
- source\_address\_exclude
- source\_port
- source\_prefix
- verbatim
- icmp\_type
- ether\_type
- traffic\_type
- dscp\_match
- dscp\_except
- flexible\_match\_range
- source\_prefix\_except
- destination\_prefix\_except
- source\_tag
- destination\_tag
- source\_service
- destination\_service

Example: `destination_address` can be either defined as:

```
destination_address: 172.17.17.1/24
```

or as a list of destination IP addresses:

```
destination_address:
- 172.17.17.1/24
- 172.17.19.1/24
```

or a list of services to be matched:

```
source_service:
- ntp
- snmp
- ldap
- bgpd
```

---

**Note:** The port fields `source_port` and `destination_port` can be used as above to select either a single value, either a list of values, but also they can select port ranges. Example:

```
source_port:
- [1000, 2000]
- [3000, 4000]
```

With the configuration above, the user is able to select the 1000-2000 and 3000-4000 source port ranges.

---

CLI Example:

```
salt 'edge01.bjm01' state.sls router.acl
```

Output Example:

```
edge01.bjm01:
-----
      ID: update_icmp_first_term
Function: netacl.term
  Result: None
  Comment: Testing mode: Configuration discarded.
  Started: 12:49:09.174179
Duration: 5751.882 ms
  Changes:
  -----
  diff:
    [edit firewall]
    +   family inet {
    +     /*
    +       ** $Id: update_icmp_first_term $
    +       ** $Date: 2017/02/30 $
    +       **
    +     */
    +     filter block-icmp {
    +       term first-term {
    +         from {
    +           protocol icmp;
```

```

+           }
+           then {
+             reject;
+           }
+         }
+       }
+     }

```

Summary for edge01.bjm01

```

-----
Succeeded: 1 (unchanged=1, changed=1)
Failed:    0
-----
Total states run:    1
Total run time:    5.752 s

```

Pillar example:

```

firewall:
- block-icmp:
  terms:
  - first-term:
    protocol:
    - icmp
    action: reject

```

State SLS example:

```

{%- set filter_name = 'block-icmp' -%}
{%- set term_name = 'first-term' -%}
{%- set my_term_cfg = salt.netacl.get_term_pillar(filter_name, term_name) -%}

update_icmp_first_term:
  netacl.term:
  - filter_name: {{ filter_name }}
  - filter_options:
    - not-interface-specific
  - term_name: {{ term_name }}
  - {{ my_term_cfg | json }}

```

Or directly referencing the pillar keys:

```

update_icmp_first_term:
  netacl.term:
  - filter_name: block-icmp
  - filter_options:
    - not-interface-specific
  - term_name: first-term
  - merge_pillar: true

```

---

**Note:** The first method allows the user to eventually apply complex manipulation and / or retrieve the data from external services before passing the data to the state. The second one is more straightforward, for less complex cases when loading the data directly from the pillar is sufficient.

---

**Note:** When passing retrieved pillar data into the state file, it is strongly recommended to use the json

serializer explicitly (``|json``), instead of relying on the default Python serializer.

---

### 14.17.160 salt.states.netconfig

#### Network Config

Manage the configuration on a network device given a specific static config or template.

**codeauthor** Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>

**maturity** new

**depends** napalm

**platform** unix

#### Dependencies

- *NAPALM proxy minion*
- *Network-related basic features execution module*

New in version 2017.7.0.

```
salt.states.netconfig.managed(name, template_name, template_source=None,
                              template_path=None, template_hash=None, template_hash_name=None,
                              template_user='root', template_group='root', template_mode='755',
                              saltenv=None, template_engine='jinja', skip_verify=False,
                              defaults=None, test=False, commit=True, debug=False, replace=False,
                              **template_vars)
```

Manages the configuration on network devices.

By default this state will commit the changes on the device. If there are no changes required, it does not commit and the field `already_configured` from the output dictionary will be set as `True` to notify that.

To avoid committing the configuration, set the argument `test` to `True` (or via the CLI argument `test=True`) and will discard (dry run).

To preserve the changes, set `commit` to `False` (either as CLI argument, either as state parameter). However, this is recommended to be used only in exceptional cases when there are applied few consecutive states and/or configuration changes. Otherwise the user might forget that the config DB is locked and the candidate config buffer is not cleared/merged in the running config.

To replace the config, set `replace` to `True`. This option is recommended to be used with caution!

**template\_name** Identifies path to the template source. The template can be either stored on the local machine, either remotely. The recommended location is under the `file_roots` as specified in the master config file. For example, let's suppose the `file_roots` is configured as:

```
file_roots:
  base:
    - /etc/salt/states
```

Placing the template under `/etc/salt/states/templates/example.jinja`, it can be used as `salt://templates/example.jinja`. Alternatively, for local files, the user can specify the absolute path. If remotely, the source can be retrieved via `http`, `https` or `ftp`.

Examples:

- salt://my\_template.jinja
- /absolute/path/to/my\_template.jinja
- http://example.com/template.cheetah
- https://example.com/template.mako
- ftp://example.com/template.py

**template\_source:** None Inline config template to be rendered and loaded on the device.

**template\_path:** None Required only in case the argument `template_name` provides only the file base-name. E.g.: if `template_name` is specified as `my_template.jinja`, in order to find the template, this argument must be provided: `template_path: /absolute/path/to/`.

**template\_hash:** None Hash of the template file. Format: `{hash_type: 'md5', 'hsum': <md5sum>}`

**template\_hash\_name:** None When `template_hash` refers to a remote file, this specifies the filename to look for in that file.

**template\_group:** root Owner of file.

**template\_user:** root Group owner of file.

**template\_user:** 755 Permissions of file

**saltenv:** base Specifies the template environment. This will influence the relative imports inside the templates.

**template\_engine:** jinja The following templates engines are supported:

- *cheetah*
- *genshi*
- *jinja*
- *mako*
- *py*
- *wempy*

**skip\_verify:** False If True, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

Changed in version 2017.7.1.

**test:** False Dry run? If set to True, will apply the config, discard and return the changes. Default: False (will commit the changes on the device).

**commit:** True Commit? Default: True.

**debug:** False Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw result after the template was rendered.

**replace:** False Load and replace the configuration. Default: False (will apply load merge).

**defaults:** None Default variables/context passed to the template.

**\*\*template\_vars** Dictionary with the arguments/context to be used when the template is rendered. Do not explicitly specify this argument. This represents any other variable that will be sent to the template rendering system. Please see an example below! In both `ntp_peers_example_using_pillar` and `ntp_peers_example`, `peers` is sent as template variable.

SLS Example (e.g.: under `salt://router/config.sls`):

```
whole_config_example:
  netconfig.managed:
    - template_name: salt://path/to/complete_config.jinja
    - debug: True
    - replace: True
bgp_config_example:
  netconfig.managed:
    - template_name: /absolute/path/to/bgp_neighbors.mako
    - template_engine: mako
prefix_lists_example:
  netconfig.managed:
    - template_name: prefix_lists.cheetah
    - template_path: /absolute/path/to/
    - debug: True
```

```

    - template_engine: cheetah
ntp_peers_example:
  netconfig.managed:
    - template_name: http://bit.ly/2gK0j20
    - skip_verify: False
    - debug: True
    - peers:
      - 192.168.0.1
      - 192.168.0.1
ntp_peers_example_using_pillar:
  netconfig.managed:
    - template_name: http://bit.ly/2gK0j20
    - peers: {{ pillar.get('ntp.peers', []) }}

```

Usage examples:

```

$ sudo salt 'juniper.device' state.sls router.config test=True
$ sudo salt -N all-routers state.sls router.config debug=True

```

`router.config` depends on the location of the SLS file (see above). Running this command, will be executed all five steps from above. These examples above are not meant to be used in a production environment, their sole purpose is to provide usage examples.

Output example:

```

$ sudo salt 'juniper.device' state.sls router.config test=True
juniper.device:
-----
      ID: ntp_peers_example_using_pillar
  Function: netconfig.managed
     Result: None
  Comment: Testing mode: Configuration discarded.
  Started: 12:01:40.744535
 Duration: 8755.788 ms
   Changes:
            -----
            diff:
                [edit system ntp]
                    peer 192.168.0.1 { ... }
                + peer 172.17.17.1;
                + peer 172.17.17.3;

Summary for juniper.device
-----
Succeeded: 1 (unchanged=1, changed=1)
Failed:    0
-----
Total states run:    1
Total run time:    8.756 s

```

Raw output example (useful when the output is reused in other states/execution modules):

```

$ sudo salt --out=pprint 'juniper.device' state.sls router.config test=True
←debug=True
{
  'juniper.device': {
    'netconfig_|-ntp_peers_example_using_pillar_|-ntp_peers_example_using_
←pillar_|-managed': {

```

```

    '__id__': 'ntp_peers_example_using_pillar',
    '__run_num__': 0,
    'already_configured': False,
    'changes': {
      'diff': '[edit system ntp] peer 192.168.0.1 { ... }+ peer 172.
↪17.17.1;+ peer 172.17.17.3;',
    },
    'comment': 'Testing mode: Configuration discarded.',
    'duration': 7400.759,
    'loaded_config': 'system { ntp { peer 172.17.17.1; peer 172.17.17.3;
↪ } }',
    'name': 'ntp_peers_example_using_pillar',
    'result': None,
    'start_time': '12:09:09.811445'
  }
}
}

```

### 14.17.161 salt.states.netntp

#### Network NTP

Manage the configuration of NTP peers and servers on the network devices through the NAPALM proxy.

**codeauthor** Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>

**maturity** new

**depends** napalm

**platform** unix

#### Dependencies

- Requires `netaddr` to be installed: `pip install netaddr` to check if IP Addresses are correctly specified
- Requires `dnspython` to be installed: `pip install dnspython` to resolve the nameserver entities

(in case the user does not configure the peers/servers using their IP addresses) - *NAPALM proxy minion - NTP operational and configuration management module*

**salt.states.netntp.managed**(*name, peers=None, servers=None*)

Manages the configuration of NTP peers and servers on the device, as specified in the state SLS file. NTP entities not specified in these lists will be removed whilst entities not configured on the device will be set.

SLS Example:

```

netntp_example:
  netntp.managed:
    - peers:
      - 192.168.0.1
      - 172.17.17.1
    - servers:
      - 24.124.0.251
      - 138.236.128.36

```

Output example:

```
{
  'edge01.nrt04': {
    'netntp_|-netntp_example_|-netntp_example_|-managed': {
      'comment': 'NTP servers already configured as needed.',
      'name': 'netntp_example',
      'start_time': '12:45:24.056659',
      'duration': 2938.857,
      'changes': {
        'peers': {
          'removed': [
            '192.168.0.2',
            '192.168.0.3'
          ],
          'added': [
            '192.168.0.1',
            '172.17.17.1'
          ]
        }
      },
      'result': None
    }
  }
}
```

### 14.17.162 salt.states.netsnmp

#### Network SNMP

Manage the SNMP configuration on network devices.

**codeauthor** Mircea Ulinic <mircea@cloudflare.com>

**maturity** new

**depends** napalm

**platform** unix

#### Dependencies

- *napalm snmp management module (salt.modules.napalm\_snmp)*

**salt.states.netsnmp.managed**(*name, config=None, defaults=None*)

Configures the SNMP on the device as specified in the SLS file.

SLS Example:

```
snmp_example:
  netsnmp.managed:
    - config:
        location: Honolulu, HI, US
    - defaults:
        contact: noc@cloudflare.com
```

Output example (for the SLS above, e.g. called snmp.sls under /router/):

```

$ sudo salt edge01.hnl01 state.sls router.snmp test=True
edge01.hnl01:
-----
      ID: snmp_example
  Function: snmp.managed
     Result: None
  Comment: Testing mode: configuration was not changed!
  Started: 13:29:06.872363
  Duration: 920.466 ms
  Changes:
  -----
    added:
  -----
      chassis_id:
         None
      contact:
         noc@cloudflare.com
      location:
         Honolulu, HI, US

Summary for edge01.hnl01
-----
Succeeded: 1 (unchanged=1, changed=1)
Failed:    0
-----
Total states run:    1
Total run time: 920.466 ms

```

### 14.17.163 salt.states.netusers

#### Network Users

Manage the users configuration on network devices via the NAPALM proxy.

```

codeauthor Mircea Ulinic <mircea@cloudflare.com>
maturity new
depends napalm
platform unix

```

#### Dependencies

- *NAPALM proxy minion*
- *Users configuration management module*

New in version 2016.11.0.

`salt.states.netusers.managed`(*name*, *users=None*, *defaults=None*)

Manages the configuration of the users on the device, as specified in the state SLS file. Users not defined in that file will be remove whilst users not configured on the device, will be added.

SLS Example:

```

netusers_example:
  netusers.managed:
    - users:
      admin:
        level: 15
        password: $1$knmhgPPv$g8745biu4rb.Zf.IT.F/U1
        sshkeys: []
      restricted:
        level: 1
        password: $1$j34j5k4b$4d5SVjTiz1l.Zf.IT.F/K7
      martin:

## 14.17.164 salt.states.network

### Configuration of network interfaces

The network module is used to create and manage network settings, interfaces can be set as either managed or ignored. By default all interfaces are ignored unless specified.

---

**Note:** Prior to version 2014.1.0, only RedHat-based systems (RHEL, CentOS, Scientific Linux, etc.) are supported. Support for Debian/Ubuntu is new in 2014.1.0 and should be considered experimental.

Other platforms are not yet supported.

---

```
system:
  network.system:
    - enabled: True
    - hostname: server1.example.com
    - gateway: 192.168.0.1
    - gatewaydev: eth0
    - nozeroconf: True
    - nisdomain: example.com
    - require_reboot: True

eth0:
  network.managed:
    - enabled: True
    - type: eth
    - proto: none
    - ipaddr: 10.1.0.1
    - netmask: 255.255.255.0
    - dns:
      - 8.8.8.8
      - 8.8.4.4

eth0-range0:
  network.managed:
    - type: eth
    - ipaddr_start: 192.168.1.1
    - ipaddr_end: 192.168.1.10
    - clonenum_start: 10
    - mtu: 9000

bond0-range0:
  network.managed:
    - type: eth
    - ipaddr_start: 192.168.1.1
    - ipaddr_end: 192.168.1.10
    - clonenum_start: 10
    - mtu: 9000

eth1.0-range0:
  network.managed:
    - type: eth
    - ipaddr_start: 192.168.1.1
    - ipaddr_end: 192.168.1.10
    - clonenum_start: 10
    - vlan: True
```

```
- mtu: 9000
bond0.1-range0:
  network.managed:
    - type: eth
    - ipaddr_start: 192.168.1.1
    - ipaddr_end: 192.168.1.10
    - clonenum_start: 10
    - vlan: True
    - mtu: 9000
.. note::
  add support of ranged interfaces (vlan, bond and eth) for redhat system,
  Important:type must be eth.

  network.managed:
    - type: vlan
    - ipaddr: 10.1.0.5
    - use:
      - network: bond0
    - require:
      - network: bond0
br0:
  network.managed:
    - enabled: True
    - type: bridge
    - proto: dhcp
    - bridge: br0
    - delay: 0
    - ports: eth4
    - bypassfirewall: True
    - use:
      - network: eth4
    - require:
      - network: eth4

system:
  network.system:
    - enabled: True
    - hostname: server1.example.com
    - gateway: 192.168.0.1
    - gatewaydev: eth0
    - nozeroconf: True
    - nisdomain: example.com
    - require_reboot: True
    - apply_hostname: True

lo:
  network.managed:
    - name: lo
    - type: eth
    - onboot: yes
    - userctl: no
    - ipv6_autoconf: no
    - enable_ipv6: true
    - ipaddrs:
      - 127.0.0.1/8
      - 10.1.0.4/32
      - 10.1.0.12/32
    - ipv6addrs:
      - fc00::1/128
      - fc00::100/128

.. note::
  Apply changes to hostname immediately.

.. versionadded:: 2015.5.0

system:
```

```

network.system:
  - hostname: server2.example.com
  - apply_hostname: True
  - retain_settings: True

.. note::
  Use `retain_settings` to retain current network settings that are not
  otherwise specified in the state. Particularly useful if only setting
  the hostname. Default behavior is to delete unspecified network
  settings.

.. versionadded:: 2016.11.0

```

**Note:** When managing bridged interfaces on a Debian or Ubuntu based system, the ports argument is required. Red Hat systems will ignore the argument.

**salt.states.network.managed**(*name*, *type*, *enabled=True*, *\*\*kwargs*)

Ensure that the named interface is configured properly.

**name** The name of the interface to manage

**type** Type of interface and configuration.

**enabled** Designates the state of this interface.

**kwargs** The IP parameters for this interface.

**salt.states.network.routes**(*name*, *\*\*kwargs*)

Manage network interface static routes.

**name** Interface name to apply the route to.

**kwargs** Named routes

**salt.states.network.system**(*name*, *\*\*kwargs*)

Ensure that global network settings are configured properly.

**name** Custom name to represent this configuration change.

**kwargs** The global parameters for the system.

### 14.17.165 salt.states.netyang

#### NAPALM YANG state

Manage the configuration of network devices according to the YANG models (OpenConfig/IETF).

New in version 2017.7.0.

#### Dependencies

- napalm-yang
- pyangbing > 0.5.11

To be able to load configuration on network devices, it requires [NAPALM](#) library to be installed: `pip install napalm`. Please check [Installation](#) for complete details.

**salt.states.netyang.configured**(*name*, *data*, *models*, *\*\*kwargs*)

Configure the network device, given the input data structured according to the YANG models.

---

**Note:** The main difference between this function and `managed` is that the later generates and loads the configuration only when there are differences between the existing configuration on the device and the expected configuration. Depending on the platform and hardware capabilities, one could be more optimal than the other. Additionally, the output of the `managed` is different, in such a way that the `pchange` field in the output contains structured data, rather than text.

---

**data** YANG structured data.

**models** A list of models to be used when generating the config.

**profiles: None** Use certain profiles to generate the config. If not specified, will use the platform default profile(s).

**test: False** Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit: True** Commit? Default: `True`.

**debug: False** Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

**replace: False** Should replace the config with the new generate one?

State SLS example:

```
{%- set expected_config = pillar.get('openconfig_interfaces_cfg') -%}
interfaces_config:
  napalm_yang.configured:
    - data: {{ expected_config | json }}
    - models:
      - models.openconfig_interfaces
    - debug: true
```

Pillar example:

```
openconfig_interfaces_cfg:
  _kwargs:
    filter: true
  interfaces:
    interface:
      Et1:
        config:
          mtu: 9000
      Et2:
        config:
          description: "description example"
```

`salt.states.netyang.managed`(*name, data, models, \*\*kwargs*)

Manage the device configuration given the input data structured according to the YANG models.

**data** YANG structured data.

**models** A list of models to be used when generating the config.

**profiles: None** Use certain profiles to generate the config. If not specified, will use the platform default profile(s).

**compliance\_report: False** Return the compliance report in the comment. The compliance report structured object can be found however in the `pchanges` field of the output (not displayed on the CLI).

New in version 2017.7.3.

**test: False** Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit: True** Commit? Default: `True`.

**debug: False** Debug mode. Will insert a new key under the output dictionary, as `loaded_config` con-

taning the raw configuration loaded on the device.

**replace: False** Should replace the config with the new generate one?

State SLS example:

```
{%- set expected_config = pillar.get('openconfig_interfaces_cfg') -%}
interfaces_config:
  napalm_yang.managed:
    - data: {{ expected_config | json }}
    - models:
      - models.openconfig_interfaces
    - debug: true
```

Pillar example:

```
openconfig_interfaces_cfg:
  _kwargs:
    filter: true
  interfaces:
    interface:
      Et1:
        config:
          mtu: 9000
      Et2:
        config:
          description: "description example"
```

### 14.17.166 salt.states.nftables

#### Management of nftables

This is an nftables-specific module designed to manage Linux firewalls. It is expected that this state module, and other system-specific firewall states, may at some point be deprecated in favor of a more generic *firewall* state.

```
httpd:
  nftables.append:
    - table: filter
    - chain: input
    - jump: accept
    - match: state
    - connstate: new
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True

httpd:
  nftables.append:
    - table: filter
    - family: ipv6
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
```

- save: True

httpd:

- nftables.insert:
  - position: 1
  - table: filter
  - chain: INPUT
  - jump: ACCEPT
  - match: state
  - connstate: NEW
  - dport: 80
  - proto: tcp
  - sport: 1025:65535
  - save: True

httpd:

- nftables.insert:
  - position: 1
  - table: filter
  - family: ipv6
  - chain: INPUT
  - jump: ACCEPT
  - match: state
  - connstate: NEW
  - dport: 80
  - proto: tcp
  - sport: 1025:65535
  - save: True

httpd:

- nftables.delete:
  - table: filter
  - chain: INPUT
  - jump: ACCEPT
  - match: state
  - connstate: NEW
  - dport: 80
  - proto: tcp
  - sport: 1025:65535
  - save: True

httpd:

- nftables.delete:
  - position: 1
  - table: filter
  - chain: INPUT
  - jump: ACCEPT
  - match: state
  - connstate: NEW
  - dport: 80
  - proto: tcp
  - sport: 1025:65535
  - save: True

httpd:

- nftables.delete:
  - table: filter
  - family: ipv6

```

- chain: INPUT
- jump: ACCEPT
- match: state
- connstate: NEW
- dport: 80
- proto: tcp
- sport: 1025:65535
- save: True

```

`salt.states.nftables.append`(*name*, *family*='ipv4', *\*\*kwargs*)

New in version 0.17.0.

Append a rule to a chain

**name** A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

**family** Network family, ipv4 or ipv6.

All other arguments are passed in with the same name as the long option that would normally be used for nftables, with one exception: `--state` is specified as `connstate` instead of `state` (not to be confused with `ctstate`).

`salt.states.nftables.chain_absent`(*name*, *table*='filter', *family*='ipv4')

New in version 2014.7.0.

Verify the chain is absent.

**family** Networking family, either ipv4 or ipv6

`salt.states.nftables.chain_present`(*name*, *table*='filter', *table\_type*=None, *hook*=None, *priority*=None, *family*='ipv4')

New in version 2014.7.0.

Verify the chain is exist.

**name** A user-defined chain name.

**table** The table to own the chain.

**family** Networking family, either ipv4 or ipv6

`salt.states.nftables.delete`(*name*, *family*='ipv4', *\*\*kwargs*)

New in version 2014.7.0.

Delete a rule to a chain

**name** A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

**family** Networking family, either ipv4 or ipv6

All other arguments are passed in with the same name as the long option that would normally be used for nftables, with one exception: `--state` is specified as `connstate` instead of `state` (not to be confused with `ctstate`).

`salt.states.nftables.flush`(*name*, *family*='ipv4', *\*\*kwargs*)

New in version 2014.7.0.

Flush current nftables state

**family** Networking family, either ipv4 or ipv6

`salt.states.nftables.insert`(*name*, *family*='ipv4', *\*\*kwargs*)

New in version 2014.7.0.

Insert a rule into a chain

**name** A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

**family** Networking family, either ipv4 or ipv6

All other arguments are passed in with the same name as the long option that would normally be used for nftables, with one exception: `--state` is specified as `connstate` instead of `state` (not to be confused with `ctstate`).

## 14.17.167 salt.states.npm

### Installation of NPM Packages

These states manage the installed packages for node.js using the Node Package Manager (npm). Note that npm must be installed for these states to be available, so npm states should include a pkg.installed state for the package which provides npm (simply npm in most cases). Example:

```
npm:
  pkg.installed

yaml:
  npm.installed:
    - require:
      - pkg: npm
```

**salt.states.npm.bootstrap** (*name*, *user=None*, *silent=True*)

Bootstraps a node.js application.

Will execute 'npm install --json' on the specified directory.

**user** The user to run NPM with

New in version 0.17.0.

**salt.states.npm.cache\_cleaned** (*name=None*, *user=None*, *force=False*)

Ensure that the given package is not cached.

If no package is specified, this ensures the entire cache is cleared.

**name** The name of the package to remove from the cache, or None for all packages

**user** The user to run NPM with

**force** Force cleaning of cache. Required for npm@5 and greater

New in version 2016.11.6.

**salt.states.npm.installed** (*name*, *pkgs=None*, *dir=None*, *user=None*, *force\_reinstall=False*, *registry=None*, *env=None*)

Verify that the given package is installed and is at the correct version (if specified).

```
coffee-script:
  npm.installed:
    - user: someuser

coffee-script@1.0.1:
  npm.installed: []
```

**name** The package to install

Changed in version 2014.7.2: This parameter is no longer lowercased by salt so that case-sensitive NPM package names will work.

**pkgs** A list of packages to install with a single npm invocation; specifying this argument will ignore the name argument

New in version 2014.7.0.

**dir** The target directory in which to install the package, or None for global installation

**user** The user to run NPM with

New in version 0.17.0.

**registry** The NPM registry from which to install the package

New in version 2014.7.0.

**env** A list of environment variables to be set prior to execution. The format is the same as the `cmd.run` state function.

New in version 2014.7.0.

**force\_reinstall** Install the package even if it is already installed

`salt.states.npm.removed` (*name*, *dir=None*, *user=None*)

Verify that the given package is not installed.

**dir** The target directory in which to install the package, or None for global installation

**user** The user to run NPM with

New in version 0.17.0.

### 14.17.168 salt.states.ntp

#### Management of NTP servers

New in version 2014.1.0.

This state is used to manage NTP servers. Currently only Windows is supported.

```
win_ntp:
  ntp.managed:
    - servers:
      - pool.ntp.org
      - us.pool.ntp.org
```

`salt.states.ntp.managed` (*name*, *servers=None*)

Manage NTP servers

**servers** A list of NTP servers

### 14.17.169 salt.states.nxos module

State module for Cisco NX OS Switches Proxy minions

For documentation on setting up the nxos proxy minion look in the documentation for `salt.proxy.nxos`.

`salt.states.nxos.config_absent` (*name*)

Ensure a specific configuration line does not exist in the running config

**name** config line to remove

Examples:

```
add snmp group:
  nxos.config_absent:
    - names:
      - snmp-server community randoSNMPstringHERE group network-operator
      - snmp-server community AnotherRandomSNMPString group network-admin
```

---

**Note:** For certain cases extra lines could be removed based on dependencies. In this example, included after the example for `config_present`, the ACLs would be removed because they depend on the existence of the group.

---

`salt.states.nxos.config_present` (*name*)

Ensure a specific configuration line exists in the running config

**name** config line to set

Examples:

```
add snmp group:
  nxos.config_present:
    - names:
      - snmp-server community randoSNMPstringHERE group network-operator
      - snmp-server community AnotherRandomSNMPString group network-admin

add snmp acl:
  nxos.config_present:
    - names:
      - snmp-server community randoSNMPstringHERE use-acl snmp-acl-ro
      - snmp-server community AnotherRandomSNMPString use-acl snmp-acl-rw
```

`salt.states.nxos.replace` (*name*, *repl*, *full\_match=False*)

Replace all instances of a string or full line in the running config

**name** String to replace

**repl** The replacement text

**full\_match** Whether *name* will match the full line or only a subset of the line. Defaults to False. When False, \* is added around *name* for matching in the *show run* config.

Examples:

```
replace snmp string:
  nxos.replace:
    - name: randoSNMPstringHERE
    - repl: NEWrandoSNMPstringHERE

replace full snmp string:
  nxos.replace:
    - name: ^snmp-server community randoSNMPstringHERE group network-operator$
    - repl: snmp-server community NEWrandoSNMPstringHERE group network-operator
    - full_match: True
```

---

**Note:** The first example will replace the SNMP string on both the group and the ACL, so you will not lose the ACL setting. Because the second is an exact match of the line, when the group is removed, the ACL is removed, but not readded, because it was not matched.

---

`salt.states.nxos.user_absent` (*name*)

Ensure a user is not present

**name** username to remove if it exists

Examples:

```
delete:
  nxos.user_absent:
    - name: daniel
```

`salt.states.nxos.user_present` (*name*, *password=None*, *roles=None*, *encrypted=False*, *crypt\_salt=None*, *algorithm='sha256'*)

Ensure a user is present with the specified groups

**name** Name of user

**password** Encrypted or Plain Text password for user

**roles** List of roles the user should be assigned. Any roles not in this list will be removed

**encrypted** Whether the password is encrypted already or not. Defaults to False

**crypt\_salt** Salt to use when encrypting the password. Default is None (salt is randomly generated for unhashed passwords)

**algorithm** Algorithm to use for hashing password. Defaults to sha256. Accepts md5, blowfish, sha256, sha512  
**Examples:**

```
create:
  nxos.user_present:
    - name: daniel
    - roles:
      - vdc-admin

set_password:
  nxos.user_present:
    - name: daniel
    - password: admin
    - roles:
      - network-admin

update:
  nxos.user_present:
    - name: daniel
    - password: AiN9jaoP
    - roles:
      - network-admin
      - vdc-admin
```

#### 14.17.170 salt.states.openstack\_config

Manage OpenStack configuration file settings.

**maintainer** Jeffrey C. Ollie <jeff@ocjtech.us>

**maturity** new

**depends**

**platform** linux

`salt.states.openstack_config.absent` (*name, filename, section, parameter=None*)

Ensure a value is not set in an OpenStack configuration file.

**filename** The full path to the configuration file

**section** The section in which the parameter will be set

**parameter (optional)** The parameter to change. If the parameter is not supplied, the name will be used as the parameter.

`salt.states.openstack_config.present` (*name, filename, section, value, parameter=None*)

Ensure a value is set in an OpenStack configuration file.

**filename** The full path to the configuration file

**section** The section in which the parameter will be set

**parameter (optional)** The parameter to change. If the parameter is not supplied, the name will be used as the parameter.

**value** The value to set

#### 14.17.171 salt.states.openvswitch\_bridge module

Management of Open vSwitch bridges.

`salt.states.openvswitch_bridge.absent` (*name*)

Ensures that the named bridge does not exist, eventually deletes it.

Parameters **name** -- The name of the bridge.

`salt.states.openvswitch_bridge.present`(*name*)

Ensures that the named bridge exists, eventually creates it.

Parameters **name** -- The name of the bridge.

### 14.17.172 `salt.states.openvswitch_port` module

Management of Open vSwitch ports.

`salt.states.openvswitch_port.absent`(*name*, *bridge=None*)

Ensures that the named port exists on bridge, eventually deletes it. If bridge is not set, port is removed from whatever bridge contains it.

Parameters

- **name** -- The name of the port.
- **bridge** -- The name of the bridge.

`salt.states.openvswitch_port.present`(*name*, *bridge*, *tunnel\_type=None*, *id=None*, *remote=None*, *dst\_port=None*, *internal=False*)

Ensures that the named port exists on bridge, eventually creates it.

Parameters

- **name** -- The name of the port.
- **bridge** -- The name of the bridge.
- **tunnel\_type** -- Optional type of interface to create, currently supports: vlan, vxlan and gre.
- **id** -- Optional tunnel's key.
- **remote** -- Remote endpoint's IP address.
- **dst\_port** -- Port to use when creating tunnelport in the switch.
- **internal** -- Create an internal port if one does not exist

### 14.17.173 `salt.states.pagerduty`

#### Create an Event in PagerDuty

New in version 2014.1.0.

This state is useful for creating events on the PagerDuty service during state runs.

```
server-warning-message:
  pagerduty.create_event:
    - name: 'This is a server warning message'
    - details: 'This is a much more detailed message'
    - service_key: 9abcd123456789efabcde362783cdbaf
    - profile: my-pagerduty-account
```

`salt.states.pagerduty.create_event`(*name*, *details*, *service\_key*, *profile*)

Create an event on the PagerDuty service

```
server-warning-message:
  pagerduty.create_event:
    - name: 'This is a server warning message'
    - details: 'This is a much more detailed message'
    - service_key: 9abcd123456789efabcde362783cdbaf
    - profile: my-pagerduty-account
```

The following parameters are required:

- name** This is a short description of the event.  
**details** This can be a more detailed description of the event.  
**service\_key** This key can be found by using `pagerduty.list_services`.  
**profile** This refers to the configuration profile to use to connect to the PagerDuty service.

### 14.17.174 salt.states.pagerduty\_escalation\_policy

Manage PagerDuty escalation policies.

Schedules and users can be referenced by pagerduty ID, or by name, or by email address.

For example:

```
ensure test escalation policy:
  pagerduty_escalation_policy.present:
    - name: bruce test escalation policy
    - escalation_rules:
      - targets:
        - type: schedule
          id: 'bruce test schedule level1'
        - type: user
          id: 'Bruce Sherrrod'
      escalation_delay_in_minutes: 15
    - targets:
      - type: schedule
        id: 'bruce test schedule level2'
      escalation_delay_in_minutes: 15
    - targets:
      - type: user
        id: 'Bruce TestUser1'
      - type: user
        id: 'Bruce TestUser2'
      - type: user
        id: 'Bruce TestUser3'
      - type: user
        id: 'bruce+test4@lyft.com'
      escalation_delay_in_minutes: 15
```

`salt.states.pagerduty_escalation_policy.absent` (*profile='pagerduty', subdomain=None, api\_key=None, \*\*kwargs*)

Ensure that a PagerDuty escalation policy does not exist. Accepts all the arguments that `pagerduty_escalation_policy.present` accepts; but ignores all arguments except the name.

Name can be the escalation policy id or the escalation policy name.

`salt.states.pagerduty_escalation_policy.present` (*profile='pagerduty', subdomain=None, api\_key=None, \*\*kwargs*)

Ensure that a pagerduty escalation policy exists. Will create or update as needed.

This method accepts as args everything defined in [https://developer.pagerduty.com/documentation/rest/escalation\\_policies/create](https://developer.pagerduty.com/documentation/rest/escalation_policies/create). In addition, user and schedule id's will be translated from name (or email address) into PagerDuty unique ids. For example:

```
pagerduty_escalation_policy.present:
  • name: bruce test escalation policy
  • escalation_rules:
```

- targets:
  - \* type: schedule id: `bruce test schedule level1`
  - \* type: user id: `Bruce Sherrod`

In this example, `Bruce Sherrod` will be looked up and replaced with the PagerDuty id (usually a 7 digit all-caps string, e.g. PX6GQL7)

### 14.17.175 salt.states.pagerduty\_schedule

Manage PagerDuty schedules.

#### Example

ensure test schedule:

pagerduty\_schedule.present:

- name: `bruce test schedule level1`
  - schedule: name: `bruce test schedule level1` time\_zone: `Pacific Time (US & Canada)` schedule\_layers:
    - name: `Schedule Layer 1` start: `2015-01-01T00:00:00` users:
      - \* user: `id: `Bruce TestUser1`  
member\_order: 1
      - \* user: `id: `Bruce TestUser2`  
member\_order: 2
      - \* user: `id: `bruce+test3@lyft.com`  
member\_order: 3
      - \* user: `id: `bruce+test4@lyft.com`  
member\_order: 4
- rotation\_virtual\_start: `2015-01-01T00:00:00` priority: 1 rotation\_turn\_length\_seconds: 604800

salt.states.pagerduty\_schedule.**absent**(*profile='pagerduty', subdomain=None, api\_key=None, \*\*kwargs*)

Ensure that a pagerduty schedule does not exist. Name can be pagerduty schedule id or pagerduty schedule name.

salt.states.pagerduty\_schedule.**present**(*profile='pagerduty', subdomain=None, api\_key=None, \*\*kwargs*)

Ensure that a pagerduty schedule exists. This method accepts as args everything defined in <https://developer.pagerduty.com/documentation/rest/schedules/create>. This means that most arguments are in a dict called ``schedule``.

User id's can be pagerduty id, or name, or email address.

### 14.17.176 salt.states.pagerduty\_service

Manage PagerDuty services

Escalation policies can be referenced by pagerduty ID or by namea.

For example:

```

```

ensure test service

pagerduty\_service.present:

- name: `my service`
- escalation\_policy\_id: `my escalation policy`
- type: nagios

[etc]

`salt.states.pagerduty_service.absent` (*profile='pagerduty', subdomain=None, api\_key=None, \*\*kwargs*)

Ensure a pagerduty service does not exist. Name can be the service name or pagerduty service id.

`salt.states.pagerduty_service.present` (*profile='pagerduty', subdomain=None, api\_key=None, \*\*kwargs*)

Ensure pagerduty service exists. This method accepts as arguments everything defined in <https://developer.pagerduty.com/documentation/rest/services/create>

Note that many arguments are mutually exclusive, depending on the ``type'' argument.

Examples:

```

```

# create a PagerDuty email service at `test-email@DOMAIN.pagerduty.com` ensure generic email service exists:

pagerduty\_service.present:

- name: my email service
- service: description: ``email service controlled by salt" escalation\_policy\_id: ``my escalation policy" type: ``generic\_email" service\_key: ``test-email"

# create a pagerduty service using cloudwatch integration ensure my cloudwatch service exists:

pagerduty\_service.present:

- name: my cloudwatch service
- service: escalation\_policy\_id: ``my escalation policy" type: aws\_cloudwatch description: ``my cloudwatch service controlled by salt"

TODO: aws\_cloudwatch type should be integrated with boto\_sns

### 14.17.177 salt.states.pagerduty\_user

Manage PagerDuty users.

#### Example

```

```

ensure bruce test user 1:

`pagerduty.user_present`:

- name: `Bruce TestUser1`
- email: `bruce+test1@lyft.com`
- requester\_id: P1GV5NT

`salt.states.pagerduty_user.absent` (*profile='pagerduty', subdomain=None, api\_key=None, \*\*kwargs*)

Ensure pagerduty user does not exist. Name can be pagerduty id, email address, or user name.

`salt.states.pagerduty_user.present` (*profile='pagerduty', subdomain=None, api\_key=None, \*\*kwargs*)

Ensure pagerduty user exists. Arguments match those supported by <https://developer.pagerduty.com/documentation/rest/users/create>.

### 14.17.178 salt.states.pcs module

#### Management of Pacemaker/Corosync clusters with PCS

A state module to manage Pacemaker/Corosync clusters with the Pacemaker/Corosync configuration system (PCS)

New in version 2016.110.

**depends** pcs

Walkthrough of a complete PCS cluster setup: [http://clusterlabs.org/doc/en-US/Pacemaker/1.1/html/Clusters\\_from\\_Scratch/](http://clusterlabs.org/doc/en-US/Pacemaker/1.1/html/Clusters_from_Scratch/)

**Requirements:** PCS is installed, pcs service is started and the password for the hacluster user is set and known.

**Remark on the cibname variable used in the examples:** The use of the cibname variable is optional. Use it only if you want to deploy your changes into a cibfile first and then push it. This makes only sense if you want to deploy multiple changes (which require each other) at once to the cluster.

At first the cibfile must be created:

```
mysql_pcs__cib_present_cib_for_galera:
  pcs.cib_present:
    - cibname: cib_for_galera
    - scope: None
    - extra_args: None
```

Then the cibfile can be modified by creating resources (creating only 1 resource for demonstration, see also 7.):

```
mysql_pcs__resource_present_galera:
  pcs.resource_present:
    - resource_id: galera
    - resource_type: "ocf:heartbeat:galera"
    - resource_options:
      - 'wsrep_cluster_address=gcomm://node1.example.org,node2.example.org,node3.
→example.org'
      - '--master'
    - cibname: cib_for_galera
```

After modifying the cibfile, it can be pushed to the live CIB in the cluster:

```
mysql_pcs__cib_pushed_cib_for_galera:
  pcs.cib_pushed:
```

```
- cibname: cib_for_galera
- scope: None
- extra_args: None
```

Create a cluster from scratch:

1. Authorize nodes to each other:

```
pcs_auth__auth:
  pcs.auth:
    - nodes:
      - node1.example.com
      - node2.example.com
    - pcsuser: hacluster
    - pcspasswd: hoonetorg
    - extra_args: []
```

2. Do the initial cluster setup:

```
pcs_setup__setup:
  pcs.cluster_setup:
    - nodes:
      - node1.example.com
      - node2.example.com
    - pcsclustername: pcscluster
    - extra_args:
      - '--start'
      - '--enable'
```

3. Optional: Set cluster properties:

```
pcs_properties__prop_has_value_no-quorum-policy:
  pcs.prop_has_value:
    - prop: no-quorum-policy
    - value: ignore
    - cibname: cib_for_cluster_settings
```

4. Optional: Set resource defaults:

```
pcs_properties__resource_defaults_to_resource-stickiness:
  pcs.resource_defaults_to:
    - default: resource-stickiness
    - value: 100
    - cibname: cib_for_cluster_settings
```

5. Optional: Set resource op defaults:

```
pcs_properties__resource_op_defaults_to_monitor-interval:
  pcs.resource_op_defaults_to:
    - op_default: monitor-interval
    - value: 60s
    - cibname: cib_for_cluster_settings
```

6. Configure Fencing (!is often not optional on production ready cluster!):

```
pcs_stonith__created_eps_fence:
  pcs.stonith_present:
    - stonith_id: eps_fence
```

```

- stonith_device_type: fence_eps
- stonith_device_options:
  - 'pcmk_host_map=node1.example.org:01;node2.example.org:02'
  - 'ipaddr=myepsdevice.example.org'
  - 'power_wait=5'
  - 'verbose=1'
  - 'debug=/var/log/pcsd/eps_fence.log'
  - 'login=hidden'
  - 'passwd=hoonetorg'
- cibname: cib_for_stonith

```

#### 7. Add resources to your cluster:

```

mysql_pcs__resource_present_galera:
  pcs.resource_present:
    - resource_id: galera
    - resource_type: "ocf:heartbeat:galera"
    - resource_options:
      - 'wsrep_cluster_address=gcomm://node1.example.org,node2.example.
↳org,node3.example.org'
      - '--master'
    - cibname: cib_for_galera

```

#### 8. Optional: Add constraints (locations, colocations, orders):

```

haproxy_pcs__constraint_present_colocation-vip_galera-haproxy-clone-INFINITY:
  pcs.constraint_present:
    - constraint_id: colocation-vip_galera-haproxy-clone-INFINITY
    - constraint_type: colocation
    - constraint_options:
      - 'add'
      - 'vip_galera'
      - 'with'
      - 'haproxy-clone'
    - cibname: cib_for_haproxy

```

New in version 2016.3.0.

`salt.states.pcs.auth` (*name*, *nodes*, *pcuser*='hacluster', *pcpasswd*='hacluster', *extra\_args*=None)

Ensure all nodes are authorized to the cluster

**name** Irrelevant, not used (recommended: `pcs_auth__auth`)

**nodes** a list of nodes which should be authorized to the cluster

**pcuser** user for communication with pcs (default: hacluster)

**pcpasswd** password for pcuser (default: hacluster)

**extra\_args** list of extra args for the `pcs cluster auth` command

Example:

```

pcs_auth__auth:
  pcs.auth:
    - nodes:
      - node1.example.com
      - node2.example.com
    - pcuser: hacluster
    - pcpasswd: hoonetorg
    - extra_args: []

```

`salt.states.pcs.cib_present` (*name*, *cibname*, *scope*=None, *extra\_args*=None)

Ensure that a CIB-file with the content of the current live CIB is created

Should be run on one cluster node only (there may be races)

**name** Irrelevant, not used (recommended: `{{formulaname}}__cib_present_{{cibname}}`)

**cibname** name/path of the file containing the CIB

**scope** specific section of the CIB (default:

**extra\_args** additional options for creating the CIB-file

Example:

```
mysql_pcs__cib_present_cib_for_galera:
  pcs.cib_present:
    - cibname: cib_for_galera
    - scope: None
    - extra_args: None
```

`salt.states.pcs.cib_pushed`(*name, cibname, scope=None, extra\_args=None*)

Ensure that a CIB-file is pushed if it is changed since the creation of it with `pcs.cib_present`

Should be run on one cluster node only (there may be races)

**name** Irrelevant, not used (recommended: `{{formulaname}}__cib_pushed_{{cibname}}`)

**cibname** name/path of the file containing the CIB

**scope** specific section of the CIB

**extra\_args** additional options for creating the CIB-file

Example:

```
mysql_pcs__cib_pushed_cib_for_galera:
  pcs.cib_pushed:
    - cibname: cib_for_galera
    - scope: None
    - extra_args: None
```

`salt.states.pcs.cluster_node_present`(*name, node, extra\_args=None*)

Add a node to the Pacemaker cluster via PCS Should be run on one cluster node only (there may be races)

Can only be run on a already setup/added node

**name** Irrelevant, not used (recommended: `pcs_setup__node_add_{{node}}`)

**node** node that should be added

**extra\_args** list of extra args for the ``pcs cluster node add`` command

Example:

```
pcs_setup__node_add_node1.example.com:
  pcs.cluster_node_present:
    - node: node1.example.com
    - extra_args:
      - '--start'
      - '--enable'
```

`salt.states.pcs.cluster_setup`(*name, nodes, pcsclustername='pcscluster', extra\_args=None*)

Setup Pacemaker cluster on nodes. Should be run on one cluster node only (there may be races)

**name** Irrelevant, not used (recommended: `pcs_setup__setup`)

**nodes** a list of nodes which should be set up

**pcsclustername** Name of the Pacemaker cluster

**extra\_args** list of extra args for the ``pcs cluster setup`` command

Example:

```
pcs_setup__setup:
  pcs.cluster_setup:
    - nodes:
      - node1.example.com
      - node2.example.com
```

```

- pcsclustername: pcscluster
- extra_args:
  - '--start'
  - '--enable'

```

`salt.states.pcs.constraint_present`(*name*, *constraint\_id*, *constraint\_type*, *constraint\_options=None*, *cibname=None*)

Ensure that a constraint is created

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

**name** Irrelevant, not used (recommended: `{{formulaname}}__constraint_present_{{constraint_id}}`)

**constraint\_id** name for the constraint (try first to create manually to find out the autogenerated name)

**constraint\_type** constraint type (location, colocation, order)

**constraint\_options** options for creating the constraint

**cibname** use a cached CIB-file named like *cibname* instead of the live CIB

Example:

```

haproxy_pcs__constraint_present_colocation-vip_galera-haproxy-clone-INFINITY:
  pcs.constraint_present:
    - constraint_id: colocation-vip_galera-haproxy-clone-INFINITY
    - constraint_type: colocation
    - constraint_options:
      - 'add'
      - 'vip_galera'
      - 'with'
      - 'haproxy-clone'
    - cibname: cib_for_haproxy

```

`salt.states.pcs.prop_has_value`(*name*, *prop*, *value*, *extra\_args=None*, *cibname=None*)

Ensure that a property in the cluster is set to a given value

Should be run on one cluster node only (there may be races)

**name** Irrelevant, not used (recommended: `pcs_properties__prop_has_value_{{prop}}`)

**prop** name of the property

**value** value of the property

**extra\_args** additional options for the pcs property command

**cibname** use a cached CIB-file named like *cibname* instead of the live CIB

Example:

```

pcs_properties__prop_has_value_no-quorum-policy:
  pcs.prop_has_value:
    - prop: no-quorum-policy
    - value: ignore
    - cibname: cib_for_cluster_settings

```

`salt.states.pcs.resource_defaults_to`(*name*, *default*, *value*, *extra\_args=None*, *cibname=None*)

Ensure a resource default in the cluster is set to a given value

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

**name** Irrelevant, not used (recommended: `pcs_properties__resource_defaults_to_{{default}}`)

**default** name of the default resource property

**value** value of the default resource property

**extra\_args** additional options for the pcs command

**cibname** use a cached CIB-file named like *cibname* instead of the live CIB

Example:

```
pcs_properties__resource_defaults_to_resource-stickiness:
  pcs.resource_defaults_to:
    - default: resource-stickiness
    - value: 100
    - cibname: cib_for_cluster_settings
```

`salt.states.pcs.resource_op_defaults_to`(*name*, *op\_default*, *value*, *extra\_args=None*, *cibname=None*)

Ensure a resource operation default in the cluster is set to a given value

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

**name** Irrelevant, not used (recommended: `pcs_properties__resource_op_defaults_to_{{op_default}}`)

**op\_default** name of the operation default resource property

**value** value of the operation default resource property

**extra\_args** additional options for the pcs command

**cibname** use a cached CIB-file named like `cibname` instead of the live CIB

Example:

```
pcs_properties__resource_op_defaults_to_monitor-interval:
  pcs.resource_op_defaults_to:
    - op_default: monitor-interval
    - value: 60s
    - cibname: cib_for_cluster_settings
```

`salt.states.pcs.resource_present`(*name*, *resource\_id*, *resource\_type*, *resource\_options=None*, *cibname=None*)

Ensure that a resource is created

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

**name** Irrelevant, not used (recommended: `{{formulaname}}__resource_present_{{resource_id}}`)

**resource\_id** name for the resource

**resource\_type** resource type (f.e. `ocf:heartbeat:IPaddr2` or `VirtualIP`)

**resource\_options** additional options for creating the resource

**cibname** use a cached CIB-file named like `cibname` instead of the live CIB

Example:

```
mysql_pcs__resource_present_galera:
  pcs.resource_present:
    - resource_id: galera
    - resource_type: "ocf:heartbeat:galera"
    - resource_options:
      - 'wsrep_cluster_address=gcomm://node1.example.org,node2.example.
↪org,node3.example.org'
      - '--master'
    - cibname: cib_for_galera
```

`salt.states.pcs.stonith_present`(*name*, *stonith\_id*, *stonith\_device\_type*, *stonith\_device\_options=None*, *cibname=None*)

Ensure that a fencing resource is created

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

**name** Irrelevant, not used (recommended: `pcs_stonith__created_{{stonith_id}}`)

**stonith\_id** name for the stonith resource

**stonith\_device\_type** name of the stonith agent `fence_eps`, `fence_xvm` f.e.

**stonith\_device\_options** additional options for creating the stonith resource

**cibname** use a cached CIB-file named like cibname instead of the live CIB

Example:

```
pcs_stonith__created_eps_fence:
  pcs.stonith_present:
    - stonith_id: eps_fence
    - stonith_device_type: fence_eps
    - stonith_device_options:
      - 'pcmk_host_map=node1.example.org:01;node2.example.org:02'
      - 'ipaddr=myepsdevice.example.org'
      - 'power_wait=5'
      - 'verbose=1'
      - 'debug=/var/log/pcsd/eps_fence.log'
      - 'login=hidden'
      - 'passwd=hoonetorg'
    - cibname: cib_for_stonith
```

### 14.17.179 salt.states.pecl

#### Installation of PHP Extensions Using pecl

These states manage the installed pecl extensions. Note that php-pear must be installed for these states to be available, so pecl states should include a requisite to a pkg.installed state for the package which provides pecl (php-pear in most cases). Example:

```
php-pear:
  pkg.installed

mongo:
  pecl.installed:
    - require:
      - pkg: php-pear
```

**salt.states.pecl.installed**(*name*, *version=None*, *defaults=False*, *force=False*, *preferred\_state='stable'*)

New in version 0.17.0.

Make sure that a pecl extension is installed.

**name** The pecl extension name to install

**version** The pecl extension version to install. This option may be ignored to install the latest stable version.

**defaults** Use default answers for extensions such as pecl\_http which ask questions before installation. Without this option, the pecl.installed state will hang indefinitely when trying to install these extensions.

**force** Whether to force the installed version or not

**preferred\_state** The pecl extension state to install

**salt.states.pecl.removed**(*name*)

Make sure that a pecl extension is not installed.

**name** The pecl extension name to uninstall

### 14.17.180 salt.states.pdbedit

Manage accounts in Samba's passdb using pdbedit

**maintainer** Jorge Schrauwen <sjorge@blackdot.be>

**maturity** new  
**depends** pdbedit  
**platform** posix

New in version 2017.7.0.

```
wash:
  pdbedit.absent

kaylee:
  pdbedit.managed:
    - password: A70C708517B5DD0EDB67714FE25336EB
    - password_hashed: True
    - drive: 'X:'
    - homedir: '\\serenity\mechanic\profile'
```

**salt.states.pdbedit.absent**(*name*)

Ensure user account is absent

**name** [string] username

**salt.states.pdbedit.managed**(*name*, *\*\*kwargs*)

Manage user account

**login** [string] login name

**password** [string] password

**password\_hashed** [boolean] set if password is a nt hash instead of plain text

**domain** [string] users domain

**profile** [string] profile path

**script** [string] logon script

**drive** [string] home drive

**homedir** [string] home directory

**fullname** [string] full name

**account\_desc** [string] account description

**machine\_sid** [string] specify the machines new primary group SID or rid

**user\_sid** [string] specify the users new primary group SID or rid

**account\_control** [string] specify user account control properties

---

**Note:** Only the following can be set: - N: No password required - D: Account disabled - H: Home directory required - L: Automatic Locking - X: Password does not expire

---

**reset\_login\_hours** [boolean] reset the users allowed logon hours

**reset\_bad\_password\_count** [boolean] reset the stored bad login counter

**salt.states.pdbedit.present**(*name*, *\*\*kwargs*)

Alias for pdbedit.managed

### 14.17.181 salt.states.pip\_state

#### Installation of Python Packages Using pip

These states manage system installed python packages. Note that pip must be installed for these states to be available, so pip states should include a requisite to a pkg.installed state for the package which provides pip (python-pip in most cases). Example:

```
python-pip:
  pkg.installed

virtualenvwrapper:
  pip.installed:
    - require:
      - pkg: python-pip
```

`salt.states.pip_state.installed`(*name*, *pkgs=None*, *pip\_bin=None*, *requirements=None*, *bin\_env=None*, *use\_wheel=False*, *no\_use\_wheel=False*, *log=None*, *proxy=None*, *timeout=None*, *repo=None*, *editable=None*, *find\_links=None*, *index\_url=None*, *extra\_index\_url=None*, *no\_index=False*, *mirrors=None*, *build=None*, *target=None*, *download=None*, *download\_cache=None*, *source=None*, *upgrade=False*, *force\_reinstall=False*, *ignore\_installed=False*, *exists\_action=None*, *no\_deps=False*, *no\_install=False*, *no\_download=False*, *install\_options=None*, *global\_options=None*, *user=None*, *no\_chown=False*, *cwd=None*, *pre\_releases=False*, *cert=None*, *allow\_all\_external=False*, *allow\_external=None*, *allow\_unverified=None*, *process\_dependency\_links=False*, *env\_vars=None*, *use\_vt=False*, *trusted\_host=None*, *no\_cache\_dir=False*, *cache\_dir=None*)

Make sure the package is installed

**name** The name of the python package to install. You can also specify version numbers here using the standard operators ==, >=, <=. If *requirements* is given, this parameter will be ignored.

Example:

```
django:
  pip.installed:
    - name: django >= 1.6, <= 1.7
    - require:
      - pkg: python-pip
```

This will install the latest Django version greater than 1.6 but less than 1.7.

**requirements** Path to a pip requirements file. If the path begins with salt:// the file will be transferred from the master file server.

**user** The user under which to run pip

**use\_wheel** [False] Prefer wheel archives (requires pip>=1.4)

**no\_use\_wheel** [False] Force to not use wheel archives (requires pip>=1.4)

**log** Log file where a complete (maximum verbosity) record will be kept

**proxy** Specify a proxy in the form user:passwd@proxy.server:port. Note that the user:password@ is optional and required only if you are behind an authenticated proxy. If you provide user@proxy.server:port then you will be prompted for a password.

**timeout** Set the socket timeout (default 15 seconds)

**editable** install something editable (i.e. git+https://github.com/worldcompany/djangoembed.git#egg=djangoembed)

**find\_links** URL to look for packages at

**index\_url** Base URL of Python Package Index

**extra\_index\_url** Extra URLs of package indexes to use in addition to *index\_url*

**no\_index** Ignore package index

**mirrors** Specific mirror URL(s) to query (automatically adds --use-mirrors)

**build** Unpack packages into *build* dir

**target** Install packages into *target* dir

**download** Download packages into *download* instead of installing them

**download\_cache** Cache downloaded packages in *download\_cache* dir

**source** Check out `editable` packages into `source` dir  
**upgrade** Upgrade all packages to the newest available version  
**force\_reinstall** When upgrading, reinstall all packages even if they are already up-to-date.  
**ignore\_installed** Ignore the installed packages (reinstalling instead)  
**exists\_action** Default action when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup  
**no\_deps** Ignore package dependencies  
**no\_install** Download and unpack all packages, but don't actually install them  
**no\_chown** When user is given, do not attempt to copy and chown a requirements file  
**no\_cache\_dir**: Disable the cache.  
**cwd** Current working directory to run pip from  
**pre\_releases** Include pre-releases in the available versions  
**cert** Provide a path to an alternate CA bundle  
**allow\_all\_external** Allow the installation of all externally hosted files  
**allow\_external** Allow the installation of externally hosted files (comma separated list)  
**allow\_unverified** Allow the installation of insecure and unverifiable files (comma separated list)  
**process\_dependency\_links** Enable the processing of dependency links  
**bin\_env** [None] Absolute path to a virtual environment directory or absolute path to a pip executable. The example below assumes a virtual environment has been created at `/foo/.virtualenvs/bar`.  
**env\_vars** Add or modify environment variables. Useful for tweaking build steps, such as specifying `INCLUDE` or `LIBRARY` paths in Makefiles, build scripts or compiler calls. This must be in the form of a dictionary or a mapping.

Example:

```

django:
  pip.installed:
    - name: django_app
    - env_vars:
      CUSTOM_PATH: /opt/django_app
      VERBOSE: True
  
```

**use\_vt** Use VT terminal emulation (see output while installing)  
**trusted\_host** Mark this host as trusted, even though it does not have valid or any HTTPS.

Example:

```

django:
  pip.installed:
    - name: django >= 1.6, <= 1.7
    - bin_env: /foo/.virtualenvs/bar
    - require:
      - pkg: python-pip
  
```

Or

Example:

```

django:
  pip.installed:
    - name: django >= 1.6, <= 1.7
    - bin_env: /foo/.virtualenvs/bar/bin/pip
    - require:
      - pkg: python-pip
  
```

---

### Attention

The following arguments are deprecated, do not use.

---

**pip\_bin** [None] Deprecated, use `bin_env`

Changed in version 0.17.0: `use_wheel` option added.

**install\_options**

Extra arguments to be supplied to the `setup.py` install command. If you are using an option with a directory path, be sure to use absolute path.

Example:

```
django:
  pip.installed:
    - name: django
    - install_options:
      - --prefix=/blah
    - require:
      - pkg: python-pip
```

**global\_options** Extra global options to be supplied to the `setup.py` call before the install command.

New in version 2014.1.3.

---

### Attention

As of Salt 0.17.0 the `pip` state **needs** an importable `pip` module. This usually means having the system's `pip` package installed or running Salt from an active `virtualenv`.

The reason for this requirement is because `pip` already does a pretty good job parsing its own requirements. It makes no sense for Salt to do `pip` requirements parsing and validation before passing them to the `pip` library. It's functionality duplication and it's more error prone.

---

---

### Attention

Please set `reload_modules: True` to have the salt minion import this module after installation.

---

Example:

```
pyopenssl:
  pip.installed:
    - name: pyOpenSSL
    - reload_modules: True
    - exists_action: i
```

`salt.states.pip_state.removed` (*name*, *requirements=None*, *bin\_env=None*, *log=None*, *proxy=None*, *timeout=None*, *user=None*, *cwd=None*, *use\_vt=False*)

Make sure that a package is not installed.

**name** The name of the package to uninstall

**user** The user under which to run `pip`

**bin\_env** [None] the `pip` executable or `virtualenv` to use

**use\_vt** Use VT terminal emulation (see output while installing)

`salt.states.pip_state.uptodate` (*name*, *bin\_env=None*, *user=None*, *cwd=None*, *use\_vt=False*)

New in version 2015.5.0.

Verify that the system is completely up to date.

**name** The name has no functional value and is only used as a tracking reference

**user** The user under which to run `pip`

`bin_env` the pip executable or virtualenv to use  
`use_vt` Use VT terminal emulation (see output while installing)

### 14.17.182 salt.states.pkg

#### Installation of packages using OS package managers such as yum or apt-get

**Note:** On minions running `systemd`  $\geq$  205, as of version 2015.8.12, 2016.3.3, and 2016.11.0, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing the package manager commands spawned by Salt, when Salt updates itself (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.use_scope`, with a value of `False` (no quotes).

Salt can manage software packages via the `pkg` state module, packages can be set up to be installed, latest, removed and purged. Package management declarations are typically rather simple:

```
vim:
  pkg.installed
```

A more involved example involves pulling from a custom repository.

```
base:
  pkgrepo.managed:
    - humaname: Logstash PPA
    - name: ppa:wolfnet/logstash
    - dist: precise
    - file: /etc/apt/sources.list.d/logstash.list
    - keyid: 28B04E4A
    - keyserver: keyserver.ubuntu.com

logstash:
  pkg.installed
    - fromrepo: ppa:wolfnet/logstash
```

Multiple packages can also be installed with the use of the `pkgs` state module

```
dotdeb.repo:
  pkgrepo.managed:
    - humaname: Dotdeb
    - name: deb http://packages.dotdeb.org wheezy-php55 all
    - dist: wheezy-php55
    - file: /etc/apt/sources.list.d/dotbeb.list
    - keyid: 89DF5277
    - keyserver: keys.gnupg.net
    - refresh_db: true

php.packages:
  pkg.installed:
    - fromrepo: wheezy-php55
    - pkgs:
      - php5-fpm
      - php5-cli
      - php5-curl
```

**Warning:** Package names are currently case-sensitive. If the minion is using a package manager which is not case-sensitive (such as *pkgng*), then this state will fail if the proper case is not used. This will be addressed in a future release of Salt.

`salt.states.pkg.downloaded`(*name*, *version=None*, *pkgs=None*, *fromrepo=None*, *ignore\_epoch=None*, *\*\*kwargs*)

New in version 2017.7.0.

Ensure that the package is downloaded, and that it is the correct version (if specified).

Currently supported for the following pkg providers: *yumpkg* and *zypper*

#### Parameters

- **name** (*str*) -- The name of the package to be downloaded. This parameter is ignored if either ``pkgs`` is used. Additionally, please note that this option can only be used to download packages from a software repository.
- **version** (*str*) -- Download a specific version of a package.

---

**Important:** As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
  pkg.downloaded:
    - version: 2:7.4.160-1.el7
```

An **ignore\_epoch** argument has been added to which causes the epoch to be disregarded when the state checks to see if the desired version was installed.

You can install a specific version when using the `pkgs` argument by including the version after the package:

```
common_packages:
  pkg.downloaded:
    - pkgs:
      - unzip
      - dos2unix
      - salt-minion: 2015.8.5-1.el6
```

CLI Example:

```
zsh:
  pkg.downloaded:
    - version: 5.0.5-4.63
    - fromrepo: "myrepository"
```

`salt.states.pkg.group_installed`(*name*, *skip=None*, *include=None*, *\*\*kwargs*)

New in version 2015.8.0.

Changed in version 2016.11.0: Added support in *pacman*

Ensure that an entire package group is installed. This state is currently only supported for the *yum* and *pacman* package managers.

**skip** Packages that would normally be installed by the package group (``default`` packages), which should not be installed.

```
Load Balancer:
  pkg.group_installed:
    - skip:
    - piranha
```

**include** Packages which are included in a group, which would not normally be installed by a `yum groupinstall` ("optional" packages). Note that this will not enforce group membership; if you include packages which are not members of the specified groups, they will still be installed.

```
Load Balancer:
  pkg.group_installed:
    - include:
    - haproxy
```

Changed in version 2016.3.0: This option can no longer be passed as a comma-separated list, it must now be passed as a list (as shown in the above example).

**Note:** Because this is essentially a wrapper around `pkg.install`, any argument which can be passed to `pkg.install` may also be included here, and it will be passed on to the call to `pkg.install`.

```
salt.states.pkg.installed(name, version=None, refresh=None, fromrepo=None, skip_verify=False,
                           skip_suggestions=False, pkgs=None, sources=None, allow_updates=False,
                           pkg_verify=False, normalize=True, ignore_epoch=False, reinstall=False,
                           update_holds=False, **kwargs)
```

Ensure that the package is installed, and that it is the correct version (if specified).

**param str name** The name of the package to be installed. This parameter is ignored if either `pkgs` or `sources` is used. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the `sources` option detailed below.

**param str version** Install a specific version of a package. This option is ignored if `sources` is used. Currently, this option is supported for the following pkg providers: `apt`, `ebuild`, `pacman`, `win_pkg`, `yumpkg`, and `zypper`. The version number includes the release designation where applicable, to allow Salt to target a specific release of a given version. When in doubt, using the `pkg.latest_version` function for an uninstalled package will tell you the version available.

```
# salt myminion pkg.latest_version vim-enhanced
myminion:
  2:7.4.160-1.el7
```

**Important:** As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon like in the `pkg.latest_version` output above) must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
  pkg.installed:
    - version: 2:7.4.160-1.el7
```

In version 2015.8.9, an `ignore_epoch` argument has been added to `pkg.installed`, `pkg.removed`, and `pkg.purged` states, which causes the epoch to be disregarded when the state checks to see if the desired version

was installed.

Also, while this function is not yet implemented for all pkg frontends, `pkg.list_repo_pkgs` will show all versions available in the various repositories for a given package, irrespective of whether or not it is installed.

```
# salt myminion pkg.list_repo_pkgs bash
myminion:
-----
  bash:
    - 4.2.46-21.el7_3
    - 4.2.46-20.el7_2
```

This function was first added for `pkg.list_repo_pkgs` in 2014.1.0, and was expanded to *Debian/Ubuntu* and *Arch Linux*-based distros in the 2017.7.0 release.

The version strings returned by either of these functions can be used as version specifiers in pkg states.

You can install a specific version when using the `pkgs` argument by including the version after the package:

```
common_packages:
  pkg.installed:
    - pkgs:
      - unzip
      - dos2unix
      - salt-minion: 2015.8.5-1.el6
```

If the version given is the string `latest`, the latest available package version will be installed à la `pkg.latest`.

### WILDCARD VERSIONS

As of the 2017.7.0 release, this state now supports wildcards in package versions for SUSE SLES/Leap/Tumbleweed, Debian/Ubuntu, RHEL/CentOS, Arch Linux, and their derivatives. Using wildcards can be useful for packages where the release name is built into the version in some way, such as for RHEL/CentOS which typically has version numbers like `1.2.34-5.el7`. An example of the usage for this would be:

```
mypkg:
  pkg.installed:
    - version: '1.2.34*'
```

**param bool refresh** This parameter controls whether or not the package repo database is updated prior to installing the requested package(s).

If `True`, the package database will be refreshed (`apt-get update` or equivalent, depending on platform) before installing.

If `False`, the package database will *not* be refreshed before installing.

If unset, then Salt treats package database refreshes differently depending on whether or not a `pkg` state has been executed already during the current Salt run. Once a refresh has been performed in a `pkg` state, for the remainder of that Salt run no other refreshes will be performed for `pkg` states which do not

explicitly set `refresh` to `True`. This prevents needless additional refreshes from slowing down the Salt run.

**param str cache\_valid\_time** New in version 2016.11.0.

This parameter sets the value in seconds after which the cache is marked as invalid, and a cache update is necessary. This overwrites the `refresh` parameter's default behavior.

Example:

```
httpd:
  pkg.installed:
    - fromrepo: mycustomrepo
    - skip_verify: True
    - skip_suggestions: True
    - version: 2.0.6~ubuntu3
    - refresh: True
    - cache_valid_time: 300
    - allow_updates: True
    - hold: False
```

In this case, a refresh will not take place for 5 minutes since the last `apt-get` update was executed on the system.

---

**Note:** This parameter is available only on Debian based distributions and has no effect on the rest.

---

**param str fromrepo** Specify a repository from which to install

---

**Note:** Distros which use APT (Debian, Ubuntu, etc.) do not have a concept of repositories, in the same way as YUM-based distros do. When a source is added, it is assigned to a given release. Consider the following source configuration:

```
deb http://ppa.launchpad.net/saltstack/salt/ubuntu precise
↳main
```

The packages provided by this source would be made available via the `precise` release, therefore `fromrepo` would need to be set to `precise` for Salt to install the package from this source.

Having multiple sources in the same release may result in the default install candidate being newer than what is desired. If this is the case, the desired version must be specified using the `version` parameter.

If the `pkgs` parameter is being used to install multiple packages in the same state, then instead of using `version`, use the method of version specification described in the **Multiple Package Installation Options** section below.

Running the shell command `apt-cache policy pkgname` on a minion can help elucidate the APT configuration and aid in properly configuring states:

```
root@saltmaster:~# salt ubuntu01 cmd.run 'apt-cache policy
↳ffmpeg'
ubuntu01:
  ffmpeg:
    Installed: (none)
```

```

Candidate: 7:0.10.11-1~precise1
Version table:
 7:0.10.11-1~precise1 0
   500 http://ppa.launchpad.net/jon-severinsson/
↳ffmpeg/ubuntu/ precise/main amd64 Packages
 4:0.8.10-0ubuntu0.12.04.1 0
   500 http://us.archive.ubuntu.com/ubuntu/
↳precise-updates/main amd64 Packages
   500 http://security.ubuntu.com/ubuntu/ precise-
↳security/main amd64 Packages
 4:0.8.1-0ubuntu1 0
   500 http://us.archive.ubuntu.com/ubuntu/
↳precise/main amd64 Packages

```

The release is located directly after the source's URL. The actual release name is the part before the slash, so to install version **4:0.8.10-0ubuntu0.12.04.1** either `precise-updates` or `precise-security` could be used for the `fromrepo` value.

**param bool skip\_verify** Skip the GPG verification check for the package to be installed

**param bool skip\_suggestions** Force strict package naming. Disables lookup of package alternatives.

New in version 2014.1.1.

**param bool allow\_updates** Allow the package to be updated outside Salt's control (e.g. auto updates on Windows). This means a package on the Minion can have a newer version than the latest available in the repository without enforcing a re-installation of the package.

New in version 2014.7.0.

Example:

```

httpd:
  pkg.installed:
    - fromrepo: mycustomrepo
    - skip_verify: True
    - skip_suggestions: True
    - version: 2.0.6~ubuntu3
    - refresh: True
    - allow_updates: True
    - hold: False

```

**param bool pkg\_verify** New in version 2014.7.0.

For requested packages that are already installed and would not be targeted for upgrade or downgrade, use `pkg.verify` to determine if any of the files installed by the package have been altered. If files have been altered, the `reinstall` option of `pkg.install` is used to force a reinstall. Types to ignore can be passed to `pkg.verify`. Additionally, `verify_options` can be used to modify further the behavior of `pkg.verify`. See examples below. Currently, this option is supported for the following pkg providers: [yumpkg](#).

Examples:

```

httpd:
  pkg.installed:

```

```
- version: 2.2.15-30.el6.centos
- pkg_verify: True
```

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: 1.2.3-4
      - baz
    - pkg_verify:
      - ignore_types:
        - config
        - doc
```

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: 1.2.3-4
      - baz
    - pkg_verify:
      - ignore_types:
        - config
        - doc
      - verify_options:
        - nodeps
        - nofiledigest
```

**param list ignore\_types** List of types to ignore when verifying the package

New in version 2014.7.0.

**param list verify\_options** List of additional options to pass when verifying the package. These options will be added to the `rpm -V` command, prepended with `--` (for example, when `nodeps` is passed in this option, `rpm -V` will be run with `--nodeps`).

New in version 2016.11.0.

**param bool normalize** Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2014.7.0.

Example:

```
gpfs.gplbin-2.6.32-279.31.1.el6.x86_64:
  pkg.installed:
    - normalize: False
```

**param bool ignore\_epoch** When a package version contains a non-zero epoch (e.g. `1:3.14.159-2.el7`), and a specific version of a package is desired, set this option to `True` to ignore the epoch when comparing versions. This allows for the following SLS to be used:

```
# Actual vim-enhanced version: 2:7.4.160-1.el7
vim-enhanced:
  pkg.installed:
```

```
- version: 7.4.160-1.el7
- ignore_epoch: True
```

Without this option set to `True` in the above example, the package would be installed, but the state would report as failed because the actual installed version would be `2:7.4.160-1.el7`. Alternatively, this option can be left as `False` and the full version string (with epoch) can be specified in the SLS file:

```
vim-enhanced:
  pkg.installed:
    - version: 2:7.4.160-1.el7
```

New in version 2015.8.9.

### MULTIPLE PACKAGE INSTALLATION OPTIONS: (not supported in pkgng)

**param list pkgs** A list of packages to install from a software repository. All packages listed under `pkgs` will be installed via a single command.

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar
      - baz
    - hold: True
```

**NOTE:** For *apt*, *ebuild*, *pacman*, *winrepo*, *yumpkg*, and *zypper*, version numbers can be specified in the `pkgs` argument. For example:

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: 1.2.3-4
      - baz
```

Additionally, *ebuild*, *pacman* and *zypper* support the `<`, `<=`, `>=`, and `>` operators for more control over what versions will be installed. For example:

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: '>=1.2.3-4'
      - baz
```

**NOTE:** When using comparison operators, the expression must be enclosed in quotes to avoid a YAML render error.

With *ebuild* is also possible to specify a use flag list and/or if the given packages should be in `package.accept_keywords` file and/or the overlay from which you want the package to be installed. For example:

```

mypkgs:
  pkg.installed:
    - pkgs:
      - foo: '~'
      - bar: '~>=1.2:slot::overlay[use,-otheruse]'
      - baz

```

**param list sources** A list of packages to install, along with the source URI or local path from which to install each package. In the example below, `foo`, `bar`, `baz`, etc. refer to the name of the package, as it would appear in the output of the `pkg.version` or `pkg.list_pkgs` salt CLI commands.

```

mypkgs:
  pkg.installed:
    - sources:
      - foo: salt://rpms/foo.rpm
      - bar: http://somesite.org/bar.rpm
      - baz: ftp://someothersite.org/baz.rpm
      - qux: /minion/path/to/qux.rpm

```

## PLATFORM-SPECIFIC ARGUMENTS

These are specific to each OS. If it does not apply to the execution module for your OS, it is ignored.

**param bool hold** Force the package to be held at the current installed version. Currently works with YUM/DNF & APT based systems.

New in version 2014.7.0.

**param bool update\_holds** If `True`, and this function would update the package version, any packages which are being held will be temporarily unheld so that they can be updated. Otherwise, if this function attempts to update a held package, the held package(s) will be skipped and the state will fail. By default, this parameter is set to `False`.

Currently works with YUM/DNF & APT based systems.

New in version 2016.11.0.

**param list names** A list of packages to install from a software repository. Each package will be installed individually by the package manager.

**Warning:** Unlike `pkgs`, the `names` parameter cannot specify a version. In addition, it makes a separate call to the package management frontend to install each package, whereas `pkgs` makes just a single call. It is therefore recommended to use `pkgs` instead of `names` to install multiple packages, both for the additional features and the performance improvement that it brings.

**param bool install\_recommends** Whether to install the packages marked as recommended. Default is `True`. Currently only works with APT-based systems.

New in version 2015.5.0.

```

httpd:
  pkg.installed:
    - install_recommends: False

```

**param bool only\_upgrade** Only upgrade the packages, if they are already installed. Default is `False`. Currently only works with APT-based systems.

New in version 2015.5.0.

```
httpd:
  pkg.installed:
    - only_upgrade: True
```

---

**Note:** If this parameter is set to True and the package is not already installed, the state will fail.

---

Parameters **report\_reboot\_exit\_codes** (*bool*) --

If the installer exits with a recognized exit code indicating that a reboot is required, the module function

*win\_system.set\_reboot\_required\_witnessed*

will be called, preserving the knowledge of this event for the remainder of the current boot session. For the time being, 3010 is the only recognized exit code, but this is subject to future refinement. The value of this param defaults to True. This parameter has no effect on non-Windows systems.

New in version 2016.11.0.

```
ms vcpp installed:
  pkg.installed:
    - name: ms-vcpp
    - version: 10.0.40219
    - report_reboot_exit_codes: False
```

**return** A dictionary containing the state of the software installation  
**rtype** dict

---

**Note:** The `pkg.installed` state supports the usage of `reload_modules`. This functionality allows you to force Salt to reload all modules. In many cases, Salt is clever enough to transparently reload the modules. For example, if you install a package, Salt reloads modules because some other module or state might require the package which was installed. However, there are some edge cases where this may not be the case, which is what `reload_modules` is meant to resolve.

You should only use `reload_modules` if your `pkg.installed` does some sort of installation where if you do not reload the modules future items in your state which rely on the software being installed will fail. Please see the [Reloading Modules](#) documentation for more information.

---

`salt.states.pkg.latest` (*name*, *refresh=None*, *fromrepo=None*, *skip\_verify=False*, *pkgs=None*, *watch\_flags=True*, *\*\*kwargs*)

Ensure that the named package is installed and the latest available package. If the package can be updated, this state function will update the package. Generally it is better for the *installed* function to be used, as *latest* will update the package whenever a new package is available.

**name** The name of the package to maintain at the latest available version. This parameter is ignored if `pkgs` is used.

**fromrepo** Specify a repository from which to install

**skip\_verify** Skip the GPG verification check for the package to be installed

**refresh** This parameter controls whether or not the package repo database is updated prior to checking for the latest available version of the requested packages.

If True, the package database will be refreshed (`apt-get update` or equivalent, de-

pending on platform) before checking for the latest available version of the requested packages.

If `False`, the package database will *not* be refreshed before checking.

If unset, then Salt treats package database refreshes differently depending on whether or not a `pkg` state has been executed already during the current Salt run. Once a refresh has been performed in a `pkg` state, for the remainder of that Salt run no other refreshes will be performed for `pkg` states which do not explicitly set `refresh` to `True`. This prevents needless additional refreshes from slowing down the Salt run.

**param str cache\_valid\_time** New in version 2016.11.0.

This parameter sets the value in seconds after which the cache is marked as invalid, and a cache update is necessary. This overwrites the `refresh` parameter's default behavior.

Example:

```
httpd:
  pkg.latest:
    - refresh: True
    - cache_valid_time: 300
```

In this case, a refresh will not take place for 5 minutes since the last `apt-get` update was executed on the system.

---

**Note:** This parameter is available only on Debian based distributions and has no effect on the rest.

---

Multiple Package Installation Options:

(Not yet supported for: FreeBSD, OpenBSD, MacOS, and Solaris `pkgutil`)

**pkgs** A list of packages to maintain at the latest available version.

```
mypkgs:
  pkg.latest:
    - pkgs:
      - foo
      - bar
      - baz
```

**install\_recommends** Whether to install the packages marked as recommended. Default is `True`. Currently only works with APT-based systems.

New in version 2015.5.0.

```
httpd:
  pkg.latest:
    - install_recommends: False
```

**only\_upgrade** Only upgrade the packages, if they are already installed. Default is `False`. Currently only works with APT-based systems.

New in version 2015.5.0.

```
httpd:
  pkg.latest:
    - only_upgrade: True
```

---

**Note:** If this parameter is set to True and the package is not already installed, the state will fail.

---

**report\_reboot\_exit\_codes** If the installer exits with a recognized exit code indicating that a reboot is required, the module function

*win\_system.set\_reboot\_required\_witnessed*

will be called, preserving the knowledge of this event for the remainder of the current boot session. For the time being, 3010 is the only recognized exit code, but this is subject to future refinement. The value of this param defaults to True. This parameter has no effect on non-Windows systems.

New in version 2016.11.0.

```
ms vcpp installed:
  pkg.latest:
    - name: ms-vcpp
    - report_reboot_exit_codes: False
```

**salt.states.pkg.mod\_aggregate**(*low, chunks, running*)

The mod\_aggregate function which looks up all packages in the available low chunks and merges them into a single pkgs ref in the present low data

**salt.states.pkg.mod\_init**(*low*)

Set a flag to tell the install functions to refresh the package database. This ensures that the package database is refreshed only once during a state run significantly improving the speed of package management during a state run.

It sets a flag for a number of reasons, primarily due to timeline logic. When originally setting up the mod\_init for pkg a number of corner cases arose with different package managers and how they refresh package data.

It also runs the ``ex\_mod\_init`` from the package manager module that is currently loaded. The ``ex\_mod\_init`` is expected to work as a normal ``mod\_init`` function.

**See also:**

[\*salt.modules.ebuild.ex\\_mod\\_init\(\)\*](#)

**salt.states.pkg.mod\_watch**(*name, \*\*kwargs*)

Install/reinstall a package based on a watch requisite

**salt.states.pkg.patch\_downloaded**(*name, advisory\_ids=None, \*\*kwargs*)

New in version 2017.7.0.

Ensure that packages related to certain advisory ids are downloaded.

Currently supported for the following pkg providers: *yumpkg* and *zypper*

CLI Example:

```
preparing-to-fix-issues:
  pkg.patch_downloaded:
    - advisory_ids:
      - SUSE-SLE-SERVER-12-SP2-2017-185
      - SUSE-SLE-SERVER-12-SP2-2017-150
      - SUSE-SLE-SERVER-12-SP2-2017-120
```

**salt.states.pkg.patch\_installed**(*name, advisory\_ids=None, downloadonly=None, \*\*kwargs*)

New in version 2017.7.0.

Ensure that packages related to certain advisory ids are installed.

Currently supported for the following pkg providers: *yumpkg* and *zypper*

CLI Example:

```
issue-foo-fixed:
  pkg.patch_installed:
    - advisory_ids:
      - SUSE-SLE-SERVER-12-SP2-2017-185
      - SUSE-SLE-SERVER-12-SP2-2017-150
      - SUSE-SLE-SERVER-12-SP2-2017-120
```

`salt.states.pkg.purged`(*name*, *version=None*, *pkgs=None*, *normalize=True*, *ignore\_epoch=False*, *\*\*kwargs*)

Verify that a package is not installed, calling `pkg.purge` if necessary to purge the package. All configuration files are also removed.

**name** The name of the package to be purged.

**version** The version of the package that should be removed. Don't do anything if the package is installed with an unmatching version.

---

**Important:** As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon like in the example above) must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
  pkg.installed:
    - version: 2:7.4.160-1.el7
```

In version 2015.8.9, an **ignore\_epoch** argument has been added to `pkg.installed`, `pkg.removed`, and `pkg.purged` states, which causes the epoch to be disregarded when the state checks to see if the desired version was installed. If **ignore\_epoch** was not set to `True`, and instead of `2:7.4.160-1.el7` a version of `7.4.160-1.el7` were used, this state would report success since the actual installed version includes the epoch, and the specified version would not match.

---

**normalize** [True] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2015.8.0.

**ignore\_epoch** [False] When a package version contains a non-zero epoch (e.g. `1:3.14.159-2.el7`, and a specific version of a package is desired, set this option to `True` to ignore the epoch when comparing versions. This allows for the following SLS to be used:

```
# Actual vim-enhanced version: 2:7.4.160-1.el7
vim-enhanced:
  pkg.purged:
    - version: 7.4.160-1.el7
    - ignore_epoch: True
```

Without this option set to `True` in the above example, the state would falsely report success since the actual installed version is `2:7.4.160-1.el7`. Alternatively, this option can be left as `False` and the full version string (with epoch) can be specified in the SLS file:

```
vim-enhanced:
  pkg.purged:
    - version: 2:7.4.160-1.el7
```

New in version 2015.8.9.

Multiple Package Options:

**pkgs** A list of packages to purge. Must be passed as a python list. The name parameter will be ignored if this option is passed. It accepts version numbers as well.

New in version 0.16.0.

```
salt.states.pkg.removed(name, version=None, pkgs=None, normalize=True, ignore_epoch=False,
                        **kwargs)
```

Verify that a package is not installed, calling `pkg.remove` if necessary to remove the package.

**name** The name of the package to be removed.

**version** The version of the package that should be removed. Don't do anything if the package is installed with an unmatching version.

---

**Important:** As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon like in the example above) must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
  pkg.installed:
    - version: 2:7.4.160-1.el7
```

In version 2015.8.9, an **ignore\_epoch** argument has been added to `pkg.installed`, `pkg.removed`, and `pkg.purged` states, which causes the epoch to be disregarded when the state checks to see if the desired version was installed. If **ignore\_epoch** was not set to `True`, and instead of `2:7.4.160-1.el7` a version of `7.4.160-1.el7` were used, this state would report success since the actual installed version includes the epoch, and the specified version would not match.

**normalize** [True] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2015.8.0.

**ignore\_epoch** [False] When a package version contains a non-zero epoch (e.g. `1:3.14.159-2.el7`, and a specific version of a package is desired, set this option to `True` to ignore the epoch when comparing versions. This allows for the following SLS to be used:

```
# Actual vim-enhanced version: 2:7.4.160-1.el7
vim-enhanced:
  pkg.removed:
    - version: 7.4.160-1.el7
    - ignore_epoch: True
```

Without this option set to `True` in the above example, the state would falsely report success since the actual installed version is `2:7.4.160-1.el7`. Alternatively, this option can be left as `False` and the full version string (with epoch) can be specified in the SLS file:

```
vim-enhanced:
  pkg.removed:
    - version: 2:7.4.160-1.el7
```

New in version 2015.8.9.

Multiple Package Options:

**pkgs** A list of packages to remove. Must be passed as a python list. The name parameter will be ignored if this option is passed. It accepts version numbers as well.

New in version 0.16.0.

`salt.states.pkg.uptodate` (*name*, *refresh=False*, *pkgs=None*, *\*\*kwargs*)

New in version 2014.7.0.

Verify that the system is completely up to date.

**name** The name has no functional value and is only used as a tracking reference

**refresh** refresh the package database before checking for new upgrades

**pkgs** list of packages to upgrade

**Parameters** **cache\_valid\_time** (*str*) -- This parameter sets the value in seconds after which cache marked as invalid, and cache update is necessary. This overwrite `refresh` parameter default behavior.

In this case `cache_valid_time` is set, `refresh` will not take place for amount in seconds since last `apt-get update` executed on the system.

---

**Note:** This parameter available only on Debian based distributions, and have no effect on the rest.

---

**kwargs** Any keyword arguments to pass through to `pkg.upgrade`.

New in version 2015.5.0.

### 14.17.183 salt.states.pkgbuild

The `pkgbuild` state is the front of Salt package building backend. It automatically builds DEB and RPM packages from specified sources

New in version 2015.8.0.

```
salt_2015.5.2:
  pkgbuild.built:
    - runas: thatch
    - results:
      - salt-2015.5.2-2.el7.centos.noarch.rpm
      - salt-api-2015.5.2-2.el7.centos.noarch.rpm
      - salt-cloud-2015.5.2-2.el7.centos.noarch.rpm
      - salt-master-2015.5.2-2.el7.centos.noarch.rpm
      - salt-minion-2015.5.2-2.el7.centos.noarch.rpm
      - salt-ssh-2015.5.2-2.el7.centos.noarch.rpm
      - salt-syndic-2015.5.2-2.el7.centos.noarch.rpm
    - dest_dir: /tmp/pkg
    - spec: salt://pkg/salt/spec/salt.spec
    - template: jinja
    - deps:
      - salt://pkg/salt/sources/required_dependency.rpm
    - tgt: epel-7-x86_64
    - sources:
      - salt://pkg/salt/sources/logrotate.salt
      - salt://pkg/salt/sources/README.fedora
      - salt://pkg/salt/sources/salt-2015.5.2.tar.gz
      - salt://pkg/salt/sources/salt-2015.5.2-tests.patch
      - salt://pkg/salt/sources/salt-api
      - salt://pkg/salt/sources/salt-api.service
      - salt://pkg/salt/sources/salt-master
      - salt://pkg/salt/sources/salt-master.service
      - salt://pkg/salt/sources/salt-minion
      - salt://pkg/salt/sources/salt-minion.service
```

```

- salt://pkg/salt/sources/saltpkg.sls
- salt://pkg/salt/sources/salt-syndic
- salt://pkg/salt/sources/salt-syndic.service
- salt://pkg/salt/sources/SaltTesting-2015.5.8.tar.gz
/tmp/pkg:
  pkgbuild.repo

```

`salt.states.pkgbuild.built`(*name*, *runas*, *dest\_dir*, *spec*, *sources*, *tgt*, *template=None*, *deps=None*, *env=None*, *results=None*, *force=False*, *saltenv='base'*, *log\_dir='/var/log/salt/pkgbuild'*)

Ensure that the named package is built and exists in the named directory

**name** The name to track the build, the name value is otherwise unused

**runas** The user to run the build process as

**dest\_dir** The directory on the minion to place the built package(s)

**spec** The location of the spec file (used for rpms)

**sources** The list of package sources

**tgt** The target platform to run the build on

**template** Run the spec file through a templating engine

Changed in version 2015.8.2: This argument is now optional, allowing for no templating engine to be used if none is desired.

**deps** Packages required to ensure that the named package is built can be hosted on either the salt master server or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials

**env** A dictionary of environment variables to be set prior to execution. Example:

```

- env:
  DEB_BUILD_OPTIONS: 'nocheck'

```

**Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

**results** The names of the expected rpms that will be built

**force** [False] If True, packages will be built even if they already exist in the `dest_dir`. This is useful when building a package for continuous or nightly package builds.

New in version 2015.8.2.

**saltenv** The saltenv to use for files downloaded from the salt fileserver

**log\_dir** [/var/log/salt/rpmbuild] Root directory for log files created from the build. Logs will be organized by package name, version, OS release, and CPU architecture under this directory.

New in version 2015.8.2.

`salt.states.pkgbuild.repo`(*name*, *keyid=None*, *env=None*, *use\_passphrase=False*, *gnupghome='/etc/salt/gpgkeys'*, *runas='builder'*, *timeout=15.0*)

Make a package repository and optionally sign it and packages present

The name is directory to turn into a repo. This state is best used with onchanges linked to your package building states.

**name** The directory to find packages that will be in the repository

**keyid** Changed in version 2016.3.0.

Optional Key ID to use in signing packages and repository. Utilizes Public and Private keys associated with `keyid` which have been loaded into the minion's Pillar data.

For example, contents from a Pillar data file with named Public and Private keys as follows:

```

gpg_pkg_priv_key: |
-----BEGIN PGP PRIVATE KEY BLOCK-----
Version: GnuPG v1

lQ0+BFciIfQBCADAPctzx7I5Rl32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b
w82PCE8Y1jF/9Uk2m3RKVWp3YcLlc7Ap3gj6V04ysvVz28UbnhPxsIk0lf2cq8qc
.
.
Ebe+8JCQTWqSXPRTzXmy/b5WXDeM79CkLWvuGpXFor76D+ECMRPv/rawukEcNptn
R50mgHqvdydEn04pWbn8JzQ09YX/Us0SMHBVzLC8eIi5ZiopzalvX
=JvW8
-----END PGP PRIVATE KEY BLOCK-----

gpg_pkg_priv_keyname: gpg_pkg_key.pem

gpg_pkg_pub_key: |
-----BEGIN PGP PUBLIC KEY BLOCK-----
Version: GnuPG v1

mQENBFciIfQBCADAPctzx7I5Rl32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b
w82PCE8Y1jF/9Uk2m3RKVWp3YcLlc7Ap3gj6V04ysvVz28UbnhPxsIk0lf2cq8qc
.
.
bYP7t5iwJmQzRMMyFInYRt77wkJBPCpJc9FPNebL9vLZcN4zv0KQta+4alcWivvoP

inNqW9c=
=s1CX
-----END PGP PUBLIC KEY BLOCK-----

gpg_pkg_pub_keyname: gpg_pkg_key.pub

```

**env** Changed in version 2016.3.0.

A dictionary of environment variables to be utilized in creating the repository. Example:

```
- env:
  OPTIONS: 'ask-passphrase'
```

**Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Use of `OPTIONS` on some platforms, for example: `ask-passphrase`, will require `gpg-agent` or similar to cache passphrases.

**Note:** This parameter is not used for making yum repositories.

**use\_passphrase** [False] New in version 2016.3.0.

Use a passphrase with the signing key presented in `keyid`. Passphrase is received from Pillar data which could be passed on the command line with `pillar` parameter. For example:

```
pillar='{ "gpg_passphrase" : "my_passphrase" }'
```

**gnupghome** [/etc/salt/gpgkeys] New in version 2016.3.0.

Location where GPG related files are stored, used with ``keyid``

**runas** [builder] New in version 2016.3.0.

User to create the repository as, and optionally sign packages.

---

**Note:** Ensure the user has correct permissions to any files and directories which are to be utilized.

---

**timeout** [15.0] New in version 2016.3.4.

Timeout in seconds to wait for the prompt for inputting the passphrase.

### 14.17.184 salt.states.pkgng

#### Manage package remote repo using FreeBSD pkgng

Salt can manage the URL pkgng pulls packages from. ATM the state and module are small so use cases are typically rather simple:

```
pkgng_clients:
  pkgng.update_packaging_site:
    - name: "http://192.168.0.2"
```

### 14.17.185 salt.states.pkgrepo

#### Management of APT/YUM package repos

Package repositories for APT-based and YUM-based distros can be managed with these states. Here is some example SLS:

```
base:
  pkgrepo.managed:
    - humaname: CentOS-$releasever - Base

    - refresh: True
```

**Note:** On Ubuntu systems, the `python-software-properties` package should be installed for better support of PPA repositories. To check if this package is installed, run `dpkg -l python-software-properties`.

Also, some Ubuntu releases have a [bug](#) in their `python-software-properties` package, a missing dependency on `pycurl`, so `python-pycurl` will need to be manually installed if it is not present once `python-software-properties` is installed.

On Ubuntu & Debian systems, the `python-apt` package is required to be installed. To check if this package is installed, run `dpkg -l python-software-properties`. `python-apt` will need to be manually installed if it is not present.

`salt.states.pkgrepo.absent` (*name*, *\*\*kwargs*)

This function deletes the specified repo on the system, if it exists. It is essentially a wrapper around `pkg.del_repo`.

**name** The name of the package repo, as it would be referred to when running the regular package manager commands.

#### UBUNTU-SPECIFIC OPTIONS

**ppa** On Ubuntu, you can take advantage of Personal Package Archives on Launchpad simply by specifying the user and archive name.

```
logstash-ppa:
  pkgrepo.absent:
    - ppa: wolfnet/logstash
```

**ppa\_auth** For Ubuntu PPAs there can be private PPAs that require authentication to access. For these PPAs the username/password can be specified. This is required for matching if the name format uses the `ppa:` specifier and is private (requires username/password to access, which is encoded in the URI).

```
logstash-ppa:
  pkgrepo.absent:
```

- ppa: wolfnet/logstash
- ppa\_auth: username:password

**keyid** If passed, then the GPG key corresponding to the passed KeyID will also be removed.

**keyid\_ppa** [False] If set to True, the GPG key's ID will be looked up from ppa.launchpad.net and removed, and the `keyid` argument will be ignored.

---

**Note:** This option will be disregarded unless the `ppa` argument is present.

---

`salt.states.pkgrepo.managed` (*name*, *ppa=None*, *\*\*kwargs*)

This state manages software package repositories. Currently, *yum*, *apt*, and *zypper* repositories are supported.

### YUM/DNF/ZYPPER-BASED SYSTEMS

---

**Note:** One of `baseurl` or `mirrorlist` below is required. Additionally, note that this state is not presently capable of managing more than one repo in a single repo file, so each instance of this state will manage a single repo file containing the configuration for a single repo.

---

**name** This value will be used in two ways: Firstly, it will be the repo ID, as seen in the entry in square brackets (e.g. [foo]) for a given repo. Secondly, it will be the name of the file as stored in `/etc/yum.repos.d` (e.g. `/etc/yum.repos.d/foo.conf`).

**enabled** [True] Whether or not the repo is enabled. Can be specified as True/False or 1/0.

**disabled** [False] Included to reduce confusion due to APT's use of the `disabled` argument. If this is passed for a yum/dnf/zypper-based distro, then the reverse will be passed as `enabled`. For example passing `disabled=True` will assume `enabled=False`.

**humanname** This is used as the `name` value in the repo file in `/etc/yum.repos.d/` (or `/etc/zypp/repos.d` for SUSE distros).

**baseurl** The URL to a yum repository

**mirrorlist** A URL which points to a file containing a collection of baseurls

**comments** Sometimes you want to supply additional information, but not as enabled configuration. Anything supplied for this list will be saved in the repo configuration with a comment marker (#) in front.

Additional configuration values seen in yum repo files, such as `gpgkey` or `gpgcheck`, will be used directly as key-value pairs. For example:

```
foo:
  pkgrepo.managed:
    - humanname: Personal repo for foo
    - baseurl: https://mydomain.tld/repo/foo/$releasever/$basearch
    - gpgkey: file:///etc/pki/rpm-gpg/foo-signing-key
    - gpgcheck: 1
```

### APT-BASED SYSTEMS

**ppa** On Ubuntu, you can take advantage of Personal Package Archives on Launchpad simply by specifying the user and archive name. The `keyid` will be queried from launchpad and everything else is set automatically. You can override any of the below settings by simply setting them as you would normally. For example:

```
logstash-ppa:
  pkgrepo.managed:
    - ppa: wolfnet/logstash
```

**ppa\_auth** For Ubuntu PPAs there can be private PPAs that require authentication to access. For these PPAs the username/password can be passed as an HTTP Basic style username/password combination.

```
logstash-ppa:
  pkgrepo.managed:
    - ppa: wolfnets/logstash
    - ppa_auth: username:password
```

**name** On apt-based systems this must be the complete entry as it would be seen in the sources.list file. This can have a limited subset of components (i.e. `main`) which can be added/modified with the `comps` option.

```
precise-repo:
  pkgrepo.managed:
    - name: deb http://us.archive.ubuntu.com/ubuntu precise main
```

**Note:** The above example is intended as a more readable way of configuring the SLS, it is equivalent to the following:

```
'deb http://us.archive.ubuntu.com/ubuntu precise main':
  pkgrepo.managed
```

**disabled** [False] Toggles whether or not the repo is used for resolving dependencies and/or installing packages.

**enabled** [True] Included to reduce confusion due to yum/dnf/zypper's use of the `enabled` argument. If this is passed for an APT-based distro, then the reverse will be passed as `disabled`. For example, passing `enabled=False` will assume `disabled=False`.

**architectures** On apt-based systems, architectures can restrict the available architectures that the repository provides (e.g. only amd64). architectures should be a comma-separated list.

**comps** On apt-based systems, comps dictate the types of packages to be installed from the repository (e.g. main, nonfree, ...). For purposes of this, comps should be a comma-separated list.

**file** The filename for the .list that the repository is configured in. It is important to include the full-path AND make sure it is in a directory that APT will look in when handling packages

**dist** This dictates the release of the distro the packages should be built for. (e.g. unstable). This option is rarely needed.

**keyid** The KeyID of the GPG key to install. This option also requires the `keyserver` option to be set.

**keyserver** This is the name of the keyserver to retrieve gpg keys from. The `keyid` option must also be set for this option to work.

**key\_url** URL to retrieve a GPG key from. Allows the usage of `http://`, `https://` as well as `salt://`.

**Note:** Use either `keyid/keyserver` or `key_url`, but not both.

**consolidate** If set to true, this will consolidate all sources definitions to the sources.list file, cleanup the now unused files, consolidate components (e.g. main) for the same URI, type, and architecture to a single line, and finally remove comments from the sources.list file. The consolidate will run every time the state is processed. The option only needs to be set on one repo managed by salt to take effect.

**clean\_file** If set to true, empty file before config repo, dangerous if use multiple sources in one file.

New in version 2015.8.0.

**refresh\_db** If set to false this will skip refreshing the apt package database on debian based systems.

**require\_in** Set this to a list of `pkg.installed` or `pkg.latest` to trigger the running of `apt-get update` prior to attempting to install these packages. Setting a `require` in the `pkg` will not work for this.

### 14.17.186 salt.states.portage\_config

#### Management of Portage package configuration on Gentoo

A state module to manage Portage configuration on Gentoo

```
salt:
  portage_config.flags:
    - use:
      - openssl
```

`salt.states.portage_config.flags` (*name*, *use=None*, *accept\_keywords=None*, *env=None*, *license=None*, *properties=None*, *unmask=False*, *mask=False*)

Enforce the given flags on the given package or DEPEND atom.

**Warning:** In most cases, the affected package(s) need to be rebuilt in order to apply the changes.

**name** The name of the package or its DEPEND atom

**use** A list of USE flags

**accept\_keywords** A list of keywords to accept. ~ARCH means current host arch, and will be translated into a line without keywords

**env** A list of environment files

**license** A list of accepted licenses

**properties** A list of additional properties

**unmask** A boolean to unmask the package

**mask** A boolean to mask the package

`salt.states.portage_config.mod_init` (*low*)

Enforce a nice structure on the configuration files.

### 14.17.187 salt.states.ports

Manage software from FreeBSD ports

New in version 2014.1.0.

---

**Note:** It may be helpful to use a higher timeout when running a `ports.installed` state, since compiling the port may exceed Salt's timeout.

```
salt -t 1200 '*' state.highstate
```

`salt.states.ports.installed` (*name*, *options=None*)

Verify that the desired port is installed, and that it was compiled with the desired options.

**options** Make sure that the desired non-default options are set

**Warning:** Any build options not passed here assume the default values for the port, and are not just differences from the existing cached options from a previous `make config`.

Example usage:

```
security/nmap:
  ports.installed:
    - options:
      - IPV6: off
```

### 14.17.188 salt.states.postgres\_cluster module

#### Management of PostgreSQL clusters

The `postgres_cluster` state module is used to manage PostgreSQL clusters. Clusters can be set as either absent or present

```
create cluster 9.3 main:
  postgres_cluster.present:
    - name: 'main'
    - version: '9.3'
```

`salt.states.postgres_cluster.absent` (*version, name*)

Ensure that the named cluster is absent

**version** Version of the postgresql server of the cluster to remove

**name** The name of the cluster to remove

New in version 2015.XX.

`salt.states.postgres_cluster.present` (*version, name, port=None, encoding=None, locale=None, datadir=None*)

Ensure that the named cluster is present with the specified properties. For more information about all of these options see `man pg_createcluster(1)`

**version** Version of the postgresql cluster

**name** The name of the cluster

**port** Cluster port

**encoding** The character encoding scheme to be used in this database

**locale** Locale with which to create cluster

**datadir** Where the cluster is stored

New in version 2015.XX.

### 14.17.189 salt.states.postgres\_database

#### Management of PostgreSQL databases

The `postgres_database` module is used to create and manage Postgres databases. Databases can be set as either absent or present

```
frank:
  postgres_database.present
```

`salt.states.postgres_database.absent` (*name, user=None, maintenance\_db=None, db\_password=None, db\_host=None, db\_port=None, db\_user=None*)

Ensure that the named database is absent

**name** The name of the database to remove

**db\_user** database username if different from config or default

**db\_password** user password if any password for a specified user

**db\_host** Database host if different from config or default  
**db\_port** Database port if different from config or default  
**user** System user all operations should be performed on behalf of

New in version 0.17.0.

```
salt.states.postgres_database.present(name,          tablespace=None,      encoding=None,
                                       lc_collate=None,  lc_ctype=None,       owner=None,
                                       owner_recurse=False, template=None,  user=None,
                                       maintenance_db=None, db_password=None,
                                       db_host=None, db_port=None, db_user=None)
```

Ensure that the named database is present with the specified properties. For more information about all of these options see `man createdb(1)`

**name** The name of the database to manage  
**tablespace** Default tablespace for the database  
**encoding** The character encoding scheme to be used in this database  
**lc\_collate** The LC\_COLLATE setting to be used in this database  
**lc\_ctype** The LC\_CTYPE setting to be used in this database  
**owner** The username of the database owner  
**owner\_recurse** Recurse owner change to all relations in the database  
**template** The template database from which to build this database  
**user** System user all operations should be performed on behalf of  
**db\_user** database username if different from config or default  
**db\_password** user password if any password for a specified user  
**db\_host** Database host if different from config or default  
**db\_port** Database port if different from config or default

New in version 0.17.0.

### 14.17.190 salt.states.postgres\_extension

#### Management of PostgreSQL extensions

A module used to install and manage PostgreSQL extensions.

```
adminpack:
  postgres_extension.present
```

New in version 2014.7.0.

```
salt.states.postgres_extension.absent(name, if_exists=None, restrict=None, cascade=None,
                                       user=None, maintenance_db=None, db_user=None,
                                       db_password=None, db_host=None, db_port=None)
```

Ensure that the named extension is absent.

**name** Extension name of the extension to remove  
**if\_exists** Add if exist slug  
**restrict** Add restrict slug  
**cascade** Drop on cascade  
**user** System user all operations should be performed on behalf of  
**maintenance\_db** Database to act on  
**db\_user** Database username if different from config or default  
**db\_password** User password if any password for a specified user  
**db\_host** Database host if different from config or default  
**db\_port** Database port if different from config or default

```
salt.states.postgres_extension.present(name, if_not_exists=None, schema=None,
                                         ext_version=None, from_version=None,
                                         user=None, maintenance_db=None, db_user=None,
                                         db_password=None, db_host=None, db_port=None)
```

Ensure that the named extension is present.

---

**Note:** Before you can use the state to load an extension into a database, the extension's supporting files must be already installed.

---

For more information about all of these options see CREATE EXTENSION SQL command reference in the PostgreSQL documentation.

**name** The name of the extension to be installed  
**if\_not\_exists** Add an IF NOT EXISTS parameter to the DDL statement  
**schema** Schema to install the extension into  
**ext\_version** Version to install  
**from\_version** Old extension version if already installed  
**user** System user all operations should be performed on behalf of  
**maintenance\_db** Database to act on  
**db\_user** Database username if different from config or default  
**db\_password** User password if any password for a specified user  
**db\_host** Database host if different from config or default  
**db\_port** Database port if different from config or default

### 14.17.191 salt.states.postgres\_group

#### Management of PostgreSQL groups (roles)

The postgres\_group module is used to create and manage Postgres groups.

```
frank:
  postgres_group.present
```

```
salt.states.postgres_group.absent(name, user=None, maintenance_db=None,
                                     db_password=None, db_host=None, db_port=None,
                                     db_user=None)
```

Ensure that the named group is absent

**name** The groupname of the group to remove  
**user** System user all operations should be performed on behalf of

New in version 0.17.0.

**db\_user** database username if different from config or default  
**db\_password** user password if any password for a specified user  
**db\_host** Database host if different from config or default  
**db\_port** Database port if different from config or default

```
salt.states.postgres_group.present(name, createdb=None, createroles=None, createuser=None,
                                     encrypted=None, superuser=None, inherit=None, lo-
                                     gin=None, replication=None, password=None, re-
                                     fresh_password=None, groups=None, user=None, main-
                                     tenance_db=None, db_password=None, db_host=None,
                                     db_port=None, db_user=None)
```

Ensure that the named group is present with the specified privileges Please note that the user/group notion in postgresql is just abstract, we have roles, where users can be seen as roles with the LOGIN privilege and groups the others.

**name** The name of the group to manage  
**createdb** Is the group allowed to create databases?  
**createroles** Is the group allowed to create other roles/users  
**createuser** Alias to create roles, and history problem, in pgsqll normally createuser == superuser  
**encrypted** Should the password be encrypted in the system catalog?  
**login** Should the group have login perm  
**inherit** Should the group inherit permissions  
**superuser** Should the new group be a ``superuser"  
**replication** Should the new group be allowed to initiate streaming replication  
**password** The group's password It can be either a plain string or a md5 postgresql hashed password:

```
'md5{MD50F({password}{role}}'
```

If encrypted is None or True, the password will be automatically encrypted to the previous format if it is not already done.

**refresh\_password** Password refresh flag

Boolean attribute to specify whether to password comparison check should be performed.

If refresh\_password is True, the password will be automatically updated without extra password change check.

This behaviour makes it possible to execute in environments without superuser access available, e.g. Amazon RDS for PostgreSQL

**groups** A string of comma separated groups the group should be in

**user** System user all operations should be performed on behalf of

New in version 0.17.0.

**db\_user** database username if different from config or default

**db\_password** user password if any password for a specified user

**db\_host** Database host if different from config or default

**db\_port** Database port if different from config or default

### 14.17.192 salt.states.postgres\_initdb

#### Initialization of PostgreSQL data directory

The postgres\_initdb module is used to initialize the postgresql data directory.

New in version 2016.3.0.

```
pgsql-data-dir:
  postgres_initdb.present:
    - name: /var/lib/pgsql/data
    - auth: password
    - user: postgres
    - password: strong_password
    - encoding: UTF8
    - locale: C
    - runas: postgres
```

**salt.states.postgres\_initdb.present** (*name, user=None, password=None, auth='password', encoding='UTF8', locale=None, runas=None*)

Initialize the PostgreSQL data directory

**name** The name of the directory to initialize

**user** The database superuser name

**password** The password to set for the postgres user

**auth** The default authentication method for local connections  
**encoding** The default encoding for new databases  
**locale** The default locale for new databases  
**runas** The system user the operation should be performed on behalf of

### 14.17.193 salt.states.postgres\_language

#### Management of PostgreSQL languages

The postgres\_language module is used to create and manage Postgres languages. Languages can be set as either absent or present

New in version 2016.3.0.

```
plpgsql:
  postgres_language.present:
    - maintenance_db: testdb
```

```
plpgsql:
  postgres_language.absent:
    - maintenance_db: testdb
```

**salt.states.postgres\_language.absent** (*name, maintenance\_db, user=None, db\_password=None, db\_host=None, db\_port=None, db\_user=None*)

Ensure that a named language is absent in the specified database.

**name** The name of the language to remove  
**maintenance\_db** The name of the database in which the language is to be installed  
**user** System user all operations should be performed on behalf of  
**db\_user** database username if different from config or default  
**db\_password** user password if any password for a specified user  
**db\_host** Database host if different from config or default  
**db\_port** Database port if different from config or default

**salt.states.postgres\_language.present** (*name, maintenance\_db, user=None, db\_password=None, db\_host=None, db\_port=None, db\_user=None*)

Ensure that a named language is present in the specified database.

**name** The name of the language to install  
**maintenance\_db** The name of the database in which the language is to be installed  
**user** System user all operations should be performed on behalf of  
**db\_user** database username if different from config or default  
**db\_password** user password if any password for a specified user  
**db\_host** Database host if different from config or default  
**db\_port** Database port if different from config or default

### 14.17.194 salt.states.postgres\_privileges

#### Management of PostgreSQL Privileges

The postgres\_privileges module is used to manage Postgres privileges. Privileges can be set as either absent or present.

Privileges can be set on the following database object types:

- database

- schema
- tablespace
- table
- sequence
- language
- group

Setting the grant option is supported as well.

New in version 2016.3.0.

```
baruwa:
  postgres_privileges.present:
    - object_name: awl
    - object_type: table
    - privileges:
      - SELECT
      - INSERT
      - DELETE
    - grant_option: False
    - prepend: public
    - maintenance_db: testdb
```

```
andrew:
  postgres_privileges.present:
    - object_name: admins
    - object_type: group
    - grant_option: False
    - maintenance_db: testdb
```

```
baruwa:
  postgres_privileges.absent:
    - object_name: awl
    - object_type: table
    - privileges:
      - SELECT
      - INSERT
      - DELETE
    - prepend: public
    - maintenance_db: testdb
```

```
andrew:
  postgres_privileges.absent:
    - object_name: admins
    - object_type: group
    - maintenance_db: testdb
```

`salt.states.postgres_privileges.absent`(*name*, *object\_name*, *object\_type*, *privileges=None*, *prepend='public'*, *maintenance\_db=None*, *user=None*, *db\_password=None*, *db\_host=None*, *db\_port=None*, *db\_user=None*)

Revoke the requested privilege(s) on the specified object(s)

**name** Name of the role whose privileges should be revoked

**object\_name** Name of the object on which the revoke is to be performed

**object\_type** The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

**privileges** Comma separated list of privileges to revoke, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

**note** privileges should not be set when revoking group membership

**prepend** Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

**maintenance\_db** The name of the database in which the language is to be installed

**user** System user all operations should be performed on behalf of

**db\_user** database username if different from config or default

**db\_password** user password if any password for a specified user

**db\_host** Database host if different from config or default

**db\_port** Database port if different from config or default

`salt.states.postgres_privileges.present`(*name*, *object\_name*, *object\_type*, *privileges=None*, *grant\_option=None*, *prepend='public'*, *maintenance\_db=None*, *user=None*, *db\_password=None*, *db\_host=None*, *db\_port=None*, *db\_user=None*)

Grant the requested privilege(s) on the specified object to a role

**name** Name of the role to which privileges should be granted

**object\_name** Name of the object on which the grant is to be performed. `ALL` may be used for objects of type `table` or `sequence`.

**object\_type** The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

**privileges** List of privileges to grant, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT

- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

**note** privileges should not be set when granting group membership

**grant\_option** If grant\_option is set to True, the recipient of the privilege can in turn grant it to others

**prepend** Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

**maintenance\_db** The name of the database in which the language is to be installed

**user** System user all operations should be performed on behalf of

**db\_user** database username if different from config or default

**db\_password** user password if any password for a specified user

**db\_host** Database host if different from config or default

**db\_port** Database port if different from config or default

### 14.17.195 salt.states.postgres\_schema

#### Management of PostgreSQL schemas

The postgres\_schemas module is used to create and manage Postgres schemas.

```
public:
  postgres_schema.present 'dbname' 'name'
```

**absent**(*dbname*, *name*, *db\_user=None*, *db\_password=None*,  
*db\_host=None*, *db\_port=None*)

Ensure that the named schema is absent.

**dbname** The database's name will work on

**name** The name of the schema to remove

**db\_user** database username if different from config or default

**db\_password** user password if any password for a specified user

**db\_host** Database host if different from config or default

**db\_port** Database port if different from config or default

**present**(*dbname*, *name*, *owner=None*, *db\_user=None*,  
*db\_password=None*, *db\_host=None*, *db\_port=None*)

Ensure that the named schema is present in the database.

**dbname** The database's name will work on

**name** The name of the schema to manage

**owner** The database user that will be the owner of the schema

**db\_user** database username if different from config or default

**db\_password** user password if any password for a specified user

**db\_host** Database host if different from config or default

**db\_port** Database port if different from config or default

## 14.17.196 salt.states.postgres\_tablespace

### Management of PostgreSQL tablespace

A module used to create and manage PostgreSQL tablespaces.

```

ssd-tablespace:
  postgres_tablespace.present:
    - name: indexes
    - directory: /mnt/ssd-data

```

New in version 2015.8.0.

**salt.states.postgres\_tablespace.absent**(*name*, *user=None*, *maintenance\_db=None*, *db\_user=None*, *db\_password=None*, *db\_host=None*, *db\_port=None*)

Ensure that the named tablespace is absent.

**name** The name of the tablespace to remove

**user** System user all operations should be performed on behalf of

**maintenance\_db** Database to act on

**db\_user** Database username if different from config or default

**db\_password** User password if any password for a specified user

**db\_host** Database host if different from config or default

**db\_port** Database port if different from config or default

**salt.states.postgres\_tablespace.present**(*name*, *directory*, *options=None*, *owner=None*, *user=None*, *maintenance\_db=None*, *db\_password=None*, *db\_host=None*, *db\_port=None*, *db\_user=None*)

Ensure that the named tablespace is present with the specified properties. For more information about all of these options see `man ``create_tablespace``(7)`.

**name** The name of the tablespace to create/manage.

**directory** The directory where the tablespace will be located, must already exist

**options** A dictionary of options to specify for the tablespace. Currently, the only tablespace options supported are `seq_page_cost` and `random_page_cost`. Default values are shown in the example below:

```

my_space:
  postgres_tablespace.present:
    - directory: /srv/my_tablespace
    - options:
        seq_page_cost: 1.0
        random_page_cost: 4.0

```

**owner** The database user that will be the owner of the tablespace. Defaults to the user executing the command (i.e. the *user* option)

**user** System user all operations should be performed on behalf of

**maintenance\_db** Database to act on

**db\_user** Database username if different from config or default

**db\_password** User password if any password for a specified user

**db\_host** Database host if different from config or default

**db\_port** Database port if different from config or default

## 14.17.197 salt.states.postgres\_user

### Management of PostgreSQL users (roles)

The postgres\_users module is used to create and manage Postgres users.

```
frank:
  postgres_user.present
```

```
salt.states.postgres_user.absent(name,          user=None,          maintenance_db=None,
                                   db_password=None, db_host=None,  db_port=None,
                                   db_user=None)
```

Ensure that the named user is absent

**name** The username of the user to remove

**user** System user all operations should be performed on behalf of

New in version 0.17.0.

**db\_user** database username if different from config or default

**db\_password** user password if any password for a specified user

**db\_host** Database host if different from config or default

**db\_port** Database port if different from config or default

```
salt.states.postgres_user.present(name,      createdb=None,  createroles=None,  crea-
                                   teuser=None, encrypted=None, superuser=None, replica-
                                   tion=None, inherit=None, login=None, password=None,
                                   default_password=None,      refresh_password=None,
                                   groups=None,   user=None,    maintenance_db=None,
                                   db_password=None, db_host=None, db_port=None,
                                   db_user=None)
```

Ensure that the named user is present with the specified privileges Please note that the user/group notion in postgresql is just abstract, we have roles, where users can be seen as roles with the LOGIN privilege and groups the others.

**name** The name of the system user to manage.

**createdb** Is the user allowed to create databases?

**createroles** Is the user allowed to create other users?

**createuser** Alias to create roles

**encrypted** Should the password be encrypted in the system catalog?

**login** Should the group have login perm

**inherit** Should the group inherit permissions

**superuser** Should the new user be a ``superuser``

**replication** Should the new user be allowed to initiate streaming replication

**password** The system user's password. It can be either a plain string or a md5 postgresql hashed password:

```
'md5{MD50F({password}{role}}'
```

If encrypted is None or True, the password will be automatically encrypted to the previous format if it is not already done.

**default\_password** The password used only when creating the user, unless password is set.

New in version 2016.3.0.

**refresh\_password** Password refresh flag

Boolean attribute to specify whether to password comparison check should be performed.

If refresh\_password is True, the password will be automatically updated without extra password change check.

This behaviour makes it possible to execute in environments without superuser access available, e.g. Amazon RDS for PostgreSQL

**groups** A string of comma separated groups the user should be in  
**user** System user all operations should be performed on behalf of

New in version 0.17.0.

**db\_user** Postgres database username, if different from config or default.

**db\_password** Postgres user's password, if any password, for a specified db\_user.

**db\_host** Postgres database host, if different from config or default.

**db\_port** Postgres database port, if different from config or default.

### 14.17.198 salt.states.powerpath

#### Powerpath configuration support

Allows configuration of EMC Powerpath. Currently only addition/deletion of licenses is supported.

```
key:
  powerpath.license_present: []
```

**salt.states.powerpath.license\_absent**(*name*)

Ensures that the specified PowerPath license key is absent on the host.

**name** The license key to ensure is absent

**salt.states.powerpath.license\_present**(*name*)

Ensures that the specified PowerPath license key is present on the host.

**name** The license key to ensure is present

### 14.17.199 salt.states.probes

#### Network Probes

Configure RPM (JunOS)/SLA (Cisco) probes on the device via NAPALM proxy.

**codeauthor** Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>

**maturity** new

**depends** napalm

**platform** unix

#### Dependencies

- *napalm probes management module*

**salt.states.probes.managed**(*name, probes, defaults=None*)

Ensure the networks device is configured as specified in the state SLS file. Probes not specified will be removed, while probes not configured as expected will trigger config updates.

**Parameters probes** -- Defines the probes as expected to be configured on the device.

In order to ease the configuration and avoid repeating the same parameters for each probe, the next parameter (defaults) can be used, providing common characteristics. :param defaults: Specifies common parameters for the probes.

SLS Example:

```

rpmprobes:
  probes.managed:
    - probes:
      probe_name1:
        probe1_test1:
          source: 192.168.0.2
          target: 192.168.0.1
        probe1_test2:
          target: 172.17.17.1
        probe1_test3:
          target: 8.8.8.8
          probe_type: http-ping
      probe_name2:
        probe2_test1:
          test_interval: 100
    - defaults:
      target: 10.10.10.10
      probe_count: 15
      test_interval: 3
      probe_type: icmp-ping

```

In the probes configuration, the only mandatory attribute is *target* (specified either in probes configuration, either in the defaults dictionary). All the other parameters will use the operating system defaults, if not provided:

- **source:** Specifies the source IP Address to be used during the tests. If not specified will use the IP Address of the logical interface loopback0.
- **target:** Destination IP Address.
- **probe\_count:** Total number of probes per test (1..15). System defaults: 1 on both JunOS & Cisco.
- **probe\_interval:** Delay between tests (0..86400 seconds). System defaults: 3 on JunOS, 5 on Cisco.
- **probe\_type:** Probe request type. Available options:
  - icmp-ping
  - tcp-ping
  - udp-ping

Using the example configuration above, after running the state, on the device will be configured 4 probes, with the following properties:

```

probe_name1:
  probe1_test1:
    source: 192.168.0.2
    target: 192.168.0.1
    probe_count: 15
    test_interval: 3
    probe_type: icmp-ping
  probe1_test2:
    target: 172.17.17.1
    probe_count: 15
    test_interval: 3
    probe_type: icmp-ping
  probe1_test3:
    target: 8.8.8.8
    probe_count: 15
    test_interval: 3
    probe_type: http-ping
probe_name2:
  probe2_test1:
    target: 10.10.10.10
    probe_count: 15

```

```
test_interval: 3
probe_type: icmp-ping
```

### 14.17.200 salt.states.process

#### Process Management

Ensure a process matching a given pattern is absent.

```
httpd-absent:
  process.absent:
    - name: apache2
```

`salt.states.process.absent` (*name*, *user=None*, *signal=None*)

Ensures that the named command is not running.

**name** The pattern to match.

**user** The user process belongs

**signal** Signal to send to the process(es).

### 14.17.201 salt.states.proxy module

#### Allows you to manage proxy settings on minions

Setup proxy settings on minions

```
192.168.1.4:
  proxy.managed:
    - port: 3128
    - bypass_domains:
      - localhost
      - 127.0.0.1
```

`salt.states.proxy.managed` (*name*, *port*, *services=None*, *user=None*, *password=None*, *bypass\_domains=None*, *network\_service='Ethernet'*)

Manages proxy settings for this minion

**name** The proxy server to use

**port** The port used by the proxy server

**services** A list of the services that should use the given proxy settings, valid services include http, https and ftp. If no service is given all of the valid services will be used.

**user** The username to use for the proxy server if required

**password** The password to use if required by the server

**bypass\_domains** An array of the domains that should bypass the proxy

**network\_service** The network service to apply the changes to, this only necessary on macOS

### 14.17.202 salt.states.pushover

#### Send a message to PushOver

This state is useful for sending messages to PushOver during state runs.

New in version 2015.5.0.

```

pushover-message:
  pushover.post_message:
    - user: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
    - token: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
    - title: Salt Returner
    - device: phone
    - priority: -1
    - expire: 3600
    - retry: 5
    - message: 'This state was executed successfully.'

```

The api key can be specified in the master or minion configuration like below: .. code-block:: yaml

```
pushover: token: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

```
salt.states.pushover.post_message(name, user=None, device=None, message=None, title=None,
                                priority=None, expire=None, retry=None, sound=None,
                                api_version=1, token=None)
```

Send a message to a PushOver channel.

```

pushover-message:
  pushover.post_message:
    - user: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
    - token: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
    - title: Salt Returner
    - device: phone
    - priority: -1
    - expire: 3600
    - retry: 5

```

The following parameters are required:

**name** The unique name for this event.

**user** The user or group of users to send the message to. Must be ID of user, not name or email address.

**message** The message that is to be sent to the PushOver channel.

The following parameters are optional:

**title** The title to use for the message.

**device** The device for the user to send the message to.

**priority** The priority for the message.

**expire** The message should expire after specified amount of seconds.

**retry** The message should be resent this many times.

**token** The token for PushOver to use for authentication, if not specified in the configuration options of master or minion.

### 14.17.203 salt.states.pyenv

#### Managing python installations with pyenv

This module is used to install and manage python installations with pyenv. Different versions of python can be installed, and uninstalled. pyenv will be installed automatically the first time it is needed and can be updated later. This module will *not* automatically install packages which pyenv will need to compile the versions of python.

If pyenv is run as the root user then it will be installed to `/usr/local/pyenv`, otherwise it will be installed to the users `~/.pyenv` directory. To make pyenv available in the shell you may need to add the `pyenv/shims` and `pyenv/bin` directories to the users `PATH`. If you are installing as root and want other users to be able to access pyenv then you will need to add `pyenv_ROOT` to their environment.

This is how a state configuration could look like:

```

pyenv-deps:
  pkg.installed:
    - pkgs:
      - make
      - build-essential
      - libssl-dev
      - zlib1g-dev
      - libbz2-dev
      - libreadline-dev
      - libsqlite3-dev
      - wget
      - curl
      - llvm
python-2.6:
  pyenv.absent:
    - require:
      - pkg: pyenv-deps
python-2.7.6:
  pyenv.installed:
    - default: True
    - require:
      - pkg: pyenv-deps

```

---

**Note:** Git needs to be installed and available via PATH if pyenv is to be installed automatically by the module.

---

`salt.states.pyenv.absent` (*name*, *user=None*)

Verify that the specified python is not installed with pyenv. pyenv is installed if necessary.

**name** The version of python to uninstall

**user: None** The user to run pyenv as.

New in version 0.17.0.

New in version 0.16.0.

`salt.states.pyenv.install_pyenv` (*name*, *user=None*)

Install pyenv if not installed. Allows you to require pyenv be installed prior to installing the plugins. Useful if you want to install pyenv plugins via the git or file modules and need them installed before installing any rubies.

Use the `pyenv.root` configuration option to set the path for pyenv if you want a system wide install that is not in a user home dir.

**user: None** The user to run pyenv as.

`salt.states.pyenv.installed` (*name*, *default=False*, *user=None*)

Verify that the specified python is installed with pyenv. pyenv is installed if necessary.

**name** The version of python to install

**default** [False] Whether to make this python the default.

**user: None** The user to run pyenv as.

New in version 0.17.0.

New in version 0.16.0.

### 14.17.204 salt.states.pyrax\_queues

#### Manage Rackspace Queues

New in version 2015.5.0.

Create and destroy Rackspace queues. Be aware that this interacts with Rackspace's services, and so may incur charges.

This module uses pyrax, which can be installed via package, or pip. This module is greatly inspired by boto\_\* modules from SaltStack code source.

```
myqueue:
  pyrax_queues.present:
    - provider: my-pyrax

myqueue:
  pyrax_queues.absent:
    - provider: my-pyrax
```

`salt.states.pyrax_queues.absent` (*name*, *provider*)

Ensure the named Rackspace queue is deleted.

**name** Name of the Rackspace queue.

**provider** Salt Cloud provider

`salt.states.pyrax_queues.present` (*name*, *provider*)

Ensure the RackSpace queue exists.

**name** Name of the Rackspace queue.

**provider** Salt Cloud Provider

### 14.17.205 salt.states.quota

#### Management of POSIX Quotas

The quota can be managed for the system:

```
/:
  quota.mode:
    mode: off
    quotatype: user
```

`salt.states.quota.mode` (*name*, *mode*, *quotatype*)

Set the quota for the system

**name** The filesystem to set the quota mode on

**mode** Whether the quota system is on or off

**quotatype** Must be user or group

### 14.17.206 salt.states.rabbitmq\_cluster

#### Manage RabbitMQ Clusters

Example:

```
rabbit@rabbit.example.com:
rabbitmq_cluster.join:
- user: rabbit
- host: rabbit.example.com
```

`salt.states.rabbitmq_cluster.join(name, host, user='rabbit', ram_node=None, runas='root')`

This function is an alias of `joined`.

Ensure the current node joined to a cluster with node `user@host`

**name** Irrelevant, not used (recommended: `user@host`)

**user** The user of node to join to (default: `rabbit`)

**host** The host of node to join to

**ram\_node** Join node as a RAM node

**runas** The user to run the rabbitmq command as

`salt.states.rabbitmq_cluster.joined(name, host, user='rabbit', ram_node=None, runas='root')`

Ensure the current node joined to a cluster with node `user@host`

**name** Irrelevant, not used (recommended: `user@host`)

**user** The user of node to join to (default: `rabbit`)

**host** The host of node to join to

**ram\_node** Join node as a RAM node

**runas** The user to run the rabbitmq command as

### 14.17.207 salt.states.rabbitmq\_plugin

#### Manage RabbitMQ Plugins

New in version 2014.1.0.

Example:

```
some_plugin:
  rabbitmq_plugin.enabled: []
```

`salt.states.rabbitmq_plugin.disabled(name, runas=None)`

Ensure the RabbitMQ plugin is disabled.

**name** The name of the plugin

**runas** The user to run the rabbitmq-plugin command as

`salt.states.rabbitmq_plugin.enabled(name, runas=None)`

Ensure the RabbitMQ plugin is enabled.

**name** The name of the plugin

**runas** The user to run the rabbitmq-plugin command as

### 14.17.208 salt.states.rabbitmq\_policy

#### Manage RabbitMQ Policies

**maintainer** Benn Eichhorn <benn@getlocalmeasure.com>

**maturity** new

**platform** all

Example:

```
rabbit_policy:
  rabbitmq_policy.present:
    - name: HA
    - pattern: '.*'
    - definition: '{"ha-mode": "all"}'
```

**salt.states.rabbitmq\_policy.absent**(*name*, *vhost='/'*, *runas=None*)  
Ensure the named policy is absent

Reference: <http://www.rabbitmq.com/ha.html>

**name** The name of the policy to remove

**runas** Name of the user to run the command as

**salt.states.rabbitmq\_policy.present**(*name*, *pattern*, *definition*, *priority=0*, *vhost='/'*,  
*runas=None*)

Ensure the RabbitMQ policy exists.

Reference: <http://www.rabbitmq.com/ha.html>

**name** Policy name

**pattern** A regex of queues to apply the policy to

**definition** A json dict describing the policy

**priority** Priority (defaults to 0)

**vhost** Virtual host to apply to (defaults to '/')

**runas** Name of the user to run the command as

## 14.17.209 salt.states.rabbitmq\_user

### Manage RabbitMQ Users

Example:

```
rabbit_user:
  rabbitmq_user.present:
    - password: password
    - force: True
    - tags:
      - monitoring
      - user
    - perms:
      - '/':
        - '.*'
        - '.*'
        - '.*'
    - runas: rabbitmq
```

**salt.states.rabbitmq\_user.absent**(*name*, *runas=None*)  
Ensure the named user is absent

**name** The name of the user to remove

**runas** User to run the command

**salt.states.rabbitmq\_user.present**(*name*, *password=None*, *force=False*, *tags=None*, *perms=()*,  
*runas=None*)

Ensure the RabbitMQ user exists.

**name** User name

**password** User's password, if one needs to be set

**force** If user exists, forcibly change the password

**tags** Optional list of tags for the user  
**perms** A list of dicts with vhost keys and 3-tuple values  
**runas** Name of the user to run the command

### 14.17.210 salt.states.rabbitmq\_vhost

#### Manage RabbitMQ Virtual Hosts

Example:

```
virtual_host:
  rabbitmq_vhost.present:
    - user: rabbit_user
    - conf: .*
    - write: .*
    - read: .*
```

#### salt.states.rabbitmq\_vhost.**absent**(*name*)

Ensure the RabbitMQ Virtual Host is absent

**name** Name of the Virtual Host to remove

**runas** User to run the command

Deprecated since version 2015.8.0.

#### salt.states.rabbitmq\_vhost.**present**(*name*)

Ensure the RabbitMQ VHost exists.

**name** VHost name

**user** Initial user permission to set on the VHost, if present

Deprecated since version 2015.8.0.

**owner** Initial owner permission to set on the VHost, if present

Deprecated since version 2015.8.0.

**conf** Initial conf string to apply to the VHost and user. Defaults to `*`

Deprecated since version 2015.8.0.

**write** Initial write permissions to apply to the VHost and user. Defaults to `*`

Deprecated since version 2015.8.0.

**read** Initial read permissions to apply to the VHost and user. Defaults to `*`

Deprecated since version 2015.8.0.

**runas** Name of the user to run the command

Deprecated since version 2015.8.0.

===== salt.states.rbac\_solaris ===== Management of Solaris RBAC

**maintainer** Jorge Schrauwen <sjorge@blackdot.be>

**maturity** new

**depends** rbac\_solaris,solaris\_user

**platform** solaris,illumos

New in version 2016.11.0.

```
sjorge:
  rbac.managed:
    - roles:
```

- ```
- netcfg
- profiles:
  - System Power
- authorizations:
  - solaris.audit.*
```

`salt.states.rbac_solaris.managed`(*name*, *roles=None*, *profiles=None*, *authorizations=None*)

Manage RBAC properties for user

**name** [string] username

**roles** [list] list of roles for user

**profiles** [list] list of profiles for user

**authorizations** [list] list of authorizations for user

**Warning:** All existing roles, profiles and authorizations will be replaced! An empty list will remove everything.

Set the property to *None* to not manage it.

### 14.17.211 salt.states.rbenv

#### Managing Ruby installations with rbenv

This module is used to install and manage ruby installations with rbenv and the ruby-build plugin. Different versions of ruby can be installed, and uninstalled. Rbenv will be installed automatically the first time it is needed and can be updated later. This module will *not* automatically install packages which rbenv will need to compile the versions of ruby. If your version of ruby fails to install, refer to the ruby-build documentation to verify you are not missing any dependencies: <https://github.com/sstephenson/ruby-build/wiki>

If rbenv is run as the root user then it will be installed to `/usr/local/rbenv`, otherwise it will be installed to the users `~/.rbenv` directory. To make rbenv available in the shell you may need to add the `rbenv/shims` and `rbenv/bin` directories to the users `PATH`. If you are installing as root and want other users to be able to access rbenv then you will need to add `RBENV_ROOT` to their environment.

The following state configuration demonstrates how to install Ruby 1.9.x and 2.x using rbenv on Ubuntu/Debian:

```
rbenv-deps:
  pkg.installed:
    - names:
      - bash
      - git
      - openssl
      - libssl-dev
      - make
      - curl
      - autoconf
      - bison
      - build-essential
      - libffi-dev
      - libyaml-dev
      - libreadline6-dev
      - zlib1g-dev
      - libncurses5-dev

ruby-1.9.3-p429:
  rbenv.absent:
```

```

- require:
  - pkg: rbenv-deps

ruby-2.0.0-p598:
  rbenv.installed:
    - default: True
    - require:
      - pkg: rbenv-deps

```

`salt.states.rbenv.absent`(*name*, *user=None*)

Verify that the specified ruby is not installed with rbenv. Rbenv is installed if necessary.

**name** The version of ruby to uninstall

**user: None** The user to run rbenv as.

New in version 0.17.0.

New in version 0.16.0.

`salt.states.rbenv.install_rbenv`(*name*, *user=None*)

Install rbenv if not installed. Allows you to require rbenv be installed prior to installing the plugins. Useful if you want to install rbenv plugins via the git or file modules and need them installed before installing any rubies.

Use the `rbenv.root` configuration option to set the path for rbenv if you want a system wide install that is not in a user home dir.

**user: None** The user to run rbenv as.

`salt.states.rbenv.installed`(*name*, *default=False*, *user=None*)

Verify that the specified ruby is installed with rbenv. Rbenv is installed if necessary.

**name** The version of ruby to install

**default** [False] Whether to make this ruby the default.

**user: None** The user to run rbenv as.

New in version 0.17.0.

New in version 0.16.0.

### 14.17.212 salt.states.rdp

Manage RDP Service on Windows servers

`salt.states.rdp.disabled`(*name*)

Disable the RDP service

`salt.states.rdp.enabled`(*name*)

Enable the RDP service and make sure access to the RDP port is allowed in the firewall configuration

### 14.17.213 salt.states.redismod

#### Management of Redis server

New in version 2014.7.0.

**depends**

- redis Python module

**configuration** See `salt.modules.redis` for setup instructions.

```
key_in_redis:
  redis.string:
    - value: string data
```

The redis server information specified in the minion config file can be overridden in states using the following arguments: `host`, `post`, `db`, `password`.

```
key_in_redis:
  redis.string:
    - value: string data
    - host: localhost
    - port: 6379
    - db: 0
    - password: somuchkittycat
```

`salt.states.redismod.absent` (*name*, *keys=None*, *\*\*connection\_args*)

Ensure key absent from redis

**name** Key to ensure absent from redis

**keys** list of keys to ensure absent, name will be ignored if this is used

`salt.states.redismod.slaveof` (*name*, *sentinel\_host=None*, *sentinel\_port=None*, *sentinel\_password=None*, *\*\*connection\_args*)

Set this redis instance as a slave.

**name** Master to make this a slave of

**sentinel\_host** Ip of the sentinel to check for the master

**sentinel\_port** Port of the sentinel to check for the master

`salt.states.redismod.string` (*name*, *value*, *expire=None*, *expireat=None*, *\*\*connection\_args*)

Ensure that the key exists in redis with the value specified

**name** Redis key to manage

**value** Data to persist in key

**expire** Sets time to live for key in seconds

**expireat** Sets expiration time for key via UNIX timestamp, overrides *expire*

## 14.17.214 salt.states.reg

### Manage the Windows registry

Many python developers think of registry keys as if they were python keys in a dictionary which is not the case. The windows registry is broken down into the following components:

#### Hives

This is the top level of the registry. They all begin with HKEY. - HKEY\_CLASSES\_ROOT (HKCR) - HKEY\_CURRENT\_USER (HKCU) - HKEY\_LOCAL\_MACHINE (HKLM) - HKEY\_USER (HKU) - HKEY\_CURRENT\_CONFIG

#### Keys

Hives contain keys. These are basically the folders beneath the hives. They can contain any number of subkeys.

## Values or Entries

Values or Entries are the name/data pairs beneath the keys and subkeys. All keys have a default name/data pair. It is usually ``(Default)"="(value not set)". The actual value for the name and the date is Null. The registry editor will display ``(Default)" and ``(value not set)".

The following example is taken from the windows startup portion of the registry: `[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Run]` `"RTHDVCPL"="\"C:\\Program Files\\Realtek\\Audio\\HDA\\RtkNGUI64.exe\" -s"` `"NvBackend"="\"C:\\Program Files (x86)\\NVIDIA Corporation\\Update Core\\NvBackend.exe\""` `"BTMTrayAgent"="rundll32.exe \"C:\\Program Files (x86)\\Intel\\Bluetooth\\btmshellex.dll\",TrayApp"` In this example these are the values for each:

Hive: `HKEY_LOCAL_MACHINE`

Key and subkeys: `SOFTWAREMicrosoftWindowsCurrentVersionRun`

Value:

- There are 3 value names: `RTHDVCPL`, `NvBackend`, and `BTMTrayAgent`
- Each value name has a corresponding value

`salt.states.reg.absent` (*name*, *vname=None*, *use\_32bit\_registry=False*)

Ensure a registry value is removed. To remove a key use `key_absent`.

**Parameters** *name* (*str*) -- A string value representing the full path of the key to include the HIVE, Key, and all Subkeys. For example:

```
HKEY_LOCAL_MACHINE\SOFTWARE\Salt
```

Valid hive values include:

- `HKEY_CURRENT_USER` or `HKCU`
- `HKEY_LOCAL_MACHINE` or `HKLM`
- `HKEY_USERS` or `HKU`

**Parameters** *vname* (*str*) -- The name of the value you'd like to create beneath the

Key. If this parameter is not passed it will assume you want to set the (Default) value

**Parameters** *use\_32bit\_registry* (*bool*) -- Use the 32bit portion of the registry.

Applies only to 64bit windows. 32bit Windows will ignore this parameter. Default is False.

**Returns** Returns a dictionary showing the results of the registry operation.

**Return type** `dict`

CLI Example:

```
'HKEY_CURRENT_USER\SOFTWARE\Salt':
  reg.absent
  - vname: version
```

In the above example the value named `version` will be removed from the `SOFTWARE\Salt` key in the `HKEY_CURRENT_USER` hive. If `vname` was not passed, the (Default) value would be deleted.

`salt.states.reg.key_absent` (*name*, *use\_32bit\_registry=False*)

New in version 2015.5.4.

Ensure a registry key is removed. This will remove a key and all value entries it contains. It will fail if the key contains subkeys.

**Parameters** *name* (*str*) -- A string representing the full path to the key to be removed to include the hive and the keypath. The hive can be any of the following:

- `HKEY_LOCAL_MACHINE` or `HKLM`
- `HKEY_CURRENT_USER` or `HKCU`

- HKEY\_USER or HKU

**Parameters** `use_32bit_registry` (*bool*) -- Use the 32bit portion of the registry.

Applies only to 64bit windows. 32bit Windows will ignore this parameter. Default is False.

**Returns** Returns a dictionary showing the results of the registry operation.

**Return type** `dict`

The following example will delete the SOFTWARE\Salt key and all subkeys under the HKEY\_CURRENT\_USER hive.

Example:

```
'HKEY_CURRENT_USER\SOFTWARE\Salt':
  reg.key_absent:
    - force: True
```

In the above example the path is interpreted as follows:

- HKEY\_CURRENT\_USER is the hive
- SOFTWARE\Salt is the key

`salt.states.reg.present` (*name*, *vname=None*, *vdata=None*, *vtype='REG\_SZ'*, *use\_32bit\_registry=False*)

Ensure a registry key or value is present.

**Parameters** `name` (*str*) -- A string value representing the full path of the key to include the HIVE, Key, and all Subkeys. For example:

HKEY\_LOCAL\_MACHINE\SOFTWARE\Salt

Valid hive values include: - HKEY\_CURRENT\_USER or HKCU - HKEY\_LOCAL\_MACHINE or HKLM - HKEY\_USERS or HKU

**Parameters** `vname` (*str*) -- The name of the value you'd like to create beneath the Key. If this parameter is not passed it will assume you want to set the (Default) value

**Parameters** `vdata` (*str*) -- The value you'd like to set. If a value name (*vname*) is passed, this will be the data for that value name. If not, this will be the (Default) value for the key.

The type for the (Default) value is always REG\_SZ and cannot be changed. This parameter is optional. If not passed, the Key will be created with no associated item/value pairs.

**Parameters** `vtype` (*str*) -- The value type for the data you wish to store in the registry. Valid values are:

- REG\_BINARY
- REG\_DWORD
- REG\_EXPAND\_SZ
- REG\_MULTI\_SZ
- REG\_SZ (Default)

**Parameters** `use_32bit_registry` (*bool*) -- Use the 32bit portion of the registry.

Applies only to 64bit windows. 32bit Windows will ignore this parameter. Default is False.

**Returns** Returns a dictionary showing the results of the registry operation.

**Return type** `dict`

The following example will set the (Default) value for the SOFTWARE\Salt key in the HKEY\_CURRENT\_USER hive to 2016.3.1:

Example:

```
HKEY_CURRENT_USER\SOFTWARE\Salt:
  reg.present:
    - vdata: 2016.3.1
```

The following example will set the value for the `version` entry under the `SOFTWARE\Salt` key in the `HKEY_CURRENT_USER` hive to `2016.3.1`. The value will be reflected in `Wow6432Node`:

Example:

```
HKEY_CURRENT_USER\SOFTWARE\Salt:
  reg.present:
    - vname: version
    - vdata: 2016.3.1
```

In the above example the path is interpreted as follows: - `HKEY_CURRENT_USER` is the hive - `SOFTWARE\Salt` is the key - `vname` is the value name (`'version'`) that will be created under the key - `vdata` is the data that will be assigned to `'version'`

### 14.17.215 `salt.states.rsync`

State to synchronize files and directories with `rsync`.

New in version 2016.3.0.

```
/opt/user-backups:
  rsync.synchronized:
    - source: /home
    - force: True
```

`salt.states.rsync.synchronized`(*name*, *source*, *delete=False*, *force=False*, *update=False*, *passwordfile=None*, *exclude=None*, *excludefrom=None*, *prepare=False*, *dryrun=False*)

Guarantees that the source directory is always copied to the target.

**name** Name of the target directory.

**source** Source directory.

**prepare** Create destination directory if it does not exist.

**delete** Delete extraneous files from the destination dirs (True or False)

**force** Force deletion of dirs even if not empty

**update** Skip files that are newer on the receiver (True or False)

**passwordfile** Read daemon-access password from the file (path)

**exclude** Exclude files, that matches pattern.

**excludefrom** Read exclude patterns from the file (path)

**dryrun** Perform a trial run with no changes made. Is the same as doing `test=True`

New in version 2016.3.1.

### 14.17.216 `salt.states.rvm`

#### Managing Ruby installations and gemsets with Ruby Version Manager (RVM)

This module is used to install and manage ruby installations and gemsets with RVM, the Ruby Version Manager. Different versions of ruby can be installed and gemsets created. RVM itself will be installed automatically if it's not present. This module will not automatically install packages that RVM depends on or ones that are needed to build ruby. If you want to run RVM as an unprivileged user (recommended) you will have to create this user yourself. This is how a state configuration could look like:

```
rvm:
  group.present: []
  user.present:
```

```
- gid: rvm
- home: /home/rvm
- require:
  - group: rvm

rvm-deps:
  pkg.installed:
    - pkgs:
      - bash
      - coreutils
      - gzip
      - bzip2
      - gawk
      - sed
      - curl
      - git-core
      - subversion

mri-deps:
  pkg.installed:
    - pkgs:
      - build-essential
      - openssl
      - libreadline6
      - libreadline6-dev
      - curl
      - git-core
      - zlib1g
      - zlib1g-dev
      - libssl-dev
      - libyaml-dev
      - libsqlite3-0
      - libsqlite3-dev
      - sqlite3
      - libxml2-dev
      - libxslt1-dev
      - autoconf
      - libc6-dev
      - libncurses5-dev
      - automake
      - libtool
      - bison
      - subversion
      - ruby

jruby-deps:
  pkg.installed:
    - pkgs:
      - curl
      - g++
      - openjdk-6-jre-headless

ruby-1.9.2:
  rvm.installed:
    - default: True
    - user: rvm
    - require:
      - pkg: rvm-deps
```

```

    - pkg: mri-deps
    - user: rvm

jruby:
  rvm.installed:
    - user: rvm
    - require:
      - pkg: rvm-deps
      - pkg: jruby-deps
      - user: rvm

jgemset:
  rvm.gemset_present:
    - ruby: jruby
    - user: rvm
    - require:
      - rvm: jruby

mygemset:
  rvm.gemset_present:
    - ruby: ruby-1.9.2
    - user: rvm
    - require:
      - rvm: ruby-1.9.2

```

**salt.states.rvm.gemset\_present** (*name*, *ruby*='default', *user*=None)

Verify that the gemset is present.

**name** The name of the gemset.

**ruby: default** The ruby version this gemset belongs to.

**user: None** The user to run rvm as.

New in version 0.17.0.

**salt.states.rvm.installed** (*name*, *default*=False, *user*=None)

Verify that the specified ruby is installed with RVM. RVM is installed when necessary.

**name** The version of ruby to install

**default** [False] Whether to make this ruby the default.

**user: None** The user to run rvm as.

New in version 0.17.0.

### 14.17.217 salt.states.salt\_proxy module

Salt proxy state

New in version 2015.8.2.

State to deploy and run salt-proxy processes on a minion.

Set up pillar data for your proxies per the documentation.

Run the state as below

..code-block:: yaml

```

salt-proxy-configure:
  salt_proxy.configure_proxy:
    • proxyname: p8000

```

- `start: True`

This state will configure the salt proxy settings within `/etc/salt/proxy` (if `/etc/salt/proxy` doesn't exist) and start the salt-proxy process (default `true`), if it isn't already running.

`salt.states.salt_proxy.configure_proxy` (*name*, *proxyname*='p8000', *start*=*True*)

Create the salt proxy file and start the proxy process if required

#### Parameters

- **name** -- The name of this state
- **proxyname** -- Name to be used for this proxy (should match entries in pillar)
- **start** -- Boolean indicating if the process should be started

Example:

```
..code-block:: yaml
  salt-proxy-configure:
    salt_proxy.configure_proxy:
      - proxyname: p8000
      - start: True
```

## 14.17.218 salt.states.saltmod

### Control the Salt command interface

This state is intended for use from the Salt Master. It provides access to sending commands down to minions as well as access to executing master-side modules. These state functions wrap Salt's *Python API*.

Support for masterless minions was added to the `salt.state` function, so they can run orchestration `sls` files. This is particularly useful when the rendering of a state is dependent on the execution of another state. Orchestration will render and execute each orchestration block independently, while honoring requisites to ensure the states are applied in the correct order.

#### See also:

More Orchestrate documentation

- [Full Orchestrate Tutorial](#)
- [The Orchestrate runner](#)

`salt.states.saltmod.function` (*name*, *tgt*, *ssh*=*False*, *tgt\_type*='glob', *expr\_form*=*None*, *ret*='', *expect\_minions*=*False*, *fail\_minions*=*None*, *fail\_function*=*None*, *arg*=*None*, *kwarg*=*None*, *timeout*=*None*, *batch*=*None*, *subset*=*None*)

Execute a single module function on a remote minion via salt or salt-ssh

**name** The name of the function to run, aka `cmd.run` or `pkg.install`

**tgt** The target specification, aka '\*' for all minions

**tgt\_type** The target type, defaults to `glob`

**expr\_form** Deprecated since version 2017.7.0: Use `tgt_type` instead

**arg** The list of arguments to pass into the function

**kwarg** The dict (not a list) of keyword arguments to pass into the function

**ret** Optionally set a single or a list of returners to use

**expect\_minions** An optional boolean for failing if some minions do not respond

**fail\_minions** An optional list of targeted minions where failure is an option

**fail\_function** An optional string that points to a salt module that returns `True` or `False` based on the returned data dict for individual minions

**ssh** Set to `True` to use the ssh client instead of the standard salt client

**batch** Execute the command *in batches*. E.g.: `10%`.

**subset** Number of minions from the targeted set to randomly use

New in version 2017.7.0.

`salt.states.saltmod.runner` (*name*, *\*\*kwargs*)

Execute a runner module on the master

New in version 2014.7.0.

**name** The name of the function to run

**kwargs** Any keyword arguments to pass to the runner function

```
run-manage-up:
  salt.runner:
    - name: manage.up
```

`salt.states.saltmod.state` (*name*, *tgt*, *ssh=False*, *tgt\_type='glob'*, *expr\_form=None*, *ret=''*, *highstate=None*, *sls=None*, *top=None*, *saltenv=None*, *test=False*, *pillar=None*, *pillarenv=None*, *expect\_minions=True*, *fail\_minions=None*, *allow\_fail=0*, *concurrent=False*, *timeout=None*, *batch=None*, *queue=False*, *subset=None*, *orchestration\_jid=None*)

Invoke a state run on a given target

**name** An arbitrary name used to track the state execution

**tgt** The target specification for the state run.

Masterless support: When running on a masterless minion, the `tgt` is ignored and will always be the local minion.

**tgt\_type** The target type to resolve, defaults to `glob`

**expr\_form** Deprecated since version 2017.7.0: Use `tgt_type` instead

**ret** Optionally set a single or a list of returners to use

**highstate** Defaults to `None`, if set to `True` the target systems will ignore any `sls` references specified in the `sls` option and call `state.highstate` on the targeted minions

**top** Should be the name of a top file. If set `state.top` is called with this top file instead of `state.sls`.

**sls** A group of `sls` files to execute. This can be defined as a single string containing a single `sls` file, or a list of `sls` files

**test** Pass `test=true` through to the state function

**pillar** Pass the `pillar` kwarg through to the state function

**pillarenv** The pillar environment to grab pillars from

New in version 2017.7.0.

**saltenv** The default salt environment to pull `sls` files from

**ssh** Set to `True` to use the `ssh` client instead of the standard salt client

**roster** In the event of using `salt-ssh`, a roster system can be set

**expect\_minions** An optional boolean for failing if some minions do not respond

**fail\_minions** An optional list of targeted minions where failure is an option

**allow\_fail** Pass in the number of minions to allow for failure before setting the result of the execution to `False`

**concurrent** Allow multiple state runs to occur at once.

WARNING: This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same Do not use this flag for performance optimization.

**queue** Pass `queue=true` through to the state function

**batch** Execute the command *in batches*. E.g.: `10%`.

New in version 2016.3.0.

**subset** Number of minions from the targeted set to randomly use

New in version 2017.7.0.

Examples:

Run a list of `sls` files via `state.sls` on target minions:

```

webservers:
  salt.state:
    - tgt: 'web*'
    - sls:
      - apache
      - django
      - core
    - saltenv: prod

```

Run a full `state.highstate` on target minions.

```

databases:
  salt.state:
    - tgt: role:database
    - tgt_type: grain
    - highstate: True

```

`salt.states.saltmod.wait_for_event`(*name*, *id\_list*, *event\_id*='id', *timeout*=300, *node*='master')

Watch Salt's event bus and block until a condition is met

New in version 2014.7.0.

**name** An event tag to watch for; supports Reactor-style globbing.

**id\_list** A list of event identifiers to watch for -- usually the minion ID. Each time an event tag is matched the event data is inspected for *event\_id*, if found it is removed from *id\_list*. When *id\_list* is empty this function returns success.

**event\_id** [*id*] The name of a key in the event data. Default is *id* for the minion ID, another common value is *name* for use with orchestrating salt-cloud events.

**timeout** [300] The maximum time in seconds to wait before failing.

The following example blocks until all the listed minions complete a restart and reconnect to the Salt master:

```

reboot_all_minions:
  salt.function:
    - name: system.reboot
    - tgt: '*'

wait_for_reboots:
  salt.wait_for_event:
    - name: salt/minion/*/start
    - id_list:
      - jerry
      - stuart
      - dave
      - phil
      - kevin
      - mike
    - require:
      - salt: reboot_all_minions

```

`salt.states.saltmod.wheel`(*name*, **\*\*kwargs**)

Execute a wheel module on the master

New in version 2014.7.0.

**name** The name of the function to run

**kwargs** Any keyword arguments to pass to the wheel function

```

accept_minion_key:
  salt.wheel:

```

- name: key.accept
- match: frank

### 14.17.219 salt.states.schedule

#### Management of the Salt scheduler

```
job3:
  schedule.present:
    - function: test.ping
    - seconds: 3600
    - splay: 10
```

This will schedule the command: test.ping every 3600 seconds (every hour) splaying the time between 0 and 10 seconds

```
job2:
  schedule.present:
    - function: test.ping
    - seconds: 15
    - splay:
      start: 10
      end: 20
```

This will schedule the command: test.ping every 15 seconds splaying the time between 10 and 20 seconds

```
job1:
  schedule.present:
    - function: state.sls
    - job_args:
      - httpd
    - job_kwargs:
      test: True
    - when:
      - Monday 5:00pm
      - Tuesday 3:00pm
      - Wednesday 5:00pm
      - Thursday 3:00pm
      - Friday 5:00pm
```

This will schedule the command: state.sls httpd test=True at 5pm on Monday, Wednesday and Friday, and 3pm on Tuesday and Thursday. Requires that python-dateutil is installed on the minion.

```
job1:
  schedule.present:
    - function: state.sls
    - job_args:
      - httpd
    - job_kwargs:
      test: True
    - cron: '*/*5 * * * *'
```

Scheduled jobs can also be specified using the format used by cron. This will schedule the command: state.sls httpd test=True to run every 5 minutes. Requires

that python-croniter is installed on the minion.

```
job1:
  schedule.present:
    - function: state.sls
    - job_args:
      - httpd
    - job_kwargs:
      test: True
    - when:
      - Monday 5:00pm
      - Tuesday 3:00pm
      - Wednesday 5:00pm
      - Thursday 3:00pm
      - Friday 5:00pm
    - returner: xmpp
    - return_config: xmpp_state_run
    - return_kwargs:
      recipient: user@domain.com
```

This will schedule the command: `state.sls httpd test=True` at 5pm on Monday, Wednesday and Friday, and 3pm on Tuesday and Thursday. Using the `xmpp` returner to return the results of the scheduled job, with the alternative configuration options found in the `xmpp_state_run` section.

`salt.states.schedule.absent`(*name*, *\*\*kwargs*)

Ensure a job is absent from the schedule

**name** The unique name that is given to the scheduled job.

**persist** Whether the job should persist between minion restarts, defaults to True.

`salt.states.schedule.disabled`(*name*, *\*\*kwargs*)

Ensure a job is disabled in the schedule

**name** The unique name that is given to the scheduled job.

**persist** Whether the job should persist between minion restarts, defaults to True.

`salt.states.schedule.enabled`(*name*, *\*\*kwargs*)

Ensure a job is enabled in the schedule

**name** The unique name that is given to the scheduled job.

**persist** Whether the job should persist between minion restarts, defaults to True.

`salt.states.schedule.present`(*name*, *\*\*kwargs*)

Ensure a job is present in the schedule

**name** The unique name that is given to the scheduled job.

**seconds** The scheduled job will be executed after the specified number of seconds have passed.

**minutes** The scheduled job will be executed after the specified number of minutes have passed.

**hours** The scheduled job will be executed after the specified number of hours have passed.

**days** The scheduled job will be executed after the specified number of days have passed.

**when** This will schedule the job at the specified time(s). The `when` parameter must be a single value or a dictionary with the date string(s) using the `dateutil` format. Requires `python-dateutil`.

**cron** This will schedule the job at the specified time(s) using the `crontab` format. Requires `python-croniter`.

**run\_on\_start** Whether the job will run when Salt minion start. Value should be a boolean.

**function** The function that should be executed by the scheduled job.

**job\_args** The arguments that will be used by the scheduled job.

**job\_kwargs** The keyword arguments that will be used by the scheduled job.

**maxrunning** Ensure that there are no more than N copies of a particular job running.

**jid\_include** Include the job into the job cache.

**splay** The amount of time in seconds to splay a scheduled job. Can be specified as a single value in seconds

or as a dictionary range with `start` and `end` values.

**range** This will schedule the command within the range specified. The range parameter must be a dictionary with the date strings using the dateutil format. Requires python-dateutil.

**once** This will schedule a job to run once on the specified date.

**once\_fmt** The default date format is ISO 8601 but can be overridden by also specifying the `once_fmt` option.

**enabled** Whether the job should be enabled or disabled. Value should be a boolean.

**return\_job** Whether to return information to the Salt master upon job completion.

**metadata** Using the metadata parameter special values can be associated with a scheduled job. These values are not used in the execution of the job, but can be used to search for specific jobs later if combined with the `return_job` parameter. The metadata parameter must be specified as a dictionary, otherwise it will be ignored.

**returner** The returner to use to return the results of the scheduled job.

**return\_config** The alternative configuration to use for returner configuration options.

**return\_kwargs** Any individual returner configuration items to override. Should be passed as a dictionary.

**persist** Whether the job should persist between minion restarts, defaults to True.

### 14.17.220 salt.states.selinux

#### Management of SELinux rules

If SELinux is available for the running system, the mode can be managed and booleans can be set.

```
enforcing:
  selinux.mode

samba_create_home_dirs:
  selinux.boolean:
    - value: True
    - persist: True

nginx:
  selinux.module:
    - enabled: False
```

---

**Note:** Use of these states require that the `selinux` execution module is available.

---

`salt.states.selinux.boolean`(*name*, *value*, *persist=False*)

Set up an SELinux boolean

**name** The name of the boolean to set

**value** The value to set on the boolean

**persist** Defaults to False, set persist to true to make the boolean apply on a reboot

`salt.states.selinux.fcontext_policy_absent`(*name*, *filetype='a'*, *sel\_type=None*, *sel\_user=None*, *sel\_level=None*)

New in version 2017.7.0.

Makes sure an SELinux file context policy for a given filespec (*name*), filetype and SELinux context type is absent.

**name** filespec of the file or directory. Regex syntax is allowed.

**filetype** The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also *man semanage-fcontext*. Defaults to `a` (all files).

**sel\_type** The SELinux context type. There are many.

**sel\_user** The SELinux user.

**sel\_level** The SELinux MLS range.

`salt.states.selinux.fcontext_policy_applied`(*name*, *recursive=False*)

New in version 2017.7.0.

Checks and makes sure the SELinux policies for a given filespec are applied.

`salt.states.selinux.fcontext_policy_present`(*name*, *sel\_type*, *filetype='a'*, *sel\_user=None*,  
*sel\_level=None*)

New in version 2017.7.0.

Makes sure a SELinux policy for a given filespec (*name*), filetype and SELinux context type is present.

**name** filespec of the file or directory. Regex syntax is allowed.

**sel\_type** SELinux context type. There are many.

**filetype** The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also *man semanage-fcontext*. Defaults to `a' (all files).

**sel\_user** The SELinux user.

**sel\_level** The SELinux MLS range.

`salt.states.selinux.mode`(*name*)

Verifies the mode SELinux is running in, can be set to enforcing, permissive, or disabled

**Note:** A change to or from disabled mode requires a system reboot. You will need to perform this yourself.

**name** The mode to run SELinux in, permissive, enforcing, or disabled.

`salt.states.selinux.module`(*name*, *module\_state='Enabled'*, *version='any'*, *\*\*opts*)

Enable/Disable and optionally force a specific version for an SELinux module

**name** The name of the module to control

**module\_state** Should the module be enabled or disabled?

**version** Defaults to no preference, set to a specified value if required. Currently can only alert if the version is incorrect.

**install** Setting to True installs module

**source** Points to module source file, used only when install is True

**remove** Setting to True removes module

New in version 2016.3.0.

`salt.states.selinux.module_install`(*name*)

Installs custom SELinux module from given file

**name** Path to file with module to install

New in version 2016.11.6.

`salt.states.selinux.module_remove`(*name*)

Removes SELinux module

**name** The name of the module to remove

New in version 2016.11.6.

### 14.17.221 salt.states.serverdensity\_device

#### Monitor Server with Server Density

New in version 2014.7.0.

*Server Density* Is a hosted monitoring service.

|                                                                                                          |
|----------------------------------------------------------------------------------------------------------|
| <b>Warning:</b> This state module is beta. It might be changed later to include more or less automation. |
|----------------------------------------------------------------------------------------------------------|

**Note:** This state module requires a pillar for authentication with Server Density To install a v1 agent:

```
serverdensity:
  api_token: "b97da80a41c4f61bff05975ee51eb1aa"
  account_url: "https://your-account.serverdensity.io"
```

To install a v2 agent:

```
serverdensity:
  api_token: "b97da80a41c4f61bff05975ee51eb1aa"
  account_name: "your-account"
```

**Note:** Although Server Density allows duplicate device names in its database, this module will raise an exception if you try monitoring devices with the same name.

Example:

```
'server_name':
  serverdensity_device.monitored
```

```
salt.states.serverdensity_device.monitored(name, group=None, salt_name=True,
   salt_params=True, agent_version=1,
   **params)
```

Device is monitored with Server Density.

**name** Device name in Server Density.

**salt\_name** If `True` (default), takes the name from the `id` grain. If `False`, the provided name is used.

**group** Group name under which device will appear in Server Density dashboard. Default - `None`.

**agent\_version** The agent version you want to use. Valid values are 1 or 2. Default - 1.

**salt\_params** If `True` (default), needed config parameters will be sourced from grains and from `status.all_status`.

**params** Add parameters that you want to appear in the Server Density dashboard. Will overwrite the `salt_params` parameters. For more info, see the [API docs](#).

Usage example:

```
'server_name':
  serverdensity_device.monitored
```

```
'server_name':
  serverdensity_device.monitored:
    - group: web-servers
```

```
'my_special_server':
  serverdensity_device.monitored:
    - salt_name: False
    - group: web-servers
    - cpuCores: 2
    - os: '{"code": "linux", "name": "Linux"}'
```

### 14.17.222 salt.states.service

#### Starting or restarting of services and daemons

Services are defined as system daemons typically started with system init or rc scripts. The service state uses whichever service module that is loaded on the minion with the virtualname of `service`. Services can be defined as running or dead.

If you need to know if your init system is supported, see the list of supported `service` modules for your desired init system (systemd, sysvinit, launchctl, etc.).

Note that Salt's service execution module, and therefore this service state, uses OS grains to ascertain which service module should be loaded and used to execute service functions. As existing distributions change init systems or new distributions are created, OS detection can sometimes be incomplete. If your service states are running into trouble with init system detection, please see the [Overriding Virtual Module Providers](#) section of Salt's module documentation to work around possible errors.

---

**Note:** The current status of a service is determined by the return code of the init/rc script status command. A status return code of 0 it is considered running. Any other return code is considered dead.

---

```
httpd:
  service.running: []
```

The service can also be set to be started at runtime via the enable option:

```
openvpn:
  service.running:
    - enable: True
```

By default if a service is triggered to refresh due to a watch statement the service is by default restarted. If the desired behavior is to reload the service, then set the reload value to True:

```
redis:
  service.running:
    - enable: True
    - reload: True
    - watch:
      - pkg: redis
```

---

**Note:** More details regarding watch can be found in the [Requisites](#) documentation.

---

`salt.states.service.dead`(*name*, *enable=None*, *sig=None*, *init\_delay=None*, *\*\*kwargs*)

Ensure that the named service is dead by stopping the service if it is running

**name** The name of the init or rc script used to manage the service

**enable** Set the service to be enabled at boot time, True sets the service to be enabled, False sets the named service to be disabled. The default is None, which does not enable or disable anything.

**sig** The string to search for when looking for the service process with ps

**init\_delay** Add a sleep command (in seconds) before the check to make sure service is killed.

New in version 2017.7.0.

**no\_block** [False] **For systemd minions only.** Stops the service using `--no-block`.

New in version 2017.7.0.

`salt.states.service.disabled(name, **kwargs)`

Ensure that the service is disabled on boot, only use this state if you don't want to manage the running process, remember that if you want to disable a service to use the `enable: False` option for the running or dead function.

**name** The name of the init or rc script used to manage the service

`salt.states.service.enabled(name, **kwargs)`

Ensure that the service is enabled on boot, only use this state if you don't want to manage the running process, remember that if you want to enable a running service to use the `enable: True` option for the running or dead function.

**name** The name of the init or rc script used to manage the service

`salt.states.service.masked(name, runtime=False)`

New in version 2017.7.0.

---

**Note:** This state is only available on minions which use `systemd`.

---

Ensures that the named service is masked (i.e. prevented from being started).

**name** Name of the service to mask

**runtime** [False] By default, this state will manage an indefinite mask for the named service. Set this argument to `True` to runtime mask the service.

---

**Note:** It is possible for a service to have both indefinite and runtime masks set for it. Therefore, this state will manage a runtime or indefinite mask independently of each other. This means that if the service is already indefinitely masked, running this state with `runtime` set to `True` will `_not_` remove the indefinite mask before setting a runtime mask. In these cases, if it is desirable to ensure that the service is runtime masked and not indefinitely masked, pair this state with a `service.unmasked` state, like so:

```
mask_runtime_foo:
  service.masked:
    - name: foo
    - runtime: True

unmask_indefinite_foo:
  service.unmasked:
    - name: foo
    - runtime: False
```

`salt.states.service.mod_watch(name, sfun=None, sig=None, reload=False, full_restart=False, init_delay=None, force=False, **kwargs)`

The service watcher, called to invoke the watch command.

**name** The name of the init or rc script used to manage the service

**sfun** The original function which triggered the `mod_watch` call (`service.running`, for example).

**sig** The string to search for when looking for the service process with `ps`

**reload** Use reload instead of the default restart (exclusive option with `full_restart`, defaults to reload if both are used)

**full\_restart** Use `service.full_restart` instead of restart (exclusive option with `reload`)

**force** Use `service.force_reload` instead of reload (needs `reload` to be set to `True`)

**init\_delay** Add a sleep command (in seconds) before the service is restarted/reloaded

`salt.states.service.running(name, enable=None, sig=None, init_delay=None, no_block=False, unmask=False, unmask_runtime=False, **kwargs)`

Ensure that the service is running

**name** The name of the init or rc script used to manage the service

**enable** Set the service to be enabled at boot time, `True` sets the service to be enabled, `False` sets the named service to be disabled. The default is `None`, which does not enable or disable anything.

**sig** The string to search for when looking for the service process with `ps`

**init\_delay** Some services may not be truly available for a short period after their startup script indicates to the system that they are. Provide an `'init_delay'` to specify that this state should wait an additional given number of seconds after a service has started before returning. Useful for requisite states wherein a dependent state might assume a service has started but is not yet fully initialized.

**no\_block** [`False`] **For systemd minions only.** Starts the service using `--no-block`.

New in version 2017.7.0.

**unmask** [`False`] **For systemd minions only.** Set to `True` to remove an indefinite mask before attempting to start the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before making any changes. This behavior is no longer the default.

**unmask\_runtime** [`False`] **For systemd minions only.** Set to `True` to remove a runtime mask before attempting to start the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before making any changes. This behavior is no longer the default.

---

**Note:**

**watch** can be used with `service.running` to restart a service when another state changes ( example: a file.managed state that creates the service's config file ). More details regarding `watch` can be found in the [Requisites](#) documentation.

---

`salt.states.service.unmasked`(*name*, *runtime=False*)

New in version 2017.7.0.

---

**Note:** This state is only available on minions which use `systemd`.

---

Ensures that the named service is unmasked

**name** Name of the service to unmask

**runtime** [`False`] By default, this state will manage an indefinite mask for the named service. Set this argument to `True` to ensure that the service is runtime masked.

---

**Note:** It is possible for a service to have both indefinite and runtime masks set for it. Therefore, this state will manage a runtime or indefinite mask independently of each other. This means that if the service is indefinitely masked, running this state with `runtime` set to `True` will `_not_` remove the indefinite mask.

---

### 14.17.223 `salt.states.slack`

#### Send a message to Slack

This state is useful for sending messages to Slack during state runs.

New in version 2015.5.0.

```
slack-message:
  slack.post_message:
    - channel: '#general'
    - from_name: SuperAdmin
```

```
- message: 'This state was executed successfully.'
- api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

The api key can be specified in the master or minion configuration like below:

```
slack:
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

**salt.states.slack.post\_message** (*name, channel, from\_name, message, api\_key=None, icon=None*)  
Send a message to a Slack channel.

```
slack-message:
  slack.post_message:
    - channel: '#general'
    - from_name: SuperAdmin
    - message: 'This state was executed successfully.'
    - api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

The following parameters are required:

**name** The unique name for this event.

**channel** The channel to send the message to. Can either be the ID or the name.

**from\_name** The name of that is to be shown in the ``from`` field.

**message** The message that is to be sent to the Slack channel.

The following parameters are optional:

**api\_key** The api key for Slack to use for authentication, if not specified in the configuration options of master or minion.

**icon** URL to an image to use as the icon for this message

#### 14.17.224 salt.states.smartos

Management of SmartOS Standalone Compute Nodes

**maintainer** Jorge Schrauwen <[sjorge@blackdot.be](mailto:sjorge@blackdot.be)>

**maturity** new

**depends** vmadm, imgadm

**platform** smartos

New in version 2016.3.0.

```
vmtest.example.org:
  smartos.vm_present:
    - config:
      reprovision: true
    - vmconfig:
      image_uuid: c02a2044-c1bd-11e4-bd8c-dfc1db8b0182
      brand: joyent
      alias: vmtest
      quota: 5
      max_physical_memory: 512
      tags:
        label: 'test vm'
        owner: 'sjorge'
      nics:
        "82:1b:8e:49:e9:12"
        nic_tag: trunk
```

```
    mtu: 1500
    ips:
      - 172.16.1.123/16
      - 192.168.2.123/24
    vlan_id: 10
    "82:1b:8e:49:e9:13"
    nic_tag: trunk
    mtu: 1500
    ips:
      - dhcp
    vlan_id: 30
  filesystems:
    "/bigdata":
      source: "/bulk/data"
      type: lofs
      options:
        - ro
        - nodevices

kvmtest.example.org:
  smartos.vm_present:
    - vmconfig:
        brand: kvm
        alias: kvmtest
        cpu_type: host
        ram: 512
        vnc_port: 9
        tags:
          label: 'test kvm'
          owner: 'sjorge'
        disks:
          disk0
            size: 2048
            model: virtio
            compression: lz4
            boot: true
        nics:
          "82:1b:8e:49:e9:15"
            nic_tag: trunk
            mtu: 1500
            ips:
              - dhcp
            vlan_id: 30

cleanup_images:
  smartos.image_vacuum
```

---

**Note:** Keep in mind that when removing properties from vmconfig they will not get removed from the vm's current configuration, except for nics, disk, tags, ... they get removed via `add_*`, `set_*`, `update_*`, and `remove_*`. Properties must be manually reset to their default value. The same behavior as when using ``vmadm update``.

---

`salt.states.smartos.config_absent`(*name*)  
Ensure configuration property is absent in `/usbkey/config`  
**name** [string] name of property

`salt.states.smartos.config_present`(*name, value*)

Ensure configuration property is set to value in /usbkey/config

**name** [string] name of property

**value** [string] value of property

`salt.states.smartos.image_absent(name)`

Ensure image is absent on the computenode

**name** [string] uuid of image

---

**Note:** computenode.image\_absent will only remove the image if it is not used by a vm.

---

`salt.states.smartos.image_present(name)`

Ensure image is present on the computenode

**name** [string] uuid of image

`salt.states.smartos.image_vacuum(name)`

Delete images not in use or installed via image\_present

`salt.states.smartos.vm_absent(name, archive=False)`

Ensure vm is absent on the computenode

**name** [string] hostname of vm

**archive** [boolean] toggle archiving of vm on removal

---

**Note:** State ID is used as hostname. Hostnames must be unique.

---

`salt.states.smartos.vm_present(name, vmconfig, config=None)`

Ensure vm is present on the computenode

**name** [string] hostname of vm

**vmconfig** [dict] options to set for the vm

**config** [dict] fine grain control over vm\_present

---

**Note:**

The following configuration properties can be toggled in the config parameter.

- kvm\_reboot (true) - reboots of kvm zones if needed for a config update
  - auto\_import (false) - automatic importing of missing images
  - reprovision (false) - reprovision on image\_uuid changes
  - enforce\_customer\_metadata (true) - false = add metadata only, true = add, update, and remove metadata
  - enforce\_tags (true) - false = add tags only, true = add, update, and remove tags
- 

---

**Note:** State ID is used as hostname. Hostnames must be unique.

---

---

**Note:** If hostname is provided in vmconfig this will take president over the State ID. This allows multiple states to be applied to the same vm.

---

---

**Note:**

The following instances should have a unique ID.

- nic : mac
- filesystem: target
- disk : path or diskN for zvols

e.g. disk0 will be the first disk added, disk1 the 2nd,...

---

`salt.states.smartos.vm_running(name)`  
Ensure vm is in the running state on the computenode  
**name** [string] hostname of vm

---

**Note:** State ID is used as hostname. Hostnames must be unique.

---

`salt.states.smartos.vm_stopped(name)`  
Ensure vm is in the stopped state on the computenode  
**name** [string] hostname of vm

---

**Note:** State ID is used as hostname. Hostnames must be unique.

---

### 14.17.225 salt.states.smtp

#### Sending Messages via SMTP

New in version 2014.7.0.

This state is useful for firing messages during state runs, using the SMTP protocol

```
server-warning-message:
  smtp.send_msg:
    - name: 'This is a server warning message'
    - profile: my-smtp-account
    - recipient: admins@example.com
```

`salt.states.smtp.send_msg(name, recipient, subject, sender=None, profile=None, use_ssl=True')`  
Send a message via SMTP

```
server-warning-message:
  smtp.send_msg:
    - name: 'This is a server warning message'
    - profile: my-smtp-account
    - subject: 'Message from Salt'
    - recipient: admin@example.com
    - sender: admin@example.com
    - use_ssl: True
```

**name** The message to send via SMTP

### 14.17.226 salt.states.snapper module

#### Managing implicit state and baselines using snapshots

New in version 2016.11.0.

Salt can manage state against explicitly defined state, for example if your minion state is defined by:

```
/etc/config_file:
  file.managed:
    - source: salt://configs/myconfig
```

If someone modifies this file, the next application of the highstate will allow the admin to correct this deviation and the file will be corrected.

Now, what happens if somebody creates a file `/etc/new_config_file` and deletes `/etc/important_config_file`? Unless you have an explicit rule, this change will go unnoticed.

The snapper state module allows you to manage state implicitly, in addition to explicit rules, in order to define a baseline and iterate with explicit rules as they show that they work in production.

The workflow is: once you have a working and audited system, you would create your baseline snapshot (eg. with `salt tgt snapper.create_snapshot`) and define in your state this baseline using the identifier of the snapshot (in this case: 20):

```
my_baseline:
  snapper.baseline_snapshot:
    - number: 20
    - include_diff: False
    - ignore:
      - /var/log
      - /var/cache
```

Baseline snapshots can be also referenced by tag. Most recent baseline snapshot is used in case of multiple snapshots with the same tag:

```
my_baseline_external_storage:
  snapper.baseline_snapshot:
    • tag: my_custom_baseline_tag
    • config: external
    • ignore: - /mnt/tmp_files/
```

If you have this state, and you haven't done changes to the system since the snapshot, and you add a user, the state will show you the changes (including full diffs) to `/etc/passwd`, `/etc/shadow`, etc if you call it with `test=True` and will undo all changes if you call it without.

This allows you to add more explicit state knowing that you are starting from a very well defined state, and that you can audit any change that is not part of your explicit configuration.

So after you made this your state, you decided to introduce a change in your configuration:

```
my_baseline:
  snapper.baseline_snapshot:
    - number: 20
    - ignore:
      - /var/log
      - /var/cache

hosts_entry:
  file.blockreplace:
    - name: /etc/hosts
    - content: 'First line of content'
    - append_if_not_found: True
```

The change in `/etc/hosts` will be done after any other change that deviates from the specified snapshot is reverted. This could be for example, modifications to the `/etc/passwd` file or changes in the `/etc/hosts` that could render your the `hosts_entry` rule void or dangerous.

Once you take a new snapshot and you update the baseline snapshot number to include the change in `/etc/hosts` the `hosts_entry` rule will basically do nothing. You are free to leave it there for documentation, to ensure that the change is made in case the snapshot is wrong, but if you remove anything that comes after the `snapper.baseline_snapshot` as it will have no effect; by the moment the state is evaluated, the baseline state was already applied and include this change.

**Warning:** Make sure you specify the baseline state before other rules, otherwise the baseline state will revert all changes if they are not present in the snapshot.

**Warning:** Do not specify more than one baseline rule as only the last one will affect the result.

`codeauthor` Duncan Mac-Vicar P. <dmacvicar@suse.de>

`codeauthor` Pablo Suárez Hernández <psuarezhernandez@suse.de>

`maturity` new

`platform` Linux

`salt.states.snapper.baseline_snapshot`(*name*, *number=None*, *tag=None*, *include\_diff=True*,  
*config='root'*, *ignore=None*)

Enforces that no file is modified comparing against a previously defined snapshot identified by number.

**number** Number of selected baseline snapshot.

**tag** Tag of the selected baseline snapshot. Most recent baseline baseline snapshot is used in case of multiple snapshots with the same tag. (*tag* and *number* cannot be used at the same time)

**include\_diff** Include a diff in the response (Default: True)

**config** Snapper config name (Default: root)

**ignore** List of files to ignore. (Default: None)

### 14.17.227 salt.states.solrcloud module

States for solrcloud alias and collection configuration

New in version 2017.7.0.

`salt.states.solrcloud.alias`(*name*, *collections*, *\*\*kwargs*)

Create alias and enforce collection list.

Use the solrcloud module to get alias members and set them.

You can pass additional arguments that will be forwarded to `http.query`

**name** The collection name

**collections** list of collections to include in the alias

`salt.states.solrcloud.collection`(*name*, *options=None*, *\*\*kwargs*)

Create collection and enforce options.

Use the solrcloud module to get collection parameters.

You can pass additional arguments that will be forwarded to `http.query`

**name** The collection name

**options** [{}] options to ensure

### 14.17.228 salt.states.splunk

Splunk User State Module

New in version 2016.3.0..

This state is used to ensure presence of users in splunk.

```

ensure example test user 1:
  splunk.present:
    - name: 'Example TestUser1'
    - email: example@domain.com

```

**salt.states.splunk.absent** (*email*, *profile='splunk'*, *\*\*kwargs*)

Ensure a splunk user is absent

```

ensure example test user 1:
  splunk.absent:
    - email: 'example@domain.com'
    - name: 'exampleuser'

```

The following parameters are required:

**email** This is the email of the user in splunk

**name** This is the splunk username used to identify the user.

**salt.states.splunk.present** (*email*, *profile='splunk'*, *\*\*kwargs*)

Ensure a user is present

```

ensure example test user 1:
  splunk.user_present:
    - realname: 'Example TestUser1'
    - name: 'exampleuser'
    - email: 'example@domain.com'
    - roles: ['user']

```

The following parameters are required:

**email** This is the email of the user in splunk

### 14.17.229 salt.states.splunk\_search

Splunk Search State Module

New in version 2015.5.0.

This state is used to ensure presence of splunk searches.

```

server-warning-message:
  splunk_search.present:
    - name: This is the splunk search name
    - search: index=main sourcetype=

```

**salt.states.splunk\_search.absent** (*name*, *profile='splunk'*)

Ensure a search is absent

```

API Error Search:
  splunk_search.absent

```

The following parameters are required:

**name** This is the name of the search in splunk

`salt.states.splunk_search.present` (*name*, *profile='splunk'*, *\*\*kwargs*)

Ensure a search is present

```
API Error Search:
splunk_search.present:
  search: index=main sourcetype=blah
  template: alert_5min
```

The following parameters are required:

**name** This is the name of the search in splunk

### 14.17.230 salt.states.sqlite3

#### Management of SQLite3 databases

**depends**

- SQLite3 Python Module

**configuration** See `salt.modules.sqlite3` for setup instructions

New in version 2016.3.0.

The sqlite3 module is used to create and manage sqlite3 databases and execute queries

Here is an example of creating a table using sql statements:

```
users:
  sqlite3.table_present:
    - db: /var/www/data/app.sqlite
    - schema: CREATE TABLE `users` (`username` TEXT COLLATE NOCASE UNIQUE NOT NULL,
    ↪ `password` BLOB NOT NULL, `salt` BLOB NOT NULL, `last_login` INT)
```

Here is an example of creating a table using yaml/jinja instead of sql:

```
users:
  sqlite3.table_present:
    - db: /var/www/app.sqlite
    - schema:
      - email TEXT COLLATE NOCASE UNIQUE NOT NULL
      - firstname TEXT NOT NULL
      - lastname TEXT NOT NULL
      - company TEXT NOT NULL
      - password BLOB NOT NULL
      - salt BLOB NOT NULL
```

Here is an example of making sure a table is absent:

```
badservers:
  sqlite3.table_absent:
    - db: /var/www/data/users.sqlite
```

Sometimes you would to have specific data in tables to be used by other services Here is an example of making sure rows with specific data exist:

```

user_john_doe_xyz:
  sqlite3.row_present:
    - db: /var/www/app.sqlite
    - table: users
    - where_sql: email='john.doe@companyxyz.com'
    - data:
      email: john.doe@companyxyz.com
      lastname: doe
      firstname: john
      company: companyxyz.com
      password: abcdef012934125
      salt: abcdef012934125
    - require:
      - sqlite3: users

```

Here is an example of removing a row from a table:

```

user_john_doe_abc:
  sqlite3.row_absent:
    - db: /var/www/app.sqlite
    - table: users
    - where_sql: email="john.doe@companyabc.com"
    - require:
      - sqlite3: users

```

Note that there is no explicit state to perform random queries, however, this can be approximated with sqlite3's module functions and module.run:

```

zone-delete:
  module.run:
    - name: sqlite3.modify
    - db: {{ db }}
    - sql: "DELETE FROM records WHERE id > {{ count[0] }} AND domain_id = {{
↳domain_id }}"
    - watch:
      - sqlite3: zone-insert-12

```

`salt.states.sqlite3.row_absent`(*name*, *db*, *table*, *where\_sql*, *where\_args=None*)

Makes sure the specified row is absent in db. If multiple rows match *where\_sql*, then the state will fail.

**name** Only used as the unique ID

**db** The database file name

**table** The table name to check

**where\_sql** The sql to select the row to check

**where\_args** The list parameters to substitute in *where\_sql*

`salt.states.sqlite3.row_present`(*name*, *db*, *table*, *data*, *where\_sql*, *where\_args=None*, *update=False*)

Checks to make sure the given row exists. If row exists and *update* is True then row will be updated with *data*. Otherwise it will leave existing row unmodified and check it against *data*. If the existing data doesn't match *data\_check* the state will fail. If the row doesn't exist then it will insert *data* into the table. If more than one row matches, then the state will fail.

**name** Only used as the unique ID

**db** The database file name

**table** The table name to check the data

**data** The dictionary of key/value pairs to check against if row exists, insert into the table if it doesn't

**where\_sql** The sql to select the row to check

**where\_args** The list parameters to substitute in *where\_sql*

**update** True will replace the existing row with data. When False and the row exists and data does not equal the row data then the state will fail.

`salt.states.sqlite3.table_absent(name, db)`

Make sure the specified table does not exist.

**name** The name of the table.

**db** The name of the database file.

`salt.states.sqlite3.table_present(name, db, schema, force=False)`

Make sure the specified table exists with the specified schema.

**name** The name of the table.

**db** The name of the database file.

**schema** The dictionary containing the schema information.

**force** If the name of the table exists and force is set to False, the state will fail. If force is set to True, the existing table will be replaced with the new table.

### 14.17.231 salt.states.ssh\_auth

#### Control of entries in SSH authorized\_key files

The information stored in a user's SSH authorized key file can be easily controlled via the `ssh_auth` state. Defaults can be set by the `enc`, `options`, and `comment` keys. These defaults can be overridden by including them in the name.

Since the YAML specification limits the length of simple keys to 1024 characters, and since SSH keys are often longer than that, you may have to use a YAML 'explicit key', as demonstrated in the second example below.

```
AAAAB3NzaC1kc3MAAACBAL0sQ9fJ5bYTEyY==:
  ssh_auth.present:
    - user: root
    - enc: ssh-dss

? AAAAB3NzaC1kc3MAAACBAL0sQ9fJ5bYTEyY==...
:
  ssh_auth.present:
    - user: root
    - enc: ssh-dss

thatch:
  ssh_auth.present:
    - user: root
    - source: salt://ssh_keys/thatch.id_rsa.pub
    - config: '%h/.ssh/authorized_keys'

sshkeys:
  ssh_auth.present:
    - user: root
    - enc: ssh-rsa
    - options:
      - option1="value1"
      - option2="value2 flag2"
    - comment: myuser
    - names:
      - AAAAB3NzaC1kc3MAAACBAL0sQ9fJ5bYTEyY==
      - ssh-dss AAAAB3NzaCL0sQ9fJ5bYTEyY== user@domain
      - option3="value3" ssh-dss AAAAB3NzaC1kcQ9J5bYTEyY== other@testdomain
      - AAAAB3NzaC1kcQ9fJFF435bYTEyY== newcomment
```

`salt.states.ssh_auth.absent` (*name, user, enc='ssh-rsa', comment='', source='', options=None, con-  
fig='ssh/authorized\_keys', fingerprint\_hash\_type=None*)

Verifies that the specified SSH key is absent

**name** The SSH key to manage

**user** The user who owns the SSH authorized keys file to modify

**enc** Defines what type of key is being used; can be ed25519, ecdsa, ssh-rsa or ssh-dss

**comment** The comment to be placed with the SSH public key

**options** The options passed to the key, pass a list object

**source** The source file for the key(s). Can contain any number of public keys, in standard ``authorized\_keys`` format. If this is set, comment, enc and options will be ignored.

New in version 2015.8.0.

**config** The location of the authorized keys file relative to the user's home directory, defaults to ".ssh/authorized\_keys". Token expansion %u and %h for username and home path supported.

**fingerprint\_hash\_type** The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to md5 if not specified.

New in version 2016.11.7.

---

**Note:** The default value of the `fingerprint_hash_type` will change to sha256 in Salt 2017.7.0.

---

`salt.states.ssh_auth.present` (*name, user, enc='ssh-rsa', comment='', source='', options=None, con-  
fig='ssh/authorized\_keys', fingerprint\_hash\_type=None, \*\*kwargs*)

Verifies that the specified SSH key is present for the specified user

**name** The SSH key to manage

**user** The user who owns the SSH authorized keys file to modify

**enc** Defines what type of key is being used; can be ed25519, ecdsa, ssh-rsa or ssh-dss

**comment** The comment to be placed with the SSH public key

**source** The source file for the key(s). Can contain any number of public keys, in standard ``authorized\_keys`` format. If this is set, comment and enc will be ignored.

---

**Note:** The source file must contain keys in the format `<enc> <key> <comment>`. If you have generated a keypair using PuTTYgen, then you will need to do the following to retrieve an OpenSSH-compatible public key.

1. In PuTTYgen, click Load, and select the *private* key file (not the public key), and click Open.
  2. Copy the public key from the box labeled Public key for pasting into OpenSSH authorized\_keys file.
  3. Paste it into a new file.
- 

**options** The options passed to the key, pass a list object

**config** The location of the authorized keys file relative to the user's home directory, defaults to ".ssh/authorized\_keys". Token expansion %u and %h for username and home path supported.

**fingerprint\_hash\_type** The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to md5 if not specified.

New in version 2016.11.7.

---

**Note:** The default value of the `fingerprint_hash_type` will change to sha256 in Salt 2017.7.0.

---

### 14.17.232 salt.states.ssh\_known\_hosts

#### Control of SSH known\_hosts entries

Manage the information stored in the known\_hosts files.

```
github.com:
  ssh_known_hosts:
    - present
    - user: root
    - fingerprint: 16:27:ac:a5:76:28:2d:36:63:1b:56:4d:eb:df:a6:48

example.com:
  ssh_known_hosts:
    - absent
    - user: root
```

**salt.states.ssh\_known\_hosts.absent** (*name*, *user=None*, *config=None*)

Verifies that the specified host is not known by the given user

**name** The host name

**user** The user who owns the ssh authorized keys file to modify

**config** The location of the authorized keys file relative to the user's home directory, defaults to ".ssh/known\_hosts". If no user is specified, defaults to "/etc/ssh/ssh\_known\_hosts". If present, must be an absolute path when a user is not specified.

**salt.states.ssh\_known\_hosts.present** (*name*, *user=None*, *fingerprint=None*,  
*key=None*, *port=None*, *enc=None*, *config=None*,  
*hash\_known\_hosts=True*, *timeout=5*, *fingerprint\_hash\_type=None*)

Verifies that the specified host is known by the specified user

On many systems, specifically those running with openssh 4 or older, the enc option must be set, only openssh 5 and above can detect the key type.

**name** The name of the remote host (e.g. "github.com")

**user** The user who owns the ssh authorized keys file to modify

**fingerprint** The fingerprint of the key which must be present in the known\_hosts file (optional if key specified)

**key** The public key which must be present in the known\_hosts file (optional if fingerprint specified)

**port** optional parameter, port which will be used to when requesting the public key from the remote host, defaults to port 22.

**enc** Defines what type of key is being used, can be ed25519, ecdsa ssh-rsa or ssh-dss

**config** The location of the authorized keys file relative to the user's home directory, defaults to ".ssh/known\_hosts". If no user is specified, defaults to "/etc/ssh/ssh\_known\_hosts". If present, must be an absolute path when a user is not specified.

**hash\_known\_hosts** [True] Hash all hostnames and addresses in the known hosts file.

**timeout** [int] Set the timeout for connection attempts. If `timeout` seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.

New in version 2016.3.0.

**fingerprint\_hash\_type** The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to sha256 if not specified.

New in version 2016.11.4.

Changed in version 2017.7.0:: default changed from md5 to sha256

### 14.17.233 salt.states.stateconf

#### Stateconf System

The stateconf system is intended for use only with the stateconf renderer. This State module presents the set function. This function does not execute any functionality, but is used to interact with the stateconf renderer.

`salt.states.stateconf.context(name, **kwargs)`  
No-op state to support state config via the stateconf renderer.

`salt.states.stateconf.set(name, **kwargs)`  
No-op state to support state config via the stateconf renderer.

### 14.17.234 salt.states.status

Minion status monitoring

Maps to the `status` execution module.

`salt.states.status.loadavg(name, maximum=None, minimum=None)`  
Return the current load average for the specified minion. Available values for name are `1-min`, `5-min` and `15-min`. `minimum` and `maximum` values should be passed in as strings.

`salt.states.status.process(name)`  
Return whether the specified signature is found in the process tree. This differs slightly from the services states, in that it may refer to a process that is not managed via the init system.

### 14.17.235 salt.states.statuspage

#### StatusPage

Manage the `StatusPage` configuration.

In the minion configuration file, the following block is required:

```
statuspage:
  api_key: <API_KEY>
  page_id: <PAGE_ID>
```

New in version 2017.7.0.

`salt.states.statuspage.create(name, endpoint='incidents', api_url=None, page_id=None, api_key=None, api_version=None, **kwargs)`

Insert a new entry under a specific endpoint.

**endpoint: incidents** Insert under this specific endpoint.

**page\_id** Page ID. Can also be specified in the config file.

**api\_key** API key. Can also be specified in the config file.

**api\_version: 1** API version. Can also be specified in the config file.

**api\_url** Custom API URL in case the user has a StatusPage service running in a custom environment.

**\*\*kwargs** Other params.

SLS Example:

```
create-my-component:
  statuspage.create:
    - endpoint: components
```

```
- name: my component
- group_id: 993vgplshj12
```

`salt.states.statuspage.delete` (*name*, *endpoint=u'incidents'*, *id=None*, *api\_url=None*, *page\_id=None*, *api\_key=None*, *api\_version=None*)

Remove an entry from an endpoint.

**endpoint: incidents** Request a specific endpoint.

**page\_id** Page ID. Can also be specified in the config file.

**api\_key** API key. Can also be specified in the config file.

**api\_version: 1** API version. Can also be specified in the config file.

**api\_url** Custom API URL in case the user has a StatusPage service running in a custom environment.

SLS Example:

```
delete-my-component:
  statuspage.delete:
    - endpoint: components
    - id: ftgks51sfs2d
```

`salt.states.statuspage.managed` (*name*, *config*, *api\_url=None*, *page\_id=None*, *api\_key=None*, *api\_version=None*, *pace=1*, *allow\_empty=False*)

Manage the StatusPage configuration.

**config** Dictionary with the expected configuration of the StatusPage. The main level keys of this dictionary represent the endpoint name. If a certain endpoint does not exist in this structure, it will be ignored / not configured.

**page\_id** Page ID. Can also be specified in the config file.

**api\_key** API key. Can also be specified in the config file.

**api\_version: 1** API version. Can also be specified in the config file.

**api\_url** Custom API URL in case the user has a StatusPage service running in a custom environment.

**pace: 1** Max requests per second allowed by the API.

**allow\_empty: False** Allow empty config.

SLS example:

```
my-statuspage-config:
  statuspage.managed:
    - config:
        components:
          - name: component1
            group_id: uy4g37rf
          - name: component2
            group_id: 3n4uyu4gf
        incidents:
          - name: incident1
            status: resolved
            impact: major
            backfilled: false
          - name: incident2
            status: investigating
            impact: minor
```

`salt.states.statuspage.update` (*name*, *endpoint=u'incidents'*, *id=None*, *api\_url=None*, *page\_id=None*, *api\_key=None*, *api\_version=None*, *\*\*kwargs*)

Update attribute(s) of a specific endpoint.

**id** The unique ID of the endpoint entry.

**endpoint: incidents** Endpoint name.

**page\_id** Page ID. Can also be specified in the config file.

**api\_key** API key. Can also be specified in the config file.

**api\_version:** 1 API version. Can also be specified in the config file.  
**api\_url** Custom API URL in case the user has a StatusPage service running in a custom environment.  
 SLS Example:

```
update-my-incident:
  statuspage.update:
    - id: dz959yz2nd4l
    - status: resolved
```

### 14.17.236 salt.states.stormpath\_account

Support for Stormpath.

New in version 2015.8.0.

**salt.states.stormpath\_account.absent**(*name*, *directory\_id=None*)

Ensure that an account associated with the given email address is absent. Will search all directories for the account, unless a *directory\_id* is specified.

**name** The email address of the account to delete.

**directory\_id** Optional. The ID of the directory that the account is expected to belong to. If not specified, then a list of directories will be retrieved, and each will be scanned for the account. Specifying a *directory\_id* will therefore cut down on the number of requests to Stormpath, and increase performance of this state.

**salt.states.stormpath\_account.present**(*name*, *\*\*kwargs*)

Ensure that an account is present and properly configured

**name** The email address associated with the Stormpath account

**directory\_id** The ID of a directory which the account belongs to. Required.

**password** Required when creating a new account. If specified, it is advisable to reference the password in another database using an `sdb://` URL. Will NOT update the password if an account already exists.

**givenName** Required when creating a new account.

**surname** Required when creating a new account.

**username** Optional. Must be unique across the owning directory. If not specified, the username will default to the email field.

**middleName** Optional.

**status** `enabled` accounts are able to login to their assigned applications, `disabled` accounts may not login to applications, `unverified` accounts are disabled and have not verified their email address.

**customData**. Optional. Must be specified as a dict.

### 14.17.237 salt.states.supervisord

#### Interaction with the Supervisor daemon

```
wsgi_server:
  supervisord.running:
    - require:
      - pkg: supervisor
    - watch:
      - file: /etc/nginx/sites-enabled/wsgi_server.conf
```

**salt.states.supervisord.dead**(*name*, *user=None*, *conf\_file=None*, *bin\_env=None*, *\*\*kwargs*)

Ensure the named service is dead (not running).

**name** Service name as defined in the supervisor configuration file

**user** Name of the user to run the supervisorctl command

New in version 0.17.0.

**conf\_file** path to supervisorctl config file

**bin\_env** path to supervisorctl bin or path to virtualenv with supervisor installed

`salt.states.supervisord.running`(*name, restart=False, update=False, user=None, conf\_file=None, bin\_env=None, \*\*kwargs*)

Ensure the named service is running.

**name** Service name as defined in the supervisor configuration file

**restart** Whether to force a restart

**update** Whether to update the supervisor configuration.

**user** Name of the user to run the supervisorctl command

New in version 0.17.0.

**conf\_file** path to supervisorctl config file

**bin\_env** path to supervisorctl bin or path to virtualenv with supervisor installed

## 14.17.238 salt.states.svn

### Manage SVN repositories

Manage repository checkouts via the svn vcs system. Note that subversion must be installed for these states to be available, so svn states should include a requisite to a pkg.installed state for the package which provides subversion (subversion in most cases). Example:

```
subversion:
  pkg.installed

http://unladen-swallow.googlecode.com/svn/trunk/:
  svn.latest:
    - target: /tmp/swallow
```

`salt.states.svn.dirty`(*name, target, user=None, username=None, password=None, ignore\_unversioned=False*)

Determine if the working directory has been changed.

`salt.states.svn.export`(*name, target=None, rev=None, user=None, username=None, password=None, force=False, overwrite=False, externals=True, trust=False*)

Export a file or directory from an SVN repository

**name** Address and path to the file or directory to be exported.

**target** Name of the target directory where the checkout will put the working directory

**rev** [None] The name revision number to checkout. Enable ``force" if the directory already exists.

**user** [None] Name of the user performing repository management operations

**username** [None] The user to access the name repository with. The svn default is the current user

**password** Connect to the Subversion server with this password

New in version 0.17.0.

**force** [False] Continue if conflicts are encountered

**overwrite** [False] Overwrite existing target

**externals** [True] Change to False to not checkout or update externals

**trust** [False] Automatically trust the remote server. SVN's --trust-server-cert

`salt.states.svn.latest`(*name, target=None, rev=None, user=None, username=None, password=None, force=False, externals=True, trust=False*)

Checkout or update the working directory to the latest revision from the remote repository.

**name** Address of the name repository as passed to ``svn checkout"

**target** Name of the target directory where the checkout will put the working directory

**rev** [None] The name revision number to checkout. Enable ``force" if the directory already exists.

**user** [None] Name of the user performing repository management operations  
**username** [None] The user to access the name repository with. The svn default is the current user  
**password** Connect to the Subversion server with this password

New in version 0.17.0.

**force** [False] Continue if conflicts are encountered  
**externals** [True] Change to False to not checkout or update externals  
**trust** [False] Automatically trust the remote server. SVN's --trust-server-cert

### 14.17.239 salt.states.sysctl

#### Configuration of the Linux kernel using sysctl

Control the kernel sysctl system.

```
vm.swappiness:
  sysctl.present:
    - value: 20
```

**salt.states.sysctl.present** (*name, value, config=None*)

Ensure that the named sysctl value is set in memory and persisted to the named configuration file. The default sysctl configuration file is /etc/sysctl.conf

**name** The name of the sysctl value to edit

**value** The sysctl value to apply

**config** The location of the sysctl configuration file. If not specified, the proper location will be detected based on platform.

### 14.17.240 salt.states.syslog\_ng

#### State module for syslog\_ng

**maintainer** Tibor Benke <btibi@sch.bme.hu>

**maturity** new

**depends** cmd, ps, syslog\_ng

**platform** all

Users can generate syslog-ng configuration files from YAML format or use plain ones and reload, start, or stop their syslog-ng by using this module.

#### Details

The service module is not available on all system, so this module includes *syslog\_ng.reloaded*, *syslog\_ng.stopped*, and *syslog\_ng.started* functions. If the service module is available on the computers, users should use that.

Users can generate syslog-ng configuration with *syslog\_ng.config* function. For more information see syslog-ng state usage.

## Syslog-ng configuration file format

The syntax of a configuration snippet in `syslog-ng.conf`:

```
object_type object_id {<options>;
```

These constructions are also called statements. There are options inside of them:

```
option(parameter1, parameter2); option2(parameter1, parameter2);
```

You can find more information about syslog-ng's configuration syntax in the Syslog-ng Admin guide: <http://www.balabit.com/sites/default/files/documents/syslog-ng-ose-3.5-guides/en/syslog-ng-ose-v3.5-guide-admin/html-single/index.html#syslog-ng.conf.5>

`salt.states.syslog_ng.config`(*name*, *config*, *write=True*)

Builds syslog-ng configuration.

*name* : the id of the Salt document *config* : the parsed YAML code *write* : if True, it writes the config into the configuration file, otherwise just returns it

`salt.states.syslog_ng.reloaded`(*name*)

Reloads syslog-ng.

`salt.states.syslog_ng.started`(*name=None*, *user=None*, *group=None*, *chroot=None*, *caps=None*, *no\_caps=False*, *pidfile=None*, *enable\_core=False*, *fd\_limit=None*, *verbose=False*, *debug=False*, *trace=False*, *yydebug=False*, *persist\_file=None*, *control=None*, *worker\_threads=None*, *\*args*, *\*\*kwargs*)

Ensures, that syslog-ng is started via the given parameters.

Users shouldn't use this function, if the service module is available on their system.

`salt.states.syslog_ng.stopped`(*name=None*)

Kills syslog-ng.

### 14.17.241 salt.states.sysrc

`salt.states.sysrc.absent`(*name*, *\*\*kwargs*)

Ensure a sysrc variable is absent.

**name** The variable name to set

**file** (optional) The rc file to add the variable to.

**jail** (option) the name or JID of the jail to set the value in.

`salt.states.sysrc.managed`(*name*, *value*, *\*\*kwargs*)

Ensure a sysrc variable is set to a specific value.

**name** The variable name to set

**value** Value to set the variable to

**file** (optional) The rc file to add the variable to.

**jail** (option) the name or JID of the jail to set the value in.

Example:

```
syslogd:
  sysrc.managed:
    - name: syslogd_flags
    - value: -ss
```

### 14.17.242 salt.states.telemetry\_alert

New in version 2016.3.0..

#### Manage Telemetry alert configurations

Create, Update and destroy Mongo Telemetry alert configurations.

This module uses requests, which can be installed via package, or pip.

This module accepts explicit credential (telemetry api key) or can also read api key credentials from a pillar. Example:

```
ensure telemetry alert X is defined on deployment Y:
telemetry_alert.present:
  - deployment_id: "rs-XXXXXX"
  - metric_name: "testMetric"
  - alert_config:
    max: 1
    filter: SERVER_ROLE_MONGOD_PRIMARY
    escalate_to: "example@pagerduty.com"
  - name: "**MANAGED BY ORCA DO NOT EDIT BY HAND** manages alarm on testMetric"
```

`salt.states.telemetry_alert.absent`(*name*, *deployment\_id*, *metric\_name*, *api\_key=None*, *profile='telemetry'*)

Ensure the telemetry alert config is deleted

**name** An optional description of the alarms (not currently supported by telemetry API)

**deployment\_id** Specifies the ID of the root deployment resource (replica set cluster or sharded cluster) to which this alert definition is attached

**metric\_name** Specifies the unique ID of the metric to whose values these thresholds will be applied

**api\_key** Telemetry api key for the user

**profile** A dict with telemetry config data. If present, will be used instead of `api_key`.

`salt.states.telemetry_alert.present`(*name*, *deployment\_id*, *metric\_name*, *alert\_config*, *api\_key=None*, *profile='telemetry'*)

Ensure the telemetry alert exists.

**name** An optional description of the alarm (not currently supported by telemetry API)

**deployment\_id** Specifies the ID of the root deployment resource (replica set cluster or sharded cluster) to which this alert definition is attached

**metric\_name** Specifies the unique ID of the metric to whose values these thresholds will be applied

**alert\_config:** Is a list of dictionaries where each dict contains the following fields:

**filter** By default the alert will apply to the deployment and all its constituent resources. If the alert only applies to a subset of those resources, a filter may be specified to narrow this scope.

**min** the smallest ``ok`` value the metric may take on; if missing or null, no minimum is enforced.

**max** the largest ``ok`` value the metric may take on; if missing or null, no maximum is enforced.

**notify\_all** Used to indicate if you want to alert both onCallEngineer and apiNotifications

**api\_key** Telemetry api key for the user

**profile** A dict of telemetry config information. If present, will be used instead of `api_key`.

### 14.17.243 salt.states.test

#### Test States

Provide test case states that enable easy testing of things to do with state calls, e.g. running, calling, logging, output filtering etc.

```
always-passes-with-any-kwarg:
  test.nop:
    - name: foo
    - something: else
    - foo: bar

always-passes:
  test.succeed_without_changes:
    - name: foo

always-fails:
  test.fail_without_changes:
    - name: foo

always-changes-and-succeeds:
  test.succeed_with_changes:
    - name: foo

always-changes-and-fails:
  test.fail_with_changes:
    - name: foo

my-custom-combo:
  test.configurable_test_state:
    - name: foo
    - changes: True
    - result: False
    - comment: bar.baz

is-pillar-foo-present-and-bar-is-int:
  test.check_pillar:
    - present:
      - foo
    - integer:
      - bar
```

**salt.states.test.check\_pillar**(*name*, *present=None*, *boolean=None*, *integer=None*, *string=None*, *listing=None*, *dictionary=None*, *verbose=False*)

Checks the presence and, optionally, the type of given keys in Pillar. Supported kwargs for types are: - boolean (bool) - integer (int) - string (str) - listing (list) - dictionary (dict)

Checking for None type pillars is not implemented yet.

```
is-pillar-foo-present-and-bar-is-int:
  test.check_pillar:
    - present:
      - foo
    - integer:
      - bar
```

**salt.states.test.configurable\_test\_state**(*name*, *changes=True*, *result=True*, *comment=''*)

A configurable test state which determines its output based on the inputs.

New in version 2014.7.0.

**name:** A unique string.

**changes:** Do we return anything in the changes field? Accepts True, False, and `Random` Default is True

**result:** Do we return successfully or not? Accepts True, False, and `Random` Default is True If test is True and changes is True, this will be None. If test is True and and changes is False, this will be True.

**comment:** String to fill the comment field with. Default is ``

`salt.states.test.fail_with_changes(name)`

Returns failure and changes is not empty.

New in version 2014.7.0.

**name:** A unique string.

`salt.states.test.fail_without_changes(name)`

Returns failure.

New in version 2014.7.0.

**name:** A unique string.

`salt.states.test.mod_watch(name, sfun=None, **kwargs)`

Call this function via a watch statement

New in version 2014.7.0.

Any parameters in the state return dictionary can be customized by adding the keywords `result`, `comment`, and `changes`.

```

this_state_will_return_changes:
  test.succeed_with_changes

this_state_will_NOT_return_changes:
  test.succeed_without_changes

this_state_is_watching_another_state:
  test.succeed_without_changes:
    - comment: 'This is a custom comment'
    - watch:
      - test: this_state_will_return_changes
      - test: this_state_will_NOT_return_changes

this_state_is_also_watching_another_state:
  test.succeed_without_changes:
    - watch:
      - test: this_state_will_NOT_return_changes

```

`salt.states.test.nop(name, **kwargs)`

A no-op state that does nothing. Useful in conjunction with the *use* requisite, or in templates which could otherwise be empty due to jinja rendering

New in version 2015.8.1.

`salt.states.test.show_notification(name, text=None, **kwargs)`

Simple notification using text argument.

New in version 2015.8.0.

**name** A unique string.

**text** Text to return in the comment.

`salt.states.test.succeed_with_changes(name)`

Returns successful and changes is not empty

New in version 2014.7.0.

**name:** A unique string.

`salt.states.test.succeed_without_changes(name)`

Returns successful.

New in version 2014.7.0.

**name** A unique string.

#### 14.17.244 salt.states.testinframod module

#### 14.17.245 salt.states.timezone

##### Management of timezones

The timezone can be managed for the system:

```
America/Denver:
  timezone.system
```

The system and the hardware clock are not necessarily set to the same time. By default, the hardware clock is set to localtime, meaning it is set to the same time as the system clock. If *utc* is set to True, then the hardware clock will be set to UTC, and the system clock will be an offset of that.

```
America/Denver:
  timezone.system:
    - utc: True
```

The Ubuntu community documentation contains an explanation of this setting, as it applies to systems that dual-boot with Windows. This is explained in greater detail [here](#).

**salt.states.timezone.system**(*name, utc=True*)

Set the timezone for the system.

**name** The name of the timezone to use (e.g.: America/Denver)

**utc** Whether or not to set the hardware clock to UTC (default is True)

#### 14.17.246 salt.states.tls

##### Enforce state for SSL/TLS

**salt.states.tls.valid\_certificate**(*name, weeks=0, days=0, hours=0, minutes=0, seconds=0*)

Verify that a TLS certificate is valid now and (optionally) will be valid for the time specified through weeks, days, hours, minutes, and seconds.

#### 14.17.247 salt.states.tomcat

##### Manage Apache Tomcat web applications

---

**Note:** This state requires the Tomcat Manager webapp to be installed and running.

---

The following grains/pillars must be set for communication with Tomcat Manager to work:

```
tomcat-manager:
  user: 'tomcat-manager'
  passwd: 'Passw0rd'
```

## Configuring Tomcat Manager

To manage webapps via the Tomcat Manager, you'll need to configure a valid user in the file `conf/tomcat-users.xml`.

Listing 14.1: `conf/tomcat-users.xml`

```
<?xml version='1.0' encoding='utf-8'?>
<tomcat-users>
  <role rolename="manager-script"/>
  <user username="tomcat-manager" password="Passw0rd" roles="manager-script"/>
</tomcat-users>
```

### Notes

- Using multiple versions (aka. parallel deployments) on the same context path is not supported.
- More information about the Tomcat Manager: <http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html>
- If you use only this module for deployments you might want to restrict access to the manager so it's only accessible via localhost. For more info: [http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html#Configuring\\_Manager\\_Application\\_Access](http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html#Configuring_Manager_Application_Access)

- **Last tested on:**

**Tomcat Version:** Apache Tomcat/7.0.54

**JVM Vendor:** Oracle Corporation

**JVM Version:** 1.8.0\_101-b13

**OS Architecture:** amd64

**OS Name:** Linux

**OS Version:** 3.10.0-327.22.2.el7.x86\_64

`salt.states.tomcat.mod_watch`(*name*, *url*='http://localhost:8080/manager', *timeout*=180)

The tomcat watcher function. When called it will reload the webapp in question

`salt.states.tomcat.undeployed`(*name*, *url*='http://localhost:8080/manager', *timeout*=180)

Enforce that the WAR will be undeployed from the server

**name** The context path to undeploy.

**url** [<http://localhost:8080/manager>] The URL of the server with the Tomcat Manager webapp.

**timeout** [180] Timeout for HTTP request to the Tomcat Manager.

Example:

```
jenkins:
  tomcat.undeployed:
    - name: /ran
    - require:
      - service: application-service
```

`salt.states.tomcat.wait`(*name*, *url*='http://localhost:8080/manager', *timeout*=180)

Wait for the Tomcat Manager to load.

Notice that if tomcat is not running we won't wait for it start and the state will fail. This state can be required in the `tomcat.war_deployed` state to make sure tomcat is running and that the manager is running as well and ready for deployment.

**url** [<http://localhost:8080/manager>] The URL of the server with the Tomcat Manager webapp.

**timeout** [180] Timeout for HTTP request to the Tomcat Manager.

Example:

```
tomcat-service:
  service.running:
    - name: tomcat
    - enable: True

wait-for-tomcatmanager:
  tomcat.wait:
    - timeout: 300
    - require:
      - service: tomcat-service

jenkins:
  tomcat.war_deployed:
    - name: /ran
    - war: salt://jenkins-1.2.4.war
    - require:
      - tomcat: wait-for-tomcatmanager
```

`salt.states.tomcat.war_deployed`(*name*, *war*, *force=False*, *url='http://localhost:8080/manager'*, *timeout=180*, *temp\_war\_location=None*, *version=True*)

Enforce that the WAR will be deployed and started in the context path, while making use of WAR versions in the filename.

---

**Note:** For more info about Tomcats file paths and context naming, please see <http://tomcat.apache.org/tomcat-7.0-doc/config/context.html#Naming>

---

**name** The context path to deploy (incl. forward slash) the WAR to.

**war** Absolute path to WAR file (should be accessible by the user running Tomcat) or a path supported by the `salt.modules.cp.get_url` function.

**force** [False] Force deployment even if the version strings are the same. Disabled by default.

**url** [<http://localhost:8080/manager>] The URL of the Tomcat Web Application Manager.

**timeout** [180] Timeout for HTTP requests to the Tomcat Manager.

**temp\_war\_location** [None] Use another location to temporarily copy the WAR file to. By default the system's temp directory is used.

**version** [``] Specify the WAR version. If this argument is provided, it overrides the version encoded in the WAR file name, if one is present.

New in version 2015.8.6.

Use `False` or blank value to prevent guessing the version and keeping it blank.

New in version 2016.11.0.

Example:

```
jenkins:
  tomcat.war_deployed:
    - name: /salt-powered-jenkins
    - war: salt://jenkins-1.2.4.war
    - require:
      - service: application-service
```

---

**Note:** Be aware that in the above example the WAR `jenkins-1.2.4.war` will be deployed to the context path `salt-powered-jenkins##1.2.4`. To avoid this either specify a version yourself, or set `version` to `False`.

---

### 14.17.248 `salt.states.trafficserver`

#### Control Apache Traffic Server

New in version 2015.8.0.

`salt.states.trafficserver.bounce_cluster`(*name*)

Bounce all Traffic Server nodes in the cluster. Bouncing Traffic Server shuts down and immediately restarts Traffic Server, node-by-node.

```
bounce_ats_cluster:
  trafficserver.bounce_cluster
```

`salt.states.trafficserver.bounce_local`(*name*, *drain=False*)

Bounce Traffic Server on the local node. Bouncing Traffic Server shuts down and immediately restarts the Traffic Server node.

This option modifies the behavior of `traffic_line -b` and `traffic_line -L` such that `traffic_server` is not shut down until the number of active client connections drops to the number given by the `proxy.config.restart.active_client_threshold` configuration variable.

```
bounce_ats_local:
  trafficserver.bounce_local

bounce_ats_local:
  trafficserver.bounce_local
  - drain: True
```

`salt.states.trafficserver.clear_cluster`(*name*)

Clears accumulated statistics on all nodes in the cluster.

```
clear_ats_cluster:
  trafficserver.clear_cluster
```

`salt.states.trafficserver.clear_node`(*name*)

Clears accumulated statistics on the local node.

```
clear_ats_node:
  trafficserver.clear_node
```

`salt.states.trafficserver.config`(*name*, *value*)

Set Traffic Server configuration variable values.

```
proxy.config.proxy_name:
  trafficserver.config:
    - value: cdn.site.domain.tld
```

OR

```
traffic_server_setting:
```

```
trafficserver.config:
- name: proxy.config.proxy_name
- value: cdn.site.domain.tld
```

`salt.states.trafficserver.offline`(*name*, *path*)

Mark a cache storage device as offline. The storage is identified by a path which must match exactly a path specified in `storage.config`. This removes the storage from the cache and redirects requests that would have used this storage to other storage. This has exactly the same effect as a disk failure for that storage. This does not persist across restarts of the `traffic_server` process.

```
offline_ats_path:
  trafficserver.offline:
    - path: /path/to/cache
```

`salt.states.trafficserver.refresh`(*name*)

Initiate a Traffic Server configuration file reread. Use this command to update the running configuration after any configuration file modification.

The timestamp of the last reconfiguration event (in seconds since epoch) is published in the `proxy.node.config.reconfigure_time` metric.

```
refresh_ats:
  trafficserver.refresh
```

`salt.states.trafficserver.restart_cluster`(*name*)

Restart the `traffic_manager` process and the `traffic_server` process on all the nodes in a cluster.

```
restart_ats_cluster:
  trafficserver.restart_cluster
```

`salt.states.trafficserver.restart_local`(*name*, *drain=False*)

Restart the `traffic_manager` and `traffic_server` processes on the local node.

This option modifies the behavior of `traffic_line -b` and `traffic_line -L` such that `traffic_server` is not shut down until the number of active client connections drops to the number given by the `proxy.config.restart.active_client_threshold` configuration variable.

```
restart_ats_local:
  trafficserver.restart_local

restart_ats_local_drain:
  trafficserver.restart_local
  - drain: True
```

`salt.states.trafficserver.set_var`(*name*, *value*)

Set Traffic Server configuration variable values.

Deprecated since version Fluorine: Use `trafficserver.config` instead.

```
proxy.config.proxy_name:
  trafficserver.set_var:
    - value: cdn.site.domain.tld
```

OR

```
traffic_server_setting:
  trafficserver.set_var:
```

```
- name: proxy.config.proxy_name
- value: cdn.site.domain.tld
```

`salt.states.trafficserver.shutdown(name)`  
Shut down Traffic Server on the local node.

```
shutdown_ats:
  trafficserver.shutdown
```

`salt.states.trafficserver.startup(name)`  
Start Traffic Server on the local node.

```
startup_ats:
  trafficserver.startup
```

`salt.states.trafficserver.zero_cluster(name)`  
Reset performance statistics to zero across the cluster.

```
zero_ats_cluster:
  trafficserver.zero_cluster
```

`salt.states.trafficserver.zero_node(name)`  
Reset performance statistics to zero on the local node.

```
zero_ats_node:
  trafficserver.zero_node
```

## 14.17.249 salt.states.tuned

Interface to Red Hat tuned-adm module

**maintainer** Syed Ali <alicsyed@gmail.com>

**maturity** new

**depends** cmd.run

**platform** Linux

`salt.states.tuned.off(name=None)`

Turns `tuned` off. Example tuned.sls file for turning tuned off:

```
tuned: tuned.off: []
```

To see a valid list of states call execution module: `tuned.list`

`salt.states.tuned.profile(name)`

This state module allows you to modify system tuned parameters

Example tuned.sls file to set profile to virtual-guest

```
tuned:
```

```
  tuned:
```

- profile
- name: virtual-guest

**name** tuned profile name to set the system to

To see a valid list of states call execution module: `tuned.list`

### 14.17.250 salt.states.uptime

#### Monitor Web Server with Uptime

Uptime is an open source remote monitoring application using Node.js, MongoDB, and Twitter Bootstrap.

**Warning:** This state module is beta. It might be changed later to include more or less automation.

---

**Note:** This state module requires a pillar to specify the location of your uptime install

```
uptime:
  application_url: "http://uptime-url.example.org"
```

Example:

```
url:
  uptime.monitored
url/sitemap.xml:
  uptime.monitored:
    - polling: 600 # every hour
```

`salt.states.uptime.monitored`(*name*, *\*\*params*)

Makes sure an URL is monitored by uptime. Checks if URL is already monitored, and if not, adds it.

### 14.17.251 salt.states.user

#### Management of user accounts

The user module is used to create and manage user settings, users can be set as either absent or present

```
fred:
  user.present:
    - fullname: Fred Jones
    - shell: /bin/zsh
    - home: /home/fred
    - uid: 4000
    - gid: 4000
    - groups:
      - wheel
      - storage
      - games

testuser:
  user.absent
```

`salt.states.user.absent`(*name*, *purge=False*, *force=False*)

Ensure that the named user is absent

**name** The name of the user to remove

**purge** Set purge to True to delete all of the user's files as well as the user, Default is False.

**force** If the user is logged in, the absent state will fail. Set the force option to True to remove the user even if they are logged in. Not supported in FreeBSD and Solaris, Default is False.

```
salt.states.user.present(name, uid=None, gid=None, gid_from_name=False, groups=None,
    optional_groups=None, remove_groups=True, home=None, createhome=True,
    password=None, hash_password=False, enforce_password=True, empty_password=False,
    shell=None, unique=True, system=False, fullname=None, roomnumber=None,
    workphone=None, homephone=None, loginclass=None, date=None, mindays=None,
    maxdays=None, inactdays=None, warndays=None, expire=None,
    win_homedrive=None, win_profile=None, win_logonscript=None,
    win_description=None, nologinit=False)
```

Ensure that the named user is present with the specified properties

**name** The name of the user to manage

**uid** The user id to assign, if left empty then the next available user id will be assigned

**gid** The default group id. Also accepts group name.

**gid\_from\_name** If True, the default group id will be set to the id of the group with the same name as the user, Default is False.

**groups** A list of groups to assign the user to, pass a list object. If a group specified here does not exist on the minion, the state will fail. If set to the empty list, the user will be removed from all groups except the default group. If unset, salt will assume current groups are still wanted (see issue #28706).

**optional\_groups** A list of groups to assign the user to, pass a list object. If a group specified here does not exist on the minion, the state will silently ignore it.

NOTE: If the same group is specified in both ``groups" and ``optional\_groups", then it will be assumed to be required and not optional.

**remove\_groups** Remove groups that the user is a member of that weren't specified in the state, Default is True.

**home** The custom login directory of user. Uses default value of underlying system if not set. Notice that this directory does not have to exist. This also the location of the home directory to create if createhome is set to True.

**createhome** [True] If set to False, the home directory will not be created if it doesn't already exist.

**Warning:** Not supported on Windows or Mac OS.

Additionally, parent directories will *not* be created. The parent directory for home must already exist.

**nologinit** [False] If set to True, it will not add the user to lastlog and faillog databases.

---

**Note:** Not supported on Windows or Mac OS.

---

**password** A password hash to set for the user. This field is only supported on Linux, FreeBSD, NetBSD, OpenBSD, and Solaris. If the `empty_password` argument is set to True then password is ignored. For Windows this is the plain text password. For Linux, the hash can be generated with `openssl passwd -1`.

Changed in version 0.16.0: BSD support added.

**hash\_password** Set to True to hash the clear text password. Default is False.

**enforce\_password** Set to False to keep the password from being changed if it has already been set and the password hash differs from what is specified in the ``password" field. This option will be ignored if ``password" is not specified, Default is True.

**empty\_password** Set to True to enable password-less login for user, Default is False.

**shell** The login shell, defaults to the system default shell

**unique** Require a unique UID, Default is True.

**system** Choose UID in the range of FIRST\_SYSTEM\_UID and LAST\_SYSTEM\_UID, Default is False.

**loginclass** The login class, defaults to empty (BSD only)

User comment field (GECOS) support (currently Linux, BSD, and MacOS only):

The below values should be specified as strings to avoid ambiguities when the values are loaded. (Especially the phone and room number fields which are likely to contain numeric data)

**fullname** The user's full name

**roomnumber** The user's room number (not supported in MacOS)

**workphone** The user's work phone number (not supported in MacOS)

**homephone** The user's home phone number (not supported in MacOS) If GECOS field contains more than 3 commas, this field will have the rest of `em

Changed in version 2014.7.0: Shadow attribute support added.

Shadow attributes support (currently Linux only):

The below values should be specified as integers.

**date** Date of last change of password, represented in days since epoch (January 1, 1970).

**mindays** The minimum number of days between password changes.

**maxdays** The maximum number of days between password changes.

**inactdays** The number of days after a password expires before an account is locked.

**warndays** Number of days prior to maxdays to warn users.

**expire** Date that account expires, represented in days since epoch (January 1, 1970).

The below parameters apply to windows only:

**win\_homedrive (Windows Only)** The drive letter to use for the home directory. If not specified the home directory will be a unc path. Otherwise the home directory will be mapped to the specified drive. Must be a letter followed by a colon. Because of the colon, the value must be surrounded by single quotes. ie: - win\_homedrive: `U:

Changed in version 2015.8.0.

**win\_profile (Windows Only)** The custom profile directory of the user. Uses default value of underlying system if not set.

Changed in version 2015.8.0.

**win\_logonscript (Windows Only)** The full path to the logon script to run when the user logs in.

Changed in version 2015.8.0.

**win\_description (Windows Only)** A brief description of the purpose of the users account.

Changed in version 2015.8.0.

## 14.17.252 salt.states.vault module

**maintainer** SaltStack

**maturity** new

**platform** all

New in version 2017.7.0.

States for managing Hashicorp Vault. Currently handles policies. Configuration instructions are documented in the execution module docs.

**salt.states.vault.policy\_present**(*name, rules*)

Ensure a Vault policy with the given name and rules is present.

**name** The name of the policy

**rules** Rules formatted as in-line HCL

```
demo-policy:
```

```
  vault.policy_present:
```

- name: foo/bar

```

• rules: |
    path ``secret/top-secret/*" { policy = ``deny"
    } path ``secret/not-very-secret/*" {
      policy = ``write"
    }

```

### 14.17.253 salt.states.vbox\_guest

VirtualBox Guest Additions installer state

**salt.states.vbox\_guest.additions\_installed**(*name*, *reboot=False*, *upgrade\_os=False*)  
 Ensure that the VirtualBox Guest Additions are installed. Uses the CD, connected by VirtualBox.  
**name** The name has no functional value and is only used as a tracking reference.  
**reboot** [False] Restart OS to complete installation.  
**upgrade\_os** [False] Upgrade OS (to ensure the latests version of kernel and developer tools installed).

**salt.states.vbox\_guest.additions\_removed**(*name*, *force=False*)  
 Ensure that the VirtualBox Guest Additions are removed. Uses the CD, connected by VirtualBox.  
 To connect VirtualBox Guest Additions via VirtualBox graphical interface press `Host+D` (`Host` is usually `Right Ctrl`).  
**name** The name has no functional value and is only used as a tracking reference.  
**force** Force VirtualBox Guest Additions removing.

**salt.states.vbox\_guest.grant\_access\_to\_shared\_folders\_to**(*name*, *users=None*)  
 Grant access to auto-mounted shared folders to the users.  
 User is specified by it's name. To grant access for several users use argument *users*.  
**name** Name of the user to grant access to auto-mounted shared folders to.  
**users** List of names of users to grant access to auto-mounted shared folders to. If specified, *name* will not be taken into account.

### 14.17.254 salt.states.victorops

#### Create an Event in VictorOps

New in version 2015.8.0.

This state is useful for creating events on the VictorOps service during state runs.

```

webserver-warning-message:
  victorops.create_event:
    - message_type: 'CRITICAL'
    - entity_id: 'webserver/diskspace'
    - state_message: 'Webserver diskspace is low.'

```

**salt.states.victorops.create\_event**(*name*, *message\_type*, *routing\_key='everyone'*, *\*\*kwargs*)  
 Create an event on the VictorOps service

```

webserver-warning-message:
  victorops.create_event:
    - message_type: 'CRITICAL'
    - entity_id: 'webserver/diskspace'
    - state_message: 'Webserver diskspace is low.'

database-server-warning-message:

```

```
victorops.create_event:
- message_type: 'WARNING'
- entity_id: 'db_server/load'
- state_message: 'Database Server load is high.'
- entity_is_host: True
- entity_display_name: 'dbdserver.example.com'
```

The following parameters are required:

**name** This is a short description of the event.

**message\_type** One of the following values: INFO, WARNING, ACKNOWLEDGEMENT, CRITICAL, RECOVERY.

The following parameters are optional:

**routing\_key** The key for where messages should be routed. By default, sent to `everyone` route.

**entity\_id** The name of alerting entity. If not provided, a random name will be assigned.

**timestamp** Timestamp of the alert in seconds since epoch. Defaults to the time the alert is received at VictorOps.

**timestamp\_fmt** The date format for the timestamp parameter. Defaults to ``%Y-%m-%dT%H:%M:%S``.

**state\_start\_time** The time this entity entered its current state (seconds since epoch). Defaults to the time alert is received.

**state\_start\_time\_fmt** The date format for the timestamp parameter. Defaults to ``%Y-%m-%dT%H:%M:%S``.

**state\_message** Any additional status information from the alert item.

**entity\_is\_host** Used within VictorOps to select the appropriate display format for the incident.

**entity\_display\_name** Used within VictorOps to display a human-readable name for the entity.

**ack\_message** A user entered comment for the acknowledgment.

**ack\_author** The user that acknowledged the incident.

### 14.17.255 salt.states.virt module

#### Manage virt

For the key certificate this state uses the external pillar in the master to call for the generation and signing of certificates for systems running libvirt:

```
libvirt_keys:
  virt.keys
```

**salt.states.virt.keys** (*name*, *basepath*='etc/pki')

Manage libvirt keys.

**name** The name variable used to track the execution

**basepath** Defaults to /etc/pki, this is the root location used for libvirt keys on the hypervisor

**salt.states.virt.powered\_off** (*name*)

Stops a VM by power off.

New in version 2016.3.0.

```
domain_name:
  virt.stopped
```

**salt.states.virt.rebooted** (*name*)

Reboots VMs

New in version 2016.3.0.

Parameters **name** --

Returns

`salt.states.virt.reverted`(*name*, *snapshot=None*, *cleanup=False*)

Deprecated since version 2016.3.0.

Reverts to the particular snapshot.

New in version 2016.3.0.

```
domain_name:
  virt.reverted:
    - cleanup: True

domain_name_1:
  virt.reverted:
    - snapshot: snapshot_name
    - cleanup: False
```

`salt.states.virt.running`(*name*, *\*\*kwargs*)

Starts an existing guest, or defines and starts a new VM with specified arguments.

New in version 2016.3.0.

```
domain_name:
  virt.running
```

```
domain_name:
  virt.running:
    - cpu: 2
    - mem: 2048
    - eth0_mac: 00:00:6a:53:00:e3
```

`salt.states.virt.saved`(*name*, *suffix=None*)

Deprecated since version 2016.3.0: Use `snapshot()` instead.

Takes a snapshot of a particular VM or by a UNIX-style wildcard.

New in version 2016.3.0.

```
domain_name:
  virt.saved:
    - suffix: periodic

domain*:
  virt.saved:
    - suffix: periodic
```

`salt.states.virt.snapshot`(*name*, *suffix=None*)

Takes a snapshot of a particular VM or by a UNIX-style wildcard.

New in version 2016.3.0.

```
domain_name:
  virt.snapshot:
    - suffix: periodic

domain*:
  virt.snapshot:
    - suffix: periodic
```

`salt.states.virt.stopped(name)`

Stops a VM by shutting it down nicely.

New in version 2016.3.0.

```
domain_name:
  virt.stopped
```

`salt.states.virt.unpowered(name)`

Deprecated since version 2016.3.0: Use `powered_off()` instead.

Stops a VM by power off.

New in version 2016.3.0.

```
domain_name:
  virt.stopped
```

### 14.17.256 salt.states.virtualenv

Setup of Python virtualenv sandboxes.

New in version 0.17.0.

`salt.states.virtualenv_mod.managed(name, venv_bin=None, requirements=None, system_site_packages=False, distribute=False, use_wheel=False, clear=False, python=None, extra_search_dir=None, never_download=None, prompt=None, user=None, no_chown=False, cwd=None, index_url=None, extra_index_url=None, pre_releases=False, no_deps=False, pip_download=None, pip_download_cache=None, pip_exists_action=None, pip_ignore_installed=False, proxy=None, use_vt=False, env_vars=None, no_use_wheel=False, pip_upgrade=False, pip_pkgs=None, pip_no_cache_dir=False, pip_cache_dir=None, process_dependency_links=False)`

Create a virtualenv and optionally manage it with pip

**name** Path to the virtualenv.

**requirements: None** Path to a pip requirements file. If the path begins with `salt://` the file will be transferred from the master file server.

**use\_wheel: False** Prefer wheel archives (requires pip >= 1.4).

**python** [None] Python executable used to build the virtualenv

**user: None** The user under which to run virtualenv and pip.

**no\_chown: False** When user is given, do not attempt to copy and chown a requirements file (needed if the requirements file refers to other files via relative paths, as the copy-and-chown procedure does not account for such files)

**cwd: None** Path to the working directory where `pip install` is executed.

**no\_deps: False** Pass `--no-deps` to `pip install`.

**pip\_exists\_action: None** Default action of pip when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup.

**proxy: None** Proxy address which is passed to `pip install`.

**env\_vars: None** Set environment variables that some builds will depend on. For example, a Python C-module may have a Makefile that needs `INCLUDE_PATH` set to pick up a header file while compiling.

**no\_use\_wheel: False** Force to not use wheel archives (requires pip>=1.4)

**pip\_upgrade: False** Pass `--upgrade` to `pip install`.

**pip\_pkgs: None** As an alternative to `requirements`, pass a list of pip packages that should be installed.

**process\_dependency\_links:** False Run pip install with the `--process_dependency_links` flag.

New in version 2017.7.0.

Also accepts any kwargs that the `virtualenv` module will. However, some kwargs, such as the `pip` option, require `-distribute: True`.

```
/var/www/myvirtualenv.com:
  virtualenv.managed:
    - system_site_packages: False
    - requirements: salt://REQUIREMENTS.txt
    - env_vars:
      PATH_VAR: '/usr/local/bin/'
```

### 14.17.257 salt.states.win\_certutil module

#### Installing of certificates to the Windows Certificate Manager

Install certificates to the Windows Certificate Manager

```
salt://certs/cert.cer:
  certutil.add_store:
    - store: TrustedPublisher
```

**salt.states.win\_certutil.add\_store** (*name, store, saltenv='base'*)

Store a certificate to the given store

**name** The certificate to store, this can use local paths or `salt://` paths

**store** The store to add the certificate to

**saltenv** The salt environment to use, this is ignored if a local path is specified

**salt.states.win\_certutil.del\_store** (*name, store, saltenv='base'*)

Remove a certificate in the given store

**name** The certificate to remove, this can use local paths or `salt://` paths

**store** The store to remove the certificate from

**saltenv** The salt environment to use, this is ignored if a local path is specified

### 14.17.258 salt.states.win\_dacl

Windows Object Access Control Lists

#### Ensure an ACL is present

**parameters:** **name** - the path of the object **objectType** - Registry/File/Directory **user** - user account or SID for the ace **permission** - permission for the ace (see module `win_acl` for available permissions for each **objectType**) **acetype** - Allow/Deny **propagation** - how the ACL should apply to child objects (see module `win_acl` for available propagation types)

```
addAcl:
  win_dacl.present:
    - name: HKEY_LOCAL_MACHINE\SOFTWARE\mykey
    - objectType: Registry
    - user: FakeUser
    - permission: FullControl
    - acetype: ALLOW
    - propagation: KEY&SUBKEYS
```

Ensure an ACL does not exist

**parameters:** name - the path of the object objectType - Registry/File/Directory user - user account or SID for the ace permission - permission for the ace (see module win\_acl for available permissions for each objectType) acetype - Allow/Deny propagation - how the ACL should apply to child objects (see module win\_acl for available propagation types)

**removeAcl:**

**win\_dacl.absent:**

- name: HKEY\_LOCAL\_MACHINESOFTWARE\mykey
- objectType: Registry
- user: FakeUser
- permission: FullControl
- acetype: ALLOW
- propagation: KEY&SUBKEYS

#### Ensure an object is inheriting permissions

**parameters:** name - the path of the object objectType - Registry/File/Directory clear\_existing\_acl - True/False - when inheritance is enabled, should the existing ACL be kept or cleared out

**eInherit:**

**win\_dacl.enableinheritance:**

- name: HKEY\_LOCAL\_MACHINESOFTWARE\mykey
- objectType: Registry
- clear\_existing\_acl: True

#### Ensure an object is not inheriting permissions

**parameters:** name - the path of the object objectType - Registry/File/Directory copy\_inherited\_acl - True/False - if inheritance is enabled, should the inherited permissions be copied to the ACL when inheritance is disabled

**dInherit:**

**win\_dacl.disableinheritance:**

- name: HKEY\_LOCAL\_MACHINESOFTWARE\mykey
- objectType: Registry
- copy\_inherited\_acl: False

**salt.states.win\_dacl.absent**(*name, objectType, user, permission, acetype, propagation*)  
Ensure a Linux ACL does not exist

**salt.states.win\_dacl.disinherit**(*name, objectType, copy\_inherited\_acl=True*)  
Ensure an object is not inheriting ACLs from its parent

**salt.states.win\_dacl.inherit**(*name, objectType, clear\_existing\_acl=False*)  
Ensure an object is inheriting ACLs from its parent

`salt.states.win_dacl.present` (*name, objectType, user, permission, acetype, propagation*)  
Ensure an ACE is present

### 14.17.259 salt.states.win\_dism module

#### Installing of Windows features using DISM

Install windows features/capabilities with DISM

```
Language.Basic~en-US~0.0.1.0:
  dism.capability_installed

NetFx3:
  dism.feature_installed
```

`salt.states.win_dism.capability_installed` (*name, source=None, limit\_access=False, image=None, restart=False*)

Install a DISM capability

##### Parameters

- **name** (*str*) -- The capability to install
- **source** (*str*) -- The optional source of the capability
- **limit\_access** (*bool*) -- Prevent DISM from contacting Windows Update for online images
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

#### Example

Run `dism.available_capabilities` to get a list of available capabilities. This will help you get the proper name to use.

```
install_dotnet35:
  dism.capability_installed:
    - name: NetFX3~en~en
```

`salt.states.win_dism.capability_removed` (*name, image=None, restart=False*)

Uninstall a DISM capability

##### Parameters

- **name** (*str*) -- The capability to uninstall
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

#### Example

Run `dism.installed_capabilities` to get a list of installed capabilities. This will help you get the proper name to use.

```
remove_dotnet35:
  dism.capability_removed:
    - name: NetFX3~en~en
```

```
salt.states.win_dism.feature_installed(name, package=None, source=None,
                                       limit_access=False, enable_parent=False, im-
                                       age=None, restart=False)
```

Install a DISM feature

#### Parameters

- **name** (*str*) -- The feature in which to install
- **package** (*Optional[str]*) -- The parent package for the feature. You do not have to specify the package if it is the Windows Foundation Package. Otherwise, use package to specify the parent package of the feature
- **source** (*str*) -- The optional source of the feature
- **limit\_access** (*bool*) -- Prevent DISM from contacting Windows Update for on-line images
- **enable\_parent** (*Optional[bool]*) -- True will enable all parent features of the specified feature
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

#### Example

Run `dism.available_features` to get a list of available features. This will help you get the proper name to use.

```
install_telnet_client:
  dism.feature_installed:
    - name: TelnetClient
```

```
salt.states.win_dism.feature_removed(name, remove_payload=False, image=None,
                                     restart=False)
```

Disables a feature.

#### Parameters

- **name** (*str*) -- The feature to disable
- **remove\_payload** (*Optional[bool]*) -- Remove the feature's payload. Must supply source when enabling in the future.
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

#### Example

Run `dism.installed_features` to get a list of installed features. This will help you get the proper name to use.

```
remove_telnet_client:
  dism.feature_removed:
    - name: TelnetClient
    - remove_payload: True
```

```
salt.states.win_dism.package_installed(name, ignore_check=False, prevent_pending=False,
                                       image=None, restart=False)
```

Install a package.

#### Parameters

- **name** (*str*) -- The package to install. Can be a .cab file, a .msu file, or a folder

- **ignore\_check** (*Optional[bool]*) -- Skip installation of the package if the applicability checks fail
- **prevent\_pending** (*Optional[bool]*) -- Skip the installation of the package if there are pending online actions
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

### Example

```
install_KB123123123:
  dism.package_installed:
    - name: C:\Packages\KB123123123.cab
```

`salt.states.win_dism.package_removed` (*name, image=None, restart=False*)

Uninstall a package

#### Parameters

- **name** (*str*) -- The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. This can also be the name of a package as listed in `dism.installed_packages`
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

### Example

```
# Example using source
remove_KB1231231:
  dism.package_installed:
    - name: C:\Packages\KB1231231.cab

# Example using name from ``dism.installed_packages``
remove_KB1231231:
  dism.package_installed:
    - name: Package_for_KB1231231~31bf3856ad364e35~amd64~~10.0.1.3
```

## 14.17.260 salt.states.win\_dns\_client

Module for configuring DNS Client on Windows systems

`salt.states.win_dns_client.dns_dhcp` (*name, interface='Local Area Connection'*)

Configure the DNS server list from DHCP Server

`salt.states.win_dns_client.dns_exists` (*name, servers=None, interface='Local Area Connection', replace=False*)

Configure the DNS server list in the specified interface

Example:

```
config_dns_servers:
  win_dns_client.dns_exists:
    - replace: True #remove any servers not in the "servers" list, default is False
    - servers:
```

- 8.8.8.8
- 8.8.8.9

`salt.states.win_dns_client.primary_suffix`(*name*, *suffix=None*, *updates=False*)

New in version 2014.7.0.

Configure the global primary DNS suffix of a DHCP client.

**suffix** [None] The suffix which is advertised for this client when acquiring a DHCP lease. When none is set, the explicitly configured DNS suffix will be removed.

**updates** [False] Allow syncing the DNS suffix with the AD domain when the client's AD domain membership changes.

```
primary_dns_suffix:
  win_dns_client.primary_suffix:
    - suffix: sub.domain.tld
    - updates: True
```

### 14.17.261 salt.states.win\_firewall

State for configuring Windows Firewall

`salt.states.win_firewall.add_rule`(*name*, *localport*, *protocol='tcp'*, *action='allow'*, *dir='in'*, *remoteip='any'*)

Add a new inbound or outbound rule to the firewall policy

#### Parameters

- **name** (*str*) -- The name of the rule. Must be unique and cannot be ``all``. Required.
- **localport** (*int*) -- The port the rule applies to. Must be a number between 0 and 65535. Can be a range. Can specify multiple ports separated by commas. Required.
- **protocol** (*Optional[str]*) -- The protocol. Can be any of the following:
  - A number between 0 and 255
  - icmpv4
  - icmpv6
  - tcp
  - udp
  - any
- **action** (*Optional[str]*) -- The action the rule performs. Can be any of the following:
  - allow
  - block
  - bypass
- **dir** (*Optional[str]*) -- The direction. Can be `in` or `out`.
- **remoteip** (*Optional [str]*) -- The remote IP. Can be any of the following:
  - any
  - localsubnet
  - dns
  - dhcp
  - wins
  - defaultgateway
  - Any valid IPv4 address (192.168.0.12)
  - Any valid IPv6 address (2002:9b3b:1a31:4:208:74ff:fe39:6c43)
  - Any valid subnet (192.168.1.0/24)
  - Any valid range of IP addresses (192.168.0.1-192.168.0.12)
  - A list of valid IP addresses

Can be combinations of the above separated by commas.

New in version 2016.11.6.

Example:

```
open_smb_port:
  win_firewall.add_rule:
    - name: SMB (445)
    - localport: 445
    - protocol: tcp
    - action: allow
```

**salt.states.win\_firewall.disabled**(*name='allprofiles'*)

Disable all the firewall profiles (Windows only)

**Parameters** **profile** (*Optional[str]*) -- The name of the profile to disable. Default is all-profiles. Valid options are:

- allprofiles
- domainprofile
- privateprofile
- publicprofile

Example:

```
# To disable the domain profile
disable_domain:
  win_firewall.disabled:
    - name: domainprofile

# To disable all profiles
disable_all:
  win_firewall.disabled:
    - name: allprofiles
```

**salt.states.win\_firewall.enabled**(*name='allprofiles'*)

Enable all the firewall profiles (Windows only)

**Parameters** **profile** (*Optional[str]*) -- The name of the profile to enable. Default is all-profiles. Valid options are:

- allprofiles
- domainprofile
- privateprofile
- publicprofile

Example:

```
# To enable the domain profile
enable_domain:
  win_firewall.enabled:
    - name: domainprofile

# To enable all profiles
enable_all:
  win_firewall.enabled:
    - name: allprofiles
```

## 14.17.262 salt.states.win\_iis module

Microsoft IIS site management

This module provides the ability to add/remove websites and application pools from Microsoft IIS.

New in version 2016.3.0.

`salt.states.win_iis.container_setting`(*name*, *container*, *settings=None*)

Set the value of the setting for an IIS container.

**Parameters**

- **name** (*str*) -- The name of the IIS container.
- **container** (*str*) -- The type of IIS container. The container types are: AppPools, Sites, SslBindings
- **settings** (*str*) -- A dictionary of the setting names and their values.

Example of usage for the AppPools container:

```
site0-appool-setting:
  win_iis.container_setting:
    - name: site0
    - container: AppPools
    - settings:
        managedPipelineMode: Integrated
        processModel.maxProcesses: 1
        processModel.userName: TestUser
        processModel.password: TestPassword
        processModel.identityType: SpecificUser
```

Example of usage for the Sites container:

```
site0-site-setting:
  win_iis.container_setting:
    - name: site0
    - container: Sites
    - settings:
        logFile.logFormat: W3C
        logFile.period: Daily
        limits.maxUrlSegments: 32
```

`salt.states.win_iis.create_app`(*name*, *site*, *sourcepath*, *apppool=None*)

Create an IIS application.

**Parameters**

- **name** (*str*) -- The IIS application.
- **site** (*str*) -- The IIS site name.
- **sourcepath** (*str*) -- The physical path.
- **apppool** (*str*) -- The name of the IIS application pool.

Example of usage with only the required arguments:

```
site0-v1-app:
  win_iis.create_app:
    - name: v1
    - site: site0
    - sourcepath: C:\inetpub\site0\v1
```

Example of usage specifying all available arguments:

```
site0-v1-app:
  win_iis.create_app:
    - name: v1
    - site: site0
    - sourcepath: C:\inetpub\site0\v1
    - apppool: site0
```

`salt.states.win_iis.create_appool`(*name*)

Create an IIS application pool.

**Parameters** *name* (*str*) -- The name of the IIS application pool.

Usage:

```
site0-appool:
  win_iis.create_appool:
    - name: site0
```

`salt.states.win_iis.create_binding`(*name*, *site*, *hostheader=''*, *ipaddress='\*'*, *port=80*, *protocol='http'*, *sslflags=0*)

Create an IIS binding.

**Parameters**

- **site** (*str*) -- The IIS site name.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*str*) -- The TCP port of the binding.
- **protocol** (*str*) -- The application protocol of the binding.
- **sslflags** (*str*) -- The flags representing certificate type and storage of the binding.

Example of usage with only the required arguments:

```
site0-https-binding:
  win_iis.create_binding:
    - site: site0
```

Example of usage specifying all available arguments:

```
site0-https-binding:
  win_iis.create_binding:
    - site: site0
    - hostheader: site0.local
    - ipaddress: '*'
    - port: 443
    - protocol: https
    - sslflags: 0
```

`salt.states.win_iis.create_cert_binding`(*name*, *site*, *hostheader=''*, *ipaddress='\*'*, *port=443*, *sslflags=0*)

Assign a certificate to an IIS binding.

**Parameters**

- **name** (*str*) -- The thumbprint of the certificate.
- **site** (*str*) -- The IIS site name.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*str*) -- The TCP port of the binding.
- **sslflags** (*str*) -- Flags representing certificate type and certificate storage of the binding.

Example of usage with only the required arguments:

```
site0-cert-binding:
  win_iis.create_cert_binding:
    - name: 9988776655443322111000AAABBBCCDDDEEEFFF
    - site: site0
```

Example of usage specifying all available arguments:

```

site0-cert-binding:
  win_iis.create_cert_binding:
    - name: 9988776655443322111000AAABBBCCDDDEEEFFF
    - site: site0
    - hostheader: site0.local
    - ipaddress: 192.168.1.199
    - port: 443
    - sslflags: 1

```

New in version 2016.11.0.

`salt.states.win_iis.create_vdir` (*name*, *site*, *sourcepath*, *app*='')

Create an IIS virtual directory.

#### Parameters

- **name** (*str*) -- The virtual directory name.
- **site** (*str*) -- The IIS site name.
- **sourcepath** (*str*) -- The physical path.
- **app** (*str*) -- The IIS application.

Example of usage with only the required arguments:

```

site0-foo-vdir:
  win_iis.create_vdir:
    - name: foo
    - site: site0
    - sourcepath: C:\inetpub\vdirs\foo

```

Example of usage specifying all available arguments:

```

site0-foo-vdir:
  win_iis.create_vdir:
    - name: foo
    - site: site0
    - sourcepath: C:\inetpub\vdirs\foo
    - app: v1

```

`salt.states.win_iis.deployed` (*name*, *sourcepath*, *apppool*='', *hostheader*='', *ipaddress*='\*', *port*=80, *protocol*='http')

Ensure the website has been deployed.

#### Parameters

- **name** (*str*) -- The IIS site name.
- **sourcepath** (*str*) -- The physical path of the IIS site.
- **apppool** (*str*) -- The name of the IIS application pool.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*str*) -- The TCP port of the binding.
- **protocol** (*str*) -- The application protocol of the binding.

Example of usage with only the required arguments. This will default to using the default application pool assigned by IIS:

```

site0-deployed:
  win_iis.deployed:
    - name: site0
    - sourcepath: C:\inetpub\site0

```

Example of usage specifying all available arguments:

```

site0-deployed:
  win_iis.deployed:
    - name: site0
    - sourcepath: C:\inetpub\site0
    - apppool: site0
    - hostheader: site0.local
    - ipaddress: '*'
    - port: 443
    - protocol: https

```

**salt.states.win\_iis.remove\_app**(*name, site*)

Remove an IIS application.

**Parameters**

- **name** (*str*) -- The application name.
- **site** (*str*) -- The IIS site name.

Usage:

```

site0-v1-app-remove:
  win_iis.remove_app:
    - name: v1
    - site: site0

```

**salt.states.win\_iis.remove\_apppool**(*name*)

Remove an IIS application pool.

**Parameters** **name** (*str*) -- The name of the IIS application pool.

Usage:

```

defaultapppool-remove:
  win_iis.remove_apppool:
    - name: DefaultAppPool

```

**salt.states.win\_iis.remove\_binding**(*name, site, hostheader='', ipaddress='\*', port=80*)

Remove an IIS binding.

**Parameters**

- **site** (*str*) -- The IIS site name.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*str*) -- The TCP port of the binding.

Example of usage with only the required arguments:

```

site0-https-binding-remove:
  win_iis.remove_binding:
    - site: site0

```

Example of usage specifying all available arguments:

```

site0-https-binding-remove:
  win_iis.remove_binding:
    - site: site0
    - hostheader: site0.local
    - ipaddress: '*'
    - port: 443

```

**salt.states.win\_iis.remove\_cert\_binding**(*name, site, hostheader='', ipaddress='\*', port=443*)

Remove a certificate from an IIS binding.

**Parameters**

- **name** (*str*) -- The thumbprint of the certificate.
- **site** (*str*) -- The IIS site name.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*str*) -- The TCP port of the binding.

Example of usage with only the required arguments:

```
site0-cert-binding-remove:
  win_iis.remove_cert_binding:
    - name: 9988776655443322111000AAABBBCCDDDEEEFFF
    - site: site0
```

Example of usage specifying all available arguments:

```
site0-cert-binding-remove:
  win_iis.remove_cert_binding:
    - name: 9988776655443322111000AAABBBCCDDDEEEFFF
    - site: site0
    - hostheader: site0.local
    - ipaddress: 192.168.1.199
    - port: 443
```

New in version 2016.11.0.

`salt.states.win_iis.remove_site` (*name*)

Delete a website from IIS.

**Parameters** *name* (*str*) -- The IIS site name.

Usage:

```
defaultwebsite-remove:
  win_iis.remove_site:
    - name: Default Web Site
```

`salt.states.win_iis.remove_vdir` (*name, site, app=''*)

Remove an IIS virtual directory.

**Parameters**

- **name** (*str*) -- The virtual directory name.
- **site** (*str*) -- The IIS site name.
- **app** (*str*) -- The IIS application.

Example of usage with only the required arguments:

```
site0-foo-vdir-remove:
  win_iis.remove_vdir:
    - name: foo
    - site: site0
```

Example of usage specifying all available arguments:

```
site0-foo-vdir-remove:
  win_iis.remove_vdir:
    - name: foo
    - site: site0
    - app: v1
```

`salt.states.win_iis.set_app` (*name, site, settings=None*)

Set the value of the setting for an IIS web application. .. note:

This function only configures existing app.  
Params are case sensitive.

#### Parameters

- **name** (*str*) -- The IIS application.
- **site** (*str*) -- The IIS site name.
- **settings** (*str*) -- A dictionary of the setting names and their values.

**Available settings** physicalPath: The physical path of the webapp.

: applicationPool: The application pool for the webapp. : userName: ``connectAs" user : password: ``connectAs" password for user :rtype: bool .. versionadded:: 2017.7.0 Example of usage:

```
site0-webapp-setting:
  win_iis.set_app:
    - name: app0
    - site: Default Web Site
    - settings:
      userName: domain\user
      password: pass
      physicalPath: c:\inetpub\wwwroot
      applicationPool: appPool0
```

## 14.17.263 salt.states.win\_lgpo module

### Manage Windows Local Group Policy

New in version 2016.11.0.

This state allows configuring local Windows Group Policy

The state can be used to ensure the setting of a single policy or multiple policies in one pass.

Single policies must specify the policy name, the setting, and the policy class (Machine/User/Both)

Example single policy configuration

```
Ensure Account Lockout Duration:
  lgpo.set:
    - name: Account lockout duration
    - setting: 90
    - policy_class: Machine
```

```
Account lockout duration:
  gpo.set:
    - setting: 120
    - policy_class: Machine
```

Multiple policy configuration

```
Company Local Group Policy:
  lgpo.set:
    - computer_policy:
      Deny logon locally: Guest
      Account lockout duration: 120
      Account lockout threshold: 10
      Reset account lockout counter after: 1440
      Enforce password history: 24
```

```

Maximum password age: 60
Minimum password age: 1
Minimum password length: 14
Password must meet complexity requirements: Enabled
Store passwords using reversible encryption: Disabled
Configure Automatic Updates:
  Configure automatic updating: 4 - Auto download and schedule the install
  Scheduled install day: 7 - Every Saturday
  Scheduled install time: 17:00
Specify intranet Microsoft update service location:
  Set the intranet update service for detecting updates: http://mywsus
  Set the intranet statistics server: http://mywsus
- user_policy:
  Do not process the legacy run list: Enabled

```

```

server_policy:
  lgpo.set:
    - computer_policy:
      Maximum password age: 60
      Minimum password age: 1
      Minimum password length: 14
      Account lockout duration: 1440
      Account lockout threshold: 10
      Reset account lockout counter after: 1440
      Manage auditing and security log:
        - "BUILTIN\Administrators"
      Replace a process level token:
        - "NT AUTHORITY\NETWORK SERVICE"
        - "NT AUTHORITY\LOCAL SERVICE"
      "Accounts: Guest account status": Disabled
      "Accounts: Rename guest account": Not_4_U
      "Audit: Audit the use of Backup and Restore privilege": Enabled
      "Interactive logon: Do not display last user name": Enabled
      "Network\DNS Client\Dynamic update": Disabled
      "System\Logon\Do not display the Getting Started welcome screen at logon":☒
    →Enabled
      "Windows Components\Remote Desktop Services\Remote Desktop Session☒
    →Host\Connections>Select RDP transport protocols":
      "Select Transport Type": "Use both UDP and TCP"
      "Windows Components\Windows Update\Allow Automatic Updates immediate☒
    →installation": Enabled
      "Windows Components\Windows Update\Allow non-administrators to receive update☒
    →notifications": Disabled
      "Windows Components\Windows Update\Always automatically restart at the☒
    →scheduled time":
      "The restart timer will give users this much time to save their work☒
    →(minutes)": 15
      "Windows Components\Windows Update\Automatic Updates detection frequency":
      "Check for updates at the following interval (hours)": 1
      "Windows Components\Windows Update\Configure Automatic Updates":
      "Configure automatic updating": 4 - Auto download and schedule the install
      "Install during automatic maintenance": False
      "Scheduled install day": 7 - Every Saturday
      "Scheduled install time": "17:00"
      "Windows Components\Windows Update\Delay Restart for scheduled installations":
      "Wait the following period before proceeding with a scheduled restart☒
    →(minutes)": 1
      "Windows Components\Windows Update\No auto-restart with logged on users for☒
    →scheduled automatic updates installations": Disabled

```

```

    "Windows Components\Windows Update\Re-prompt for restart with scheduled
    →installations":
        "Wait the following period before prompting again with a scheduled restart
    →(minutes)": 30
        "Windows Components\Windows Update\Reschedule Automatic Updates scheduled
    →installations": Disabled
        "Windows Components\Windows Update\Specify intranet Microsoft update service
    →location":
            "Set the intranet update service for detecting updates": http://mywsus
            "Set the intranet statistics server": http://mywsus
        - cumulative_rights_assignments: True

```

```

salt.states.win_lgpo.set(name, setting=None, policy_class=None, computer_policy=None,
                        user_policy=None, cumulative_rights_assignments=True,
                        adml_language='en-US')

```

Ensure the specified policy is set

**name** the name of a single policy to configure

**setting** the configuration setting for the single named policy if this argument is used the computer\_policy/user\_policy arguments will be ignored

**policy\_class** the policy class of the single named policy to configure this can ``machine``, ``user``, or ``both``

**computer\_policy** a dict of policyname: value pairs of a set of computer policies to configure if this argument is used, the name/setting/policy\_class arguments will be ignored

**user\_policy** a dict of policyname: value pairs of a set of user policies to configure if this argument is used, the name/setting/policy\_class arguments will be ignored

**cumulative\_rights\_assignments** determine if any user right assignment policies specified will be cumulative or explicit

**adml\_language** the adml language to use for AMDX policy data/display conversions

## 14.17.264 salt.states.win\_license module

### Installation and activation of windows licenses

Install and activate windows licenses

```

XXXXX-XXXXX-XXXXX-XXXXX-XXXXX:
  license.activate

```

```

salt.states.win_license.activate(name)

```

Install and activate the given product key

**name** The 5x5 product key given to you by Microsoft

## 14.17.265 salt.states.win\_network

### Configuration of network interfaces on Windows hosts

New in version 2014.1.0.

This module provides the network state(s) on Windows hosts. DNS servers, IP addresses and default gateways can currently be managed.

Below is an example of the configuration for an interface that uses DHCP for both DNS servers and IP addresses:

```
Local Area Connection #2:
network.managed:
- dns_proto: dhcp
- ip_proto: dhcp
```

---

**Note:** Both the `dns_proto` and `ip_proto` arguments are required.

---

Static DNS and IP addresses can be configured like so:

```
Local Area Connection #2:
network.managed:
- dns_proto: static
- dns_servers:
- 8.8.8.8
- 8.8.4.4
- ip_proto: static
- ip_addrs:
- 10.2.3.4/24
```

---

**Note:** IP addresses are specified using the format `<ip-address>/<subnet-length>`. Salt provides a convenience function called `ip.get_subnet_length` to calculate the subnet length from a netmask.

---

Optionally, if you are setting a static IP address, you can also specify the default gateway using the `gateway` parameter:

```
Local Area Connection #2:
network.managed:
- dns_proto: static
- dns_servers:
- 8.8.8.8
- 8.8.4.4
- ip_proto: static
- ip_addrs:
- 10.2.3.4/24
- gateway: 10.2.3.1
```

`salt.states.win_network.managed`(*name*, *dns\_proto=None*, *dns\_servers=None*, *ip\_proto=None*, *ip\_addrs=None*, *gateway=None*, *enabled=True*, *\*\*kwargs*)

Ensure that the named interface is configured properly.

**name** The name of the interface to manage

**dns\_proto** [None] Set to `static` and use the `dns_servers` parameter to provide a list of DNS name-servers. set to `dhcp` to use DHCP to get the DNS servers.

**dns\_servers** [None] A list of static DNS servers.

**ip\_proto** [None] Set to `static` and use the `ip_addrs` and (optionally) `gateway` parameters to provide a list of static IP addresses and the default gateway. Set to `dhcp` to use DHCP.

**ip\_addrs** [None] A list of static IP addresses.

**gateway** [None] A list of static IP addresses.

**enabled** [True] Set to `False` to ensure that this interface is disabled.

### 14.17.266 salt.states.win\_path

Manage the Windows System PATH

`salt.states.win_path.absent` (*name*)

Remove the directory from the SYSTEM path

index: where the directory should be placed in the PATH (default: 0)

Example:

```
'C:\sysinternals':
  win_path.absent
```

`salt.states.win_path.exists` (*name*, *index=None*)

Add the directory to the system PATH at index location

index: where the directory should be placed in the PATH (default: None) [Note: Providing no index will append directory to PATH and will not enforce its location within the PATH.]

Example:

```
'C:\python27':
  win_path.exists

'C:\sysinternals':
  win_path.exists:
    - index: 0
```

## 14.17.267 salt.states.win\_pki module

Microsoft certificate management via the Pki PowerShell module.

**platform** Windows

New in version 2016.11.0.

`salt.states.win_pki.import_cert` (*name*, *cert\_format='cer'*, *context='LocalMachine'*, *store='My'*, *exportable=True*, *password=''*, *saltenv='base'*)

Import the certificate file into the given certificate store.

### Parameters

- **name** (*str*) -- The path of the certificate file to import.
- **cert\_format** (*str*) -- The certificate format. Specify `cer` for X.509, or `pfx` for PKCS #12.
- **context** (*str*) -- The name of the certificate store location context.
- **store** (*str*) -- The name of the certificate store.
- **exportable** (*bool*) -- Mark the certificate as exportable. Only applicable to pfx format.
- **password** (*str*) -- The password of the certificate. Only applicable to pfx format.
- **saltenv** (*str*) -- The environment the file resides in.

Example of usage with only the required arguments:

```
site0-cert-imported:
  win_pki.import_cert:
    - name: salt://win/webserver/certs/site0.cer
```

Example of usage specifying all available arguments:

```
site0-cert-imported:
  win_pki.import_cert:
    - name: salt://win/webserver/certs/site0.pfx
    - cert_format: pfx
```

```

- context: LocalMachine
- store: My
- exportable: True
- password: TestPassword
- saltenv: base

```

`salt.states.win_pki.remove_cert`(*name*, *thumbprint*, *context*='LocalMachine', *store*='My')

Remove the certificate from the given certificate store.

**Parameters**

- **thumbprint** (*str*) -- The thumbprint value of the target certificate.
- **context** (*str*) -- The name of the certificate store location context.
- **store** (*str*) -- The name of the certificate store.

Example of usage with only the required arguments:

```

site0-cert-removed:
  win_pki.remove_cert:
    - thumbprint: 9988776655443322111000AAABBBCCDDDEEEFFF

```

Example of usage specifying all available arguments:

```

site0-cert-removed:
  win_pki.remove_cert:
    - thumbprint: 9988776655443322111000AAABBBCCDDDEEEFFF
    - context: LocalMachine
    - store: My

```

### 14.17.268 salt.states.win\_powercfg

This module allows you to control the power settings of a windows minion via powercfg.

New in version 2015.8.0.

```

monitor:
  powercfg.set_timeout:
    - value: 30
    - power: dc

```

`salt.states.win_powercfg.set_timeout`(*name*, *value*, *power*='ac', *scheme*=None)

Set the sleep timeouts of specific items such as disk, monitor.

CLI Example:

```

monitor:
  powercfg.set_timeout:
    - value: 30
    - power: dc

disk:
  powercfg.set_timeout:
    - value: 12
    - power: ac

```

**name** The setting to change, can be one of the following: monitor, disk, standby, hibernate

**timeout** The amount of time in minutes before the item will timeout i.e the monitor

**power** Should we set the value for AC or DC (battery)? Valid options ac,dc.

**scheme** The scheme to use, leave as None to use the current.

### 14.17.269 salt.states.win\_servermanager

Manage Windows features via the ServerManager powershell module

`salt.states.win_servermanager.installed`(*name*, *recurse=False*, *force=False*, *restart=False*, *source=None*, *exclude=None*)

Install the windows feature

#### Parameters

- **name** (*str*) -- Short name of the feature (the right column in `win_servermanager.list_available`)
- **recurse** (*Optional[bool]*) -- install all sub-features as well
- **force** (*Optional[bool]*) -- if the feature is installed but one of its sub-features are not installed set this to True to force the installation of the sub-features
- **source** (*Optional[str]*) -- Path to the source files if missing from the target system. None means that the system will use windows update services to find the required files. Default is None
- **restart** (*Optional[bool]*) -- Restarts the computer when installation is complete, if required by the role/feature installed. Default is False
- **exclude** (*Optional[str]*) -- The name of the feature to exclude when installing the named feature.

**restart:** Restarts the computer when installation is complete, if restarting is required by the role feature installed.

---

**Note:** Some features require reboot after un/installation. If so, until the server is restarted other features can not be installed!

---

#### Example

Run `salt MinionName win_servermanager.list_available` to get a list of available roles and features. Use the name in the right column. Do not use the role or feature names mentioned in the PKGMGR documentation. In this example for IIS-WebServerRole the name to be used is Web-Server.

```
ISWebserverRole:
  win_servermanager.installed:
    - force: True
    - recurse: True
    - name: Web-Server
```

`salt.states.win_servermanager.removed`(*name*, *remove\_payload=False*, *restart=False*)

Remove the windows feature

#### Parameters

- **name** (*str*) -- Short name of the feature (the right column in `win_servermanager.list_available`)
- **remove\_payload** (*Optional[bool]*) -- True will case the feature to be removed from the side-by-side store
- **restart** (*Optional[bool]*) -- Restarts the computer when uninstall is complete, if required by the role/feature removed. Default is False

---

**Note:** Some features require a reboot after uninstallation. If so the feature will not be completely uninstalled until the server is restarted.

---

### Example

Run `salt MinionName win_servermanager.list_installed` to get a list of all features installed. Use the top name listed for each feature, not the indented one. Do not use the role or feature names mentioned in the PKGMGR documentation.

```
ISWebserverRole:
  win_servermanager.removed:
    - name: Web-Server
```

## 14.17.270 salt.states.win\_smtp\_server module

Module for managing IIS SMTP server configuration on Windows servers.

`salt.states.win_smtp_server.active_log_format` (*name*, *log\_format*, *server*='SmtpSvc/1')

Manage the active log format for the SMTP server.

#### Parameters

- **log\_format** (*str*) -- The log format name.
- **server** (*str*) -- The SMTP server name.

Example of usage:

```
smtp-log-format:
  win_smtp_server.active_log_format:
    - log_format: Microsoft IIS Log File Format
```

`salt.states.win_smtp_server.connection_ip_list` (*name*, *addresses*=None, *grant\_by\_default*=False, *server*='SmtpSvc/1')

Manage IP list for SMTP connections.

#### Parameters

- **addresses** (*str*) -- A dictionary of IP + subnet pairs.
- **grant\_by\_default** (*bool*) -- Whether the addresses should be a blacklist or whitelist.
- **server** (*str*) -- The SMTP server name.

Example of usage for creating a whitelist:

```
smtp-connection-whitelist:
  win_smtp_server.connection_ip_list:
    - addresses:
        127.0.0.1: 255.255.255.255
        172.16.1.98: 255.255.255.255
        172.16.1.99: 255.255.255.255
    - grant_by_default: False
```

Example of usage for creating a blacklist:

```
smtp-connection-blacklist:
  win_smtp_server.connection_ip_list:
    - addresses:
        172.16.1.100: 255.255.255.255
        172.16.1.101: 255.255.255.255
    - grant_by_default: True
```

Example of usage for allowing any source to connect:

```
smtp-connection-blacklist:
  win_smtp_server.connection_ip_list:
    - addresses: {}
    - grant_by_default: True
```

`salt.states.win_smtp_server.relay_ip_list(name, addresses=None, server='SmtSvc/1')`

Manage IP list for SMTP relay connections.

Due to the unusual way that Windows stores the relay IPs, it is advisable to retrieve the existing list you wish to set from a pre-configured server.

For example, setting `127.0.0.1` as an allowed relay IP through the GUI would generate an actual relay IP list similar to the following:

```
['24.0.0.128', '32.0.0.128', '60.0.0.128', '68.0.0.128', '1.0.0.0', '76.0.0.0',
 '0.0.0.0', '0.0.0.0', '1.0.0.0', '1.0.0.0', '2.0.0.0', '2.0.0.0', '4.0.0.0',
 '0.0.0.0', '76.0.0.128', '0.0.0.0', '0.0.0.0', '0.0.0.0', '0.0.0.0',
 '255.255.255.255', '127.0.0.1']
```

**Note:** Setting the list to None corresponds to the restrictive `Only the list below` GUI parameter with an empty access list configured, and setting an empty list/tuple corresponds to the more permissive `All except the list below` GUI parameter.

#### Parameters

- **addresses** (*str*) -- A list of the relay IPs. The order of the list is important.
- **server** (*str*) -- The SMTP server name.

Example of usage:

```
smtp-relay-list:
  win_smtp_server.relay_ip_list:
    - addresses:
      - 24.0.0.128
      - 32.0.0.128
      - 60.0.0.128
      - 1.0.0.0
      - 76.0.0.0
      - 0.0.0.0
      - 0.0.0.0
      - 1.0.0.0
      - 1.0.0.0
      - 2.0.0.0
      - 2.0.0.0
      - 4.0.0.0
      - 0.0.0.0
      - 76.0.0.128
      - 0.0.0.0
      - 0.0.0.0
      - 0.0.0.0
      - 0.0.0.0
      - 255.255.255.255
      - 127.0.0.1
```

Example of usage for disabling relaying:

```
smtp-relay-list:
  win_smtp_server.relay_ip_list:
    - addresses: None
```

Example of usage for allowing relaying from any source:

```
smtp-relay-list:
  win_smtp_server.relay_ip_list:
    - addresses: []
```

`salt.states.win_smtp_server.server_setting(name, settings=None, server='SmtpSvc/1')`  
Ensure the value is set for the specified setting.

---

**Note:** The setting names are case-sensitive.

---

#### Parameters

- **settings** (*str*) -- A dictionary of the setting names and their values.
- **server** (*str*) -- The SMTP server name.

Example of usage:

```
smtp-settings:
  win_smtp_server.server_setting:
    - settings:
      LogType: 1
      LogFilePeriod: 1
      MaxMessageSize: 16777216
      MaxRecipients: 10000
      MaxSessionSize: 16777216
```

### 14.17.271 salt.states.win\_snmp module

Module for managing SNMP service settings on Windows servers.

`salt.states.win_snmp.agent_settings(name, contact, location, services=None)`  
Manage the SNMP sysContact, sysLocation, and sysServices settings.

#### Parameters

- **contact** (*str*) -- The SNMP contact.
- **location** (*str*) -- The SNMP location.
- **services** (*str*) -- A list of selected services.

Example of usage:

```
snmp-agent-settings:
  win_snmp.agent_settings:
    - contact: Test Contact
    - location: Test Location
    - services:
      - Physical
      - Internet
```

`salt.states.win_snmp.auth_traps_enabled(name, status=True)`  
Manage the sending of authentication traps.

**Parameters** **status** (*bool*) -- The enabled status.

Example of usage:

```
snmp-auth-traps:
  win_snmp.auth_traps_enabled:
    - status: True
```

`salt.states.win_snmp.community_names` (*name*, *communities=None*)

Manage the SNMP accepted community names and their permissions.

**Parameters** **communities** (*str*) -- A dictionary of SNMP communities and permissions.

Example of usage:

```
snmp-community-names:
  win_snmp.community_names:
    - communities:
      TestCommunity: Read Only
      OtherCommunity: Read Write
```

### 14.17.272 salt.states.win\_system

#### Management of Windows system information

New in version 2014.1.0.

This state is used to manage system information such as the computer name and description.

```
ERIK-WORKSTATION:
  system.computer_name: []

This is Erik's computer, don't touch!:
  system.computer_desc: []
```

`salt.states.win_system.computer_desc` (*name*)

Manage the computer's description field

**name** The desired computer description

`salt.states.win_system.computer_name` (*name*)

Manage the computer's name

**name** The desired computer name

`salt.states.win_system.hostname` (*name*)

New in version 2016.3.0.

Manage the hostname of the computer

**name** The hostname to set

`salt.states.win_system.join_domain` (*name*, *username=None*, *password=None*, *account\_ou=None*, *account\_exists=False*, *restart=False*)

Checks if a computer is joined to the Domain. If the computer is not in the Domain, it will be joined.

**name:** The name of the Domain.

**username:** Username of an account which is authorized to join computers to the specified domain. Need to be either fully qualified like `user@domain.tld` or simply `user`.

**password:** Password of the account to add the computer to the Domain.

**account\_ou:** The DN of the OU below which the account for this computer should be created when joining the domain, e.g. `ou=computers,ou=departm_432,dc=my-company,dc=com`.

**account\_exists:** Needs to be set to True to allow re-using an existing computer account.

**restart:** Needs to be set to True to restart the computer after a successful join.

`salt.states.win_system.reboot`(*name*, *message=None*, *timeout=5*, *force\_close=True*, *in\_seconds=False*, *only\_on\_pending\_reboot=True*)

Reboot the computer

**Parameters**

- **message** (*str*) -- An optional message to display to users. It will also be used as a comment in the event log entry.

The default value is None.

- **timeout** (*int*) -- The number of minutes or seconds before a reboot will occur. Whether this number represents minutes or seconds depends on the value of `in_seconds`.

The default value is 5.

- **in\_seconds** (*bool*) -- If this is True, the value of `timeout` will be treated as a number of seconds. If this is False, the value of `timeout` will be treated as a number of minutes.

The default value is False.

- **force\_close** (*bool*) -- If this is True, running applications will be forced to close without warning. If this is False, running applications will not get the opportunity to prompt users about unsaved data.

The default value is True.

- **only\_on\_pending\_reboot** (*bool*) -- If this is True, the reboot will only occur if the system reports a pending reboot. If this is False, the reboot will always occur.

The default value is True.

`salt.states.win_system.shutdown`(*name*, *message=None*, *timeout=5*, *force\_close=True*, *reboot=False*, *in\_seconds=False*, *only\_on\_pending\_reboot=False*)

Shutdown the computer

**Parameters**

- **message** (*str*) -- An optional message to display to users. It will also be used as a comment in the event log entry.

The default value is None.

- **timeout** (*int*) -- The number of minutes or seconds before a shutdown will occur. Whether this number represents minutes or seconds depends on the value of `in_seconds`.

The default value is 5.

- **in\_seconds** (*bool*) -- If this is True, the value of `timeout` will be treated as a number of seconds. If this is False, the value of `timeout` will be treated as a number of minutes.

The default value is False.

- **force\_close** (*bool*) -- If this is True, running applications will be forced to close without warning. If this is False, running applications will not get the opportunity to prompt users about unsaved data.

The default value is True.

- **reboot** (*bool*) -- If this is True, the computer will restart immediately after shutting down. If False the system flushes all caches to disk and safely powers down the system.

The default value is False.

- **only\_on\_pending\_reboot** (*bool*) -- If this is True, the shutdown will only occur if the system reports a pending reboot. If this is False, the shutdown will always occur.

The default value is False.

### 14.17.273 salt.states.win\_update

#### Management of the windows update agent

This module is being deprecated and will be removed in Salt Fluorine. Please use the `win_wua` state module instead.

New in version 2014.7.0.

Set windows updates to run by category. Default behavior is to install all updates that do not require user interaction to complete.

Optionally set `category` to a category of your choice to only install certain updates. Default is to set to install all available updates.

The following example will install all Security and Critical Updates, and download but not install standard updates.

```
updates:
  win_update.installed:
    - categories:
      - 'Critical Updates'
      - 'Security Updates'
    - skips:
      - downloaded
  win_update.downloaded:
    - categories:
      - 'Updates'
    - skips:
      - downloaded
```

You can also specify a number of features about the update to have a fine grain approach to specific types of updates. These are the following features/states of updates available for configuring:

```
'UI' - User interaction required, skipped by default
'downloaded' - Already downloaded, included by default
'present' - Present on computer, skipped by default
'installed' - Already installed, skipped by default
'reboot' - Reboot required, included by default
'hidden' - Skip updates that have been hidden, skipped by default
'software' - Software updates, included by default
'driver' - driver updates, included by default
```

The following example installs all driver updates that don't require a reboot: .. code-block:: yml

```
gryffindor:
  win_update.installed:
    • skips: - driver: True - software: False - reboot: False
```

To just update your windows machine, add this your sls:

```
updates:
  win_update.installed
```

`salt.states.win_update.downloaded` (*name*, *categories=None*, *skips=None*, *retries=10*)  
Cache updates for later install.

**name:** if categories is left empty, it will be assumed that you are passing the category option through the name. These are separate because you can only have one name, but can have multiple categories.

**categories:** the list of categories to be downloaded. These are simply strings in the update's information, so there is no enumeration of the categories available. Some known categories:

```
Updates
Windows 7
Critical Updates
Security Updates
Update Rollups
```

**skips:** a list of features of the updates to cull by. Available features:

```
'UI' - User interaction required, skipped by default
'downloaded' - Already downloaded, skipped by default (downloading)
'present' - Present on computer, included by default (installing)
'installed' - Already installed, skipped by default
'reboot' - Reboot required, included by default
'hidden' - skip those updates that have been hidden.
'software' - Software updates, included by default
'driver' - driver updates, skipped by default
```

**retries** Number of retries to make before giving up. This is total, not per step.

`salt.states.win_update.installed` (*name, categories=None, skips=None, retries=10*)

Install specified windows updates.

**name:** if categories is left empty, it will be assumed that you are passing the category option through the name. These are separate because you can only have one name, but can have multiple categories.

**categories:** the list of categories to be downloaded. These are simply strings in the update's information, so there is no enumeration of the categories available. Some known categories:

```
Updates
Windows 7
Critical Updates
Security Updates
Update Rollups
```

**skips:** a list of features of the updates to cull by. Available features:

```
'UI' - User interaction required, skipped by default
'downloaded' - Already downloaded, skipped by default (downloading)
'present' - Present on computer, included by default (installing)
'installed' - Already installed, skipped by default
'reboot' - Reboot required, included by default
'hidden' - skip those updates that have been hidden.
'software' - Software updates, included by default
'driver' - driver updates, skipped by default
```

**retries** Number of retries to make before giving up. This is total, not per step.

### 14.17.274 `salt.states.win_wua` module

Installation of Windows Updates using the Windows Update Agent

New in version 2017.7.0.

Salt can manage Windows updates via the `win_wua` state module. Updates can be installed and removed. Update management declarations are as follows:

For installation:

```
# Install a single update using the KB
KB3194343:
  wua.installed

# Install a single update using the name parameter
install_update:
  wua.installed:
    - name: KB3194343

# Install multiple updates using the updates parameter and a combination of
# KB number and GUID
install_updates:
  wua.installed:
    - updates:
      - KB3194343
      - bb1dbb26-3fb6-45fd-bb05-e3c8e379195c
```

For removal:

```
# Remove a single update using the KB
KB3194343:
  wua.removed

# Remove a single update using the name parameter
remove_update:
  wua.removed:
    - name: KB3194343

# Remove multiple updates using the updates parameter and a combination of
# KB number and GUID
remove_updates:
  wua.removed:
    - updates:
      - KB3194343
      - bb1dbb26-3fb6-45fd-bb05-e3c8e379195c
```

`salt.states.win_wua.installed`(*name*, *updates=None*)

Ensure Microsoft Updates are installed. Updates will be downloaded if needed.

#### Parameters

- **name** (*str*) -- The identifier of a single update to install.
- **updates** (*list*) -- A list of identifiers for updates to be installed.
- **name. Default is None. (Overrides)** --

---

**Note:** Identifiers can be the GUID, the KB number, or any part of the Title of the Microsoft update. GUIDs and KBs are the preferred method to ensure you're installing the correct update.

---

**Warning:** Using a partial KB number or a partial Title could result in more than one update being installed.

**Returns** A dictionary containing the results of the update

**Return type** `dict`

CLI Example:

```

# using a GUID
install_update:
  wua.installed:
    - name: 28cf1b09-2b1a-458c-9bd1-971d1b26b211

# using a KB
install_update:
  wua.installed:
    - name: KB3194343

# using the full Title
install_update:
  wua.installed:
    - name: Security Update for Adobe Flash Player for Windows 10 Version 1607
      ↪(for x64-based Systems) (KB3194343)

# Install multiple updates
install_updates:
  wua.installed:
    - name:
      - KB3194343
      - 28cf1b09-2b1a-458c-9bd1-971d1b26b211

```

`salt.states.win_wua.removed`(*name*, *updates=None*)

Ensure Microsoft Updates are uninstalled.

#### Parameters

- **name** (*str*) -- The identifier of a single update to uninstall.
- **updates** (*list*) -- A list of identifiers for updates to be removed.
- **name. Default is None.** (*Overrides*) --

**Note:** Identifiers can be the GUID, the KB number, or any part of the Title of the Microsoft update. GUIDs and KBs are the preferred method to ensure you're uninstalling the correct update.

**Warning:** Using a partial KB number or a partial Title could result in more than one update being removed.

**Returns** A dictionary containing the results of the removal

**Return type** `dict`

CLI Example:

```

# using a GUID
uninstall_update:
  wua.removed:
    - name: 28cf1b09-2b1a-458c-9bd1-971d1b26b211

# using a KB
uninstall_update:
  wua.removed:
    - name: KB3194343

# using the full Title
uninstall_update:
  wua.removed:
    - name: Security Update for Adobe Flash Player for Windows 10 Version 1607
      ↪(for x64-based Systems) (KB3194343)

```

```
# Install multiple updates
uninstall_updates:
  wua.removed:
    - updates:
      - KB3194343
      - 28cf1b09-2b1a-458c-9bd1-971d1b26b211
```

### 14.17.275 salt.states.winrepo

Manage Windows Package Repository

`salt.states.winrepo.genrepo` (*name*, *force=False*, *allow\_empty=False*)

Refresh the winrepo.p file of the repository (salt-run winrepo.genrepo)

If *force* is True no checks will be made and the repository will be generated if *allow\_empty* is True then the state will not return an error if there are 0 packages,

---

**Note:** This state only loads on minions that have the roles: `salt-master` grain set.

---

Example:

```
winrepo:
  winrepo.genrepo
```

### 14.17.276 salt.states.x509

Manage X509 Certificates

New in version 2015.8.0.

**depends** M2Crypto

This module can enable managing a complete PKI infrastructure including creating private keys, CA's, certificates and CRLs. It includes the ability to generate a private key on a server, and have the corresponding public key sent to a remote CA to create a CA signed certificate. This can be done in a secure manner, where private keys are always generated locally and never moved across the network.

Here is a simple example scenario. In this example `ca` is the ca server, and `www` is a web server that needs a certificate signed by `ca`.

For remote signing, peers must be permitted to remotely call the `sign_remote_certificate` function.

`/etc/salt/master.d/peer.conf`

```
peer:
  .*:
    - x509.sign_remote_certificate
```

`/srv/salt/top.sls`

```
base:
  '*':
    - cert
  'ca':
```

```
- ca
'www':
- www
```

This state creates the CA key, certificate and signing policy. It also publishes the certificate to the mine where it can be easily retrieved by other minions.

/srv/salt/ca.sls

```
salt-minion:
  service.running:
    - enable: True
    - listen:
      - file: /etc/salt/minion.d/signing_policies.conf

/etc/salt/minion.d/signing_policies.conf:
  file.managed:
    - source: salt://signing_policies.conf

/etc/pki:
  file.directory: []

/etc/pki/issued_certs:
  file.directory: []

/etc/pki/ca.crt:
  x509.certificate_managed:
    - signing_private_key: /etc/pki/ca.key
    - CN: ca.example.com
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - basicConstraints: "critical CA:true"
    - keyUsage: "critical cRLSign, keyCertSign"
    - subjectKeyIdentifier: hash
    - authorityKeyIdentifier: keyid,issuer:always
    - days_valid: 3650
    - days_remaining: 0
    - backup: True
    - managed_private_key:
      name: /etc/pki/ca.key
      bits: 4096
      backup: True
    - require:
      - file: /etc/pki

mine.send:
  module.run:
    - func: x509.get_pem_entries
    - kwargs:
      glob_path: /etc/pki/ca.crt
    - onchanges:
      - x509: /etc/pki/ca.crt
```

The signing policy defines properties that override any property requested or included in a CRL. It also can define a restricted list of minions which are allowed to remotely invoke this signing policy.

/srv/salt/signing\_policies.conf

```
x509_signing_policies:
  www:
    - minions: 'www'
    - signing_private_key: /etc/pki/ca.key
    - signing_cert: /etc/pki/ca.crt
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - basicConstraints: "critical CA:false"
    - keyUsage: "critical keyEncipherment"
    - subjectKeyIdentifier: hash
    - authorityKeyIdentifier: keyid,issuer:always
    - days_valid: 90
    - copypath: /etc/pki/issued_certs/
```

This state will instruct all minions to trust certificates signed by our new CA. Using Jinja to strip newlines from the text avoids dealing with newlines in the rendered yml, and the `sign_remote_certificate` state will handle properly formatting the text before writing the output.

/srv/salt/cert.sls

```
/usr/local/share/ca-certificates:
  file.directory: []

/usr/local/share/ca-certificates/intca.crt:
  x509.pem_managed:
    - text: {{ salt['mine.get']('ca', 'x509.get_pem_entries')['ca']['/etc/pki/ca.crt
→']|replace('\n', '') }}
```

This state creates a private key then requests a certificate signed by ca according to the www policy.

/srv/salt/www.sls

```
/etc/pki/www.crt:
  x509.certificate_managed:
    - ca_server: ca
    - signing_policy: www
    - public_key: /etc/pki/www.key
    - CN: www.example.com
    - days_remaining: 30
    - backup: True
    - managed_private_key:
      name: /etc/pki/www.key
      bits: 4096
      backup: True
```

`salt.states.x509.certificate_managed`(*name*, *days\_remaining*=90, *managed\_private\_key*=None, *append\_certs*=None, *\*\*kwargs*)

Manage a Certificate

**name:** Path to the certificate

**days\_remaining:** The minimum number of days remaining when the certificate should be recreated. Default is 90. A value of 0 disables automatic renewal.

**managed\_private\_key:** Manages the private key corresponding to the certificate. All of the arguments supported by `:state: x509.private_key_managed <salt.states.x509.private_key_managed>` are supported. If *name* is not specified or is the same as the name of the certificate, the private key and certificate will be written together in the same file.

**append\_certs:** A list of certificates to be appended to the managed file.

**kwargs:** Any arguments supported by `x509.create_certificate` or `:state:`file.managed` <salt.states.file.managed>` are supported.

**Examples:**

```
/etc/pki/ca.crt:
  x509.certificate_managed:
    - signing_private_key: /etc/pki/ca.key
    - CN: ca.example.com
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - basicConstraints: "critical CA:true"
    - keyUsage: "critical cRLSign, keyCertSign"
    - subjectKeyIdentifier: hash
    - authorityKeyIdentifier: keyid,issuer:always
    - days_valid: 3650
    - days_remaining: 0
    - backup: True
```

```
/etc/ssl/www.crt:
  x509.certificate_managed:
    - ca_server: pki
    - signing_policy: www
    - public_key: /etc/ssl/www.key
    - CN: www.example.com
    - days_valid: 90
    - days_remaining: 30
    - backup: True
```

`salt.states.x509.crl_managed`(*name*, *signing\_private\_key*, *signing\_private\_key\_passphrase*=None, *signing\_cert*=None, *revoked*=None, *days\_valid*=100, *digest*='', *days\_remaining*=30, *include\_expired*=False, *\*\*kwargs*)

Manage a Certificate Revocation List

**name:** Path to the certificate

**signing\_private\_key:** The private key that will be used to sign this crl. This is usually your CA's private key.

**signing\_private\_key\_passphrase:** Passphrase to decrypt the private key.

**signing\_cert:** The certificate of the authority that will be used to sign this crl. This is usually your CA's certificate.

**revoked:** A list of certificates to revoke. Must include either a serial number or a the certificate itself. Can optionally include the revocation date and notAfter date from the certificate. See example below for details.

**days\_valid:** The number of days the certificate should be valid for. Default is 100.

**digest:** The digest to use for signing the CRL. This has no effect on versions of pyOpenSSL less than 0.14

**days\_remaining:** The crl should be automatically recreated if there are less than `days_remaining` days until the crl expires. Set to 0 to disable automatic renewal. Default is 30.

**include\_expired:** Include expired certificates in the CRL. Default is False.

**kwargs:** Any arguments supported by `:state:`file.managed` <salt.states.file.managed>` are supported.

**Example:**

```
/etc/pki/ca.crl:
  x509.crl_managed:
    - signing_private_key: /etc/pki/myca.key
    - signing_cert: /etc/pki/myca.crt
    - revoked:
      - compromised_Web_key:
        - certificate: /etc/pki/certs/badweb.crt
        - revocation_date: 2015-03-01 00:00:00
```

```

- reason: keyCompromise
- terminated_vpn_user:
- serial_number: D6:D2:DC:D8:4D:5C:C0:F4
- not_after: 2016-01-01 00:00:00
- revocation_date: 2015-02-25 00:00:00
- reason: cessationOfOperation

```

`salt.states.x509.csr_managed(name, **kwargs)`

Manage a Certificate Signing Request

**name:** Path to the CSR

**properties:** The properties to be added to the certificate request, including items like subject, extensions and public key. See above for valid properties.

**kwargs:** Any arguments supported by `:state:file.managed <salt.states.file.managed>` are supported.

Example:

```

/etc/pki/mycert.csr:
  x509.csr_managed:
    - private_key: /etc/pki/mycert.key
    - CN: www.example.com
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - keyUsage: 'critical dataEncipherment'

```

`salt.states.x509.pem_managed(name, text, backup=False, **kwargs)`

Manage the contents of a PEM file directly with the content in text, ensuring correct formatting.

**name:** The path to the file to manage

**text:** The PEM formatted text to write.

**kwargs:** Any arguments supported by `:state:file.managed <salt.states.file.managed>` are supported.

`salt.states.x509.private_key_managed(name, bits=2048, passphrase=None, cipher='aes_128_cbc', new=False, overwrite=False, verbose=True, **kwargs)`

Manage a private key's existence.

**name:** Path to the private key

**bits:** Key length in bits. Default 2048.

**passphrase:** Passphrase for encrypting the private key.

**cipher:** Cipher for encrypting the private key.

**new:** Always create a new key. Defaults to False. Combining new with `prereq`, or when used as part of a `managed_private_key` can allow key rotation whenever a new certificate is generated.

**overwrite:** Overwrite an existing private key if the provided passphrase cannot decrypt it.

**verbose:** Provide visual feedback on stdout, dots while key is generated. Default is True.

New in version 2016.11.0.

**kwargs:** Any kwargs supported by `file.managed` are supported.

Example:

The jinja templating in this example ensures a private key is generated if the file doesn't exist and that a new private key is generated whenever the certificate that uses it is to be renewed.

```

/etc/pki/www.key:
  x509.private_key_managed:
    - bits: 4096
    - new: True
    {% if salt['file.file_exists']('/etc/pki/ca.key') -%}
    - prereq:
      - x509: /etc/pki/www.crt

```

```
{%- endif %}
```

### 14.17.277 salt.states.xmpp

#### Sending Messages over XMPP

New in version 2014.1.0.

This state is useful for firing messages during state runs, using the XMPP protocol

```
server-warning-message:
  xmpp.send_msg:
    - name: 'This is a server warning message'
    - profile: my-xmpp-account
    - recipient: admins@xmpp.example.com/salt
```

`salt.states.xmpp.send_msg` (*name, recipient, profile*)  
Send a message to an XMPP user

```
server-warning-message:
  xmpp.send_msg:
    - name: 'This is a server warning message'
    - profile: my-xmpp-account
    - recipient: admins@xmpp.example.com/salt
```

**name** The message to send to the XMPP user

`salt.states.xmpp.send_msg_multi` (*name, profile, recipients=None, rooms=None*)  
Send a message to an list of recipients or rooms

```
server-warning-message:
  xmpp.send_msg:
    - name: 'This is a server warning message'
    - profile: my-xmpp-account
    - recipients:
      - admins@xmpp.example.com/salt
    - rooms:
      - qa@conference.xmpp.example.com
```

**name** The message to send to the XMPP user

### 14.17.278 salt.states.zabbix\_host module

Management of Zabbix hosts.

**codeauthor** Jiri Kotlin <jiri.kotlin@ultimum.io>

`salt.states.zabbix_host.absent` (*name, \*\*kwargs*)  
Ensures that the host does not exists, eventually deletes host.

New in version 2016.3.0.

**Param** name: technical name of the host

**Parameters**

- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)

- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
TestHostWithInterfaces:
  zabbix_host.absent
```

`salt.states.zabbix_host.assign_templates` (*host, templates, \*\*kwargs*)

Ensures that templates are assigned to the host.

New in version 2017.7.0.

#### Parameters

- **host** -- technical name of the host
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
add_zabbix_templates_to_host:
  zabbix_host.assign_templates:
    - host: TestHost
    - templates:
      - "Template OS Linux"
      - "Template App MySQL"
```

`salt.states.zabbix_host.present` (*host, groups, interfaces, \*\*kwargs*)

Ensures that the host exists, eventually creates new host. NOTE: please use argument `visible_name` instead of `name` to not mess with name from salt sls. This function accepts all standard host properties: keyword argument names differ depending on your zabbix version, see: <https://www.zabbix.com/documentation/2.4/manual/api/reference/host/object#host>

New in version 2016.3.0.

#### Parameters

- **host** -- technical name of the host
- **groups** -- groupids of host groups to add the host to
- **interfaces** -- interfaces to be created for the host
- **proxy\_host** -- Optional proxy name or proxyid to monitor host
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)
- **visible\_name** -- Optional - string with visible name of the host, use `'visible_name'` instead of `'name'` parameter to not mess with value supplied from Salt sls file.

```
create_test_host:
  zabbix_host.present:
    - host: TestHostWithInterfaces
    - proxy_host: 12345
    - groups:
      - 5
      - 6
      - 7
```

```

- interfaces:
  - test1.example.com:
    - ip: '192.168.1.8'
    - type: 'Agent'
    - port: 92
  - testing2_create:
    - ip: '192.168.1.9'
    - dns: 'test2.example.com'
    - type: 'agent'
    - main: false
  - testovacil_ipmi:
    - ip: '192.168.100.111'
    - type: 'ipmi'

```

### 14.17.279 salt.states.zabbix\_hostgroup module

Management of Zabbix host groups.

**codeauthor** Jiri Kotlin <jiri.kotlin@ultimum.io>

`salt.states.zabbix_hostgroup.absent`(*name*, *\*\*kwargs*)

Ensures that the host group does not exist, eventually delete host group.

New in version 2016.3.0.

#### Parameters

- **name** -- name of the host group
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```

delete_testing_host_group:
  zabbix_hostgroup.absent:
    - name: 'My hostgroup name'

```

`salt.states.zabbix_hostgroup.present`(*name*, *\*\*kwargs*)

Ensures that the host group exists, eventually creates new host group.

New in version 2016.3.0.

#### Parameters

- **name** -- name of the host group
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```

create_testing_host_group:
  zabbix_hostgroup.present:
    - name: 'My hostgroup name'

```

### 14.17.280 salt.states.zabbix\_mediatype module

Management of Zabbix mediatypes.

**codeauthor** Raymond Kuiper <qix@the-wired.net>

`salt.states.zabbix_mediatype.absent` (*name*, *\*\*kwargs*)

Ensures that the mediatype does not exist, eventually deletes the mediatype.

#### Parameters

- **name** -- name of the mediatype
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
delete_mediatype:
  zabbix_mediatype.absent:
    - name: 'Email'
```

`salt.states.zabbix_mediatype.present` (*name*, *mediatype*, *\*\*kwargs*)

Creates new mediatype. NOTE: This function accepts all standard mediatype properties: keyword argument names differ depending on your zabbix version, see: [https://www.zabbix.com/documentation/3.0/manual/api/reference/host/object#host\\_inventory](https://www.zabbix.com/documentation/3.0/manual/api/reference/host/object#host_inventory)

#### Parameters

- **name** -- name of the mediatype
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
make_new_mediatype:
  zabbix_mediatype.present:
    - name: 'Email'
    - mediatype: 0
    - smtp_server: smtp.example.com
    - smtp_hello: zabbix.example.com
    - smtp_email: zabbix@example.com
```

### 14.17.281 salt.states.zabbix\_user module

Management of Zabbix users.

**codeauthor** Jiri Kotlin <jiri.kotlin@ultimum.io>

`salt.states.zabbix_user.absent` (*name*, *\*\*kwargs*)

Ensures that the user does not exist, eventually delete user.

New in version 2016.3.0.

#### Parameters

- **name** -- user alias
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)

- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
George:
  zabbix_user.absent
```

`salt.states.zabbix_user.present` (*alias, passwd, usrgrps, medias, password\_reset=False, \*\*kwargs*)

Ensures that the user exists, eventually creates new user. NOTE: use argument `firstname` instead of `name` to not mess values with `name` from salt sls.

New in version 2016.3.0.

#### Parameters

- **alias** -- user alias
- **passwd** -- user's password
- **usrgrps** -- user groups to add the user to
- **medias** -- user's medias to create
- **password\_reset** -- whether or not to reset password at update
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)
- **firstname** -- string with firstname of the user, use `'firstname'` instead of `'name'` parameter to not mess with value supplied from Salt sls file.

```
make_user:
  zabbix_user.present:
    - alias: George
    - passwd: donottellanyonE@456x
    - password_reset: True
    - usrgrps:
      - 13
      - 7
    - medias:
      - me@example.com:
          - mediatype: mail
          - period: '1-7,00:00-24:00'
          - severity: NIWAHD
      - make_jabber:
          - active: true
          - mediatype: jabber
          - period: '1-5,08:00-19:00'
          - sendto: jabbera@example.com
      - text_me_morning_disabled:
          - active: false
          - mediatype: sms
          - period: '1-5,09:30-10:00'
          - severity: D
          - sendto: '+42032132588568'
```

### 14.17.282 salt.states.zabbix\_usergroup module

Management of Zabbix user groups.

**codeauthor** Jiri Kotlin <jiri.kotlin@ultimum.io>

`salt.states.zabbix_usergroup.absent` (*name*, *\*\*kwargs*)

Ensures that the user group does not exist, eventually delete user group.

New in version 2016.3.0.

#### Parameters

- **name** -- name of the user group
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
delete_thai_monks_usrgrp:
  zabbix_usergroup.absent:
    - name: 'Thai monks'
```

`salt.states.zabbix_usergroup.present` (*name*, *\*\*kwargs*)

Creates new user group. NOTE: This function accepts all standard user group properties: keyword argument names differ depending on your zabbix version, see: [https://www.zabbix.com/documentation/2.0/manual/appendix/api/usergroup/definitions#user\\_group](https://www.zabbix.com/documentation/2.0/manual/appendix/api/usergroup/definitions#user_group)

New in version 2016.3.0.

#### Parameters

- **name** -- name of the user group
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
make_new_thai_monks_usergroup:
  zabbix_usergroup.present:
    - name: 'Thai monks'
    - gui_access: 1
    - debug_mode: 0
    - users_status: 0
```

## 14.17.283 salt.states.zcbuildout

### Management of zc.buildout

This module is inspired from minitage's buildout maker (<https://github.com/minitage/minitage/blob/master/src/minitage/core/makers/buildout.py>)

New in version 2016.3.0.

---

**Note:** This state module is beta; the API is subject to change and no promise as to performance or functionality is yet present

---

## Available Functions

- built

```
installed1
  buildout.installed:
    - name: /path/to/buildout

installed2
  buildout.installed:
    - name: /path/to/buildout
    - parts:
      - a
      - b
    - python: /path/to/pythonpath/bin/python
    - unless: /bin/test_something_installed
    - onlyif: /bin/test_else_installed
```

`salt.states.zcbuildout.installed`(*name*, *config*='buildout.cfg', *quiet*=False, *parts*=None, *user*=None, *env*=(), *buildout\_ver*=None, *test\_release*=False, *distribute*=None, *new\_st*=None, *offline*=False, *newest*=False, *python*='/usr/bin/python', *debug*=False, *verbose*=False, *unless*=None, *onlyif*=None, *use\_vt*=False, *loglevel*='debug', *\*\*kwargs*)

Install buildout in a specific directory

It is a thin wrapper to `modules.buildout.buildout`

**name** directory to execute in

**quiet**

do not output console & logs

**config** buildout config to use (default: buildout.cfg)

**parts** specific buildout parts to run

**user** user used to run buildout as

New in version 2014.1.4.

**env** environment variables to set when running

**buildout\_ver** force a specific buildout version (1 | 2)

**test\_release** buildout accept test release

**new\_st** Forcing use of `setuptools >= 0.7`

**distribute** use distribute over `setuptools` if possible

**offline** does buildout run offline

**python** python to use

**debug** run buildout with `-D` debug flag

**onlyif** Only execute cmd if statement on the host return 0

**unless** Do not execute cmd if statement on the host return 0

**newest** run buildout in newest mode

**verbose** run buildout in verbose mode (`-vvvvv`)

**use\_vt** Use the new salt VT to stream output [experimental]

**loglevel** loglevel for buildout commands

### 14.17.284 salt.states.zenoss

State to manage monitoring in Zenoss.

New in version 2016.3.0.

This state module depends on the `zenoss` Salt execution module.

Allows for setting a state of minions in Zenoss using the Zenoss API. Currently Zenoss 4.x is supported.

```
enable_monitoring:
  zenoss.monitored:
    - name: web01.example.com
    - device_class: /Servers/Linux
    - collector: localhost
    - prod_state: 1000
```

`salt.states.zenoss.monitored`(*name*, *device\_class*=None, *collector*='localhost', *prod\_state*=None)  
Ensure a device is monitored. The `name` given will be used for Zenoss device name and should be resolvable.

```
enable_monitoring:
  zenoss.monitored:
    - name: web01.example.com
    - device_class: /Servers/Linux
    - collector: localhost
    - prod_state: 1000
```

#### 14.17.285 salt.states.zk\_concurrency

##### Control concurrency of steps within state execution using zookeeper

This module allows you to "wrap" a state's execution with concurrency control. This is useful to protect against all hosts executing highstate simultaneously if your services don't all HUP restart. The common way of protecting against this is to run in batch mode, but that doesn't protect from another person running the same batch command (and thereby having 2x the number of nodes deploying at once).

This module will block while acquiring a slot, meaning that however the command gets called it will coordinate with zookeeper to ensure that no more than `max_concurrency` steps are executing with a single path.

```
acquire_lock:
  zk_concurrency.lock:
    - name: /trafficserver
    - zk_hosts: 'zookeeper:2181'
    - max_concurrency: 4
    - prereq:
      - service: trafficserver

trafficserver:
  service.running:
    - watch:
      - file: /etc/trafficserver/records.config

/etc/trafficserver/records.config:
  file.managed:
    - source: salt://records.config

release_lock:
  zk_concurrency.unlock:
    - name: /trafficserver
    - require:
      - service: trafficserver
```

This example would allow the file state to change, but would limit the concurrency of the trafficserver service restart to 4.

```
salt.states.zk_concurrency.lock(name, zk_hosts, identifier=None, max_concurrency=1, time-  
                                out=None, ephemeral_lease=False)  
    Block state execution until you are able to get the lock (or hit the timeout)
```

```
salt.states.zk_concurrency.min_party(name, zk_hosts, min_nodes, blocking=False)  
    Ensure that there are min_nodes in the party at name, optionally blocking if not available.
```

```
salt.states.zk_concurrency.unlock(name, zk_hosts=None, identifier=None, max_concurrency=1,  
                                   ephemeral_lease=False)  
    Remove lease from semaphore.
```

### 14.17.286 salt.states.zfs

Management zfs datasets

**maintainer** Jorge Schrauwen <sjorge@blackdot.be>

**maturity** new

**depends** zfs

**platform** smartos, illumos, solaris, freebsd, linux

New in version 2016.3.0.

```
test/shares/yuki:  
  zfs.filesystem_present:  
    - create_parent: true  
    - properties:  
      quota: 16G  
  
test/iscsi/haruhi:  
  zfs.volume_present:  
    - create_parent: true  
    - volume_size: 16M  
    - sparse: true  
    - properties:  
      readonly: on  
  
test/shares/yuki@frozen:  
  zfs.snapshot_present  
  
moka_origin:  
  zfs.hold_present  
    - snapshot: test/shares/yuki@frozen  
  
test/shares/moka:  
  zfs.filesystem_present:  
    - cloned_from: test/shares/yuki@frozen  
  
test/shares/moka@tsukune:  
  zfs.snapshot_absent
```

```
salt.states.zfs.bookmark_absent(name, force=False, recursive=False)  
    ensure bookmark is absent on the system  
name [string] name of snapshot  
force [boolean] try harder to destroy the dataset (zfs destroy -f)
```

**recursive** [boolean] also destroy all the child datasets (zfs destroy -r)

**salt.states.zfs.bookmark\_present**(*name*, *snapshot*)

ensure bookmark exists

**name** [string] name of bookmark

**snapshot** [string] name of snapshot

**salt.states.zfs.filesystem\_absent**(*name*, *force=False*, *recursive=False*)

ensure filesystem is absent on the system

**name** [string] name of filesystem

**force** [boolean] try harder to destroy the dataset (zfs destroy -f)

**recursive** [boolean] also destroy all the child datasets (zfs destroy -r)

**Warning:** If a volume with name exists, this state will succeed without destroying the volume specified by name. This module is dataset type sensitive.

**salt.states.zfs.filesystem\_present**(*name*, *create\_parent=False*, *properties=None*,  
*cloned\_from=None*)

ensure filesystem exists and has properties set

**name** [string] name of filesystem

**create\_parent** [boolean] creates all the non-existing parent datasets. any property specified on the command line using the -o option is ignored.

**cloned\_from** [string] name of snapshot to clone

**properties** [dict] additional zfs properties (-o)

---

**Note:** `cloned_from` is only use if the filesystem does not exist yet, when `cloned_from` is set after the filesystem exists it will be ignored.

---

---

**Note:** Properties do not get cloned, if you specify the properties in the state file they will be applied on a subsequent run.

---

**salt.states.zfs.hold\_absent**(*name*, *snapshot*, *recursive=False*)

ensure hold is absent on the system

**name** [string] name of holdt

**snapshot** [string] name of snapshot

**recursive** [boolean] recursively releases a hold with the given tag on the snapshots of all descendent file systems.

**salt.states.zfs.hold\_present**(*name*, *snapshot*, *recursive=False*)

ensure hold is present on the system

**name** [string] name of holdt

**snapshot** [string] name of snapshot

**recursive** [boolean] recursively add hold with the given tag on the snapshots of all descendent file systems.

**salt.states.zfs.promoted**(*name*)

ensure a dataset is not a clone

**name** [string] name of fileset or volume

**Warning:** only one dataset can be the origin, if you promote a clone the original will now point to the promoted dataset

**salt.states.zfs.scheduled\_snapshot**(*name*, *prefix*, *recursive=True*, *schedule=None*)

maintain a set of snapshots based on a schedule

**name** [string] name of filesystem or volume

**prefix** [string] prefix for the snapshots e.g. 'test' will result in snapshots being named 'test-YYYYMMDD\_HHMM'

**recursive** [boolean] create snapshots for all children also

**schedule** [dict] dict holding the schedule, the following keys are available (minute, hour, day, month, and year) by default all are set to 0 the value indicated the number of snapshots of that type to keep around.

**Warning:** snapshots will only be created and pruned every time the state runs. a schedule must be setup to automatically run the state. this means that if you run the state daily the hourly snapshot will only be made once per day!

`salt.states.zfs.snapshot_absent` (*name*, *force=False*, *recursive=False*)

ensure snapshot is absent on the system

**name** [string] name of snapshot

**force** [boolean] try harder to destroy the dataset (zfs destroy -f)

**recursive** [boolean] also destroy all the child datasets (zfs destroy -r)

`salt.states.zfs.snapshot_present` (*name*, *recursive=False*, *properties=None*)

ensure snapshot exists and has properties set

**name** [string] name of snapshot

**recursive** [boolean] recursively create snapshots of all descendent datasets

**properties** [dict] additional zfs properties (-o)

`salt.states.zfs.volume_absent` (*name*, *force=False*, *recursive=False*)

ensure volume is absent on the system

**name** [string] name of volume

**force** [boolean] try harder to destroy the dataset (zfs destroy -f)

**recursive** [boolean] also destroy all the child datasets (zfs destroy -r)

**Warning:** If a filesystem with name exists, this state will succeed without destroying the filesystem specified by name. This module is dataset type sensitive.

`salt.states.zfs.volume_present` (*name*, *volume\_size*, *sparse=False*, *create\_parent=False*, *properties=None*, *cloned\_from=None*)

ensure volume exists and has properties set

**name** [string] name of volume

**volume\_size** [string] size of volume

**sparse** [boolean] create sparse volume

**create\_parent** [boolean] creates all the non-existing parent datasets. any property specified on the command line using the -o option is ignored.

**cloned\_from** [string] name of snapshot to clone

**properties** [dict] additional zfs properties (-o)

---

**Note:** `cloned_from` is only use if the volume does not exist yet, when `cloned_from` is set after the volume exists it will be ignored.

---

---

**Note:** Properties do not get cloned, if you specify the properties in the state file they will be applied on a subsequent run.

`volume_size` is considered a property, so the volume's size will be corrected when the properties get updated if it differs from the original volume.

The sparse parameter is ignored when using `cloned_from`.

### 14.17.287 salt.states.zone

Management of Solaris Zones

**maintainer** Jorge Schrauwen <[sjorge@blackdot.be](mailto:sjorge@blackdot.be)>

**maturity** new

**depends** salt.modules.zoneadm, salt.modules.zonecfg

**platform** solaris

New in version 2017.7.0.

Bellow are some examples of how to use this state. Lets start with creating a zone and installing it.

```
omipkg1_configuration:
  zone.present:
    - name: omipkg1
    - brand: ipkg
    - zonepath: /zones/omipkg1
    - properties:
      - autoboot: true
      - ip-type: exclusive
      - cpu-shares: 50
    - resources:
      - attr:
          - name: owner
          - value: Jorge Schrauwen
          - type: string
      - attr:
          - name: description
          - value: OmniOS ipkg zone for testing
          - type: string
      - capped-memory:
          - physical: 64M
omipkg1_installation:
  zone.installed:
    - name: omipkg1
    - require:
        - zone: omipkg1_configuration
omipkg1_running:
  zone.booted:
    - name: omipkg1
    - require:
        - zone: omipkg1_installation
```

A zone without network access is not very useful. We could update the `zone.present` state in the example above to add a network interface or we could use a separate state for this.

```
omipkg1_network:
  zone.resource_present:
    - name: omipkg1
    - resource_type: net
    - resource_selector_property: mac-addr
    - resource_selector_value: "02:08:20:a2:a3:10"
```

```
- physical: znic1
- require:
  - zone: omipkg1_configuration
```

Since this is a single tenant system having the owner attribute is pointless. Let's remove that attribute.

---

**Note:** The following state run the omipkg1\_configuration state will add it again! If the entire configuration is managed it would be better to add resource\_prune and optionally the resource\_selector\_property properties to the resource.

---

```
omipkg1_strip_owner:
  zone.resource_present:
    - name: omipkg1
    - resource_type: attr
    - resource_selector_property: name
    - resource_selector_value: owner
    - require:
      - zone: omipkg1_configuration
```

Let's bump the zone's CPU shares a bit.

---

**Note:** The following state run the omipkg1\_configuration state will set it to 50 again. Update the entire zone configuration is managed you should update it there instead.

---

```
omipkg1_more_cpu:
  zone.property_present:
    - name: omipkg1
    - property: cpu-shares
    - value: 100
```

Or we can remove the limit altogether!

---

**Note:** The following state run the omipkg1\_configuration state will set it to 50 again. Update the entire zone configuration is managed you should set the property to None (nothing after the :) instead.

---

```
omipkg1_no_cpu:
  zone.property_absent:
    - name: omipkg1
    - property: cpu-shares
```

**salt.states.zone.absent**(*name*, *uninstall=False*)  
Ensure a zone is absent  
**name** [string] name of the zone  
**uninstall** [boolean] when true, uninstall instead of detaching the zone first.

**salt.states.zone.attached**(*name*, *force=False*)  
Ensure zone is attached  
**name** [string] name of the zone  
**force** [boolean] force attach the zone

**salt.states.zone.booted**(*name*, *single=False*)  
Ensure zone is booted

**name** [string] name of the zone  
**single** [boolean] boot in single usermode

`salt.states.zone.detached(name)`

Ensure zone is detached  
**name** [string] name of the zone

`salt.states.zone.export(name, path, replace=False)`

Export a zones configuration  
**name** [string] name of the zone  
**path** [string] path of file to export too.  
**replace** [boolean] replace the file if it exists

`salt.states.zone.halted(name, graceful=True)`

Ensure zone is halted  
**name** [string] name of the zone  
**graceful** [boolean] use shutdown instead of halt if true

`salt.states.zone.import(name, path, mode='import', nodataset=False, brand_opts=None)`

Import a zones configuration  
**name** [string] name of the zone  
**path** [string] path of the configuration file to import  
**mode** [string] either import, install, or attach  
**nodataset** [boolean] do not create a ZFS file system  
**brand\_opts** [boolean] brand specific options to pass

---

**Note:** The mode argument can be set to `import`, `install`, or `attach`. `import`: will only import the configuration `install`: will import and then try to install the zone `attach`: will import and then try to attach of the zone

---

`salt.states.zone.installed(name, nodataset=False, brand_opts=None)`

Ensure zone is installed  
**name** [string] name of the zone  
**nodataset** [boolean] do not create a ZFS file system  
**brand\_opts** [boolean] brand specific options to pass

`salt.states.zone.present(name, brand, zonepath, properties=None, resources=None)`

Ensure a zone with certain properties and resouces  
**name** [string] name of the zone  
**brand** [string] brand of the zone  
**zonepath** [string] path of the zone  
**properties** [list of key-value pairs] dict of properties  
**resources** [list of key-value pairs] dict of resources

---

**Note:** If the zone does not exist it will not be installed. You can use the `zone.installed` state for this.

---

**Note:**

Default resource selectors:

- fs: dir
- net: mac-addr
- device: match
- rctl: name
- attr: name
- dataset: name

- admin: user
- 

**Warning:** Properties and resource will not be removed when they are absent from the state!

For properties, simple set them to `None`.

For resources, add the `resource\_prune` property and set it to `True`. Also specify the `resource\_selector\_property` if the default is not the one you want.

`salt.states.zone.property_absent(name, property)`

Ensure property is absent

**name** [string] name of the zone

**property** [string] name of property

---

**Note:** This does a zoneacfg clear call. So the property may be reset to a default value! Does has the side effect of always having to be called.

---

`salt.states.zone.property_present(name, property, value)`

Ensure property has a certain value

**name** [string] name of the zone

**property** [string] name of property

**value** [string] value of property

`salt.states.zone.resource_absent(name, resource_type, resource_selector_property, resource_selector_value)`

Ensure resource is absent

**name** [string] name of the zone

**resource\_type** [string] type of resource

**resource\_selector\_property** [string] unique resource identifier

**resource\_selector\_value** [string] value for resource selection

**Warning:** Both resource\_selector\_property and resource\_selector\_value must be provided, some properties like `name` are already reserved by salt in there states.

---

**Note:** You can set both resource\_selector\_property and resource\_selector\_value to None for resources that do not require them.

---

`salt.states.zone.resource_present(name, resource_type, resource_selector_property, resource_selector_value, **kwargs)`

Ensure resource exists with provided properties

**name** [string] name of the zone

**resource\_type** [string] type of resource

**resource\_selector\_property** [string] unique resource identifier

**resource\_selector\_value** [string] value for resource selection

**\*\*kwargs** [string|int|...] resource properties

**Warning:** Both resource\_selector\_property and resource\_selector\_value must be provided, some properties like `name` are already reserved by salt in there states.

---

**Note:** You can set both `resource_selector_property` and `resource_selector_value` to `None` for resources that do not require them.

---

`salt.states.zone.uninstalled`(*name*)

Ensure zone is uninstalled

**name** [string] name of the zone

### 14.17.288 `salt.states.zpool`

Management zpool

**maintainer** Jorge Schrauwen <[sjorge@blackdot.be](mailto:sjorge@blackdot.be)>

**maturity** new

**depends** zpool

**platform** smartos, illumos, solaris, freebsd, linux

New in version 2016.3.0.

```

oldpool:
  zpool.absent:
    - export: true

newpool:
  zpool.present:
    - config:
        import: false
        force: true
    - properties:
        comment: salty storage pool
    - layout:
        mirror-0:
          /dev/disk0
          /dev/disk1
        mirror-1:
          /dev/disk2
          /dev/disk3

partitionpool:
  zpool.present:
    - config:
        import: false
        force: true
    - properties:
        comment: disk partition salty storage pool
        ashift: '12'
        feature@lz4_compress: enabled
    - filesystem_properties:
        compression: lz4
        atime: on
        relatime: on
    - layout:
        - /dev/disk/by-uuid/3e43ce94-77af-4f52-a91b-6cdbb0b0f41b

simplepool:

```

```
zpool.present:
- config:
  import: false
  force: true
- properties:
  comment: another salty storage pool
- layout:
  - /dev/disk0
  - /dev/disk1
```

**Warning:** The layout will never be updated, it will only be used at time of creation. It's a whole lot of work to figure out if a devices needs to be detached, removed, ... this is best done by the sysadmin on a case per case basis.

Filesystem properties are also not updated, this should be managed by the zfs state module.

`salt.states.zpool.absent` (*name*, *export=False*, *force=False*)

ensure storage pool is absent on the system

**name** [string] name of storage pool

**export** [boolean] export instead of destroy the zpool if present

**force** [boolean] force destroy or export

`salt.states.zpool.present` (*name*, *properties=None*, *filesystem\_properties=None*, *layout=None*, *config=None*)

ensure storage pool is present on the system

**name** [string] name of storage pool

**properties** [dict] optional set of properties to set for the storage pool

**filesystem\_properties** [dict] optional set of filesystem properties to set for the storage pool (creation only)

**layout: dict** disk layout to use if the pool does not exist (creation only)

**config** [dict] fine grain control over this state

---

**Note:**

The following configuration properties can be toggled in the `config` parameter.

- `import` (true) - try to import the pool before creating it if absent
- `import_dirs` (None) - specify additional locations to scan for devices on import
- `device_dir` (None, SunOS=/dev/rdisk) - specify device directory to use if not absolute path
- `force` (false) - try to force the import or creation

---

**Note:** Because ID's inside the layout dict must be unique they need to have a suffix.

```
mirror-0:
  /tmp/vdisk3
  /tmp/vdisk2
mirror-1:
  /tmp/vdisk0
  /tmp/vdisk1
```

The above yaml will always result in the following zpool create:

```
zpool create mypool mirror /tmp/vdisk3 /tmp/vdisk2 mirror /tmp/vdisk0 /tmp/vdisk1
```

---

**Warning:** Pay attention to the order of your dict!

```
mirror-0:
  /tmp/vdisk0
  /tmp/vdisk1
  /tmp/vdisk2:
```

The above will result in the following zpool create:

```
zpool create mypool mirror /tmp/vdisk0 /tmp/vdisk1 /tmp/vdisk2
```

Creating a 3-way mirror! While you probably expect it to be mirror root vdev with 2 devices + a root vdev of 1 device!

## 14.18 thorium modules

<i>calc</i>	Used to manage the thorium register.
<i>check</i>	The check Thorium state is used to create gateways to commands, the checks make it easy to make states that watch registers for changes and then just succeed or fail based on the state of the register, this creates the pattern of having a command execution get gated by a check state via a requisite.
<i>file</i>	Writes matches to disk to verify activity, helpful when testing
<i>key</i>	The key Thorium State is used to apply changes to the accepted/rejected/pending keys
<i>local</i>	Run remote execution commands via the local client
<i>reg</i>	Used to manage the thorium register.
<i>runner</i>	React by calling async runners
<i>status</i>	This thorium state is used to track the status beacon events and keep track of
<i>timer</i>	Allow for flow based timers.
<i>wheel</i>	React by calling async runners

### 14.18.1 salt.thorium.calc module

Used to manage the thorium register. The thorium register is where compound values are stored and computed, such as averages etc.

New in version 2016.11.0.

**depends** statistics PyPi module

`salt.thorium.calc.add`(*name*, *num*, *minimum=0*, *maximum=0*, *ref=None*)

Adds together the num most recent values. Requires a list.

USAGE:

```
foo:
  calc.add:
    - name: myregistry
    - num: 5
```

`salt.thorium.calc.calc`(*name, num, oper, minimum=0, maximum=0, ref=None*)

Perform a calculation on the num most recent values. Requires a list. Valid values for oper are:

- add: Add last num values together
- mul: Multiple last num values together
- mean: Calculate mean of last num values
- median: Calculate median of last num values
- median\_low: Calculate low median of last num values
- median\_high: Calculate high median of last num values
- median\_grouped: Calculate grouped median of last num values
- mode: Calculate mode of last num values

USAGE:

```
foo:
  calc.calc:
    - name: myregentry
    - num: 5
    - oper: mean
```

`salt.thorium.calc.mean`(*name, num, minimum=0, maximum=0, ref=None*)

Calculates the mean of the num most recent values. Requires a list.

USAGE:

```
foo:
  calc.mean:
    - name: myregentry
    - num: 5
```

`salt.thorium.calc.median`(*name, num, minimum=0, maximum=0, ref=None*)

Calculates the mean of the num most recent values. Requires a list.

USAGE:

```
foo:
  calc.median:
    - name: myregentry
    - num: 5
```

`salt.thorium.calc.median_grouped`(*name, num, minimum=0, maximum=0, ref=None*)

Calculates the grouped mean of the num most recent values. Requires a list.

USAGE:

```
foo:
  calc.median_grouped:
    - name: myregentry
    - num: 5
```

`salt.thorium.calc.median_high`(*name, num, minimum=0, maximum=0, ref=None*)

Calculates the high mean of the num most recent values. Requires a list.

USAGE:

```
foo:
  calc.median_high:
    - name: myregentry
    - num: 5
```

`salt.thorium.calc.median_low`(*name, num, minimum=0, maximum=0, ref=None*)

Calculates the low mean of the num most recent values. Requires a list.

USAGE:

```
foo:
  calc.median_low:
    - name: myregentry
    - num: 5
```

`salt.thorium.calc.mode`(*name, num, minimum=0, maximum=0, ref=None*)

Calculates the mode of the num most recent values. Requires a list.

USAGE:

```
foo:
  calc.mode:
    - name: myregentry
    - num: 5
```

`salt.thorium.calc.mul`(*name, num, minimum=0, maximum=0, ref=None*)

Multiplies together the num most recent values. Requires a list.

USAGE:

```
foo:
  calc.mul:
    - name: myregentry
    - num: 5
```

## 14.18.2 salt.thorium.check module

The check Thorium state is used to create gateways to commands, the checks make it easy to make states that watch registers for changes and then just succeed or fail based on the state of the register, this creates the pattern of having a command execution get gated by a check state via a requisite.

`salt.thorium.check.contains`(*name, value*)

Only succeed if the value in the given register location contains the given value

USAGE:

```
foo:
  check.contains:
    - value: itni

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

`salt.thorium.check.eq`(*name, value*)

Only succeed if the value in the given register location is equal to the given value

USAGE:

```
foo:
  check.eq:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

`salt.thorium.check.event`(*name*)

Checks for a specific event match and returns result True if the match happens

USAGE:

```
salt/foo/*/bar:
  check.event

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: salt/foo/*/bar
```

`salt.thorium.check.gt`(*name, value*)

Only succeed if the value in the given register location is greater than the given value

USAGE:

```
foo:
  check.gt:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

`salt.thorium.check.gte`(*name, value*)

Only succeed if the value in the given register location is greater or equal than the given value

USAGE:

```
foo:
  check.gte:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

`salt.thorium.check.lt`(*name, value*)

Only succeed if the value in the given register location is less than the given value

USAGE:

```
foo:
  check.lt:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

`salt.thorium.check.lte`(*name, value*)

Only succeed if the value in the given register location is less than or equal the given value

USAGE:

```
foo:
  check.lte:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

`salt.thorium.check.ne`(*name, value*)

Only succeed if the value in the given register location is not equal to the given value

USAGE:

```
foo:
  check.ne:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

### 14.18.3 salt.thorium.file module

Writes matches to disk to verify activity, helpful when testing

Normally this is used by giving the name of the file (without a path) that the data will be saved to. If for instance you use `foo` as the name:

Then the file will be saved to:

You may also provide an absolute path for the file to be saved to:

```
/tmp/foo.save:
  file.save
```

Files will be saved in JSON format. However, JSON does not support `set()`'s. If you are saving a register entry that contains a `set()`, then it will fail to save to JSON format. However, you may pass data through a filter which makes it JSON compliant:

```
foo:
  file.save:
    filter: True
```

Be warned that if you do this, then the file will be saved, but not in a format that can be re-imported into Python.

`salt.thorium.file.save` (*name*, *filter=False*)

Save the register to `<salt cachedir>/thorium/saves/<name>`, or to an absolute path.

USAGE:

```
foo:
  file.save

/tmp/foo:
  file.save
```

#### 14.18.4 salt.thorium.key module

The key Thorium State is used to apply changes to the accepted/rejected/pending keys

New in version 2016.11.0.

`salt.thorium.key.timeout` (*name*, *delete=0*, *reject=0*)

If any minion's status is older than the timeout value then apply the given action to the timed out key. This example will remove keys to minions that have not checked in for 300 seconds (5 minutes)

USAGE:

```
statreg:
  status.reg

clean_keys:
  key.timeout:
    - require:
      - status: statreg
    - delete: 300
```

#### 14.18.5 salt.thorium.local module

Run remote execution commands via the local client

`salt.thorium.local.cmd` (*name*, *tgt*, *func*, *arg=()*, *tgt\_type='glob'*, *ret=''*, *kwarg=None*, *\*\*kwargs*)

Execute a remote execution command

USAGE:

```
run_remote_ex:
  local.cmd:
```

```

- tgt: '*'
- func: test.ping

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.sleep
    - arg:
      - 30

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.sleep
    - kwarg:
      length: 30

```

### 14.18.6 salt.thorium.reg module

Used to manage the thorium register. The thorium register is where compound values are stored and computed, such as averages etc.

**salt.thorium.reg.clear**(*name*)

Clear the namespace from the register

USAGE:

```

clearns:
  reg.clear:
    - name: myregister

```

**salt.thorium.reg.delete**(*name*)

Delete the namespace from the register

USAGE:

```

deletens:
  reg.delete:
    - name: myregister

```

**salt.thorium.reg.list**(*name, add, match, stamp=False, prune=0*)

Add the specified values to the named list

If *stamp* is True, then the timestamp from the event will also be added if *prune* is set to an integer higher than 0, then only the last

*prune* values will be kept in the list.

USAGE:

```

foo:
  reg.list:
    - add: bar
    - match: my/custom/event
    - stamp: True

```

**salt.thorium.reg.mean**(*name, add, match*)

Accept a numeric value from the matched events and store a running average of the values in the given register. If the specified value is not numeric it will be skipped

USAGE:

```
foo:
  reg.mean:
    - add: data_field
    - match: my/custom/event
```

`salt.thorium.reg.set(name, add, match)`

Add a value to the named set

USAGE:

```
foo:
  reg.set:
    - add: bar
    - match: my/custom/event
```

### 14.18.7 salt.thorium.runner module

React by calling async runners

`salt.thorium.runner.cmd(name, fun=None, arg=(), **kwargs)`

Execute a runner async:

USAGE:

```
run_cloud:
  runner.cmd:
    - fun: cloud.create
    - arg:
      - my-ec2-config
      - myinstance

run_cloud:
  runner.cmd:
    - fun: cloud.create
    - kwargs:
      provider: my-ec2-config
      instances: myinstance
```

### 14.18.8 salt.thorium.status module

This thorium state is used to track the status beacon events and keep track of the active status of minions

New in version 2016.11.0.

`salt.thorium.status.reg(name)`

Activate this register to turn on a minion status tracking register, this register keeps the current status beacon data and the time that each beacon was last checked in.

### 14.18.9 salt.thorium.timer module

Allow for flow based timers. These timers allow for a sleep to exist across multiple runs of the flow

`salt.thorium.timer.hold`(*name*, *seconds*)

Wait for a given period of time, then fire a result of True, requiring this state allows for an action to be blocked for evaluation based on time

USAGE:

```
hold_on_a_moment:
  timer.hold:
    - seconds: 30
```

#### 14.18.10 salt.thorium.wheel module

React by calling async runners

`salt.thorium.wheel.cmd`(*name*, *fun=None*, *arg=()*, *\*\*kwargs*)

Execute a runner async:

USAGE:

```
run_cloud:
  wheel.cmd:
    - fun: key.delete
    - match: minion_id
```

### 14.19 master tops modules

<code>cobbler</code>	Cobbler Tops
<code>ext_nodes</code>	External Nodes Classifier
<code>mongo</code>	Read tops data from a mongodb collection
<code>reclass_adapter</code>	Read tops data from a reclass database
<code>varstack</code>	Use <i>Varstack</i> < <a href="https://github.com/conversis/varstack">https://github.com/conversis/varstack</a> > to provide tops data

#### 14.19.1 salt.tops.cobbler

##### Cobbler Tops

Cobbler Tops is a master tops subsystem used to look up mapping information from Cobbler via its API. The same `cobbler.*` parameters are used for both the Cobbler tops and Cobbler pillar modules.

```
master_tops:
  cobbler: {}
cobbler.url: https://example.com/cobbler_api #default is http://localhost/cobbler_api
cobbler.user: username # default is no username
cobbler.password: password # default is no password
```

##### Module Documentation

`salt.tops.cobbler.top`(*\*\*kwargs*)

Look up top data in Cobbler for a minion.

## 14.19.2 salt.tops.ext\_nodes

### External Nodes Classifier

The External Nodes Classifier is a master tops subsystem that retrieves mapping information from major configuration management systems. One of the most common external nodes classifiers system is provided by Cobbler and is called `cobbler-ext-nodes`.

The `cobbler-ext-nodes` command can be used with this configuration:

```
master_tops:
  ext_nodes: cobbler-ext-nodes
```

It is noteworthy that the Salt system does not directly ingest the data sent from the `cobbler-ext-nodes` command, but converts the data into information that is used by a Salt top file.

Any command can replace the call to ``cobbler-ext-nodes'` above, but currently the data must be formatted in the same way that the standard ``cobbler-ext-nodes'` does.

See (admittedly degenerate and probably not complete) example:

```
classes:
  - basepackages
  - database
```

The above essentially is the same as a `top.sls` containing the following:

```
base:
  '*':
    - basepackages
    - database

base:
  '*':
    - basepackages
    - database
```

```
salt.tops.ext_nodes.top(**kwargs)
    Run the command configured
```

## 14.19.3 salt.tops.mongo

Read tops data from a mongodb collection

This module will load tops data from a mongo collection. It uses the node's id for lookups.

### Salt Master Mongo Configuration

The module shares the same base mongo connection variables as `salt.returners.mongo_return`. These variables go in your master config file.

- `mongo.db` - The mongo database to connect to. Defaults to `'salt'`.
- `mongo.host` - The mongo host to connect to. Supports replica sets by specifying all hosts in the set, comma-delimited. Defaults to `'salt'`.
- `mongo.port` - The port that the mongo database is running on. Defaults to 27017.

- `mongo.user` - The username for connecting to mongo. Only required if you are using mongo authentication. Defaults to `''`.
- `mongo.password` - The password for connecting to mongo. Only required if you are using mongo authentication. Defaults to `''`.

### Configuring the Mongo Tops Subsystem

```

master_tops:
  mongo:
    collection: tops
    id_field: _id
    re_replace: ""
    re_pattern: \.example\.com
    states_field: states
    environment_field: environment

```

### Module Documentation

`salt.tops.mongo.top` (*\*\*kwargs*)

Connect to a mongo database and read per-node tops data.

#### Parameters

- **collection** (\*) -- The mongodb collection to read data from. Defaults to `'tops'`.
- **id\_field** (\*) -- The field in the collection that represents an individual minion id. Defaults to `'_id'`.
- **re\_pattern** (\*) -- If your naming convention in the collection is shorter than the minion id, you can use this to trim the name. `re_pattern` will be used to match the name, and `re_replace` will be used to replace it. Backrefs are supported as they are in the Python standard library. If `NONE`, no mangling of the name will be performed - the collection will be searched with the entire minion id. Defaults to `NONE`.
- **re\_replace** (\*) -- Use as the replacement value in node ids matched with `re_pattern`. Defaults to `''`. Feel free to use backreferences here.
- **states\_field** (\*) -- The name of the field providing a list of states.
- **environment\_field** (\*) -- The name of the field providing the environment. Defaults to `environment`.

#### 14.19.4 salt.tops.reclass\_adapter

Read tops data from a reclass database

This `master_tops` plugin provides access to the **reclass** database, such that state information (top data) are retrieved from **reclass**.

You can find more information about **reclass** at <http://reclass.pantsfullofunix.net>.

To use the plugin, add it to the `master_tops` list in the Salt master config and tell **reclass** by way of a few options how and where to find the inventory:

```

master_tops:
  reclass:
    storage_type: yaml_fs
    inventory_base_uri: /srv/salt

```

This would cause **reclass** to read the inventory from YAML files in `/srv/salt/nodes` and `/srv/salt/classes`.

If you are also using **reclass** as `ext_pillar` plugin, and you want to avoid having to specify the same information for both, use YAML anchors (take note of the differing data types for `ext_pillar` and `master_tops`):

```
reclass: &reclass
  storage_type: yaml_fs
  inventory_base_uri: /srv/salt
  reclass_source_path: ~/code/reclass

ext_pillar:
  - reclass: *reclass

master_tops:
  reclass: *reclass
```

If you want to run `reclass` from source, rather than installing it, you can either let the master know via the `PYTHONPATH` environment variable, or by setting the configuration option, like in the example above.

```
salt.tops.reclass_adapter.top(**kwargs)
    Query reclass for the top data (states of the minions).
```

### 14.19.5 salt.tops.varstack

Use *Varstack* <<https://github.com/conversis/varstack>> to provide tops data

This *master\_tops* plugin provides access to the **varstack** hierarchical yaml files, so you can use **varstack** as a full *external node classifier* and store state information (top data) in it.

#### Configuring Varstack

To use `varstack` as a master top external node classifier, install `varstack` as documented. Then, add to your master's configuration:

```
master_tops:
  varstack: /path/to/the/config/file/varstack.yaml
```

`Varstack` will then use `/path/to/the/config/file/varstack.yaml` (usually `/etc/varstack.yaml`) to determine which configuration data to return as adapter information. From there you can take a look at the *README* <<https://github.com/conversis/varstack/blob/master/README.md>> of `varstack` to learn how this file is evaluated. The ENC part will just return the `'states'` dictionary for the node.

ie, if `my.fqdn.yaml` file contains:

```
---
states:
  - sudo
  - openssh
  - apache
  - salt.minion
```

these will be returned as `{'base': ['sudo', 'openssh', 'apache', 'salt.minion']}` and managed by salt as if given from a `top.sls` file.

```
salt.tops.varstack.top(**kwargs)
    Query varstack for the top data (states of the minions).
```

## 14.20 wheel modules

<code>config</code>	Manage the master configuration file
<code>error</code>	Error generator to enable integration testing of salt wheel error handling
<code>file_roots</code>	Read in files from the <code>file_root</code> and save files to the file root
<code>key</code>	Wheel system wrapper for the Salt key system to be used in interactions with the Salt Master programmatically.
<code>minions</code>	Wheel system wrapper for connected minions
<code>pillar_roots</code>	The <code>pillar_roots</code> wheel module is used to manage files under the pillar roots directories on the master server.

### 14.20.1 salt.wheel.config

Manage the master configuration file

`salt.wheel.config.apply(key, value)`

Set a single key

---

**Note:** This will strip comments from your config file

---

`salt.wheel.config.update_config(file_name, yaml_contents)`

Update master config with `yaml_contents`.

Writes `yaml_contents` to a file named `file_name.conf` under the folder specified by `default_include`. This folder is named `master.d` by default. Please look at `include-configuration` for more information.

Example low data:

```
data = {
  'username': 'salt',
  'password': 'salt',
  'fun': 'config.update_config',
  'file_name': 'gui',
  'yaml_contents': {'id': 1},
  'client': 'wheel',
  'eauth': 'pam',
}
```

`salt.wheel.config.values()`

Return the raw values of the config file

### 14.20.2 salt.wheel.error

Error generator to enable integration testing of salt wheel error handling

`salt.wheel.error.error(name=None, message='')`

If name is None Then return empty dict

Otherwise raise an exception with `__name__` from name, message from message

CLI Example:

```
salt-wheel error
salt-wheel error.error name="Exception" message="This is an error."
```

### 14.20.3 salt.wheel.file\_roots

Read in files from the file\_root and save files to the file root

`salt.wheel.file_roots.find(path, saltenv='base')`  
Return a dict of the files located with the given path and environment

`salt.wheel.file_roots.list_env(saltenv='base')`  
Return all of the file paths found in an environment

`salt.wheel.file_roots.list_roots()`  
Return all of the files names in all available environments

`salt.wheel.file_roots.read(path, saltenv='base')`  
Read the contents of a text file, if the file is binary then

`salt.wheel.file_roots.write(data, path, saltenv='base', index=0)`  
Write the named file, by default the first file found is written, but the index of the file can be specified to write to a lower priority file root

### 14.20.4 salt.wheel.key

Wheel system wrapper for the Salt key system to be used in interactions with the Salt Master programmatically.

The key module for the wheel system is meant to provide an internal interface for other Salt systems to interact with the Salt Master. The following usage examples assume that a WheelClient is available:

```
import salt.config
import salt.wheel
opts = salt.config.master_config('/etc/salt/master')
wheel = salt.wheel.WheelClient(opts)
```

Note that importing and using the WheelClient must be performed on the same machine as the Salt Master and as the same user that runs the Salt Master, unless `external_auth` is configured and the user is authorized to execute wheel functions.

The function documentation starts with the wheel reference from the code sample above and use the WheelClient functions to show how they can be called from a Python interpreter.

The wheel key functions can also be called via a salt command at the CLI using the saltutil execution module.

`salt.wheel.key.accept(match, include_rejected=False, include_denied=False)`  
Accept keys based on a glob match. Returns a dictionary.  
**match** The glob match of keys to accept.  
**include\_rejected** To include rejected keys in the match along with pending keys, set this to True. Defaults to False.  
**include\_denied** To include denied keys in the match along with pending keys, set this to True. Defaults to False.

```
>>> wheel.cmd('key.accept', ['minion1'])
{'minions': ['minion1']}
```

`salt.wheel.key.accept_dict(match, include_rejected=False, include_denied=False)`  
Accept keys based on a dict of keys. Returns a dictionary.

**match** The dictionary of keys to accept.

**include\_rejected** To include rejected keys in the match along with pending keys, set this to True. Defaults to False.

New in version 2016.3.4.

**include\_denied** To include denied keys in the match along with pending keys, set this to True. Defaults to False.

New in version 2016.3.4.

Example to move a list of keys from the `minions_pre` (pending) directory to the `minions` (accepted) directory:

```
>>> wheel.cmd('accept_dict',
{
  'minions_pre': [
    'jerry',
    'stuart',
    'bob',
  ],
})
{'minions': ['jerry', 'stuart', 'bob']}
```

`salt.wheel.key.delete` (*match*)

Delete keys based on a glob match. Returns a dictionary.

**match** The glob match of keys to delete.

```
>>> wheel.cmd_async({'fun': 'key.delete', 'match': 'minion1'})
{'jid': '20160826201244808521', 'tag': 'salt/wheel/20160826201244808521'}
```

`salt.wheel.key.delete_dict` (*match*)

Delete keys based on a dict of keys. Returns a dictionary.

**match** The dictionary of keys to delete.

```
>>> wheel.cmd_async({'fun': 'key.delete_dict',
'match': {
  'minions': [
    'jerry',
    'stuart',
    'bob',
  ],
})
{'jid': '20160826201244808521', 'tag': 'salt/wheel/20160826201244808521'}
```

`salt.wheel.key.finger` (*match*, *hash\_type=None*)

Return the matching key fingerprints. Returns a dictionary.

**match** The key for with to retrieve the fingerprint.

**hash\_type** The hash algorithm used to calculate the fingerprint

```
>>> wheel.cmd('key.finger', ['minion1'])
{'minions': {'minion1': '5d:f6:79:43:5e:d4:42:3f:57:b8:45:a8:7e:a4:6e:ca'}}
```

`salt.wheel.key.finger_master` (*hash\_type=None*)

Return the fingerprint of the master's public key

**hash\_type** The hash algorithm used to calculate the fingerprint

```
>>> wheel.cmd('key.finger_master')
{'local': {'master.pub': '5d:f6:79:43:5e:d4:42:3f:57:b8:45:a8:7e:a4:6e:ca'}}
```

`salt.wheel.key.gen(id_=None, keysize=2048)`

Generate a key pair. No keys are stored on the master. A key pair is returned as a dict containing `pub` and `priv` keys. Returns a dictionary containing the the `pub` and `priv` keys with their generated values.

**id\_** Set a name to generate a key pair for use with salt. If not specified, a random name will be specified.

**keysize** The size of the key pair to generate. The size must be 2048, which is the default, or greater. If set to a value less than 2048, the key size will be rounded up to 2048.

```
>>> wheel.cmd('key.gen')
{'pub': '-----BEGIN PUBLIC KEY-----
```

```
MIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBC ... BBPfamX9gGPQTpN9e8HwcZjXQnmg8OrcUI10WHw09SDWLOInW+
iQIDAQAB
-----END PUBLIC KEY-----', `priv`: `-----BEGIN RSA PRIVATE KEY-----
MIIEpAIBAAKCAQEA42Kf+w9XeZWgguzv ... QH3/W74X1+WTBlx4R2KGLYBiH+bCCFEQ/Zvcu4Xp4bIOPtRKozEQ==
-----END RSA PRIVATE KEY-----`}
```

`salt.wheel.key.gen_accept(id_, keysize=2048, force=False)`

Generate a key pair then accept the public key. This function returns the key pair in a dict, only the public key is preserved on the master. Returns a dictionary.

**id\_** The name of the minion for which to generate a key pair.

**keysize** The size of the key pair to generate. The size must be 2048, which is the default, or greater. If set to a value less than 2048, the key size will be rounded up to 2048.

**force** If a public key has already been accepted for the given minion on the master, then the `gen_accept` function will return an empty dictionary and not create a new key. This is the default behavior. If `force` is set to `True`, then the minion's previously accepted key will be overwritten.

```
>>> wheel.cmd('key.gen_accept', ['foo'])
{'pub': '-----BEGIN PUBLIC KEY-----
```

```
MIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBC ... BBPfamX9gGPQTpN9e8HwcZjXQnmg8OrcUI10WHw09SDWLOInW+
iQIDAQAB
-----END PUBLIC KEY-----', `priv`: `-----BEGIN RSA PRIVATE KEY-----
MIIEpAIBAAKCAQEA42Kf+w9XeZWgguzv
... QH3/W74X1+WTBlx4R2KGLYBiH+bCCFEQ/Zvcu4Xp4bIOPtRKozEQ==
-----END RSA PRIVATE KEY-----`}
```

We can now see that the `foo` minion's key has been accepted by the master:

```
>>> wheel.cmd('key.list', ['accepted'])
{'minions': ['foo', 'minion1', 'minion2', 'minion3']}
```

`salt.wheel.key.gen_keys(keydir=None, keyname=None, keysize=None, user=None)`

Generate minion RSA public keypair

`salt.wheel.key.gen_signature(priv, pub, signature_path, auto_create=False, keysize=None)`

Generate master public-key-signature

`salt.wheel.key.print(match)`

Return information about the key. Returns a dictionary.

**match** The key to return information about.

```
>>> wheel.cmd('key.key_str', ['minion1'])
{'minions': {'minion1': '-----BEGIN PUBLIC KEY-----
```

```
MIIBJjANBgkqhkiG9w0B ... TWugEQpPt
iQIDAQAB -----END PUBLIC KEY-----}}
```

`salt.wheel.key.list`(*match*)

List all the keys under a named status. Returns a dictionary.

**match** The type of keys to list. The `pre`, `un`, and `unaccepted` options will list unaccepted/unsigned keys. `acc` or `accepted` will list accepted/signed keys. `rej` or `rejected` will list rejected keys. Finally, `all` will list all keys.

```
>>> wheel.cmd('key.list', ['accepted'])
{'minions': ['minion1', 'minion2', 'minion3']}
```

`salt.wheel.key.list_all`()

List all the keys. Returns a dictionary containing lists of the minions in each salt-key category, including `minions`, `minions_rejected`, `minions_denied`, etc. Returns a dictionary.

```
>>> wheel.cmd('key.list_all')
{'local': ['master.pem', 'master.pub'], 'minions_rejected': [],
'minions_denied': [], 'minions_pre': [],
'minions': ['minion1', 'minion2', 'minion3']}
```

`salt.wheel.key.name_match`(*match*)

List all the keys based on a glob match

`salt.wheel.key.reject`(*match*, *include\_accepted=False*, *include\_denied=False*)

Reject keys based on a glob match. Returns a dictionary.

**match** The glob match of keys to reject.

**include\_accepted** To include accepted keys in the match along with pending keys, set this to `True`. Defaults to `False`.

**include\_denied** To include denied keys in the match along with pending keys, set this to `True`. Defaults to `False`.

```
>>> wheel.cmd_async({'fun': 'key.reject', 'match': 'minion1'})
{'jid': '20160826201244808521', 'tag': 'salt/wheel/20160826201244808521'}
```

`salt.wheel.key.reject_dict`(*match*, *include\_accepted=False*, *include\_denied=False*)

Reject keys based on a dict of keys. Returns a dictionary.

**match** The dictionary of keys to reject.

**include\_accepted** To include accepted keys in the match along with pending keys, set this to `True`. Defaults to `False`.

New in version 2016.3.4.

**include\_denied** To include denied keys in the match along with pending keys, set this to `True`. Defaults to `False`.

New in version 2016.3.4.

```
>>> wheel.cmd_async({'fun': 'key.reject_dict',
'match': {
    'minions': [
        'jerry',
        'stuart',
        'bob',
    ],
```

```
}  
{'jid': '20160826201244808521', 'tag': 'salt/wheel/20160826201244808521'}
```

### 14.20.5 salt.wheel.minions

Wheel system wrapper for connected minions

`salt.wheel.minions.connected()`

List all connected minions on a salt-master

### 14.20.6 salt.wheel.pillar\_roots

The `pillar_roots` wheel module is used to manage files under the pillar roots directories on the master server.

`salt.wheel.pillar_roots.find(path, saltenv='base')`

Return a dict of the files located with the given path and environment

`salt.wheel.pillar_roots.list_env(saltenv='base')`

Return all of the file paths found in an environment

`salt.wheel.pillar_roots.list_roots()`

Return all of the files names in all available environments

`salt.wheel.pillar_roots.read(path, saltenv='base')`

Read the contents of a text file, if the file is binary then

`salt.wheel.pillar_roots.write(data, path, saltenv='base', index=0)`

Write the named file, by default the first file found is written, but the index of the file can be specified to write to a lower priority file root

---

## 15.1 Python client API

Salt provides several entry points for interfacing with Python applications. These entry points are often referred to as `*Client()` APIs. Each client accesses different parts of Salt, either from the master or from a minion. Each client is detailed below.

### See also:

There are many ways to access Salt programmatically.

Salt can be used from CLI scripts as well as via a REST interface.

See Salt's [\*outputter system\*](#) to retrieve structured data from Salt as JSON, or as shell-friendly text, or many other formats.

See the [\*state.event\*](#) runner to utilize Salt's event bus from shell scripts.

Salt's [\*netapi module\*](#) provides access to Salt externally via a REST interface. Review the [\*netapi module\*](#) documentation for more information.

### 15.1.1 Salt's `opts` dictionary

Some clients require access to Salt's `opts` dictionary. (The dictionary representation of the [\*master\*](#) or [\*minion\*](#) config files.)

A common pattern for fetching the `opts` dictionary is to defer to environment variables if they exist or otherwise fetch the config from the default location.

```
salt.config.client_config(path, env_var='SALT_CLIENT_CONFIG', defaults=None)
```

Load Master configuration data

Usage:

```
import salt.config
master_opts = salt.config.client_config('/etc/salt/master')
```

Returns a dictionary of the Salt Master configuration file with necessary options needed to communicate with a locally-running Salt Master daemon. This function searches for client specific configurations and adds them to the data from the master configuration.

This is useful for master-side operations like [\*LocalClient\*](#).

```
salt.config.minion_config(path, env_var='SALT_MINION_CONFIG', defaults=None,
                        cache_minion_id=False, ignore_config_errors=True, minion_id=None)
```

Reads in the minion configuration file and sets up special options

This is useful for Minion-side operations, such as the *Caller* class, and manually running the loader interface.

```
import salt.config
minion_opts = salt.config.minion_config('/etc/salt/minion')
```

### 15.1.2 Salt's Loader Interface

Modules in the Salt ecosystem are loaded into memory using a custom loader system. This allows modules to have conditional requirements (OS, OS version, installed libraries, etc) and allows Salt to inject special variables (`__salt__`, `__opts__`, etc).

Most modules can be manually loaded. This is often useful in third-party Python apps or when writing tests. However some modules require and expect a full, running Salt system underneath. Notably modules that facilitate master-to-minion communication such as the *mine*, *publish*, and *peer* execution modules. The error `KeyError: 'master_uri'` is a likely indicator for this situation. In those instances use the *Caller* class to execute those modules instead.

Each module type has a corresponding loader function.

```
salt.loader.minion_mods(opts, context=None, utils=None, whitelist=None, initial_load=False,
                      loaded_base_name=None, notify=False, static_modules=None,
                      proxy=None)
```

Load execution modules

Returns a dictionary of execution modules appropriate for the current system by evaluating the `__virtual__()` function in each module.

#### Parameters

- **opts** (*dict*) -- The Salt options dictionary
- **context** (*dict*) -- A Salt context that should be made present inside generated modules in `__context__`
- **utils** (*dict*) -- Utility functions which should be made available to Salt modules in `__utils__`. See *utils\_dirs* in `salt.config` for additional information about configuration.
- **whitelist** (*list*) -- A list of modules which should be whitelisted.
- **initial\_load** (*bool*) -- Deprecated flag! Unused.
- **loaded\_base\_name** (*str*) -- A string marker for the loaded base name.
- **notify** (*bool*) -- Flag indicating that an event should be fired upon completion of module loading.

```
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
__grains__ = salt.loader.grains(__opts__)
__opts__['grains'] = __grains__
__utils__ = salt.loader.utils(__opts__)
__salt__ = salt.loader.minion_mods(__opts__, utils=__utils__)
__salt__['test.ping']()
```

```
salt.loader.raw_mod(opts, name, functions, mod='modules')
```

Returns a single module loaded raw and bypassing the `__virtual__` function

```
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
testmod = salt.loader.raw_mod(__opts__, 'test', None)
testmod['test.ping']()
```

`salt.loader.states`(*opts, functions, utils, serializers, whitelist=None, proxy=None*)

Returns the state modules

Parameters

- **opts** (*dict*) -- The Salt options dictionary
- **functions** (*dict*) -- A dictionary of minion modules, with module names as keys and funcs as values.

```
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
statemods = salt.loader.states(__opts__, None, None)
```

`salt.loader.grains`(*opts, force\_refresh=False, proxy=None*)

Return the functions for the dynamic grains and the values for the static grains.

Since grains are computed early in the startup process, grains functions do not have `__salt__` or `__proxy__` available. At proxy-minion startup, this function is called with the proxymodule `LazyLoader` object so grains functions can communicate with their controlled device.

```
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
__grains__ = salt.loader.grains(__opts__)
print __grains__['id']
```

`salt.loader.grain_funcs`(*opts, proxy=None*)

Returns the grain functions

```
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
grainfuncs = salt.loader.grain_funcs(__opts__)
```

### 15.1.3 Salt's Client Interfaces

#### LocalClient

`class salt.client.LocalClient`(*c\_path='/etc/salt/master', mopts=None, skip\_perm\_errors=False, io\_loop=None, keep\_loop=False, auto\_reconnect=False*)

The interface used by the **salt** CLI tool on the Salt Master

`LocalClient` is used to send a command to Salt minions to execute *execution modules* and return the results to the Salt Master.

Importing and using `LocalClient` must be done on the same machine as the Salt Master and it must be done using the same user that the Salt Master is running as. (Unless *external\_auth* is configured and

authentication credentials are included in the execution).

**Note:** The LocalClient uses a Tornado IOloop, this can create issues when using the LocalClient inside an existing IOloop. If creating the LocalClient in partnership with another IOloop either create the IOloop before creating the LocalClient, or when creating the IOloop use `ioloop.current()` which will return the ioloop created by LocalClient.

```
import salt.client

local = salt.client.LocalClient()
local.cmd('*', 'test.fib', [10])
```

**cmd**(*tgt*, *fun*, *arg=()*, *timeout=None*, *tgt\_type='glob'*, *ret=''*, *jid=''*, *full\_return=False*, *kwarg=None*, *\*\*kwargs*)

Synchronously execute a command on targeted minions

The cmd method will execute and wait for the timeout period for all minions to reply, then it will return all minion data at once.

```
>>> import salt.client
>>> local = salt.client.LocalClient()
>>> local.cmd('*', 'cmd.run', ['whoami'])
{'jerry': 'root'}
```

With extra keyword arguments for the command function to be run:

```
local.cmd('*', 'test.arg', ['arg1', 'arg2'], kwarg={'foo': 'bar'})
```

Compound commands can be used for multiple executions in a single publish. Function names and function arguments are provided in separate lists but the index values must correlate and an empty list must be used if no arguments are required.

```
>>> local.cmd('*', [
    'grains.items',
    'sys.doc',
    'cmd.run',
  ],
  [
    [],
    [],
    ['uptime'],
  ])
```

#### Parameters

- **tgt** (*string or list*) -- Which minions to target for the execution. Default is shell glob. Modified by the `tgt_type` option.
- **fun** (*string or list of strings*) -- The module and function to call on the specified minions of the form `module.function`. For example `test.ping` or `grains.items`.

**Compound commands** Multiple functions may be called in a single publish by passing a list of commands. This can dramatically lower overhead and speed up the application communicating with Salt.

This requires that the `arg` param is a list of lists. The `fun` list and the `arg` list must correlate by index meaning a function that does not take

arguments must still have a corresponding empty list at the expected index.

- **arg** (*list or list-of-lists*) -- A list of arguments to pass to the remote function. If the function takes no arguments **arg** may be omitted except when executing a compound command.
- **timeout** -- Seconds to wait after the last minion returns but before all minions return.
- **tgt\_type** -- The type of **tgt**. Allowed values:
  - **glob** - Bash glob completion - Default
  - **pcre** - Perl style regular expression
  - **list** - Python list of hosts
  - **grain** - Match based on a grain comparison
  - **grain\_pcre** - Grain comparison with a regex
  - **pillar** - Pillar data comparison
  - **pillar\_pcre** - Pillar data comparison with a regex
  - **nodegroup** - Match on nodegroup
  - **range** - Use a Range server for matching
  - **compound** - Pass a compound match string
  - **ipcidr** - Match based on Subnet (CIDR notation) or IPv4 address.

Changed in version 2017.7.0: Renamed from `expr_form` to `tgt_type`

- **ret** -- The returner to use. The value passed can be single returner, or a comma delimited list of returners to call in order on the minions
- **kwarg** -- A dictionary with keyword arguments for the function.
- **full\_return** -- Output the job return only (default) or the full return including exit code and other job metadata.
- **kwargs** -- Optional keyword arguments. Authentication credentials may be passed when using [external\\_auth](#).

For example: `local.cmd('*', 'test.ping', username='saltdev', password='saltdev')`

Or: `local.cmd('*', 'test.ping', token='5871821ea51754fdcea8153c1c745433')`

**Returns** A dictionary with the result of the execution, keyed by minion ID. A compound command will return a sub-dictionary keyed by function name.

**cmd\_async** (*tgt, fun, arg=(), tgt\_type='glob', ret='`, jid='`, kwarg=None, \*\*kwargs*)  
Asynchronously send a command to connected minions

The function signature is the same as `cmd()` with the following exceptions.

**Returns** A job ID or 0 on failure.

```
>>> local.cmd_async('*', 'test.sleep', [300])
'20131219215921857715'
```

**cmd\_batch** (*tgt, fun, arg=(), tgt\_type='glob', ret='`, kwarg=None, batch='10%', \*\*kwargs*)  
Iteratively execute a command on subsets of minions at a time

The function signature is the same as `cmd()` with the following exceptions.

**Parameters batch** -- The batch identifier of systems to execute on

**Returns** A generator of minion returns

```
>>> returns = local.cmd_batch('*', 'state.highstate', batch='10%')
>>> for ret in returns:
...     print(ret)
{'jerry': {...}}
{'dave': {...}}
{'stewart': {...}}
```

**cmd\_iter** (*tgt, fun, arg=(), timeout=None, tgt\_type='glob', ret='`, kwarg=None, \*\*kwargs*)

Yields the individual minion returns as they come in

The function signature is the same as `cmd()` with the following exceptions.

**Returns** A generator yielding the individual minion returns

```
>>> ret = local.cmd_iter('*', 'test.ping')
>>> for i in ret:
...     print(i)
{'jerry': {'ret': True}}
{'dave': {'ret': True}}
{'stewart': {'ret': True}}
```

**cmd\_iter\_no\_block**(*tgt, fun, arg=(), timeout=None, tgt\_type='glob', ret='', kwarg=None, show\_jid=False, verbose=False, \*\*kwargs*)

Yields the individual minion returns as they come in, or `None` when no returns are available.

The function signature is the same as `cmd()` with the following exceptions.

**Returns** A generator yielding the individual minion returns, or `None` when no returns are available. This allows for actions to be injected in between minion returns.

```
>>> ret = local.cmd_iter_no_block('*', 'test.ping')
>>> for i in ret:
...     print(i)
None
{'jerry': {'ret': True}}
{'dave': {'ret': True}}
None
{'stewart': {'ret': True}}
```

**cmd\_subset**(*tgt, fun, arg=(), tgt\_type='glob', ret='', kwarg=None, sub=3, cli=False, progress=False, \*\*kwargs*)

Execute a command on a random subset of the targeted systems

The function signature is the same as `cmd()` with the following exceptions.

**Parameters** `sub` -- The number of systems to execute on

```
>>> SLC.cmd_subset('*', 'test.ping', sub=1)
{'jerry': True}
```

**get\_cli\_returns**(*jid, minions, timeout=None, tgt='\*', tgt\_type='glob', verbose=False, show\_jid=False, \*\*kwargs*)

Starts a watcher looking at the return data for a specified JID

**Returns** all of the information for the JID

**get\_event\_iter\_returns**(*jid, minions, timeout=None*)

Gather the return data from the event system, break hard when timeout is reached.

**run\_job**(*tgt, fun, arg=(), tgt\_type='glob', ret='', timeout=None, jid='', kwarg=None, listen=False, \*\*kwargs*)

Asynchronously send a command to connected minions

Prep the job directory and publish a command to any targeted minions.

**Returns** A dictionary of (validated) `pub_data` or an empty dictionary on failure. The `pub_data` contains the job ID and a list of all minions that are expected to return data.

```
>>> local.run_job('*', 'test.sleep', [300])
{'jid': '20131219215650131543', 'minions': ['jerry']}
```

## Salt Caller

**class** `salt.client.Caller`(*c\_path='/etc/salt/minion', mopts=None*)

Caller is the same interface used by the **salt-call** command-line tool on the Salt Minion.

Changed in version 2015.8.0: Added the `cmd` method for consistency with the other Salt clients. The existing `function` and `sminion.functions` interfaces still exist but have been removed from the docs.

Importing and using `Caller` must be done on the same machine as a Salt Minion and it must be done using the same user that the Salt Minion is running as.

Usage:

```
import salt.client
caller = salt.client.Caller()
caller.cmd('test.ping')
```

Note, a running master or minion daemon is not required to use this class. Running `salt-call --local` simply sets `file_client` to `'local'`. The same can be achieved at the Python level by including that setting in a minion config file.

New in version 2014.7.0: Pass the minion config as the `mopts` dictionary.

```
import salt.client
import salt.config
__opts__ = salt.config.minion_config('/etc/salt/minion')
__opts__['file_client'] = 'local'
caller = salt.client.Caller(mopts=__opts__)
```

**cmd**(*fun, \*args, \*\*kwargs*)

Call an execution module with the given arguments and keyword arguments

Changed in version 2015.8.0: Added the `cmd` method for consistency with the other Salt clients. The existing `function` and `sminion.functions` interfaces still exist but have been removed from the docs.

```
caller.cmd('test.arg', 'Foo', 'Bar', baz='Baz')

caller.cmd('event.send', 'myco/myevent/something',
           data={'foo': 'Foo'}, with_env=['GIT_COMMIT'], with_grains=True)
```

## RunnerClient

**class** `salt.runner.RunnerClient`(*opts*)

The interface used by the **salt-run** CLI tool on the Salt Master

It executes *runner modules* which run on the Salt Master.

Importing and using `RunnerClient` must be done on the same machine as the Salt Master and it must be done using the same user that the Salt Master is running as.

Salt's `external_auth` can be used to authenticate calls. The `eauth` user must be authorized to execute runner modules: (`@runner`). Only the `master_call()` below supports `eauth`.

**async**(*fun, low, user='UNKNOWN', pub=None*)

Execute the function in a multiprocess and return the event tag to use to watch for the return

**cmd**(*fun, arg=None, pub\_data=None, kwarg=None, print\_event=True, full\_return=False*)

Execute a function

**cmd\_async** (*low*)

Execute a runner function asynchronously; eauth is respected

This function requires that *external\_auth* is configured and the user is authorized to execute runner functions: (@runner).

```
runner.eauth_async({
    'fun': 'jobs.list_jobs',
    'username': 'saltdev',
    'password': 'saltdev',
    'eauth': 'pam',
})
```

**cmd\_sync** (*low, timeout=None, full\_return=False*)

Execute a runner function synchronously; eauth is respected

This function requires that *external\_auth* is configured and the user is authorized to execute runner functions: (@runner).

```
runner.eauth_sync({
    'fun': 'jobs.list_jobs',
    'username': 'saltdev',
    'password': 'saltdev',
    'eauth': 'pam',
})
```

## WheelClient

**class salt.wheel.WheelClient** (*opts=None*)

An interface to Salt's wheel modules

*Wheel modules* interact with various parts of the Salt Master.

Importing and using `WheelClient` must be done on the same machine as the Salt Master and it must be done using the same user that the Salt Master is running as. Unless *external\_auth* is configured and the user is authorized to execute wheel functions: (@wheel).

Usage:

```
import salt.config
import salt.wheel
opts = salt.config.master_config('/etc/salt/master')
wheel = salt.wheel.WheelClient(opts)
```

**async** (*fun, low, user='UNKNOWN', pub=None*)

Execute the function in a multiprocess and return the event tag to use to watch for the return

**cmd** (*fun, arg=None, pub\_data=None, kwarg=None, print\_event=True, full\_return=False*)

Execute a function

```
>>> wheel.cmd('key.finger', ['jerry'])
{'minions': {'jerry': '5d:f6:79:43:5e:d4:42:3f:57:b8:45:a8:7e:a4:6e:ca'}}
```

**cmd\_async** (*low*)

Execute a function asynchronously; eauth is respected

This function requires that *external\_auth* is configured and the user is authorized

```
>>> wheel.cmd_async({
    'fun': 'key.finger',
    'match': 'jerry',
    'eauth': 'auto',
    'username': 'saltdev',
    'password': 'saltdev',
})
{'jid': '20131219224744416681', 'tag': 'salt/wheel/20131219224744416681'}
```

**cmd\_sync** (*low*, *timeout=None*, *full\_return=False*)

Execute a wheel function synchronously; eauth is respected

This function requires that *external\_auth* is configured and the user is authorized to execute runner functions: (@wheel).

```
>>> wheel.cmd_sync({
    'fun': 'key.finger',
    'match': 'jerry',
    'eauth': 'auto',
    'username': 'saltdev',
    'password': 'saltdev',
})
{'minions': {'jerry': '5d:f6:79:43:5e:d4:42:3f:57:b8:45:a8:7e:a4:6e:ca'}}
```

## CloudClient

**class salt.cloud.CloudClient** (*path=None*, *opts=None*, *config\_dir=None*, *pillars=None*)

The client class to wrap cloud interactions

**action** (*fun=None*, *cloudmap=None*, *names=None*, *provider=None*, *instance=None*, *kwargs=None*)

Execute a single action via the cloud plugin backend

Examples:

```
client.action(fun='show_instance', names=['myinstance'])
client.action(fun='show_image', provider='my-ec2-config',
    kwargs={'image': 'ami-10314d79'})
)
```

**create** (*provider*, *names*, *\*\*kwargs*)

Create the named VMs, without using a profile

Example:

```
client.create(provider='my-ec2-config', names=['myinstance'],
    image='ami-1624987f', size='t1.micro', ssh_username='ec2-user',
    securitygroup='default', delvol_on_destroy=True)
```

**destroy** (*names*)

Destroy the named VMs

**extra\_action** (*names*, *provider*, *action*, *\*\*kwargs*)

Perform actions with block storage devices

Example:

```
client.extra_action(names=['myblock'], action='volume_create',
    provider='my-nova', kwargs={'voltype': 'SSD', 'size': 1000})
```

```
)
client.extra_action(names=['salt-net'], action='network_create',
                    provider='my-nova', kwargs={'cidr': '192.168.100.0/24'})
)
```

**full\_query** (*query\_type='list\_nodes\_full'*)

Query all instance information

**list\_images** (*provider=None*)

List all available images in configured cloud systems

**list\_locations** (*provider=None*)

List all available locations in configured cloud systems

**list\_sizes** (*provider=None*)

List all available sizes in configured cloud systems

**low** (*fun, low*)

Pass the cloud function and low data structure to run

**map\_run** (*path=None, \*\*kwargs*)

Pass in a location for a map to execute

**min\_query** (*query\_type='list\_nodes\_min'*)

Query select instance information

**profile** (*profile, names, vm\_overrides=None, \*\*kwargs*)

Pass in a profile to create, names is a list of vm names to allocate

vm\_overrides is a special dict that will be per node options overrides

Example:

```
>>> client= salt.cloud.CloudClient(path='/etc/salt/cloud')
>>> client.profile('do_512_git', names=['minion01',])
{'minion01': {u'backups_active': 'False',
              u'created_at': '2014-09-04T18:10:15Z',
              u'droplet': {u'event_id': 31000502,
                           u'id': 2530006,
                           u'image_id': 5140006,
                           u'name': u'minion01',
                           u'size_id': 66},
              u'id': '2530006',
              u'image_id': '5140006',
              u'ip_address': '107.XXX.XXX.XXX',
              u'locked': 'True',
              u'name': 'minion01',
              u'private_ip_address': None,
              u'region_id': '4',
              u'size_id': '66',
              u'status': 'new'}}
```

**query** (*query\_type='list\_nodes'*)

Query basic instance information

**select\_query** (*query\_type='list\_nodes\_select'*)

Query select instance information

## SSHClient

**class** salt.client.ssh.client.**SSHClient**(*c\_path*='/etc/salt/master', *mopts*=None, *disable\_custom\_roster*=False)

Create a client object for executing routines via the salt-ssh backend

New in version 2015.5.0.

**cmd**(*tgt*, *fun*, *arg*=(), *timeout*=None, *tgt\_type*='glob', *kwarg*=None, *\*\*kwargs*)

Execute a single command via the salt-ssh subsystem and return all routines at once

New in version 2015.5.0.

**cmd\_iter**(*tgt*, *fun*, *arg*=(), *timeout*=None, *tgt\_type*='glob', *ret*='', *kwarg*=None, *\*\*kwargs*)

Execute a single command via the salt-ssh subsystem and return a generator

New in version 2015.5.0.

## 15.2 netapi modules

### 15.2.1 Introduction to netapi modules

netapi modules provide API-centric access to Salt. Usually externally-facing services such as REST or WebSockets, XMPP, XMLRPC, etc.

In general netapi modules bind to a port and start a service. They are purposefully open-ended. A single module can be configured to run as well as multiple modules simultaneously.

netapi modules are enabled by adding configuration to your Salt Master config file and then starting the **salt-api** daemon. Check the docs for each module to see external requirements and configuration settings.

Communication with Salt and Salt satellite projects is done using Salt's own *Python API*. A list of available client interfaces is below.

---

#### salt-api

Prior to Salt's 2014.7.0 release, netapi modules lived in the separate sister projected `salt-api`. That project has been merged into the main Salt project.

---

#### See also:

*The full list of netapi modules*

### 15.2.2 Client interfaces

Salt's client interfaces expose executing functions by crafting a dictionary of values that are mapped to function arguments. This allows calling functions simply by creating a data structure. (And this is exactly how much of Salt's own internals work!)

**class** salt.netapi.**NetapiClient**(*opts*)

Provide a uniform method of accessing the various client interfaces in Salt in the form of low-data data structures. For example:

```
>>> client = NetapiClient(__opts__)
>>> lowstate = {'client': 'local', 'tgt': '*', 'fun': 'test.ping', 'arg': ''}
>>> client.run(lowstate)
```

**local** (*\*args*, *\*\*kwargs*)

Run *execution modules* synchronously

See `salt.client.LocalClient.cmd()` for all available parameters.

Sends a command from the master to the targeted minions. This is the same interface that Salt's own CLI uses. Note the `arg` and `kwarg` parameters are sent down to the minion(s) and the given function, `fun`, is called with those parameters.

**Returns** Returns the result from the execution module

**local\_async** (*\*args*, *\*\*kwargs*)

Run *execution modules* asynchronously

Wraps `salt.client.LocalClient.run_job()`.

**Returns** job ID

**local\_subset** (*\*args*, *\*\*kwargs*)

Run *execution modules* against subsets of minions

New in version 2016.3.0.

Wraps `salt.client.LocalClient.cmd_subset()`

**runner** (*fun*, *timeout=None*, *full\_return=False*, *\*\*kwargs*)

Run *runner modules* <all-salt.runners> synchronously

Wraps `salt.runner.RunnerClient.cmd_sync()`.

Note that runner functions must be called using keyword arguments. Positional arguments are not supported.

**Returns** Returns the result from the runner module

**runner\_async** (*fun*, *\*\*kwargs*)

Run *runner modules* <all-salt.runners> asynchronously

Wraps `salt.runner.RunnerClient.cmd_async()`.

Note that runner functions must be called using keyword arguments. Positional arguments are not supported.

**Returns** event data and a job ID for the executed function.

**ssh** (*\*args*, *\*\*kwargs*)

Run salt-ssh commands synchronously

Wraps `salt.client.ssh.client.SSHClient.cmd_sync()`.

**Returns** Returns the result from the salt-ssh command

**wheel** (*fun*, *\*\*kwargs*)

Run *wheel modules* synchronously

Wraps `salt.wheel.WheelClient.master_call()`.

Note that wheel functions must be called using keyword arguments. Positional arguments are not supported.

**Returns** Returns the result from the wheel module

**wheel\_async** (*fun*, *\*\*kwargs*)

Run *wheel modules* asynchronously

Wraps `salt.wheel.WheelClient.master_call()`.

Note that wheel functions must be called using keyword arguments. Positional arguments are not supported.

**Returns** Returns the result from the wheel module

## HTTP Modules

This tutorial demonstrates using the various HTTP modules available in Salt. These modules wrap the Python `tornado`, `urllib2`, and `requests` libraries, extending them in a manner that is more consistent with Salt workflows.

### The `salt.utils.http` Library

This library forms the core of the HTTP modules. Since it is designed to be used from the minion as an execution module, in addition to the master as a runner, it was abstracted into this multi-use library. This library can also be imported by 3rd-party programs wishing to take advantage of its extended functionality.

Core functionality of the execution, state, and runner modules is derived from this library, so common usages between them are described here. Documentation specific to each module is described below.

This library can be imported with:

```
import salt.utils.http
```

### Configuring Libraries

This library can make use of either `tornado`, which is required by Salt, `urllib2`, which ships with Python, or `requests`, which can be installed separately. By default, `tornado` will be used. In order to switch to `urllib2`, set the following variable:

```
backend: urllib2
```

In order to switch to `requests`, set the following variable:

```
backend: requests
```

This can be set in the master or minion configuration file, or passed as an option directly to any `http.query()` functions.

### `salt.utils.http.query()`

This function forms a basic query, but with some add-ons not present in the `tornado`, `urllib2`, and `requests` libraries. Not all functionality currently available in these libraries has been added, but can be in future iterations.

### HTTPS Request Methods

A basic query can be performed by calling this function with no more than a single URL:

```
salt.utils.http.query('http://example.com')
```

By default the query will be performed with a GET method. The method can be overridden with the `method` argument:

```
salt.utils.http.query('http://example.com/delete/url', 'DELETE')
```

When using the POST method (and others, such as PUT), extra data is usually sent as well. This data can be sent directly, in whatever format is required by the remote server (XML, JSON, plain text, etc).

```
salt.utils.http.query(  
    'http://example.com/delete/url',  
    method='POST',  
    data=json.loads(mydict)  
)
```

### Data Formatting and Templating

Bear in mind that the data must be sent pre-formatted; this function will not format it for you. However, a templated file stored on the local system may be passed through, along with variables to populate it with. To pass through only the file (untemplated):

```
salt.utils.http.query(  
    'http://example.com/post/url',  
    method='POST',  
    data_file='/srv/salt/somefile.xml'  
)
```

To pass through a file that contains jinja + yaml templating (the default):

```
salt.utils.http.query(  
    'http://example.com/post/url',  
    method='POST',  
    data_file='/srv/salt/somefile.jinja',  
    data_render=True,  
    template_dict={'key1': 'value1', 'key2': 'value2'}  
)
```

To pass through a file that contains mako templating:

```
salt.utils.http.query(  
    'http://example.com/post/url',  
    method='POST',  
    data_file='/srv/salt/somefile.mako',  
    data_render=True,  
    data_renderer='mako',  
    template_dict={'key1': 'value1', 'key2': 'value2'}  
)
```

Because this function uses Salt's own rendering system, any Salt renderer can be used. Because Salt's renderer requires `__opts__` to be set, an `opts` dictionary should be passed in. If it is not, then the default `__opts__` values for the node type (master or minion) will be used. Because this library is intended primarily for use by minions, the default node type is `minion`. However, this can be changed to `master` if necessary.

```
salt.utils.http.query(  
    'http://example.com/post/url',  
    method='POST',  
    data_file='/srv/salt/somefile.jinja',  
    data_render=True,  
    template_dict={'key1': 'value1', 'key2': 'value2'},  
    opts=__opts__  
)  
  
salt.utils.http.query(  
    'http://example.com/post/url',  
    method='POST',
```

```

data_file='/srv/salt/somefile.jinja',
data_render=True,
template_dict={'key1': 'value1', 'key2': 'value2'},
node='master'
)

```

## Headers

Headers may also be passed through, either as a `header_list`, a `header_dict`, or as a `header_file`. As with the `data_file`, the `header_file` may also be templated. Take note that because HTTP headers are normally syntactically-correct YAML, they will automatically be imported as a Python dict.

```

salt.utils.http.query(
    'http://example.com/delete/url',
    method='POST',
    header_file='/srv/salt/headers.jinja',
    header_render=True,
    header_renderer='jinja',
    template_dict={'key1': 'value1', 'key2': 'value2'}
)

```

Because much of the data that would be templated between headers and data may be the same, the `template_dict` is the same for both. Correcting possible variable name collisions is up to the user.

## Authentication

The `query()` function supports basic HTTP authentication. A username and password may be passed in as `username` and `password`, respectively.

```

salt.utils.http.query(
    'http://example.com',
    username='larry',
    password='5700g3543v4r',
)

```

## Cookies and Sessions

Cookies are also supported, using Python's built-in `cookieclib`. However, they are turned off by default. To turn cookies on, set `cookies` to `True`.

```

salt.utils.http.query(
    'http://example.com',
    cookies=True
)

```

By default cookies are stored in Salt's cache directory, normally `/var/cache/salt`, as a file called `cookies.txt`. However, this location may be changed with the `cookie_jar` argument:

```

salt.utils.http.query(
    'http://example.com',
    cookies=True,

```

```
    cookie_jar='/path/to/cookie_jar.txt'  
)
```

By default, the format of the cookie jar is LWP (aka, lib-www-perl). This default was chosen because it is a human-readable text file. If desired, the format of the cookie jar can be set to Mozilla:

```
salt.utils.http.query(  
    'http://example.com',  
    cookies=True,  
    cookie_jar='/path/to/cookie_jar.txt',  
    cookie_format='mozilla'  
)
```

Because Salt commands are normally one-off commands that are piped together, this library cannot normally behave as a normal browser, with session cookies that persist across multiple HTTP requests. However, the session can be persisted in a separate cookie jar. The default filename for this file, inside Salt's cache directory, is `cookies.session.p`. This can also be changed.

```
salt.utils.http.query(  
    'http://example.com',  
    persist_session=True,  
    session_cookie_jar='/path/to/jar.p'  
)
```

The format of this file is msgpack, which is consistent with much of the rest of Salt's internal structure. Historically, the extension for this file is `.p`. There are no current plans to make this configurable.

## Proxy

If the tornado backend is used (tornado is the default), proxy information configured in `proxy_host`, `proxy_port`, `proxy_username`, and `proxy_password` from the `__opts__` dictionary will be used. Normally these are set in the minion configuration file.

```
proxy_host: proxy.my-domain  
proxy_port: 31337  
proxy_username: charon  
proxy_password: obolus
```

```
salt.utils.http.query(  
    'http://example.com',  
    opts=__opts__,  
    backend='tornado'  
)
```

## Return Data

---

**Note:** Return data encoding

If `decode` is set to `True`, `query()` will attempt to decode the return data. `decode_type` defaults to `auto`. Set it to a specific encoding, `xml`, for example, to override autodetection.

---

Because Salt's `http` library was designed to be used with REST interfaces, `query()` will attempt to decode the data received from the remote server when `decode` is set to `True`. First it will check the `Content-type` header to try and find references to XML. If it does not find any, it will look for references to JSON. If it does not find any, it will fall back to plain text, which will not be decoded.

JSON data is translated into a dict using Python's built-in `json` library. XML is translated using `salt.utils.xml_util`, which will use Python's built-in XML libraries to attempt to convert the XML into a dict. In order to force either JSON or XML decoding, the `decode_type` may be set:

```
salt.utils.http.query(
    'http://example.com',
    decode_type='xml'
)
```

Once translated, the return dict from `query()` will include a dict called `dict`.

If the data is not to be translated using one of these methods, decoding may be turned off.

```
salt.utils.http.query(
    'http://example.com',
    decode=False
)
```

If decoding is turned on, and references to JSON or XML cannot be found, then this module will default to plain text, and return the undecoded data as `text` (even if `text` is set to `False`; see below).

The `query()` function can return the HTTP status code, headers, and/or text as required. However, each must individually be turned on.

```
salt.utils.http.query(
    'http://example.com',
    status=True,
    headers=True,
    text=True
)
```

The return from these will be found in the return dict as `status`, `headers` and `text`, respectively.

### Writing Return Data to Files

It is possible to write either the return data or headers to files, as soon as the response is received from the server, but specifying file locations via the `text_out` or `headers_out` arguments. `text` and `headers` do not need to be returned to the user in order to do this.

```
salt.utils.http.query(
    'http://example.com',
    text=False,
    headers=False,
    text_out='/path/to/url_download.txt',
    headers_out='/path/to/headers_download.txt',
)
```

### SSL Verification

By default, this function will verify SSL certificates. However, for testing or debugging purposes, SSL verification can be turned off.

```
salt.utils.http.query(  
    'https://example.com',  
    verify_ssl=False,  
)
```

## CA Bundles

The `requests` library has its own method of detecting which CA (certificate authority) bundle file to use. Usually this is implemented by the packager for the specific operating system distribution that you are using. However, `urllib2` requires a little more work under the hood. By default, Salt will try to auto-detect the location of this file. However, if it is not in an expected location, or a different path needs to be specified, it may be done so using the `ca_bundle` variable.

```
salt.utils.http.query(  
    'https://example.com',  
    ca_bundle='/path/to/ca_bundle.pem',  
)
```

## Updating CA Bundles

The `update_ca_bundle()` function can be used to update the bundle file at a specified location. If the target location is not specified, then it will attempt to auto-detect the location of the bundle file. If the URL to download the bundle from does not exist, a bundle will be downloaded from the cURL website.

CAUTION: The `target` and the `source` should always be specified! Failure to specify the `target` may result in the file being written to the wrong location on the local system. Failure to specify the `source` may cause the upstream URL to receive excess unnecessary traffic, and may cause a file to be download which is hazardous or does not meet the needs of the user.

```
salt.utils.http.update_ca_bundle(  
    target='/path/to/ca-bundle.crt',  
    source='https://example.com/path/to/ca-bundle.crt',  
    opts=__opts__,  
)
```

The `opts` parameter should also always be specified. If it is, then the `target` and the `source` may be specified in the relevant configuration file (master or minion) as `ca_bundle` and `ca_bundle_url`, respectively.

```
ca_bundle: /path/to/ca-bundle.crt  
ca_bundle_url: https://example.com/path/to/ca-bundle.crt
```

If Salt is unable to auto-detect the location of the CA bundle, it will raise an error.

The `update_ca_bundle()` function can also be passed a string or a list of strings which represent files on the local system, which should be appended (in the specified order) to the end of the CA bundle file. This is useful in environments where private certs need to be made available, and are not otherwise reasonable to add to the bundle file.

```
salt.utils.http.update_ca_bundle(  
    opts=__opts__,  
    merge_files=[  
        '/etc/ssl/private_cert_1.pem',  
        '/etc/ssl/private_cert_2.pem',  
        '/etc/ssl/private_cert_3.pem',  
    ]
```

```
]
)
```

## Test Mode

This function may be run in test mode. This mode will perform all work up until the actual HTTP request. By default, instead of performing the request, an empty dict will be returned. Using this function with TRACE logging turned on will reveal the contents of the headers and POST data to be sent.

Rather than returning an empty dict, an alternate `test_url` may be passed in. If this is detected, then test mode will replace the `url` with the `test_url`, set `test` to `True` in the return data, and perform the rest of the requested operations as usual. This allows a custom, non-destructive URL to be used for testing when necessary.

## Execution Module

The `http` execution module is a very thin wrapper around the `salt.utils.http` library. The `opts` can be passed through as well, but if they are not specified, the minion defaults will be used as necessary.

Because passing complete data structures from the command line can be tricky at best and dangerous (in terms of execution injection attacks) at worse, the `data_file`, and `header_file` are likely to see more use here.

All methods for the library are available in the execution module, as kwargs.

```
salt myminion http.query http://example.com/restapi method=POST \
  username='larry' password='5700g3543v4r' headers=True text=True \
  status=True decode_type=xml data_render=True \
  header_file=/tmp/headers.txt data_file=/tmp/data.txt \
  header_render=True cookies=True persist_session=True
```

## Runner Module

Like the execution module, the `http` runner module is a very thin wrapper around the `salt.utils.http` library. The only significant difference is that because runners execute on the master instead of a minion, a target is not required, and default `opts` will be derived from the master config, rather than the minion config.

All methods for the library are available in the runner module, as kwargs.

```
salt-run http.query http://example.com/restapi method=POST \
  username='larry' password='5700g3543v4r' headers=True text=True \
  status=True decode_type=xml data_render=True \
  header_file=/tmp/headers.txt data_file=/tmp/data.txt \
  header_render=True cookies=True persist_session=True
```

## State Module

The state module is a wrapper around the runner module, which applies stateful logic to a query. All kwargs as listed above are specified as usual in state files, but two more kwargs are available to apply stateful logic. A required parameter is `match`, which specifies a pattern to look for in the return text. By default, this will perform a string comparison of looking for the value of `match` in the return text. In Python terms this looks like:

```
if match in html_text:
    return True
```

If more complex pattern matching is required, a regular expression can be used by specifying a `match_type`. By default this is set to `string`, but it can be manually set to `pcre` instead. Please note that despite the name, this will use Python's `re.search()` rather than `re.match()`.

Therefore, the following states are valid:

```
http://example.com/restapi:
  http.query:
    - match: 'SUCCESS'
    - username: 'larry'
    - password: '5700g3543v4r'
    - data_renderer: True
    - header_file: /tmp/headers.txt
    - data_file: /tmp/data.txt
    - header_renderer: True
    - cookies: True
    - persist_session: True

http://example.com/restapi:
  http.query:
    - match_type: pcre
    - match: '(?i)succe[ss|ed]'
    - username: 'larry'
    - password: '5700g3543v4r'
    - data_renderer: True
    - header_file: /tmp/headers.txt
    - data_file: /tmp/data.txt
    - header_renderer: True
    - cookies: True
    - persist_session: True
```

In addition to, or instead of a match pattern, the status code for a URL can be checked. This is done using the `status` argument:

```
http://example.com/:
  http.query:
    - status: '200'
```

If both are specified, both will be checked, but if only one is `True` and the other is `False`, then `False` will be returned. In this case, the comments in the return data will contain information for troubleshooting.

Because this is a monitoring state, it will return extra data to code that expects it. This data will always include `text` and `status`. Optionally, `headers` and `dict` may also be requested by setting the `headers` and `decode` arguments to `True`, respectively.

## Writing netapi modules

`netapi` modules, put simply, bind a port and start a service. They are purposefully open-ended and can be used to present a variety of external interfaces to Salt, and even present multiple interfaces at once.

### See also:

*The full list of netapi modules*

## Configuration

All `netapi` configuration is done in the *Salt master config* and takes a form similar to the following:

```
rest_cherryypy:  
  port: 8000  
  debug: True  
  ssl_cert: /etc/pki/tls/certs/localhost.crt  
  ssl_key: /etc/pki/tls/certs/localhost.key
```

## The `__virtual__` function

Like all module types in Salt, `netapi` modules go through Salt's loader interface to determine if they should be loaded into memory and then executed.

The `__virtual__` function in the module makes this determination and should return `False` or a string that will serve as the name of the module. If the module raises an `ImportError` or any other errors, it will not be loaded.

## The `start` function

The `start()` function will be called for each `netapi` module that is loaded. This function should contain the server loop that actually starts the service. This is started in a multiprocess.

## Multiple instances

New in version 2016.11.0.

`rest_cherryypy` and `rest_tornado` support running multiple instances by copying and renaming entire directory of those. To start the copied multiple `netapi` modules, add configuration blocks for the copied `netapi` modules in the Salt Master config. The name of each added configuration block must match with the name of each directory of the copied `netapi` module.

## Inline documentation

As with the rest of Salt, it is a best-practice to include liberal inline documentation in the form of a module docstring and docstrings on any classes, methods, and functions in your `netapi` module.

## Loader “magic” methods

The loader makes the `__opts__` data structure available to any function in a `netapi` module.

---

## Architecture

---

If you are used to configuration management tools that require you to plan down to the last detail before you install anything, you are probably wondering why this section doesn't appear before the installation instructions. With Salt, you can switch to a high availability architecture at any time, and add additional components to scale your deployment as you go.

Since a single Salt master can manage thousands of systems, we usually recommend that you start by deploying a single Salt master, and then modifying your deployment as needed for redundancy, geographical distribution, and scale.

### 16.1 High Availability Features in Salt

Salt supports several features for high availability and fault tolerance. Brief documentation for these features is listed alongside their configuration parameters in *Configuration file examples*.

#### 16.1.1 Multimaster

Salt minions can connect to multiple masters at one time by configuring the *master* configuration parameter as a YAML list of all the available masters. By default, all masters are ``hot'', meaning that any master can direct commands to the Salt infrastructure.

In a multimaster configuration, each master must have the same cryptographic keys, and minion keys must be accepted on all masters separately. The contents of *file\_roots* and *pillar\_roots* need to be kept in sync with processes external to Salt as well

A tutorial on setting up multimaster with ``hot'' masters is here:

*Multimaster Tutorial*

#### 16.1.2 Multimaster with Failover

Changing the *master\_type* parameter from *str* to *failover* will cause minions to connect to the first responding master in the list of masters. Every *master\_alive\_interval* seconds the minions will check to make sure the current master is still responding. If the master does not respond, the minion will attempt to connect to the next master in the list. If the minion runs out of masters, the list will be recycled in case dead masters have been restored. Note that *master\_alive\_interval* must be present in the minion configuration, or else the recurring job to check master status will not get scheduled.

Failover can be combined with PKI-style encrypted keys, but PKI is NOT REQUIRED to use failover.

Multimaster with PKI and Failover is discussed in [this tutorial](#)

`master_type: failover` can be combined with `master_shuffle: True` to spread minion connections across all masters (one master per minion, not each minion connecting to all masters). Adding Salt Syndics into the mix makes it possible to create a load-balanced Salt infrastructure. If a master fails, minions will notice and select another master from the available list.

### 16.1.3 Syndic

Salt's Syndic feature is a way to create differing infrastructure topologies. It is not strictly an HA feature, but can be treated as such.

With the syndic, a Salt infrastructure can be partitioned in such a way that certain masters control certain segments of the infrastructure, and "Master of Masters" nodes can control multiple segments underneath them.

Syndics are covered in depth in [Salt Syndic](#).

### 16.1.4 Syndic with Multimaster

New in version 2015.5.0.

Syndic with Multimaster lets you connect a syndic to multiple masters to provide an additional layer of redundancy in a syndic configuration.

Syndics are covered in depth in [Salt Syndic](#).

## 16.2 Salt Syndic

The most basic or typical Salt topology consists of a single Master node controlling a group of Minion nodes. An intermediate node type, called Syndic, when used offers greater structural flexibility and scalability in the construction of Salt topologies than topologies constructed only out of Master and Minion node types.

A Syndic node can be thought of as a special passthrough Minion node. A Syndic node consists of a `salt-syndic` daemon and a `salt-master` daemon running on the same system. The `salt-master` daemon running on the Syndic node controls a group of lower level Minion nodes and the `salt-syndic` daemon connects higher level Master node, sometimes called a Master of Masters.

The `salt-syndic` daemon relays publications and events between the Master node and the local `salt-master` daemon. This gives the Master node control over the Minion nodes attached to the `salt-master` daemon running on the Syndic node.

### 16.2.1 Configuring the Syndic

To setup a Salt Syndic you need to tell the Syndic node and its Master node about each other. If your Master node is located at `10.10.0.1`, then your configurations would be:

On the Syndic node:

```
# /etc/salt/master
syndic_master: 10.10.0.1 # may be either an IP address or a hostname
```

```
# /etc/salt/minion

# id is shared by the salt-syndic daemon and a possible salt-minion daemon
# on the Syndic node
id: my_syndic
```

On the Master node:

```
# /etc/salt/master
order_masters: True
```

The `syndic_master` option tells the Syndic node where to find the Master node in the same way that the `master` option tells a Minion node where to find a Master node.

The `id` option is used by the `salt-syndic` daemon to identify with the Master node and if unset will default to the hostname or IP address of the Syndic just as with a Minion.

The `order_masters` option configures the Master node to send extra information with its publications that is needed by Syndic nodes connected directly to it.

---

**Note:** Each Syndic must provide its own `file_roots` directory. Files will not be automatically transferred from the Master node.

---

## 16.2.2 Configuring the Syndic with Multimaster

New in version 2015.5.0.

Syndic with Multimaster lets you connect a syndic to multiple masters to provide an additional layer of redundancy in a syndic configuration.

Higher level masters should first be configured in a multimaster configuration. See [Multimaster Tutorial](#).

On the syndic, the `syndic_master` option is populated with a list of the higher level masters.

Since each syndic is connected to each master, jobs sent from any master are forwarded to minions that are connected to each syndic. If the `master_id` value is set in the master config on the higher level masters, job results are returned to the master that originated the request in a best effort fashion. Events/jobs without a `master_id` are returned to any available master.

## 16.2.3 Running the Syndic

The `salt-syndic` daemon is a separate process that needs to be started in addition to the `salt-master` daemon running on the Syndic node. Starting the `salt-syndic` daemon is the same as starting the other Salt daemons.

The Master node in many ways sees the Syndic as an ordinary Minion node. In particular, the Master will need to accept the Syndic's Minion key as it would for any other Minion.

On the Syndic node:

```
# salt-syndic
or
# service salt-syndic start
```

On the Master node:

```
# salt-key -a my_syndic
```

The Master node will now be able to control the Minion nodes connected to the Syndic. Only the Syndic key will be listed in the Master node's key registry but this also means that key activity between the Syndic's Minions and the Syndic does not encumber the Master node. In this way, the Syndic's key on the Master node can be thought of as a placeholder for the keys of all the Minion and Syndic nodes beneath it, giving the Master node a clear, high level structural view on the Salt cluster.

On the Master node:

```
# salt-key -L
Accepted Keys:
my_syndic
Denied Keys:
Unaccepted Keys:
Rejected Keys:

# salt '*' test.ping
minion_1:
  True
minion_2:
  True
minion_4:
  True
minion_3:
  True
```

## 16.2.4 Topology

A Master node (a node which is itself not a Syndic to another higher level Master node) must run a `salt-master` daemon and optionally a `salt-minion` daemon.

A Syndic node must run `salt-syndic` and `salt-master` daemons and optionally a `salt-minion` daemon.

A Minion node must run a `salt-minion` daemon.

When a `salt-master` daemon issues a command, it will be received by the Syndic and Minion nodes directly connected to it. A Minion node will process the command in the way it ordinarily would. On a Syndic node, the `salt-syndic` daemon will relay the command to the `salt-master` daemon running on the Syndic node, which then propagates the command to the Minions and Syndics connected to it.

When events and job return data are generated by `salt-minion` daemons, they are aggregated by the `salt-master` daemon they are connected to, which `salt-master` daemon then relays the data back through its `salt-syndic` daemon until the data reaches the Master or Syndic node that issued the command.

## 16.2.5 Syndic wait

`syndic_wait` is a master configuration file setting that specifies the number of seconds the Salt client should wait for additional syndics to check in with their lists of expected minions before giving up. This value defaults to 5 seconds.

The `syndic_wait` setting is necessary because the higher-level master does not have a way of knowing which minions are below the syndics. The higher-level master has its own list of expected minions and the masters below them have their own lists as well, so the Salt client does not know how long to wait for all returns. The `syndic_wait` option allows time for all minions to return to the Salt client.

**Note:** To reduce the amount of time the CLI waits for Minions to respond, install a Minion on the Syndic or tune the value of the `syndic_wait` configuration.

---

While it is possible to run a Syndic without a Minion installed on the same system, it is recommended, for a faster CLI response time, to do so. Without a Minion installed on the Syndic node, the timeout value of `syndic_wait` increases significantly - about three-fold. With a Minion installed on the Syndic, the CLI timeout resides at the value defined in `syndic_wait`.

---

**Note:** If you have a very large infrastructure or many layers of Syndics, you may find that the CLI doesn't wait long enough for the Syndics to return their events. If you think this is the case, you can set the `syndic_wait` value in the Master configs on the Master or Syndic nodes from which commands are executed. The default value is 5, and should work for the majority of deployments.

---

In order for a Master or Syndic node to return information from Minions that are below their Syndics, the CLI requires a short wait time in order to allow the Syndics to gather responses from their Minions. This value is defined in the `syndic_wait` config option and has a default of five seconds.

### 16.2.6 Syndic config options

These are the options that can be used to configure a Syndic node. Note that other than `id`, Syndic config options are placed in the Master config on the Syndic node.

- `id`: Syndic id (shared by the `salt-syndic` daemon with a potential `salt-minion` daemon on the same system)
- `syndic_master`: Master node IP address or hostname
- `syndic_master_port`: Master node `ret_port`
- `syndic_log_file`: path to the logfile (absolute or not)
- `syndic_pidfile`: path to the pidfile (absolute or not)
- `syndic_wait`: time in seconds to wait on returns from this syndic

### 16.2.7 Minion Data Cache

Beginning with Salt 2016.11.0, the *Pluggable Minion Data Cache* was introduced. The minion data cache contains the Salt Mine data, minion grains, and minion pillar information cached on the Salt Master. By default, Salt uses the `localfs` cache module, but other external data stores can be used instead.

Using a pluggable minion cache modules allows for the data stored on a Salt Master about Salt Minions to be replicated on other Salt Masters the Minion is connected to. Please see the *Minion Data Cache* documentation for more information and configuration examples.

## 16.3 Using Salt at scale

The focus of this tutorial will be building a Salt infrastructure for handling large numbers of minions. This will include tuning, topology, and best practices.

For how to install the Salt Master please go here: [Installing saltstack](#)

**Note:** This tutorial is intended for large installations, although these same settings won't hurt, it may not be worth the complexity to smaller installations.

When used with minions, the term `many` refers to at least a thousand and `a few` always means 500.

For simplicity reasons, this tutorial will default to the standard ports used by Salt.

---

### 16.3.1 The Master

The most common problems on the Salt Master are:

1. too many minions authing at once
2. too many minions re-authing at once
3. too many minions re-connecting at once
4. too many minions returning at once
5. too few resources (CPU/HDD)

The first three are all ``thundering herd" problems. To mitigate these issues we must configure the minions to back-off appropriately when the Master is under heavy load.

The fourth is caused by masters with little hardware resources in combination with a possible bug in ZeroMQ. At least that's what it looks like till today ([Issue 118651](#), [Issue 5948](#), [Mail thread](#))

To fully understand each problem, it is important to understand, how Salt works.

Very briefly, the Salt Master offers two services to the minions.

- a job publisher on port 4505
- an open port 4506 to receive the minions returns

All minions are always connected to the publisher on port 4505 and only connect to the open return port 4506 if necessary. On an idle Master, there will only be connections on port 4505.

#### Too many minions authing

When the Minion service is first started up, it will connect to its Master's publisher on port 4505. If too many minions are started at once, this can cause a ``thundering herd". This can be avoided by not starting too many minions at once.

The connection itself usually isn't the culprit, the more likely cause of master-side issues is the authentication that the Minion must do with the Master. If the Master is too heavily loaded to handle the auth request it will time it out. The Minion will then wait `acceptance_wait_time` to retry. If `acceptance_wait_time_max` is set then the Minion will increase its wait time by the `acceptance_wait_time` each subsequent retry until reaching `acceptance_wait_time_max`.

#### Too many minions re-authing

This is most likely to happen in the testing phase of a Salt deployment, when all Minion keys have already been accepted, but the framework is being tested and parameters are frequently changed in the Salt Master's configuration file(s).

The Salt Master generates a new AES key to encrypt its publications at certain events such as a Master restart or the removal of a Minion key. If you are encountering this problem of too many minions re-authing against the Master,

you will need to recalibrate your setup to reduce the rate of events like a Master restart or Minion key removal (`salt-key -d`).

When the Master generates a new AES key, the minions aren't notified of this but will discover it on the next pub job they receive. When the Minion receives such a job it will then re-auth with the Master. Since Salt does minion-side filtering this means that all the minions will re-auth on the next command published on the master-- causing another ``thundering herd". This can be avoided by setting the

```
random_reauth_delay: 60
```

in the minions configuration file to a higher value and stagger the amount of re-auth attempts. Increasing this value will of course increase the time it takes until all minions are reachable via Salt commands.

### Too many minions re-connecting

By default the zmq socket will re-connect every 100ms which for some larger installations may be too quick. This will control how quickly the TCP session is re-established, but has no bearing on the auth load.

To tune the minions sockets reconnect attempts, there are a few values in the sample configuration file (default values)

```
recon_default: 1000
recon_max: 5000
recon_randomize: True
```

- `recon_default`: the default value the socket should use, i.e. 1000. This value is in milliseconds. (1000ms = 1 second)
- `recon_max`: the max value that the socket should use as a delay before trying to reconnect This value is in milliseconds. (5000ms = 5 seconds)
- `recon_randomize`: enables randomization between `recon_default` and `recon_max`

To tune this values to an existing environment, a few decision have to be made.

1. How long can one wait, before the minions should be online and reachable via Salt?
2. How many reconnects can the Master handle without a syn flood?

These questions can not be answered generally. Their answers depend on the hardware and the administrators requirements.

Here is an example scenario with the goal, to have all minions reconnect within a 60 second time-frame on a Salt Master service restart.

```
recon_default: 1000
recon_max: 59000
recon_randomize: True
```

Each Minion will have a randomized reconnect value between ``recon_default'` and ``recon_default + recon_max'`, which in this example means between 1000ms and 60000ms (or between 1 and 60 seconds). The generated random-value will be doubled after each attempt to reconnect (ZeroMQ default behavior).

Lets say the generated random value is 11 seconds (or 11000ms).

```
reconnect 1: wait 11 seconds
reconnect 2: wait 22 seconds
reconnect 3: wait 33 seconds
reconnect 4: wait 44 seconds
reconnect 5: wait 55 seconds
```

```
reconnect 6: wait time is bigger than 60 seconds (recon_default + recon_max)
reconnect 7: wait 11 seconds
reconnect 8: wait 22 seconds
reconnect 9: wait 33 seconds
reconnect x: etc.
```

With a thousand minions this will mean

```
1000/60 = ~16
```

round about 16 connection attempts a second. These values should be altered to values that match your environment. Keep in mind though, that it may grow over time and that more minions might raise the problem again.

### Too many minions returning at once

This can also happen during the testing phase, if all minions are addressed at once with

```
$ salt * disk.usage
```

it may cause thousands of minions trying to return their data to the Salt Master open port 4506. Also causing a flood of syn-flood if the Master can't handle that many returns at once.

This can be easily avoided with Salt's batch mode:

```
$ salt * disk.usage -b 50
```

This will only address 50 minions at once while looping through all addressed minions.

## 16.3.2 Too few resources

The masters resources always have to match the environment. There is no way to give good advise without knowing the environment the Master is supposed to run in. But here are some general tuning tips for different situations:

### The Master is CPU bound

Salt uses RSA-Key-Pairs on the masters and minions end. Both generate 4096 bit key-pairs on first start. While the key-size for the Master is currently not configurable, the minions keysize can be configured with different key-sizes. For example with a 2048 bit key:

```
keysize: 2048
```

With thousands of decryptions, the amount of time that can be saved on the masters end should not be neglected. See here for reference: [Pull Request 9235](#) how much influence the key-size can have.

Downsizing the Salt Master's key is not that important, because the minions do not encrypt as many messages as the Master does.

In installations with large or with complex pillar files, it is possible for the master to exhibit poor performance as a result of having to render many pillar files at once. This exhibit itself in a number of ways, both as high load on the master and on minions which block on waiting for their pillar to be delivered to them.

To reduce pillar rendering times, it is possible to cache pillars on the master. To do this, see the set of master configuration options which are prefixed with *pillar\_cache*.

---

**Note:** Caching pillars on the master may introduce security considerations. Be certain to read caveats outlined in the master configuration file to understand how pillar caching may affect a master's ability to protect sensitive data!

---

### The Master is disk IO bound

By default, the Master saves every Minion's return for every job in its job-cache. The cache can then be used later, to lookup results for previous jobs. The default directory for this is:

```
cachedir: /var/cache/salt
```

and then in the /proc directory.

Each job return for every Minion is saved in a single file. Over time this directory can grow quite large, depending on the number of published jobs. The amount of files and directories will scale with the number of jobs published and the retention time defined by

```
keep_jobs: 24
```

```
250 jobs/day * 2000 minions returns = 500,000 files a day
```

If no job history is needed, the job cache can be disabled:

```
job_cache: False
```

If the job cache is necessary there are (currently) 2 options:

- `ext_job_cache`: this will have the minions store their return data directly into a returner (not sent through the Master)
- `master_job_cache` (New in 2014.7.0): this will make the Master store the job data using a returner (instead of the local job cache on disk).

If a master has many accepted keys, it may take a long time to publish a job because the master must first determine the matching minions and deliver that information back to the waiting client before the job can be published.

To mitigate this, a key cache may be enabled. This will reduce the load on the master to a single file open instead of thousands or tens of thousands.

This cache is updated by the maintenance process, however, which means that minions with keys that are accepted may not be targeted by the master for up to sixty seconds by default.

To enable the master key cache, set `key_cache: 'sched'` in the master configuration file.

## 16.4 Multi Master Tutorial

As of Salt 0.16.0, the ability to connect minions to multiple masters has been made available. The multi-master system allows for redundancy of Salt masters and facilitates multiple points of communication out to minions. When using a multi-master setup, all masters are running hot, and any active master can be used to send commands out to the minions.

---

**Note:** If you need failover capabilities with multiple masters, there is also a MultiMaster-PKI setup available, that uses a different topology [MultiMaster-PKI with Failover Tutorial](#)

---

In 0.16.0, the masters do not share any information, keys need to be accepted on both masters, and shared files need to be shared manually or use tools like the git fileserver backend to ensure that the `file_roots` are kept consistent.

Beginning with Salt 2016.11.0, the *Pluggable Minion Data Cache* was introduced. The minion data cache contains the Salt Mine data, minion grains, and minion pillar information cached on the Salt Master. By default, Salt uses the `localfs` cache module, but other external data stores can be used instead.

Using a pluggable minion cache modules allows for the data stored on a Salt Master about Salt Minions to be replicated on other Salt Masters the Minion is connected to. Please see the *Minion Data Cache* documentation for more information and configuration examples.

### 16.4.1 Summary of Steps

1. Create a redundant master server
2. Copy primary master key to redundant master
3. Start redundant master
4. Configure minions to connect to redundant master
5. Restart minions
6. Accept keys on redundant master

### 16.4.2 Prepping a Redundant Master

The first task is to prepare the redundant master. If the redundant master is already running, stop it. There is only one requirement when preparing a redundant master, which is that masters share the same private key. When the first master was created, the master's identifying key pair was generated and placed in the master's `pk_dir`. The default location of the master's key pair is `/etc/salt/pki/master/`. Take the private key, `master.pem`, and copy it to the same location on the redundant master. Do the same for the master's public key, `master.pub`. Assuming that no minions have yet been connected to the new redundant master, it is safe to delete any existing key in this location and replace it.

---

**Note:** There is no logical limit to the number of redundant masters that can be used.

---

Once the new key is in place, the redundant master can be safely started.

### 16.4.3 Configure Minions

Since minions need to be master-aware, the new master needs to be added to the minion configurations. Simply update the minion configurations to list all connected masters:

```
master:
- saltmaster1.example.com
- saltmaster2.example.com
```

Now the minion can be safely restarted.

---

**Note:** If the `ipc_mode` for the minion is set to TCP (default in Windows), then each minion in the multi-minion setup (one per master) needs its own `tcp_pub_port` and `tcp_pull_port`.

If these settings are left as the default 4510/4511, each minion object will receive a port 2 higher than the previous. Thus the first minion will get 4510/4511, the second will get 4512/4513, and so on. If these port decisions are unacceptable, you must configure `tcp_pub_port` and `tcp_pull_port` with lists of ports for each master. The length of these lists should match the number of masters, and there should not be overlap in the lists.

---

Now the minions will check into the original master and also check into the new redundant master. Both masters are first-class and have rights to the minions.

---

**Note:** Minions can automatically detect failed masters and attempt to reconnect to them quickly. To enable this functionality, set `master_alive_interval` in the minion config and specify a number of seconds to poll the masters for connection status.

If this option is not set, minions will still reconnect to failed masters but the first command sent after a master comes back up may be lost while the minion authenticates.

---

#### 16.4.4 Sharing Files Between Masters

Salt does not automatically share files between multiple masters. A number of files should be shared or sharing of these files should be strongly considered.

##### Minion Keys

Minion keys can be accepted the normal way using `salt-key` on both masters. Keys accepted, deleted, or rejected on one master will NOT be automatically managed on redundant masters; this needs to be taken care of by running `salt-key` on both masters or sharing the `/etc/salt/pki/master/{minions,minions_pre,minions_rejected}` directories between masters.

---

**Note:** While sharing the `/etc/salt/pki/master` directory will work, it is strongly discouraged, since allowing access to the `master.pem` key outside of Salt creates a *SERIOUS* security risk.

---

##### File\_Roots

The `file_roots` contents should be kept consistent between masters. Otherwise state runs will not always be consistent on minions since instructions managed by one master will not agree with other masters.

The recommended way to sync these is to use a fileserver backend like `gitfs` or to keep these files on shared storage.

---

**Important:** If using `gitfs/git_pillar` with the `cachedir` shared between masters using `GlusterFS`, `nfs`, or another network filesystem, and the masters are running Salt 2015.5.9 or later, it is strongly recommended not to turn off `gitfs_global_lock/git_pillar_global_lock` as doing so will cause lock files to be removed if they were created by a different master.

---

##### Pillar\_Roots

Pillar roots should be given the same considerations as `file_roots`.

---

## Master Configurations

While reasons may exist to maintain separate master configurations, it is wise to remember that each master maintains independent control over minions. Therefore, access controls should be in sync between masters unless a valid reason otherwise exists to keep them inconsistent.

These access control options include but are not limited to:

- `external_auth`
- `publisher_acl`
- `peer`
- `peer_run`

## 16.5 Multi-Master-PKI Tutorial With Failover

This tutorial will explain, how to run a salt-environment where a single minion can have multiple masters and fail-over between them if its current master fails.

The individual steps are

- setup the master(s) to sign its auth-replies
- setup minion(s) to verify master-public-keys
- enable multiple masters on minion(s)
- enable master-check on minion(s)

Please note, that it is advised to have good knowledge of the salt- authentication and communication-process to understand this tutorial. All of the settings described here, go on top of the default authentication/communication process.

### 16.5.1 Motivation

The default behaviour of a salt-minion is to connect to a master and accept the masters public key. With each publication, the master sends his public-key for the minion to check and if this public-key ever changes, the minion complains and exits. Practically this means, that there can only be a single master at any given time.

Would it not be much nicer, if the minion could have any number of masters (1:n) and jump to the next master if its current master died because of a network or hardware failure?

---

**Note:** There is also a MultiMaster-Tutorial with a different approach and topology than this one, that might also suite your needs or might even be better suited [Multi-Master Tutorial](#)

---

It is also desirable, to add some sort of authenticity-check to the very first public key a minion receives from a master. Currently a minions takes the first masters public key for granted.

### 16.5.2 The Goal

Setup the master to sign the public key it sends to the minions and enable the minions to verify this signature for authenticity.

### 16.5.3 Prepping the master to sign its public key

For signing to work, both master and minion must have the signing and/or verification settings enabled. If the master signs the public key but the minion does not verify it, the minion will complain and exit. The same happens, when the master does not sign but the minion tries to verify.

The easiest way to have the master sign its public key is to set

```
master_sign_pubkey: True
```

After restarting the salt-master service, the master will automatically generate a new key-pair

```
master_sign.pem
master_sign.pub
```

A custom name can be set for the signing key-pair by setting

```
master_sign_key_name: <name_without_suffix>
```

The master will then generate that key-pair upon restart and use it for creating the public keys signature attached to the auth-reply.

The computation is done for every auth-request of a minion. If many minions auth very often, it is advised to use `conf_master:master_pubkey_signature` and `conf_master:master_use_pubkey_signature` settings described below.

If multiple masters are in use and should sign their auth-replies, the signing key-pair `master_sign.*` has to be copied to each master. Otherwise a minion will fail to verify the masters public when connecting to a different master than it did initially. That is because the public keys signature was created with a different signing key-pair.

### 16.5.4 Prepping the minion to verify received public keys

The minion must have the public key (and only that one!) available to be able to verify a signature it receives. That public key (defaults to `master_sign.pub`) must be copied from the master to the minions pki-directory.

```
/etc/salt/pki/minion/master_sign.pub
```

```
DO NOT COPY THE master_sign.pem FILE. IT MUST STAY ON THE MASTER AND ONLY THERE!
```

When that is done, enable the signature checking in the minions configuration

```
verify_master_pubkey_sign: True
```

and restart the minion. For the first try, the minion should be run in manual debug mode.

```
salt-minion -l debug
```

Upon connecting to the master, the following lines should appear on the output:

```
[DEBUG  ] Attempting to authenticate with the Salt Master at 172.16.0.10
[DEBUG  ] Loaded minion key: /etc/salt/pki/minion/minion.pem
[DEBUG  ] salt.crypt.verify_signature: Loading public key
[DEBUG  ] salt.crypt.verify_signature: Verifying signature
[DEBUG  ] Successfully verified signature of master public key with verification☒
→public key master_sign.pub
[INFO   ] Received signed and verified master pubkey from master 172.16.0.10
[DEBUG  ] Decrypting the current master AES key
```

If the signature verification fails, something went wrong and it will look like this

```
[DEBUG ] Attempting to authenticate with the Salt Master at 172.16.0.10
[DEBUG ] Loaded minion key: /etc/salt/pki/minion/minion.pem
[DEBUG ] salt.crypt.verify_signature: Loading public key
[DEBUG ] salt.crypt.verify_signature: Verifying signature
[DEBUG ] Failed to verify signature of public key
[CRITICAL] The Salt Master server's public key did not authenticate!
```

In a case like this, it should be checked, that the verification pubkey (master\_sign.pub) on the minion is the same as the one on the master.

Once the verification is successful, the minion can be started in daemon mode again.

For the paranoid among us, its also possible to verify the publication whenever it is received from the master. That is, for every single auth-attempt which can be quite frequent. For example just the start of the minion will force the signature to be checked 6 times for various things like auth, mine, *highstate*, etc.

If that is desired, enable the setting

```
always_verify_signature: True
```

### 16.5.5 Multiple Masters For A Minion

Configuring multiple masters on a minion is done by specifying two settings:

- a list of masters addresses
- what type of master is defined

```
master:
- 172.16.0.10
- 172.16.0.11
- 172.16.0.12
```

```
master_type: failover
```

This tells the minion that all the master above are available for it to connect to. When started with this configuration, it will try the master in the order they are defined. To randomize that order, set

```
master_shuffle: True
```

The master-list will then be shuffled before the first connection attempt.

The first master that accepts the minion, is used by the minion. If the master does not yet know the minion, that counts as accepted and the minion stays on that master.

For the minion to be able to detect if its still connected to its current master enable the check for it

```
master_alive_interval: <seconds>
```

If the loss of the connection is detected, the minion will temporarily remove the failed master from the list and try one of the other masters defined (again shuffled if that is enabled).

### 16.5.6 Testing the setup

At least two running masters are needed to test the failover setup.

Both masters should be running and the minion should be running on the command line in debug mode

```
salt-minion -l debug
```

The minion will connect to the first master from its master list

```
[DEBUG ] Attempting to authenticate with the Salt Master at 172.16.0.10
[DEBUG ] Loaded minion key: /etc/salt/pki/minion/minion.pem
[DEBUG ] salt.crypt.verify_signature: Loading public key
[DEBUG ] salt.crypt.verify_signature: Verifying signature
[DEBUG ] Successfully verified signature of master public key with verification
→public key master_sign.pub
[INFO ] Received signed and verified master pubkey from master 172.16.0.10
[DEBUG ] Decrypting the current master AES key
```

A test.ping on the master the minion is currently connected to should be run to test connectivity.

If successful, that master should be turned off. A firewall-rule denying the minions packets will also do the trick.

Depending on the configured `conf_minion:master_alive_interval`, the minion will notice the loss of the connection and log it to its logfile.

```
[INFO ] Connection to master 172.16.0.10 lost
[INFO ] Trying to tune in to next master from master-list
```

The minion will then remove the current master from the list and try connecting to the next master

```
[INFO ] Removing possibly failed master 172.16.0.10 from list of masters
[WARNING ] Master ip address changed from 172.16.0.10 to 172.16.0.11
[DEBUG ] Attempting to authenticate with the Salt Master at 172.16.0.11
```

If everything is configured correctly, the new masters public key will be verified successfully

```
[DEBUG ] Loaded minion key: /etc/salt/pki/minion/minion.pem
[DEBUG ] salt.crypt.verify_signature: Loading public key
[DEBUG ] salt.crypt.verify_signature: Verifying signature
[DEBUG ] Successfully verified signature of master public key with verification
→public key master_sign.pub
```

the authentication with the new master is successful

```
[INFO ] Received signed and verified master pubkey from master 172.16.0.11
[DEBUG ] Decrypting the current master AES key
[DEBUG ] Loaded minion key: /etc/salt/pki/minion/minion.pem
[INFO ] Authentication with master successful!
```

and the minion can be pinged again from its new master.

### 16.5.7 Performance Tuning

With the setup described above, the master computes a signature for every auth-request of a minion. With many minions and many auth-requests, that can chew up quite a bit of CPU-Power.

To avoid that, the master can use a pre-created signature of its public-key. The signature is saved as a base64 encoded string which the master reads once when starting and attaches only that string to auth-replies.

Enabling this also gives paranoid users the possibility, to have the signing key-pair on a different system than the actual salt-master and create the public keys signature there. Probably on a system with more restrictive firewall rules, without internet access, less users, etc.

That signature can be created with

```
salt-key --gen-signature
```

This will create a default signature file in the master pki-directory

```
/etc/salt/pki/master/master_pubkey_signature
```

It is a simple text-file with the binary-signature converted to base64.

If no signing-pair is present yet, this will auto-create the signing pair and the signature file in one call

```
salt-key --gen-signature --auto-create
```

Telling the master to use the pre-created signature is done with

```
master_use_pubkey_signature: True
```

That requires the file `master\_pubkey\_signature' to be present in the masters pki-directory with the correct signature.

If the signature file is named differently, its name can be set with

```
master_pubkey_signature: <filename>
```

With many masters and many public-keys (default and signing), it is advised to use the salt-masters hostname for the signature-files name. Signatures can be easily confused because they do not provide any information about the key the signature was created from.

Verifying that everything works is done the same way as above.

### 16.5.8 How the signing and verification works

The default key-pair of the salt-master is

```
/etc/salt/pki/master/master.pem  
/etc/salt/pki/master/master.pub
```

To be able to create a signature of a message (in this case a public-key), another key-pair has to be added to the setup. Its default name is:

```
master_sign.pem  
master_sign.pub
```

The combination of the master.\* and master\_sign.\* key-pairs give the possibility of generating signatures. The signature of a given message is unique and can be verified, if the public-key of the signing-key-pair is available to the recipient (the minion).

The signature of the masters public-key in master.pub is computed with

```
master_sign.pem  
master.pub  
M2Crypto.EVP.sign_update()
```

This results in a binary signature which is converted to base64 and attached to the auth-reply send to the minion.

With the signing-pairs public-key available to the minion, the attached signature can be verified with

```
master_sign.pub
master.pub
M2Cryptos EVP.verify_update().
```

When running multiple masters, either the signing key-pair has to be present on all of them, or the master\_pubkey\_signature has to be pre-computed for each master individually (because they all have different public-keys).

DO NOT PUT THE SAME master.pub ON ALL MASTERS FOR EASE OF USE.

---

## Minion Data Cache

---

New in version 2016.11.0.

The Minion data cache contains the Salt Mine data, minion grains and minion pillar information cached on the Salt Master. By default, Salt uses the `localfs` cache module to save the data in a `msgpack` file on the Salt Master.

### 17.1 Pluggable Data Cache

While the default Minion data cache is the `localfs` cache, other external data stores can also be used to store this data such as the `consul` module. To configure a Salt Master to use a different data store, the `cache` setting needs to be established:

```
cache: consul
```

The pluggable data cache streamlines using various Salt topologies such as a *Multi-Master* or *Salt Syndics* configuration by allowing the data stored on the Salt Master about a Salt Minion to be available to other Salt Syndics or Salt Masters that a Salt Minion is connected to.

Additional minion data cache modules can be easily created by modeling the custom data store after one of the existing cache modules.

See *cache modules* for a current list.

### 17.2 Configuring the Minion Data Cache

The default `localfs` Minion data cache module doesn't require any configuration. External data cache modules with external data stores such as Consul require a configuration setting in the master config.

Here's an example config for Consul:

```
consul.host: 127.0.0.1
consul.port: 8500
consul.token: None
consul.scheme: http
consul.consistency: default
consul.dc: dc1
consul.verify: True

cache: consul
```

This section contains details on the Windows Package Manager, and specific information you need to use Salt on Windows.

## 18.1 Windows Software Repository

---

**Note:** In 2015.8.0 and later, the Windows Software Repository cache is compiled on the Salt Minion, which enables pillar, grains and other things to be available during compilation time. To support this new functionality, a next-generation (ng) package repository was created. See the *Changes in Version 2015.8.0* for details.

---

The SaltStack Windows Software Repository provides a package manager and software repository similar to what is provided by yum and apt on Linux. This repository enables the installation of software using the installers on remote Windows systems.

In many senses, the operation is similar to that of the other package managers salt is aware of:

- the `pkg.install` and similar states work on Windows.
- the `pkg.install` and similar module functions work on Windows.

High level differences to yum and apt are:

- The repository metadata (SLS files) is hosted through either salt or git.
- Packages can be downloaded from within the salt repository, a git repository or from http(s) or ftp urls.
- No dependencies are managed. Dependencies between packages needs to be managed manually.

Requirements:

- GitPython 0.3 or later, or pygit2 0.20.3 with libgit 0.20.0 or later installed on your Salt master. The Windows package definitions are downloaded and updated using Git.

### 18.1.1 Configuration

#### Populate the Repository

The SLS files used to install Windows packages are not distributed by default with Salt. Run the following command to initialize the repository on your Salt master:

```
salt-run winrepo.update_git_repos
```

### Sync Repo to Windows Minions

Run `pkg.refresh_db` on each of your Windows minions to synchronize the package repository.

```
salt -G 'os:windows' pkg.refresh_db
```

## 18.1.2 Install Windows Software

After completing the configuration steps, you are ready to manage software on your Windows minions.

### Show Installed Packages

```
salt -G 'os:windows' pkg.list_pkgs
```

### Install a Package

You can query the available version of a package using the Salt `pkg` module.

```
salt winminion pkg.list_available firefox

winminion:
  - 15.0.1
  - 16.0.2
  - 17.0.1
```

As you can see, there are three versions of Firefox available for installation. You can refer a software package by its name or its `full_name` surround by single quotes.

```
salt winminion pkg.install 'firefox'
```

The above line will install the latest version of Firefox.

```
salt winminion pkg.install 'firefox' version=16.0.2
```

The above line will install version 16.0.2 of Firefox.

If a different version of the package is already installed it will be replaced with the version in the winrepo (only if the package itself supports live updating).

You can also specify the full name:

```
salt winminion pkg.install 'Mozilla Firefox 17.0.1 (x86 en-US)'
```

## 18.1.3 Uninstall Windows Software

Uninstall software using the `pkg` module:

```
salt winminion pkg.remove firefox
salt winminion pkg.purge firefox
```

**Note:** `pkg.purge` just executes `pkg.remove` on Windows. At some point in the future `pkg.purge` may direct the installer to remove all configs and settings for software packages that support that option.

### 18.1.4 Repository Location

Salt maintains a repository of SLS files to install a large number of Windows packages:

- 2015.8.0 and later minions: <https://github.com/saltstack/salt-winrepo-ng>
- Earlier releases: <https://github.com/saltstack/salt-winrepo>

By default, these repositories are mirrored to `/srv/salt/win/repo-ng` and `/srv/salt/win/repo`.

This location can be changed in the master config file by setting the `winrepo_dir_ng` and `winrepo_dir` options.

### 18.1.5 Maintaining Windows Repo Definitions in Git Repositories

Windows software package definitions can be hosted in one or more Git repositories. The default repositories are hosted on GitHub by SaltStack. These include software definition files for various open source software projects. These software definition files are `.sls` files. There are two default repositories: `salt-winrepo` and `salt-winrepo-ng`. `salt-winrepo` contains software definition files for older minions (older than 2015.8.0). `salt-winrepo-ng` is for newer minions (2015.8.0 and newer).

Each software definition file contains all the information salt needs to install that software on a minion including the HTTP or FTP locations of the installer files, required command-line switches for silent install, etc. Anyone is welcome to send a pull request to this repo to add new package definitions. The repos can be browsed here: [salt-winrepo](#) [salt-winrepo-ng](#)

**Note:** The newer software definition files are run through the salt's parser which allows for the use of jinja.

Configure which git repositories the master can search for package definitions by modifying or extending the `winrepo_remotes` and `winrepo_remotes_ng` options.

**Important:** `winrepo_remotes` was called `win_gitrepos` in Salt versions earlier than 2015.8.0

Package definitions are pulled down from the online repository by running the `winrepo.update_git_repos` runner. This command is run on the master:

```
salt-run winrepo.update_git_repos
```

This will pull down the software definition files for older minions (`salt-winrepo`) and new minions (`salt-winrepo-ng`). They are stored in the `file_roots` under `win/repo/salt-winrepo` and `win/repo-ng/salt-winrepo-ng` respectively.

**Important:** If you have customized software definition files that aren't maintained in a repository, those should be stored under `win/repo` for older minions and `win/repo-ng` for newer minions. The reason for this is that the

contents of `win/repo/salt-winrepo` and `win/repo-ng/salt-winrepo-ng` are wiped out every time you run a `winrepo.update_git_repos`.

Additionally, when you run `winrepo.genrepo` and `pkg.refresh_db` the entire contents under `win/repo` and `win/repo-ng`, to include all subdirectories, are used to create the msgpack file.

---

The next step (if you have older minions) is to create the msgpack file for the repo (`winrepo.p`). This is done by running the `winrepo.genrepo` runner. This is also run on the master:

```
salt-run winrepo.genrepo
```

---

**Note:** If you have only 2015.8.0 and newer minions, you no longer need to run `salt-run winrepo.genrepo` on the master.

---

Finally, you need to refresh the minion database by running the `pkg.refresh_db` command. This is run on the master as well:

```
salt '*' pkg.refresh_db
```

---

On older minions (older than 2015.8.0) this will copy the `winrepo.p` file down to the minion. On newer minions (2015.8.0 and newer) this will copy all the software definition files (`.sls`) down to the minion and then create the msgpack file (`winrepo.p`) locally. The reason this is done locally is because the jinja needs to be parsed using the minion's grains.

---

**Important:** Every time you modify the software definition files on the master, either by running `salt-run winrepo.update_git_repos`, modifying existing files, or by creating your own, you need to refresh the database on your minions. For older minions, that means running `salt-run winrepo.genrepo` and then `salt '*' pkg.refresh_db`. For newer minions (2015.8.0 and newer) it is just `salt '*' pkg.refresh_db`.

---

**Note:** If the `winrepo.genrepo` or the `pkg.refresh_db` fails, it is likely a problem with the jinja in one of the software definition files. This will cause the operations to stop. You'll need to fix the syntax in order for the msgpack file to be created successfully.

---

To disable one of the repos, set it to an empty list `[]` in the master config. For example, to disable `winrepo_remotest` set the following in the master config file:

```
winrepo_remotest: []
```

---

### 18.1.6 Creating a Package Definition SLS File

The package definition file is a yaml file that contains all the information needed to install a piece of software using salt. It defines information about the package to include version, full name, flags required for the installer and uninstaller, whether or not to use the windows task scheduler to install the package, where to find the installation package, etc.

Take a look at this example for Firefox:

```
firefox:
  '17.0.1':
    installer: 'salt://win/repo/firefox/English/Firefox Setup 17.0.1.exe'
```

---

```

full_name: Mozilla Firefox 17.0.1 (x86 en-US)
locale: en_US
reboot: False
install_flags: '-ms'
uninstaller: '%ProgramFiles(x86)%/Mozilla Firefox/uninstall/helper.exe'
uninstall_flags: '/S'
'16.0.2':
  installer: 'salt://win/repo/firefox/English/Firefox Setup 16.0.2.exe'
  full_name: Mozilla Firefox 16.0.2 (x86 en-US)
  locale: en_US
  reboot: False
  install_flags: '-ms'
  uninstaller: '%ProgramFiles(x86)%/Mozilla Firefox/uninstall/helper.exe'
  uninstall_flags: '/S'
'15.0.1':
  installer: 'salt://win/repo/firefox/English/Firefox Setup 15.0.1.exe'
  full_name: Mozilla Firefox 15.0.1 (x86 en-US)
  locale: en_US
  reboot: False
  install_flags: '-ms'
  uninstaller: '%ProgramFiles(x86)%/Mozilla Firefox/uninstall/helper.exe'
  uninstall_flags: '/S'

```

Each software definition file begins with a package name for the software. As in the example above `firefox`. The next line is indented two spaces and contains the version to be defined. As in the example above, a software definition file can define multiple versions for the same piece of software. The lines following the version are indented two more spaces and contain all the information needed to install that package.

**Warning:** The package name and the `full_name` must be unique to all other packages in the software repository.

The version line is the version for the package to be installed. It is used when you need to install a specific version of a piece of software.

**Warning:** The version must be enclosed in quotes, otherwise the yaml parser will remove trailing zeros.

**Note:** There are unique situations where previous versions are unavailable. Take Google Chrome for example. There is only one url provided for a standalone installation of Google Chrome. (<https://dl.google.com/edgedl/chrome/install/GoogleChromeStandaloneEnterprise.msi>) When a new version is released, the url just points to the new version. To handle situations such as these, set the version to *latest*. Salt will install the version of Chrome at the URL and report that version. Here's an example:

```

chrome:
  latest:
    full_name: 'Google Chrome'
    installer: 'https://dl.google.com/edgedl/chrome/install/
→GoogleChromeStandaloneEnterprise.msi'
    install_flags: '/qn /norestart'
    uninstaller: 'https://dl.google.com/edgedl/chrome/install/
→GoogleChromeStandaloneEnterprise.msi'
    uninstall_flags: '/qn /norestart'

```

```
msiexec: True
locale: en_US
reboot: False
```

Available parameters are as follows:

**param str full\_name** The Full Name for the software as shown in ``Programs and Features`` in the control panel. You can also get this information by installing the package manually and then running `pkg.list_pkgs`. Here's an example of the output from `pkg.list_pkgs`:

```
salt 'test-2008' pkg.list_pkgs
test-2008
-----
7-Zip 9.20 (x64 edition):
  9.20.00.0
Microsoft .NET Framework 4 Client Profile:
  4.0.30319,4.0.30319
Microsoft .NET Framework 4 Extended:
  4.0.30319,4.0.30319
Microsoft Visual C++ 2008 Redistributable - x64 9.0.21022:
  9.0.21022
Mozilla Firefox 17.0.1 (x86 en-US):
  17.0.1

Salt Minion 0.16.0:
  0.16.0
```

Notice the Full Name for Firefox: Mozilla Firefox 17.0.0 (x86 en-US). That's exactly what's in the `full_name` parameter in the software definition file.

If any of the software installed on the machine matches one of the software definition files in the repository the `full_name` will be automatically renamed to the package name. The example below shows the `pkg.list_pkgs` for a machine that already has Mozilla Firefox 17.0.1 installed.

0.3.9.328

**Important:** The version number and `full_name` need to match the output from `pkg.list_pkgs` so that the status can be verified when running `highstate`.

**Note:** It is still possible to successfully install packages using `pkg.install` even if they don't match. This can make troubleshooting difficult so be careful.

**param str installer** The path to the `.exe` or `.msi` to use to install the package. This can be a path or a URL. If it is a URL or a salt path (`salt://`), the package will be cached locally and then executed. If it is a path to a file on disk or a file share, it will be executed directly.

**param str install\_flags** Any flags that need to be passed to the installer to make it perform a silent install. These can often be found by adding `/?` or `/h` when running the installer from the command-line. A great resource for finding these silent install flags can be found on the WPKG project's [wiki](#):

Salt will not return if the installer is waiting for user input so these are important.

**param str uninstaller** The path to the program used to uninstall this software. This can be the path to the same `exe` or `msi` used to install the software. It can also be a GUID. You can find this value in the registry under the following keys:

- `Software\Microsoft\Windows\CurrentVersion\Uninstall`
- `Software\Wow6432None\Microsoft\Windows\CurrentVersion\Uninstall`

**param str uninstall\_flags** Any flags that need to be passed to the uninstaller to make it perform a silent uninstall. These can often be found by adding `/?` or `/h` when running the uninstaller from the command-line. A great resource for finding these silent install flags can be found on the WPKG project's [wiki](#):

Salt will not return if the uninstaller is waiting for user input so these are important.

Here are some examples of installer and uninstaller settings:

```
7zip:
  '9.20.00.0':
    installer: salt://win/repo/7zip/7z920-x64.msi
    full_name: 7-Zip 9.20 (x64 edition)
    reboot: False
    install_flags: '/qn /norestart'
    msiexec: True
    uninstaller: '{23170F69-40C1-2702-0920-000001000000}'
    uninstall_flags: '/qn /norestart'
```

Alternatively the uninstaller can also simply repeat the URL of the msi file.

```
7zip:
  '9.20.00.0':
    installer: salt://win/repo/7zip/7z920-x64.msi
    full_name: 7-Zip 9.20 (x64 edition)
    reboot: False
    install_flags: '/qn /norestart'
    msiexec: True
```

```
uninstaller: salt://win/repo/7zip/7z920-x64.msi
uninstall_flags: '/qn /norestart'
```

**param msiexec** This tells salt to use `msiexec /i` to install the package and `msiexec /x` to uninstall. This is for `.msi` installations. Possible options are: True, False or path to msiexec on your system

**7zip:**

```
'9.20.00.0': installer: salt://win/repo/7zip/7z920-x64.msi full_name: 7-Zip 9.20
(x64 edition) reboot: False install_flags: '/qn /norestart' msiexec:
'C:WindowsSystem32msiexec.exe' uninstaller: salt://win/repo/7zip/7z920-x64.msi
uninstall_flags: '/qn /norestart'
```

**param str arch** This selects which `msiexec.exe` to use. Possible values: x86, x64

**param bool allusers** This parameter is specific to `.msi` installations. It tells `msiexec` to install the software for all users. The default is True.

**param bool cache\_dir** If true when installer URL begins with `salt://`, the entire directory where the installer resides will be recursively cached. This is useful for installers that depend on other files in the same directory for installation.

**param str cache\_file** When installer URL begins with `salt://`, this indicates single file to copy down for use with the installer. Copied to the same location as the installer. Use this over `cache_dir` if there are many files in the directory and you only need a specific file and don't want to cache additional files that may reside in the installer directory.

Here's an example for a software package that has dependent files:

```
sqlxpress:
'12.0.2000.8':
  installer: 'salt://win/repo/sqlxpress/setup.exe'
  full_name: Microsoft SQL Server 2014 Setup (English)
  reboot: False
  install_flags: '/ACTION=install /IACCEPTSQLSERVERLICENSETERMS /Q'
  cache_dir: True
```

**param bool use\_scheduler** If true, windows will use the task scheduler to run the installation. This is useful for running the salt installation itself as the installation process kills any currently running instances of salt.

**param str source\_hash** This tells salt to compare a hash sum of the installer

to the provided hash sum before execution. The value can be formatted as `hash_algorithm=hash_sum`, or it can be a URI to a file containing the hash sum. For a list of supported algorithms, see the [hashlib documentation](#).

Here's an example of `source_hash` usage:

```
messageanalyzer:
'4.0.7551.0':
  full_name: 'Microsoft Message Analyzer'
  installer: 'salt://win/repo/messageanalyzer/MessageAnalyzer64.msi'
  install_flags: '/quiet /norestart'
  uninstaller: '{1CC02C23-8FCD-487E-860C-311EC0A0C933}'
  uninstall_flags: '/quiet /norestart'
  msiexec: True
  source_hash: 'sha1=62875ff451f13b10a8ff988f2943e76a4735d3d4'
```

**param bool reboot** Not implemented

**param str local** Not implemented

Examples can be found at <https://github.com/saltstack/salt-winrepo-ng>

### 18.1.7 Managing Windows Software on a Standalone Windows Minion

The Windows Package Repository functions similar in a standalone environment, with a few differences in the configuration.

To replace the winrepo runner that is used on the Salt master, an *execution module* exists to provide the same functionality to standalone minions. The functions are named the same as the ones in the runner, and are used in the same way; the only difference is that `salt-call` is used instead of `salt-run`:

```
salt-call winrepo.update_git_repos
salt-call winrepo.genrepo
salt-call pkg.refresh_db
```

After executing the previous commands the repository on the standalone system is ready to use.

#### Custom Location for Repository SLS Files

If *file\_roots* has not been modified in the minion configuration, then no additional configuration needs to be added to the minion configuration. The *winrepo.genrepo* function from the *winrepo* execution module will by default look for the filename specified by *winrepo\_cache\_file* within `C:\salt\srv\salt\win\repo`.

If the *file\_roots* parameter has been modified, then *winrepo\_dir* must be modified to fall within that path, at the proper relative path. For example, if the base environment in *file\_roots* points to `D:\foo`, and *winrepo\_source\_dir* is `salt://win/repo`, then *winrepo\_dir* must be set to `D:\foo\win\repo` to ensure that *winrepo.genrepo* puts the cache file into right location.

### 18.1.8 Config Options for Minions 2015.8.0 and Later

The *winrepo\_source\_dir* config parameter (default: `salt://win/repo`) controls where *pkg.refresh\_db* looks for the cache file (default: `winrepo.p`). This means that the default location for the winrepo cache file would be `salt://win/repo/winrepo.p`. Both *winrepo\_source\_dir* and *winrepo\_cache\_file* can be adjusted to match the actual location of this file on the Salt fileserver.

### 18.1.9 Config Options for Minions Before 2015.8.0

If connected to a master, the minion will by default look for the winrepo cache file (the file generated by the *winrepo.genrepo runner*) at `salt://win/repo/winrepo.p`. If the cache file is in a different path on the salt fileserver, then *win\_repo\_cache\_file* will need to be updated to reflect the proper location.

### 18.1.10 Changes in Version 2015.8.0

Git repository management for the Windows Software Repository has changed in version 2015.8.0, and several master/minion config parameters have been renamed to make their naming more consistent with each other.

For a list of the winrepo config options, see [here](#) for master config options, and [here](#) for configuration options for masterless Windows minions.

On the master, the *winrepo.update\_git\_repos* runner has been updated to use either *pygit2* or *GitPython* to checkout the git repositories containing repo data. If *pygit2* or *GitPython* is installed, existing winrepo git

checkouts should be removed after upgrading to 2015.8.0, to allow them to be checked out again by running `winrepo.update_git_repos`.

If neither `GitPython` nor `pygit2` are installed, then Salt will fall back to the pre-existing behavior for `winrepo.update_git_repos`, and a warning will be logged in the master log.

---

**Note:** Standalone Windows minions do not support the new `GitPython/pygit2` functionality, and will instead use the `git.latest` state to keep repositories up-to-date. More information on how to use the Windows Software Repo on a standalone minion can be found [here](#).

---

### Config Parameters Renamed

Many of the legacy winrepo configuration parameters have changed in version 2015.8.0 to make the naming more consistent. The old parameter names will still work, but a warning will be logged indicating that the old name is deprecated.

Below are the parameters which have changed for version 2015.8.0:

#### Master Config

Old Name	New Name
<code>win_repo</code>	<code>winrepo_dir</code>
<code>win_repo_mastercachefile</code>	<code>winrepo_cachefile</code>
<code>win_gitrepos</code>	<code>winrepo_remotes</code>

---

**Note:** `winrepo_cachefile` is no longer used by 2015.8.0 and later minions, and the `winrepo_dir` setting is replaced by `winrepo_dir_ng` for 2015.8.0 and later minions.

---

See [here](#) for detailed information on all master config options for the Windows Repo.

#### Minion Config

Old Name	New Name
<code>win_repo</code>	<code>winrepo_dir</code>
<code>win_repo_cachefile</code>	<code>winrepo_cachefile</code>
<code>win_gitrepos</code>	<code>winrepo_remotes</code>

See [here](#) for detailed information on all minion config options for the Windows Repo.

### pygit2/GitPython Support for Maintaining Git Repos

The `winrepo.update_git_repos` runner (and the corresponding `remote execution function` for standalone minions) now makes use of the same underlying code used by the `Git Fileserver Backend` and `Git External Pillar` to maintain and update its local clones of git repositories. If a compatible version of either `pygit2` (0.20.3 and later) or `GitPython` (0.3.0 or later) is installed, then Salt will use it instead of the old method (which invokes the `git.latest` state).

---

**Note:** If compatible versions of both `pygit2` and `GitPython` are installed, then Salt will prefer `pygit2`, to override this behavior use the `winrepo_provider` configuration parameter:

---

```
winrepo_provider: gitpython
```

The *winrepo execution module* (discussed above in the *Managing Windows Software on a Standalone Windows Minion* section) does not yet officially support the new *pygit2/GitPython* functionality, but if either *pygit2* or *GitPython* is installed into Salt's bundled Python then it *should* work. However, it should be considered experimental at this time.

To minimize potential issues, it is a good idea to remove any winrepo git repositories that were checked out by the old (pre-2015.8.0) winrepo code when upgrading the master to 2015.8.0 or later, and run *winrepo.update\_git\_repos* to clone them anew after the master is started.

Additional added features include the ability to access authenticated git repositories (**NOTE: pygit2 only**), and to set per-remote config settings. An example of this would be the following:

```
winrepo_remotes:
- https://github.com/saltstack/salt-winrepo.git
- git@github.com:myuser/myrepo.git:
  - pubkey: /path/to/key.pub
  - privkey: /path/to/key
  - passphrase: myaw3s0m3pa$$phr4$3
- https://github.com/myuser/privaterepo.git:
  - user: mygithubuser
  - password: CorrectHorseBatteryStaple
```

**Note:** Per-remote configuration settings work in the same fashion as they do in gitfs, with global parameters being overridden by their per-remote counterparts (for instance, setting *winrepo\_passphrase* would set a global passphrase for winrepo that would apply to all SSH-based remotes, unless overridden by a passphrase per-remote parameter).

See [here](#) for more a more in-depth explanation of how per-remote configuration works in gitfs, the same principles apply to winrepo.

There are a couple other changes in how Salt manages git repos using *pygit2/GitPython*. First of all, a `clean` argument has been added to the *winrepo.update\_git\_repos* runner, which (if set to `True`) will tell the runner to dispose of directories under the *winrepo\_dir* which are not explicitly configured. This prevents the need to manually remove these directories when a repo is removed from the config file. To clean these old directories, just pass `clean=True`, like so:

```
salt-run winrepo.update_git_repos clean=True
```

However, if a mix of git and non-git Windows Repo definition files are being used, then this should *not* be used, as it will remove the directories containing non-git definitions.

The other major change is that collisions between repo names are now detected, and the *winrepo.update\_git\_repos* runner will not proceed if any are detected. Consider the following configuration:

```
winrepo_remotes:
- https://foo.com/bar/baz.git
- https://mydomain.tld/baz.git
- https://github.com/foobar/baz
```

The *winrepo.update\_git\_repos* runner will refuse to update repos here, as all three of these repos would be checked out to the same directory. To work around this, a per-remote parameter called `name` can be used to resolve these conflicts:

```
winrepo_remotes:
- https://foo.com/bar/baz.git
- https://mydomain.tld/baz.git:
  - name: baz_junior
- https://github.com/foobar/baz:
  - name: baz_the_third
```

### 18.1.11 Troubleshooting

#### Incorrect name/version

If the package seems to install properly, but salt reports a failure then it is likely you have a version or `full_name` mismatch.

Check the exact `full_name` and version used by the package. Use `pkg.list_pkgs` to check that the names and version exactly match what is installed.

#### Changes to sls files not being picked up

Ensure you have (re)generated the repository cache file (for older minions) and then updated the repository cache on the relevant minions:

```
salt-run winrepo.genrepo
salt winminion pkg.refresh_db
```

#### Packages management under Windows 2003

On Windows server 2003, you need to install optional Windows component "wmi windows installer provider" to have full list of installed packages. If you don't have this, salt-minion can't report some installed software.

#### How Success and Failure are Reported

The install state/module function of the Windows package manager works roughly as follows:

1. Execute `pkg.list_pkgs` and store the result
2. Check if any action needs to be taken. (i.e. compare required package and version against `pkg.list_pkgs` results)
3. If so, run the installer command.
4. Execute `pkg.list_pkgs` and compare to the result stored from before installation.
5. Success/Failure/Changes will be reported based on the differences between the original and final `pkg.list_pkgs` results.

If there are any problems in using the package manager it is likely due to the data in your sls files not matching the difference between the pre and post `pkg.list_pkgs` results.

## 18.2 Windows-specific Behaviour

Salt is capable of managing Windows systems, however due to various differences between the operating systems, there are some things you need to keep in mind.

This document will contain any quirks that apply across Salt or generally across multiple module functions. Any Windows-specific behavior for particular module functions will be documented in the module function documentation. Therefore this document should be read in conjunction with the module function documentation.

### 18.2.1 Group parameter for files

Salt was originally written for managing Unix-based systems, and therefore the file module functions were designed around that security model. Rather than trying to shoehorn that model on to Windows, Salt ignores these parameters and makes non-applicable module functions unavailable instead.

One of the commonly ignored parameters is the `group` parameter for managing files. Under Windows, while files do have a `'primary group'` property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Because of this, any file module functions that typically require a group, do not under Windows. Attempts to directly use file module functions that operate on the group (e.g. `file.chgrp`) will return a pseudo-value and cause a log message to appear. No group parameters will be acted on.

If you do want to access and change the `'primary group'` property and understand the implications, use the `file.get_pgid` or `file.get_pgroup` functions or the `pgroup` parameter on the `file.chown` module function.

### 18.2.2 Dealing with case-insensitive but case-preserving names

Windows is case-insensitive, but however preserves the case of names and it is this preserved form that is returned from system functions. This causes some issues with Salt because it assumes case-sensitive names. These issues generally occur in the state functions and can cause bizarre looking errors.

To avoid such issues, always pretend Windows is case-sensitive and use the right case for names, e.g. `specify user=Administrator` instead of `user=administrator`.

Follow [issue 11801](#) for any changes to this behavior.

### 18.2.3 Dealing with various username forms

Salt does not understand the various forms that Windows usernames can come in, e.g. `username`, `mydomain\username`, `username@mydomain.tld` can all refer to the same user. In fact, Salt generally only considers the raw username value, i.e. the username without the domain or host information.

Using these alternative forms will likely confuse Salt and cause odd errors to happen. Use only the raw username value in the correct case to avoid problems.

Follow [issue 11801](#) for any changes to this behavior.

### 18.2.4 Specifying the None group

Each Windows system has built-in `_None_` group. This is the default `'primary group'` for files for users not on a domain environment.

Unfortunately, the word `_None_` has special meaning in Python - it is a special value indicating 'nothing', similar to `null` or `nil` in other languages.

To specify the `None` group, it must be specified in quotes, e.g. `./salt '*' file.chgrp C:\path\to\file "'None'"`.

### 18.2.5 Symbolic link loops

Under Windows, if any symbolic link loops are detected or if there are too many levels of symlinks (defaults to 64), an error is always raised.

For some functions, this behavior is different to the behavior on Unix platforms. In general, avoid symlink loops on either platform.

---

## Developing Salt

---

### 19.1 Overview

In its most typical use, Salt is a software application in which clients, called ``minions" can be commanded and controlled from a central command server called a ``master".

Commands are normally issued to the minions (via the master) by calling a client script simply called, `salt'.

Salt features a pluggable transport system to issue commands from a master to minions. The default transport is ZeroMQ.

### 19.2 Salt Client

#### 19.2.1 Overview

The salt client is run on the same machine as the Salt Master and communicates with the salt-master to issue commands and to receive the results and display them to the user.

The primary abstraction for the salt client is called `LocalClient'.

When LocalClient wants to publish a command to minions, it connects to the master by issuing a request to the master's ReqServer (TCP: 4506)

The LocalClient system listens to responses for its requests by listening to the master event bus publisher (master\_event\_pub.ipc).

### 19.3 Salt Master

#### 19.3.1 Overview

The salt-master daemon runs on the designated Salt master and performs functions such as authenticating minions, sending, and receiving requests from connected minions and sending and receiving requests and replies to the `salt' CLI.

### 19.3.2 Moving Pieces

When a Salt master starts up, a number of processes are started, all of which are called `salt-master' in a process-list but have various role categories.

Among those categories are:

- Publisher
- EventPublisher
- MWorker

### 19.3.3 Publisher

The Publisher process is responsible for sending commands over the designated transport to connected minions. The Publisher is bound to the following:

- TCP: port 4505
- IPC: publish\_pull.ipc

Each salt minion establishes a connection to the master Publisher.

### 19.3.4 EventPublisher

The EventPublisher publishes events onto the event bus. It is bound to the following:

- IPC: master\_event\_pull.ipc
- IPC: master\_event\_pub.ipc

### 19.3.5 MWorker

Worker processes manage the back-end operations for the Salt Master.

The number of workers is equivalent to the number of `worker\_threads' specified in the master configuration and is always at least one.

Workers are bound to the following:

- IPC: workers.ipc

### 19.3.6 ReqServer

The Salt request server takes requests and distributes them to available MWorker processes for processing. It also receives replies back from minions.

**The ReqServer is bound to the following:**

- TCP: 4506
- IPC: workers.ipc

Each salt minion establishes a connection to the master ReqServer.

### 19.3.7 Job Flow

The Salt master works by always publishing commands to all connected minions and the minions decide if the command is meant for them by checking themselves against the command target.

The typical lifecycle of a salt job from the perspective of the master might be as follows:

1. A command is issued on the CLI. For example, ``salt my_minion test.ping``.
- 2) The ``salt`` command uses LocalClient to generate a request to the salt master by connecting to the ReqServer on TCP:4506 and issuing the job.
- 3) The salt-master ReqServer sees the request and passes it to an available MWorker over workers.ipc.
- 4) A worker picks up the request and handles it. First, it checks to ensure that the requested user has permissions to issue the command. Then, it sends the publish command to all connected minions. For the curious, this happens in `ClearFuncs.publish()`.
- 5) The worker announces on the master event bus that it is about to publish a job to connected minions. This happens by placing the event on the master event bus (`master_event_pull.ipc`) where the EventPublisher picks it up and distributes it to all connected event listeners on `master_event_pub.ipc`.
- 6) The message to the minions is encrypted and sent to the Publisher via IPC on `publish_pull.ipc`.
- 7) Connected minions have a TCP session established with the Publisher on TCP port 4505 where they await commands. When the Publisher receives the job over `publish_pull`, it sends the jobs across the wire to the minions for processing.
- 8) After the minions receive the request, they decrypt it and perform any requested work, if they determine that they are targeted to do so.
- 9) When the minion is ready to respond, it publishes the result of its job back to the master by sending the encrypted result back to the master on TCP 4506 where it is again picked up by the ReqServer and forwarded to an available MWorker for processing. (Again, this happens by passing this message across `workers.ipc` to an available worker.)
- 10) When the MWorker receives the job it decrypts it and fires an event onto the master event bus (`master_event_pull.ipc`). (Again for the curious, this happens in `AESFuncs._return()`.)
- 11) The EventPublisher sees this event and re-publishes it on the bus to all connected listeners of the master event bus (on `master_event_pub.ipc`). This is where the LocalClient has been waiting, listening to the event bus for minion replies. It gathers the job and stores the result.
- 12) When all targeted minions have replied or the timeout has been exceeded, the salt client displays the results of the job to the user on the CLI.

## 19.4 Salt Minion

### 19.4.1 Overview

The salt-minion is a single process that sits on machines to be managed by Salt. It can either operate as a stand-alone daemon which accepts commands locally via ``salt-call`` or it can connect back to a master and receive commands remotely.

When starting up, salt minions connect `_back_` to a master defined in the minion config file. The connect to two ports on the master:

- **TCP: 4505** This is the connection to the master Publisher. It is on this port that the minion receives jobs from the master.

- **TCP: 4506** This is the connection to the master ReqServer. It is on this port that the minion sends job results back to the master.

## 19.4.2 Event System

Similar to the master, a salt-minion has its own event system that operates over IPC by default. The minion event system operates on a push/pull system with IPC files at `minion_event_{unique_id}_pub.ipc` and `minion_event_{unique_id}_pull.ipc`.

The astute reader might ask why have an event bus at all with a single-process daemon. The answer is that the salt-minion may fork other processes as required to do the work without blocking the main salt-minion process and this necessitates a mechanism by which those processes can communicate with each other. Secondly, this provides a bus by which any user with sufficient permissions can read or write to the bus as a common interface with the salt minion.

## 19.4.3 Job Flow

When a salt minion starts up, it attempts to connect to the Publisher and the ReqServer on the salt master. It then attempts to authenticate and once the minion has successfully authenticated, it simply listens for jobs.

Jobs normally come either come from the `'salt-call'` script run by a local user on the salt minion or they can come directly from a master.

## 19.4.4 Master Job Flow

- 1) A master publishes a job that is received by a minion as outlined by the master's job flow above.
- 2) The minion is polling its receive socket that's connected to the master Publisher (TCP 4505 on master). When it detects an incoming message, it picks it up from the socket and decrypts it.
- 3) A new minion process or thread is created and provided with the contents of the decrypted message. The `_thread_return()` method is provided with the contents of the received message.
- 4) The new minion thread is created. The `_thread_return()` function starts up and actually calls out to the requested function contained in the job.
  5. The requested function runs and returns a result. [Still in thread.]
- 6) The result of the function that's run is encrypted and returned to the master's ReqServer (TCP 4506 on master). [Still in thread.]
- 7) Thread exits. Because the main thread was only blocked for the time that it took to initialize the worker thread, many other requests could have been received and processed during this time.

## 19.5 A Note on ClearFuncs vs. AESFuncs

A common source of confusion is determining when messages are passed in the clear and when they are passed using encryption. There are two rules governing this behaviour:

- 1) ClearFuncs is used for intra-master communication and during the initial authentication handshake between a minion and master during the key exchange.
2. AESFuncs is used everywhere else.

## 19.6 Contributing

There is a great need for contributions to Salt and patches are welcome! The goal here is to make contributions clear, make sure there is a trail for where the code has come from, and most importantly, to give credit where credit is due!

There are a number of ways to contribute to Salt development.

For details on how to contribute documentation improvements please review [Writing Salt Documentation](#).

### 19.6.1 Salt Coding Style

SaltStack has its own coding style guide that informs contributors on various coding approaches. Please review the [Salt Coding Style](#) documentation for information about Salt's particular coding patterns.

Within the [Salt Coding Style](#) documentation, there is a section about running Salt's `.pylintrc` file. SaltStack recommends running the `.pylintrc` file on any files you are changing with your code contribution before submitting a pull request to Salt's repository. Please see the [Linting](#) documentation for more information.

### 19.6.2 Sending a GitHub pull request

Sending pull requests on GitHub is the preferred method for receiving contributions. The workflow advice below mirrors [GitHub's own guide](#) and is well worth reading.

1. Fork [saltstack/salt](#) on GitHub.
2. Make a local clone of your fork.

```
git clone git@github.com:my-account/salt.git
cd salt
```

3. Add [saltstack/salt](#) as a git remote.

```
git remote add upstream https://github.com/saltstack/salt.git
```

4. Create a new branch in your clone.

---

**Note:** A branch should have one purpose. For example, ``Fix bug X," or ``Add feature Y". Multiple unrelated fixes and/or features should be isolated into separate branches.

---

If you're working on a bug or documentation fix, create your branch from the oldest release branch that contains the bug or requires the documentation update. See [Which Salt Branch?](#).

```
git fetch upstream
git checkout -b fix-broken-thing upstream/2016.11
```

If you're working on a feature, create your branch from the develop branch.

```
git fetch upstream
git checkout -b add-cool-feature upstream/develop
```

5. Edit and commit changes to your branch.

```
vim path/to/file1 path/to/file2
git diff
git add path/to/file1 path/to/file2
git commit
```

Write a short, descriptive commit title and a longer commit message if necessary.

---

**Note:** If your change fixes a bug or implements a feature already filed in the issue tracker, be sure to reference the issue number in the commit message body.

---

```
Fix broken things in file1 and file2

Fixes #31337

# Please enter the commit message for your changes. Lines starting
# with '#' will be ignored, and an empty message aborts the commit.
# On branch fix-broken-thing
# Changes to be committed:
#   modified:   path/to/file1
#   modified:   path/to/file2
```

If you get stuck, there are many introductory Git resources on <http://help.github.com>.

6. Push your locally-committed changes to your GitHub fork.

```
git push -u origin fix-broken-thing
```

or

```
git push -u origin add-cool-feature
```

---

**Note:** You may want to rebase before pushing to work out any potential conflicts:

```
git fetch upstream
git rebase upstream/2016.11 fix-broken-thing
git push -u origin fix-broken-thing
```

or

```
git fetch upstream
git rebase upstream/develop add-cool-feature
git push -u origin add-cool-feature
```

If you do rebase, and the push is rejected with a (non-fast-forward) comment, then run `git status`. You will likely see a message about the branches diverging:

```
On branch fix-broken-thing
Your branch and 'origin/fix-broken-thing' have diverged,
and have 1 and 2 different commits each, respectively.
(use "git pull" to merge the remote branch into yours)
nothing to commit, working tree clean
```

Do **NOT** perform a `git pull` or `git merge` here. Instead, add `--force` to the end of the `git push` command to get the changes pushed to your fork. Pulling or merging, while they will resolve the non-fast-

forward issue, will likely add extra commits to the pull request which were not part of your changes.

---

7. Find the branch on your GitHub salt fork.

<https://github.com/my-account/salt/branches/fix-broken-thing>

8. Open a new pull request.

Click on `Pull Request` on the right near the top of the page,

<https://github.com/my-account/salt/pull/new/fix-broken-thing>

- (a) If your branch is a fix for a release branch, choose that as the base branch (e.g. `2016.11`),

<https://github.com/my-account/salt/compare/saltstack:2016.11...fix-broken-thing>

If your branch is a feature, choose `develop` as the base branch,

<https://github.com/my-account/salt/compare/saltstack:develop...add-cool-feature>

- (b) Review that the proposed changes are what you expect.
- (c) Write a descriptive comment. Include links to related issues (e.g. ``Fixes #31337!``) in the comment field.
- (d) Click `Create pull request`.

9. Salt project members will review your pull request and automated tests will run on it.

If you recognize any test failures as being related to your proposed changes or if a reviewer asks for modifications:

- (a) Make the new changes in your local clone on the same local branch.
- (b) Push the branch to GitHub again using the same commands as before.
- (c) New and updated commits will be added to the pull request automatically.
- (d) Feel free to add a comment to the discussion.

---

**Note:** Jenkins

Pull request against `saltstack/salt` are automatically tested on a variety of operating systems and configurations. On average these tests take 30 minutes. Depending on your GitHub notification settings you may also receive an email message about the test results.

Test progress and results can be found at <http://jenkins.saltstack.com/>.

---

### 19.6.3 Salt's Branch Topology

There are three different kinds of branches in use: `develop`, main release branches, and dot release branches.

- All feature work should go into the `develop` branch.
- Bug fixes and documentation changes should go into the oldest supported **main** release branch affected by the the bug or documentation change. Main release branches are named after a year and month, such as `2016.11` and `2017.7`.
- Hot fixes, as determined by SaltStack's release team, should be submitted against **dot** release branches. Dot release branches are named after a year, month, and version. Examples include `2016.11.8` and `2017.7.2`.

---

**Note:** GitHub will open pull requests against Salt's main branch, `develop`, by default. Be sure to check which branch is selected when creating the pull request.

---

### The Develop Branch

The `develop` branch is unstable and bleeding-edge. Pull requests containing feature additions or non-bug-fix changes should be made against the `develop` branch.

---

**Note:** If you have a bug fix or documentation change and have already forked your working branch from `develop` and do not know how to rebase your commits against another branch, then submit it to `develop` anyway. SaltStack's development team will be happy to back-port it to the correct branch.

**Please make sure you let the maintainers know that the pull request needs to be back-ported.**

---

### Main Release Branches

The current release branch is the most recent stable release. Pull requests containing bug fixes or documentation changes should be made against the main release branch that is affected.

The branch name will be a date-based name such as `2016.11`.

Bug fixes are made on this branch so that dot release branches can be cut from the main release branch without introducing surprises and new features. This approach maximizes stability.

### Dot Release Branches

Prior to tagging an official release, a branch will be created when the SaltStack release team is ready to tag. The dot release branch is created from a main release branch. The dot release branch will be the same name as the tag minus the `v`. For example, the `2017.7.1` dot release branch was created from the `2017.7` main release branch. The `v2017.7.1` release was tagged at the HEAD of the `2017.7.1` branch.

This branching strategy will allow for more stability when there is a need for a re-tag during the testing phase of the release process and further increases stability.

Once the dot release branch is created, the fixes required for a given release, as determined by the SaltStack release team, will be added to this branch. All commits in this branch will be merged forward into the main release branch as well.

### Merge Forward Process

The Salt repository follows a "Merge Forward" policy. The merge-forward behavior means that changes submitted to older main release branches will automatically be "merged-forward" into the newer branches.

For example, a pull request is merged into `2016.11`. Then, the entire `2016.11` branch is merged-forward into the `2017.7` branch, and the `2017.7` branch is merged-forward into the `develop` branch.

This process makes it easy for contributors to make only one pull-request against an older branch, but allows the change to propagate to all **main** release branches.

The merge-forward work-flow applies to all main release branches and the operation runs continuously.

## Merge-Forwards for Dot Release Branches

The merge-forward policy applies to dot release branches as well, but has a slightly different behavior. If a change is submitted to a **dot** release branch, the dot release branch will be merged into its parent **main** release branch.

For example, a pull request is merged into the 2017.7.2 release branch. Then, the entire 2017.7.2 branch is merge-forward into the 2017.7 branch. From there, the merge forward process continues as normal.

The only way in which dot release branches differ from main release branches in regard to merge-forwards, is that once a dot release branch is created from the main release branch, the dot release branch does not receive merge forwards.

---

**Note:** The merge forward process for dot release branches is one-way: dot release branch --> main release branch.

---

## Closing GitHub issues from commits

This ``merge-forward" strategy requires that the [magic keywords to close a GitHub issue](#) appear in the commit message text directly. Only including the text in a pull request will not close the issue.

GitHub will close the referenced issue once the *commit* containing the magic text is merged into the default branch (deveLop). Any magic text input only into the pull request description will not be seen at the Git-level when those commits are merged-forward. In other words, only the commits are merged-forward and not the pull request text.

## Backporting Pull Requests

If a bug is fixed on deveLop and the bug is also present on a currently-supported release branch, it will need to be back-ported to an applicable branch.

---

**Note:** Most Salt contributors can skip these instructions

These instructions do not need to be read in order to contribute to the Salt project! The SaltStack team will back-port fixes on behalf of contributors in order to keep the contribution process easy.

These instructions are intended for frequent Salt contributors, advanced Git users, SaltStack employees, or independent souls who wish to back-port changes themselves.

---

It is often easiest to fix a bug on the oldest supported release branch and then merge that branch forward into deveLop (as described earlier in this document). When that is not possible the fix must be back-ported, or copied, into any other affected branches.

These steps assume a pull request #1234 has been merged into deveLop. And upstream is the name of the remote pointing to the main Salt repo.

1. Identify the oldest supported release branch that is affected by the bug.
2. Create a new branch for the back-port by reusing the same branch from the original pull request.

Name the branch bp-<NNNN> and use the number of the original pull request.

```
git fetch upstream refs/pull/1234/head:bp-1234
git checkout bp-1234
```

3. Find the parent commit of the original pull request.

The parent commit of the original pull request must be known in order to rebase onto a release branch. The easiest way to find this is on GitHub.

Open the original pull request on GitHub and find the first commit in the list of commits. Select and copy the SHA for that commit. The parent of that commit can be specified by appending ~1 to the end.

4. Rebase the new branch on top of the release branch.

- <release-branch> is the branch identified in step #1.
- <orig-base> is the SHA identified in step #3 -- don't forget to add ~1 to the end!

```
git rebase --onto <release-branch> <orig-base> bp-1234
```

Note, release branches prior to 2016.11 will not be able to make use of rebase and must use cherry-picking instead.

5. Push the back-port branch to GitHub and open a new pull request.

Opening a pull request for the back-port allows for the test suite and normal code-review process.

```
git push -u origin bp-1234
```

### 19.6.4 Keeping Salt Forks in Sync

Salt advances quickly. It is therefore critical to pull upstream changes from upstream into your fork on a regular basis. Nothing is worse than putting hard work into a pull request only to see bunches of merge conflicts because it has diverged too far from upstream.

#### See also:

[GitHub Fork a Repo Guide](#)

The following assumes `origin` is the name of your fork and `upstream` is the name of the main `saltstack/salt` repository.

1. View existing remotes.

```
git remote -v
```

2. Add the upstream remote.

```
# For ssh github
git remote add upstream git@github.com:saltstack/salt.git

# For https github
git remote add upstream https://github.com/saltstack/salt.git
```

3. Pull upstream changes into your clone.

```
git fetch upstream
```

4. Update your copy of the `develop` branch.

```
git checkout develop
git merge --ff-only upstream/develop
```

If Git complains that a fast-forward merge is not possible, you have local commits.

- Run `git pull --rebase origin develop` to rebase your changes on top of the upstream changes.
- Or, run `git branch <branch-name>` to create a new branch with your commits. You will then need to reset your `develop` branch before updating it with the changes from upstream.

If Git complains that local files will be overwritten, you have changes to files in your working directory. Run `git status` to see the files in question.

5. Update your fork.

```
git push origin develop
```

6. Repeat the previous two steps for any other branches you work with, such as the current release branch.

### 19.6.5 Posting patches to the mailing list

Patches will also be accepted by email. Format patches using `git format-patch` and send them to the [salt-users](#) mailing list. The contributor will then get credit for the patch, and the Salt community will have an archive of the patch and a place for discussion.

### 19.6.6 Issue and Pull Request Labeling System

SaltStack uses several labeling schemes to help facilitate code contributions and bug resolution. See the [Labels and Milestones](#) documentation for more information.

### 19.6.7 Mentionbot

SaltStack runs a mention-bot which notifies contributors who might be able to help review incoming pull-requests based on their past contribution to files which are being changed.

If you do not wish to receive these notifications, please add your GitHub handle to the blacklist line in the `.mention-bot` file located in the root of the Salt repository.

### 19.6.8 GPG Verification

SaltStack has enabled [GPG Probot](#) to enforce GPG signatures for all commits included in a Pull Request.

In order for the GPG verification status check to pass, *every* contributor in the pull request must:

- Set up a GPG key on local machine
- Sign all commits in the pull request with key
- Link key with GitHub account

This applies to all commits in the pull request.

GitHub hosts a number of [help articles](#) for creating a GPG key, using the GPG key with `git` locally, and linking the GPG key to your GitHub account. Once these steps are completed, the commit signing verification will look like the example in GitHub's [GPG Signature Verification feature announcement](#).

## 19.7 Deprecating Code

Salt should remain backwards compatible, though sometimes, this backwards compatibility needs to be broken because a specific feature and/or solution is no longer necessary or required. At first one might think, let me change this code, it seems that it's not used anywhere else so it should be safe to remove. Then, once there's a new release, users complain about functionality which was removed and they were using it, etc. This should, at all costs, be avoided, and, in these cases, *that* specific code should be deprecated.

In order to give users enough time to migrate from the old code behavior to the new behavior, the deprecation time frame should be carefully determined based on the significance and complexity of the changes required by the user.

Salt feature releases are based on the Periodic Table. Any new features going into the develop branch will be named after the next element in the Periodic Table. For example, Beryllium was the feature release name of the develop branch before the 2015.8 branch was tagged. At that point in time, any new features going into the develop branch after 2015.8 was branched were part of the Boron feature release.

A deprecation warning should be in place for at least two major releases before the deprecated code and its accompanying deprecation warning are removed. More time should be given for more complex changes. For example, if the current release under development is Sodium, the deprecated code and associated warnings should remain in place and warn for at least Aluminum.

To help in this deprecation task, salt provides `salt.utils.warn_until`. The idea behind this helper function is to show the deprecation warning to the user until salt reaches the provided version. Once that provided version is equaled `salt.utils.warn_until` will raise a `RuntimeError` making salt stop its execution. This stoppage is unpleasant and will remind the developer that the deprecation limit has been reached and that the code can then be safely removed.

Consider the following example:

```
def some_function(bar=False, foo=None):
    if foo is not None:
        salt.utils.warn_until(
            'Aluminum',
            'The \'foo\' argument has been deprecated and its '
            'functionality removed, as such, its usage is no longer '
            'required.'
        )
```

Development begins on the Aluminum release when the Magnesium branch is forked from the develop branch. Once this occurs, all uses of the `warn_until` function targeting Aluminum, along with the code they are warning about should be removed from the code.

## 19.8 Dunder Dictionaries

Salt provides several special ``dunder" dictionaries as a convenience for Salt development. These include `__opts__`, `__context__`, `__salt__`, and others. This document will describe each dictionary and detail where they exist and what information and/or functionality they provide.

### 19.8.1 `__opts__`

Available in

- All loader modules

The `__opts__` dictionary contains all of the options passed in the configuration file for the master or minion.

---

**Note:** In many places in salt, instead of pulling raw data from the `__opts__` dict, configuration data should be pulled from the salt *get* functions such as `config.get`, aka - `__salt__['config.get']('foo:bar')` The *get* functions also allow for dict traversal via the `:` delimiter. Consider using *get* functions whenever using `__opts__` or `__pillar__` and `__grains__` (when using grains for configuration data)

---

The configuration file data made available in the `__opts__` dictionary is the configuration data relative to the running daemon. If the modules are loaded and executed by the master, then the master configuration data is available, if the modules are executed by the minion, then the minion configuration is available. Any additional information passed into the respective configuration files is made available

### 19.8.2 `__salt__`

#### Available in

- Execution Modules
- State Modules
- Returners
- Runners

`__salt__` contains the execution module functions. This allows for all functions to be called as they have been set up by the salt loader.

```
__salt__['cmd.run']('fdisk -l')
__salt__['network.ip_addrs']()
```

---

**Note:** When used in runners, `__salt__` references other runner modules, and not execution modules.

---

### 19.8.3 `__grains__`

#### Available in

- Execution Modules
- State Modules
- Returners
- External Pillar

The `__grains__` dictionary contains the grains data generated by the minion that is currently being worked with. In execution modules, state modules and returners this is the grains of the minion running the calls, when generating the external pillar the `__grains__` is the grains data from the minion that the pillar is being generated for.

## 19.8.4 `__pillar__`

### Available in

- Execution Modules
- State Modules
- Returners

The `__pillar__` dictionary contains the pillar for the respective minion.

## 19.8.5 `__context__`

`__context__` exists in state modules and execution modules.

During a state run the `__context__` dictionary persists across all states that are run and then is destroyed when the state ends.

When running an execution module `__context__` persists across all module executions until the modules are refreshed; such as when `saltutil.sync_all` or `state.apply` are executed.

A great place to see how to use `__context__` is in the `cp.py` module in `salt/modules/cp.py`. The fileclient authenticates with the master when it is instantiated and then is used to copy files to the minion. Rather than create a new fileclient for each file that is to be copied down, one instance of the fileclient is instantiated in the `__context__` dictionary and is reused for each file. Here is an example from `salt/modules/cp.py`:

```
if not 'cp.fileclient' in __context__:
    __context__['cp.fileclient'] = salt.fileclient.get_file_client(__opts__)
```

---

**Note:** Because `__context__` may or may not have been destroyed, always be sure to check for the existence of the key in `__context__` and generate the key before using it.

---

## 19.9 External Pillars

Salt provides a mechanism for generating pillar data by calling external pillar interfaces. This document will describe an outline of an `ext_pillar` module.

### 19.9.1 Location

Salt expects to find your `ext_pillar` module in the same location where it looks for other python modules. If the `extension_modules` option in your Salt master configuration is set, Salt will look for a `pillar` directory under there and load all the modules it finds. Otherwise, it will look in your Python site-packages `salt/pillar` directory.

### 19.9.2 Configuration

The external pillars that are called when a minion refreshes its pillars is controlled by the `ext_pillar` option in the Salt master configuration. You can pass a single argument, a list of arguments or a dictionary of arguments to your pillar:

```

ext_pillar:
- example_a: some argument
- example_b:
  - argumentA
  - argumentB
- example_c:
  keyA: valueA
  keyB: valueB

```

### 19.9.3 The Module

### 19.9.4 Imports and Logging

Import modules your external pillar module needs. You should first include generic modules that come with stock Python:

```
import logging
```

And then start logging. This is an idiomatic way of setting up logging in Salt:

```
log = logging.getLogger(__name__)
```

Finally, load modules that are specific to what you are doing. You should catch import errors and set a flag that the `__virtual__` function can use later.

```

try:
    import weird_thing
    EXAMPLE_A_LOADED = True
except ImportError:
    EXAMPLE_A_LOADED = False

```

### 19.9.5 Options

If you define an `__opts__` dictionary, it will be merged into the `__opts__` dictionary handed to the `ext_pillar` function later. This is a good place to put default configuration items. The convention is to name things `modulename.option`.

```
__opts__ = { 'example_a.someconfig': 137 }
```

### 19.9.6 Initialization

If you define an `__init__` function, it will be called with the following signature:

```

def __init__( __opts__ ):
    # Do init work here

```

**Note:** The `__init__` function is ran every time a particular minion causes the external pillar to be called, so don't put heavy initialization code here. The `__init__` functionality is a side-effect of the Salt loader, so it may not be as useful in pillars as it is in other Salt items.

### 19.9.7 `__virtual__`

If you define a `__virtual__` function, you can control whether or not this module is visible. If it returns `False` then Salt ignores this module. If it returns a string, then that string will be how Salt identifies this external pillar in its `ext_pillar` configuration. If you're not renaming the module, simply return `True` in the `__virtual__` function, which is the same as if this function did not exist, then, the name Salt's `ext_pillar` will use to identify this module is its conventional name in Python.

This is useful to write modules that can be installed on all Salt masters, but will only be visible if a particular piece of software your module requires is installed.

```
# This external pillar will be known as `example_a`
def __virtual__():
    if EXAMPLE_A_LOADED:
        return True
    return False
```

```
# This external pillar will be known as `something_else`
__virtualname__ = 'something_else'

def __virtual__():
    if EXAMPLE_A_LOADED:
        return __virtualname__
    return False
```

### 19.9.8 `ext_pillar`

This is where the real work of an external pillar is done. If this module is active and has a function called `ext_pillar`, whenever a minion updates its pillar this function is called.

How it is called depends on how it is configured in the Salt master configuration. The first argument is always the current pillar dictionary, this contains pillar items that have already been added, starting with the data from `pillar_roots`, and then from any already-ran external pillars.

Using our example above:

```
ext_pillar( id, pillar, 'some argument' )           # example_a
ext_pillar( id, pillar, 'argumentA', 'argumentB' ) # example_b
ext_pillar( id, pillar, keyA='valueA', keyB='valueB' } ) # example_c
```

In the `example_a` case, `pillar` will contain the items from the `pillar_roots`, in `example_b` `pillar` will contain that plus the items added by `example_a`, and in `example_c` `pillar` will contain that plus the items added by `example_b`. In all three cases, `id` will contain the ID of the minion making the pillar request.

This function should return a dictionary, the contents of which are merged in with all of the other pillars and returned to the minion. **Note:** this function is called once for each minion that fetches its pillar data.

```
def ext_pillar( minion_id, pillar, *args, **kwargs ):

    my_pillar = {'external_pillar': {}}

    my_pillar['external_pillar'] = get_external_pillar_dictionary()

    return my_pillar
```

You can call `pillar` with the dictionary's top name to retrieve its data. From above example, `'external_pillar'` is the top dictionary name. Therefore:

```
salt-call '*' pillar.get external_pillar
```

You shouldn't just add items to `pillar` and return that, since that will cause Salt to merge data that already exists. Rather, just return the items you are adding or changing. You could, however, use `pillar` in your module to make some decision based on pillar data that already exists.

This function has access to some useful globals:

- `__opts__` A dictionary of mostly Salt configuration options. If you had an `__opts__` dictionary defined in your module, those values will be included.
- `__salt__` A dictionary of Salt module functions, useful so you don't have to duplicate functions that already exist. E.g. `__salt__['cmd.run']( 'ls -l' )` **Note**, runs on the *master*
- `__grains__` A dictionary of the grains of the minion making this pillar call.

### 19.9.9 Example configuration

As an example, if you wanted to add external pillar via the `cmd_json` external pillar, add something like this to your master config:

```
ext_pillar:
  - cmd_json: 'echo {"arg\":\"value\"}'
```

### 19.9.10 Reminder

Just as with traditional pillars, external pillars must be refreshed in order for minions to see any fresh data:

```
salt '*' saltutil.refresh_pillar
```

## 19.10 Installing Salt for development

Clone the repository using:

```
git clone https://github.com/saltstack/salt
```

### Note: tags

Just cloning the repository is enough to work with Salt and make contributions. However, fetching additional tags from git is required to have Salt report the correct version for itself. To do this, first add the git repository as an upstream source:

```
git remote add upstream https://github.com/saltstack/salt
```

Fetching tags is done with the git `'fetch'` utility:

```
git fetch --tags upstream
```

Create a new `virtualenv`:

```
virtualenv /path/to/your/virtualenv
```

Avoid making your *virtualenv path too long*.

On Arch Linux, where Python 3 is the default installation of Python, use the `virtualenv2` command instead of `virtualenv`.

On Gentoo you must use `--system-site-packages` to enable `pkg` and `portage_config` functionality

---

**Note:** Using system Python modules in the virtualenv

To use already-installed python modules in virtualenv (instead of having pip download and compile new ones), run `virtualenv --system-site-packages` Using this method eliminates the requirement to install the salt dependencies again, although it does assume that the listed modules are all installed in the system PYTHONPATH at the time of virtualenv creation.

---

**Note:** Python development package

Be sure to install python devel package in order to install required Python modules. In Debian/Ubuntu run `sudo apt-get install -y python-dev`. In RedHat based system install `python-devel`

Activate the virtualenv:

```
source /path/to/your/virtualenv/bin/activate
```

Install Salt (and dependencies) into the virtualenv:

```
pip install pycrypto PyYAML pycrypto msgpack-python jinja2 psutil futures tornado
pip install -e ./salt # the path to the salt git clone from above
```

---

**Note:** Installing psutil

Python header files are required to build this module, otherwise the pip install will fail. If your distribution separates binaries and headers into separate packages, make sure that you have the headers installed. In most Linux distributions which split the headers into their own package, this can be done by installing the `python-dev` or `python-devel` package. For other platforms, the package will likely be similarly named.

---

**Note:** Installing dependencies on macOS.

You can install needed dependencies on macOS using homebrew or macports. See [macOS Installation](#)

---

**Warning:** Installing on RedHat-based Distros

If installing from pip (or from source using `setup.py install`), be advised that the `yum-utils` package is needed for Salt to manage packages on RedHat-based systems.

### 19.10.1 Running a self-contained development version
