salt.modules.boto_route53.create_hosted_zone(domain_name, caller_ref=None, comment='', private_zone=False, vpc_id=None, vpc_name=None, vpc_region=None, region=None, key=None, keyid=None, profile=None)
```

Create a new Route53 Hosted Zone. Returns a Python data structure with information about the newly created Hosted Zone.

**domain\_name** The name of the domain. This should be a fully-specified domain, and should terminate with a period. This is the name you have registered with your DNS registrar. It is also the name you will delegate from your registrar to the Amazon Route 53 delegation servers returned in response to this request.

**caller\_ref** A unique string that identifies the request and that allows create\_hosted\_zone() calls to be retried without the risk of executing the operation twice. You want to provide this where possible, since additional calls while the first is in PENDING status will be accepted and can lead to multiple copies of the zone being created in Route53.

**comment** Any comments you want to include about the hosted zone.

**private\_zone** Set True if creating a private hosted zone.

**vpc\_id** When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with vpc\_name. Ignored if passed for a non-private zone.

**vpc\_name** When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with vpc\_id. Ignored if passed for a non-private zone.

**vpc\_region** When creating a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from vpc\_id or vpc\_name, if possible. If this fails, you'll need to provide an explicit value for this option. Ignored if passed for a non-private zone.

**region** Region endpoint to connect to

**key** AWS key to bind with

**keyid** AWS keyid to bind with

**profile** Dict, or pillar key pointing to a dict, containing AWS region/key/keyid

CLI Example:

```
salt myminion boto_route53.create_hosted_zone example.org
```

```
salt.modules.boto_route53.create_zone(zone, private=False, vpc_id=None, vpc_region=None, region=None, key=None, keyid=None, profile=None)
```

Create a Route53 hosted zone.

New in version 2015.8.0.

**zone** DNS zone to create

**private** True/False if the zone will be a private zone

**vpc\_id** VPC ID to associate the zone to (required if private is True)

**vpc\_region** VPC Region (required if private is True)

**region** region endpoint to connect to

**key** AWS key

**keyid** AWS keyid

**profile** AWS pillar profile

CLI Example:

```
salt myminion boto_route53.create_zone example.org
```

`salt.modules.boto_route53.delete_record`(*name*, *zone*, *record\_type*, *identifier=None*, *all\_records=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *wait\_for\_sync=True*, *split\_dns=False*, *private\_zone=False*, *retry\_on\_rate\_limit=True*, *rate\_limit\_retries=5*)

Modify a record in a zone.

CLI example:

```
salt myminion boto_route53.delete_record test.example.org example.org A
```

`salt.modules.boto_route53.delete_zone`(*zone*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete a Route53 hosted zone.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_route53.delete_zone example.org
```

`salt.modules.boto_route53.describe_hosted_zones`(*zone\_id=None*, *domain\_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Return detailed info about one, or all, zones in the bound account. If neither `zone_id` nor `domain_name` is provided, return all zones. Note that the return format is slightly different between the `'all'` and `'single'` description types.

**zone\_id** The unique identifier for the Hosted Zone

**domain\_name** The FQDN of the Hosted Zone (including final period)

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

CLI Example:

```
salt myminion boto_route53.describe_hosted_zones domain_name=foo.bar.com
↪ profile='{"region": "us-east-1", "keyid": "A12345678AB", "key":
↪ "xblahblahblah"}'
```

`salt.modules.boto_route53.get_record`(*name*, *zone*, *record\_type*, *fetch\_all=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *split\_dns=False*, *private\_zone=False*, *identifier=None*, *retry\_on\_rate\_limit=True*, *rate\_limit\_retries=5*)

Get a record from a zone.

CLI example:

```
salt myminion boto_route53.get_record test.example.org example.org A
```

`salt.modules.boto_route53.list_all_zones_by_id`(*region=None*, *key=None*, *keyid=None*, *profile=None*)

List, by their IDs, all hosted zones in the bound account.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

CLI Example:

```
salt myminion boto_route53.list_all_zones_by_id
```

`salt.modules.boto_route53.list_all_zones_by_name` (*region=None, key=None, keyid=None, profile=None*)

List, by their FQDNs, all hosted zones in the bound account.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

CLI Example:

```
salt myminion boto_route53.list_all_zones_by_name
```

`salt.modules.boto_route53.update_record` (*name, value, zone, record\_type, identifier=None, ttl=None, region=None, key=None, keyid=None, profile=None, wait\_for\_sync=True, split\_dns=False, private\_zone=False, retry\_on\_rate\_limit=True, rate\_limit\_retries=5*)

Modify a record in a zone.

CLI example:

```
salt myminion boto_route53.modify_record test.example.org 1.1.1.1 example.org A
```

`salt.modules.boto_route53.zone_exists` (*zone, region=None, key=None, keyid=None, profile=None, retry\_on\_rate\_limit=True, rate\_limit\_retries=5*)

Check for the existence of a Route53 hosted zone.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_route53.zone_exists example.org
```

## 14.7.49 salt.modules.boto\_s3\_bucket module

Connection module for Amazon S3 Buckets

New in version 2016.3.0.

**depends**

- boto
- boto3

The dependencies listed above can be installed via package or pip.

**configuration** This module accepts explicit Lambda credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
s3.keyid: GKTADJGHEIQSXMKKRBJ08H
s3.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

A region may also be specified in the configuration:

```
s3.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
  region: us-east-1
```

`salt.modules.boto_s3_bucket.create`(*Bucket, ACL=None, LocationConstraint=None, GrantFullControl=None, GrantRead=None, GrantReadACP=None, GrantWrite=None, GrantWriteACP=None, region=None, key=None, keyid=None, profile=None*)

Given a valid config, create an S3 Bucket.

Returns {created: true} if the bucket was created and returns {created: False} if the bucket was not created.

CLI Example:

```
salt myminion boto_s3_bucket.create my_bucket \
    GrantFullControl='emailaddress@example.com' \
    GrantRead='uri="http://acs.amazonaws.com/groups/global/AllUsers"' \
    GrantReadACP='emailaddress="exempl@example.com", id=
↳ "2345678909876432"' \
    LocationConstraint=us-west-1
```

`salt.modules.boto_s3_bucket.delete`(*Bucket, MFA=None, RequestPayer=None, Force=False, region=None, key=None, keyid=None, profile=None*)

Given a bucket name, delete it, optionally emptying it first.

Returns {deleted: true} if the bucket was deleted and returns {deleted: false} if the bucket was not deleted.

CLI Example:

```
salt myminion boto_s3_bucket.delete mybucket
```

`salt.modules.boto_s3_bucket.delete_cors`(*Bucket, region=None, key=None, keyid=None, profile=None*)

Delete the CORS configuration for the given bucket

Returns {deleted: true} if CORS was deleted and returns {deleted: False} if CORS was not deleted.

CLI Example:

```
salt myminion boto_s3_bucket.delete_cors my_bucket
```

`salt.modules.boto_s3_bucket.delete_lifecycle_configuration`(*Bucket, region=None, key=None, keyid=None, profile=None*)

Delete the lifecycle configuration for the given bucket

Returns {deleted: true} if Lifecycle was deleted and returns {deleted: False} if Lifecycle was not deleted.

CLI Example:

```
salt myminion boto_s3_bucket.delete_lifecycle_configuration my_bucket
```

`salt.modules.boto_s3_bucket.delete_objects`(*Bucket, Delete, MFA=None, Request-Payer=None, region=None, key=None, keyid=None, profile=None*)

Delete objects in a given S3 bucket.

Returns {deleted: true} if all objects were deleted and {deleted: false, failed: [key, ...]} otherwise

CLI Example:

```
salt myminion boto_s3_bucket.delete_objects mybucket '{Objects: [Key: myobject]}'
```

`salt.modules.boto_s3_bucket.delete_policy`(*Bucket, region=None, key=None, keyid=None, profile=None*)

Delete the policy from the given bucket

Returns {deleted: true} if policy was deleted and returns {deleted: False} if policy was not deleted.

CLI Example:

```
salt myminion boto_s3_bucket.delete_policy my_bucket
```

`salt.modules.boto_s3_bucket.delete_replication`(*Bucket, region=None, key=None, keyid=None, profile=None*)

Delete the replication config from the given bucket

Returns {deleted: true} if replication configuration was deleted and returns {deleted: False} if replication configuration was not deleted.

CLI Example:

```
salt myminion boto_s3_bucket.delete_replication my_bucket
```

`salt.modules.boto_s3_bucket.delete_tagging`(*Bucket, region=None, key=None, keyid=None, profile=None*)

Delete the tags from the given bucket

Returns {deleted: true} if tags were deleted and returns {deleted: False} if tags were not deleted.

CLI Example:

```
salt myminion boto_s3_bucket.delete_tagging my_bucket
```

`salt.modules.boto_s3_bucket.delete_website`(*Bucket, region=None, key=None, keyid=None, profile=None*)

Remove the website configuration from the given bucket

Returns {deleted: true} if website configuration was deleted and returns {deleted: False} if website configuration was not deleted.

CLI Example:

```
salt myminion boto_s3_bucket.delete_website my_bucket
```

`salt.modules.boto_s3_bucket.describe`(*Bucket, region=None, key=None, keyid=None, profile=None*)

Given a bucket name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_s3_bucket.describe mybucket
```

`salt.modules.boto_s3_bucket.empty`(*Bucket, MFA=None, RequestPayer=None, region=None, key=None, keyid=None, profile=None*)

Delete all objects in a given S3 bucket.

Returns {deleted: true} if all objects were deleted and {deleted: false, failed: [key, ...]} otherwise

CLI Example:

```
salt myminion boto_s3_bucket.empty mybucket
```

`salt.modules.boto_s3_bucket.exists`(*Bucket, region=None, key=None, keyid=None, profile=None*)

Given a bucket name, check to see if the given bucket exists.

Returns True if the given bucket exists and returns False if the given bucket does not exist.

CLI Example:

```
salt myminion boto_s3_bucket.exists mybucket
```

`salt.modules.boto_s3_bucket.list`(*region=None, key=None, keyid=None, profile=None*)

List all buckets owned by the authenticated sender of the request.

Returns list of buckets

CLI Example:

```
Owner: {...}
Buckets:
- {...}
- {...}
```

`salt.modules.boto_s3_bucket.list_object_versions`(*Bucket, Delimiter=None, EncodingType=None, Prefix=None, region=None, key=None, keyid=None, profile=None*)

List objects in a given S3 bucket.

Returns a list of objects.

CLI Example:

```
salt myminion boto_s3_bucket.list_object_versions mybucket
```

`salt.modules.boto_s3_bucket.list_objects`(*Bucket, Delimiter=None, EncodingType=None, Prefix=None, FetchOwner=False, StartAfter=None, region=None, key=None, keyid=None, profile=None*)

List objects in a given S3 bucket.

Returns a list of objects.

CLI Example:

```
salt myminion boto_s3_bucket.list_objects mybucket
```

```
salt.modules.boto_s3_bucket.put_acl(Bucket, ACL=None, AccessControlPolicy=None,
                                     GrantFullControl=None, GrantRead=None,
                                     GrantReadACP=None, GrantWrite=None,
                                     GrantWriteACP=None, region=None, key=None,
                                     keyid=None, profile=None)
```

Given a valid config, update the ACL for a bucket.

Returns {updated: true} if the ACL was updated and returns {updated: False} if the ACL was not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_acl my_bucket 'public' \
      GrantFullControl='emailaddress@example.com' \
      GrantRead='uri="http://acs.amazonaws.com/groups/global/AllUsers"' \
      GrantReadACP='emailaddress="exempl@example.com", id=
      ↪"2345678909876432"'
```

```
salt.modules.boto_s3_bucket.put_cors(Bucket, CORSRules, region=None, key=None,
                                       keyid=None, profile=None)
```

Given a valid config, update the CORS rules for a bucket.

Returns {updated: true} if CORS was updated and returns {updated: False} if CORS was not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_cors my_bucket ' [{\
  "AllowedHeaders": [],\
  "AllowedMethods": ["GET"],\
  "AllowedOrigins": ["*"],\
  "ExposeHeaders": [],\
  "MaxAgeSeconds": 123,\
}]'
```

```
salt.modules.boto_s3_bucket.put_lifecycle_configuration(Bucket, Rules, re-
                                                         gion=None, key=None,
                                                         keyid=None, pro-
                                                         file=None)
```

Given a valid config, update the Lifecycle rules for a bucket.

Returns {updated: true} if Lifecycle was updated and returns {updated: False} if Lifecycle was not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_lifecycle_configuration my_bucket ' [{\
  "Expiration": {...},\
  "ID": "idstring",\
  "Prefix": "prefixstring",\
  "Status": "enabled",\
  "Transitions": [{...}],\
  "NoncurrentVersionTransitions": [{...}],\
  "NoncurrentVersionExpiration": {...},\
}]'
```

```
salt.modules.boto_s3_bucket.put_logging(Bucket, TargetBucket=None, TargetPrefix=None,
                                          TargetGrants=None, region=None, key=None,
                                          keyid=None, profile=None)
```

Given a valid config, update the logging parameters for a bucket.

Returns {updated: true} if parameters were updated and returns {updated: False} if parameters were not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_logging my_bucket log_bucket '[{...}]' prefix
```

`salt.modules.boto_s3_bucket.put_notification_configuration`(*Bucket, TopicConfigurations=None, QueueConfigurations=None, LambdaFunctionConfigurations=None, region=None, key=None, keyid=None, profile=None*)

Given a valid config, update the notification parameters for a bucket.

Returns {updated: true} if parameters were updated and returns {updated: False} if parameters were not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_notification_configuration my_bucket
[{{...}}] \
[{{...}}] \
[{{...}}]
```

`salt.modules.boto_s3_bucket.put_policy`(*Bucket, Policy, region=None, key=None, keyid=None, profile=None*)

Given a valid config, update the policy for a bucket.

Returns {updated: true} if policy was updated and returns {updated: False} if policy was not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_policy my_bucket {...}
```

`salt.modules.boto_s3_bucket.put_replication`(*Bucket, Role, Rules, region=None, key=None, keyid=None, profile=None*)

Given a valid config, update the replication configuration for a bucket.

Returns {updated: true} if replication configuration was updated and returns {updated: False} if replication configuration was not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_replication my_bucket my_role [...]
```

`salt.modules.boto_s3_bucket.put_request_payment`(*Bucket, Payer, region=None, key=None, keyid=None, profile=None*)

Given a valid config, update the request payment configuration for a bucket.

Returns {updated: true} if request payment configuration was updated and returns {updated: False} if request payment configuration was not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_request_payment my_bucket Requester
```

`salt.modules.boto_s3_bucket.put_tagging`(*Bucket, region=None, key=None, keyid=None, profile=None, \*\*kwargs*)

Given a valid config, update the tags for a bucket.

Returns {updated: true} if tags were updated and returns {updated: False} if tags were not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_tagging my_bucket my_role [...]
```

`salt.modules.boto_s3_bucket.put_versioning`(*Bucket, Status, MFADelete=None, MFA=None, region=None, key=None, keyid=None, profile=None*)

Given a valid config, update the versioning configuration for a bucket.

Returns {updated: true} if versioning configuration was updated and returns {updated: False} if versioning configuration was not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_versioning my_bucket Enabled
```

`salt.modules.boto_s3_bucket.put_website`(*Bucket, ErrorDocument=None, IndexDocument=None, RedirectAllRequestsTo=None, RoutingRules=None, region=None, key=None, keyid=None, profile=None*)

Given a valid config, update the website configuration for a bucket.

Returns {updated: true} if website configuration was updated and returns {updated: False} if website configuration was not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_website my_bucket IndexDocument='{"Suffix":  
↪ "index.html"}'
```

## 14.7.50 salt.modules.boto\_secgroup

Connection module for Amazon Security Groups

New in version 2014.7.0.

**configuration** This module accepts explicit ec2 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-  
↪ ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
secgroup.keyid: GKTADJGHEIQSXMKKRBJ08H  
secgroup.key: askdjghsdfjkghWupUjasdfklkfjlsdfjajkgsh
```

A region may also be specified in the configuration:

```
secgroup.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkdflkjgsdfjajkghs
  region: us-east-1
```

**depends** boto

**salt.modules.boto\_secgroup.authorize**(*name=None, source\_group\_name=None, source\_group\_owner\_id=None, ip\_protocol=None, from\_port=None, to\_port=None, cidr\_ip=None, group\_id=None, source\_group\_group\_id=None, region=None, key=None, keyid=None, profile=None, vpc\_id=None, vpc\_name=None, egress=False*)

Add a new rule to an existing security group.

CLI example:

```
salt myminion boto_secgroup.authorize mysecgroup ip_protocol=tcp from_port=80 to_
↳port=80 cidr_ip=['10.0.0.0/8', '192.168.0.0/24']
```

**salt.modules.boto\_secgroup.convert\_to\_group\_ids**(*groups, vpc\_id=None, vpc\_name=None, region=None, key=None, keyid=None, profile=None*)

Given a list of security groups and a vpc\_id, convert\_to\_group\_ids will convert all list items in the given list to security group ids.

CLI example:

```
salt myminion boto_secgroup.convert_to_group_ids mysecgroup vpc-89yh7h
```

**salt.modules.boto\_secgroup.create**(*name, description, vpc\_id=None, vpc\_name=None, region=None, key=None, keyid=None, profile=None*)

Create a security group.

CLI example:

```
salt myminion boto_secgroup.create mysecgroup 'My Security Group'
```

**salt.modules.boto\_secgroup.delete**(*name=None, group\_id=None, region=None, key=None, keyid=None, profile=None, vpc\_id=None, vpc\_name=None*)

Delete a security group.

CLI example:

```
salt myminion boto_secgroup.delete mysecgroup
```

**salt.modules.boto\_secgroup.delete\_tags**(*tags, name=None, group\_id=None, vpc\_name=None, vpc\_id=None, region=None, key=None, keyid=None, profile=None*)

deletes tags from a security group

New in version 2016.3.0.

**tags** a list of tags to remove

**name** the name of the security group

**group\_id** the group id of the security group (in lieu of a name/vpc combo)

**vpc\_name** the name of the vpc to search the named group for

**vpc\_id** the id of the vpc, in lieu of the vpc\_name

**region** the amazon region

**key** amazon key

**keyid** amazon keyid  
**profile** amazon profile  
 CLI example:

```
salt myminion boto_secgroup.delete_tags ['TAG_TO_DELETE1', 'TAG_TO_DELETE2']
↪ security_group_name vpc_id=vpc-13435 profile=my_aws_profile
```

**salt.modules.boto\_secgroup.exists**(*name=None, region=None, key=None, keyid=None, profile=None, vpc\_id=None, vpc\_name=None, group\_id=None*)

Check to see if a security group exists.

CLI example:

```
salt myminion boto_secgroup.exists mysecgroup
```

**salt.modules.boto\_secgroup.get\_all\_security\_groups**(*groupnames=None, group\_ids=None, filters=None, region=None, key=None, keyid=None, profile=None*)

Return a list of all Security Groups matching the given criteria and filters.

Note that the `groupnames` argument only functions correctly for EC2 Classic and default VPC Security Groups. To find groups by name in other VPCs you'll want to use the `group-name` filter instead.

**Valid keys for the filters argument are:** description - The description of the security group. egress.ip-permission.prefix-list-id - The ID (prefix) of the AWS service to which the security group allows access. group-id - The ID of the security group. group-name - The name of the security group. ip-permission.cidr - A CIDR range that has been granted permission. ip-permission.from-port - The start of port range for the TCP and UDP protocols, or an ICMP type number. ip-permission.group-id - The ID of a security group that has been granted permission. ip-permission.group-name - The name of a security group that has been granted permission. ip-permission.protocol - The IP protocol for the permission (tcp | udp | icmp or a protocol number). ip-permission.to-port - The end of port range for the TCP and UDP protocols, or an ICMP code. ip-permission.user-id - The ID of an AWS account that has been granted permission. owner-id - The AWS account ID of the owner of the security group. tag-key - The key of a tag assigned to the security group. tag-value - The value of a tag assigned to the security group. vpc-id - The ID of the VPC specified when the security group was created.

CLI example:

```
salt myminion boto_secgroup.get_all_security_groups filters='{group-name: mygroup}'
↪ !
```

**salt.modules.boto\_secgroup.get\_config**(*name=None, group\_id=None, region=None, key=None, keyid=None, profile=None, vpc\_id=None, vpc\_name=None*)

Get the configuration for a security group.

CLI example:

```
salt myminion boto_secgroup.get_config mysecgroup
```

**salt.modules.boto\_secgroup.get\_group\_id**(*name, vpc\_id=None, vpc\_name=None, region=None, key=None, keyid=None, profile=None*)

Get a Group ID given a Group Name or Group Name and VPC ID

CLI example:

```
salt myminion boto_secgroup.get_group_id mysecgroup
```

```
salt.modules.boto_secgroup.revoke(name=None, source_group_name=None,
                                     source_group_owner_id=None, ip_protocol=None,
                                     from_port=None, to_port=None, cidr_ip=None,
                                     group_id=None, source_group_group_id=None, re-
                                     gion=None, key=None, keyid=None, profile=None,
                                     vpc_id=None, vpc_name=None, egress=False)
```

Remove a rule from an existing security group.

CLI example:

```
salt myminion boto_secgroup.revoke mysecgroup ip_protocol=tcp from_port=80 to_
↪port=80 cidr_ip='10.0.0.0/8'
```

```
salt.modules.boto_secgroup.set_tags(tags, name=None, group_id=None, vpc_name=None,
                                       vpc_id=None, region=None, key=None, keyid=None,
                                       profile=None)
```

sets tags on a security group

New in version 2016.3.0.

**tags** a dict of key:value pair of tags to set on the security group

**name** the name of the security group

**group\_id** the group id of the security group (in lieu of a name/vpc combo)

**vpc\_name** the name of the vpc to search the named group for

**vpc\_id** the id of the vpc, in lieu of the vpc\_name

**region** the amazon region

**key** amazon key

**keyid** amazon keyid

**profile** amazon profile

CLI example:

```
salt myminion boto_secgroup.set_tags '{"TAG1': 'Value1', 'TAG2': 'Value2'}"
↪security_group_name vpc_id=vpc-13435 profile=my_aws_profile
```

## 14.7.51 salt.modules.boto\_sns

Connection module for Amazon SNS

**configuration** This module accepts explicit sns credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
sns.keyid: GKTADJGHEIQSXMKKRBj08H
sns.key: askdjghsdfjkghWupUjasdfkldfklgjsdfjakghs
```

A region may also be specified in the configuration:

```
sns.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRB08H
  key: askdjghsdfjkghWupUjasdfklkdflkjgsdfjajkghs
  region: us-east-1
```

**depends** boto

`salt.modules.boto_sns.create` (*name, region=None, key=None, keyid=None, profile=None*)  
Create an SNS topic.

CLI example to create a topic:

```
salt myminion boto_sns.create mytopic region=us-east-1
```

`salt.modules.boto_sns.delete` (*name, region=None, key=None, keyid=None, profile=None*)  
Delete an SNS topic.

CLI example to delete a topic:

```
salt myminion boto_sns.delete mytopic region=us-east-1
```

`salt.modules.boto_sns.exists` (*name, region=None, key=None, keyid=None, profile=None*)  
Check to see if an SNS topic exists.

CLI example:

```
salt myminion boto_sns.exists mytopic region=us-east-1
```

`salt.modules.boto_sns.get_all_subscriptions_by_topic` (*name, region=None, key=None, keyid=None, profile=None*)

Get list of all subscriptions to a specific topic.

CLI example to delete a topic:

```
salt myminion boto_sns.get_all_subscriptions_by_topic mytopic region=us-east-1
```

`salt.modules.boto_sns.get_all_topics` (*region=None, key=None, keyid=None, profile=None*)  
Returns a list of the all topics..

CLI example:

```
salt myminion boto_sns.get_all_topics
```

`salt.modules.boto_sns.get_arn` (*name, region=None, key=None, keyid=None, profile=None*)  
Returns the full ARN for a given topic name.

CLI example:

```
salt myminion boto_sns.get_arn mytopic
```

`salt.modules.boto_sns.subscribe` (*topic, protocol, endpoint, region=None, key=None, keyid=None, profile=None*)

Subscribe to a Topic.

CLI example to delete a topic:

```
salt myminion boto_sns.subscribe mytopic https https://www.example.com/sns-
↳endpoint region=us-east-1
```

`salt.modules.boto_sns.unsubscribe` (*topic*, *subscription\_arn*, *region=None*, *key=None*, *keyid=None*, *profile=None*)  
 Unsubscribe a specific SubscriptionArn of a topic.

CLI Example:

```
salt myminion boto_sns.unsubscribe my_topic my_subscription_arn region=us-east-1
```

New in version 2016.11.0.

## 14.7.52 salt.modules.boto\_sqs

Connection module for Amazon SQS

New in version 2014.7.0.

**configuration** This module accepts explicit sqs credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
sqs.keyid: GKTADJGHEIQSXMKKRBJ08H
sqs.key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
sqs.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
  region: us-east-1
```

**depends** boto

`salt.modules.boto_sqs.create` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)  
 Create an SQS queue.

CLI Example:

```
salt myminion boto_sqs.create myqueue region=us-east-1
```

`salt.modules.boto_sqs.delete` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)  
 Delete an SQS queue.

CLI Example:

```
salt myminion boto_sqs.delete myqueue region=us-east-1
```

`salt.modules.boto_sqs.exists` (*name, region=None, key=None, keyid=None, profile=None*)  
Check to see if a queue exists.

CLI Example:

```
salt myminion boto_sqs.exists myqueue region=us-east-1
```

`salt.modules.boto_sqs.get_all_queues` (*prefix=None, region=None, key=None, keyid=None, profile=None*)  
Return a list of Queue() objects describing all visible queues.

New in version 2016.11.0.

CLI Example:

```
salt myminion boto_sqs.get_all_queues region=us-east-1 --output yaml
```

`salt.modules.boto_sqs.get_attributes` (*name, region=None, key=None, keyid=None, profile=None*)  
Return attributes currently set on an SQS queue.

CLI Example:

```
salt myminion boto_sqs.get_attributes myqueue
```

`salt.modules.boto_sqs.list` (*prefix=None, region=None, key=None, keyid=None, profile=None*)  
Return a list of the names of all visible queues.

New in version 2016.11.0.

CLI Example:

```
salt myminion boto_sqs.list region=us-east-1
```

`salt.modules.boto_sqs.set_attributes` (*name, attributes, region=None, key=None, keyid=None, profile=None*)  
Set attributes on an SQS queue.

CLI Example:

```
salt myminion boto_sqs.set_attributes myqueue '{ReceiveMessageWaitTimeSeconds: 20}'  
↪ region=us-east-1
```

### 14.7.53 salt.modules.boto\_vpc

Connection module for Amazon VPC

New in version 2014.7.0.

#### depends

- boto >= 2.8.0
- boto3 >= 1.2.6

**configuration** This module accepts explicit VPC credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-  
↪ ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
vpc.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
  region: us-east-1
```

Changed in version 2015.8.0: All methods now return a dictionary. Create and delete methods return:

```
created: true
```

or

```
created: false
error:
  message: error message
```

Request methods (e.g., *describe\_vpc*) return:

```
vpcs:
  - {...}
  - {...}
```

or

```
error:
  message: error message
```

New in version 2016.11.0.

Functions to request, accept, delete and describe VPC peering connections. Named VPC peering connections can be requested using these modules. VPC owner accounts can accept VPC peering connections (named or otherwise).

Examples showing creation of VPC peering connection

```
# Create a named VPC peering connection
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da
  ↳name=my_vpc_connection
# Without a name
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da
# Specify a region
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da
  ↳region=us-west-2
```

Check to see if VPC peering connection is pending

```

salt myminion boto_vpc.is_peering_connection_pending name=salt-vpc
# Specify a region
salt myminion boto_vpc.is_peering_connection_pending name=salt-vpc region=us-west-2
# specify an id
salt myminion boto_vpc.is_peering_connection_pending conn_id=pcx-8a8939e3

```

Accept VPC peering connection

```

salt myminion boto_vpc.accept_vpc_peering_connection name=salt-vpc
# Specify a region
salt myminion boto_vpc.accept_vpc_peering_connection name=salt-vpc region=us-west-2
# specify an id
salt myminion boto_vpc.accept_vpc_peering_connection conn_id=pcx-8a8939e3

```

Deleting VPC peering connection via this module

```

# Delete a named VPC peering connection
salt myminion boto_vpc.delete_vpc_peering_connection name=salt-vpc
# Specify a region
salt myminion boto_vpc.delete_vpc_peering_connection name=salt-vpc region=us-west-2
# specify an id
salt myminion boto_vpc.delete_vpc_peering_connection conn_id=pcx-8a8939e3

```

```

salt.modules.boto_vpc.accept_vpc_peering_connection(conn_id='', name='', re-
                                                    gion=None, key=None,
                                                    keyid=None, profile=None,
                                                    dry_run=False)

```

Request a VPC peering connection between two VPCs.

New in version 2016.11.0.

#### Parameters

- **conn\_id** -- The ID to use. String type.
- **name** -- The name of this VPC peering connection. String type.
- **region** -- The AWS region to use. Type string.

:param key. The key to use for this connection. Type string. :param keyid. The key id to use. :param profile. The profile to use. :param dry\_run. The dry\_run flag to set. :return: dict

Warning: Please specify either the vpc\_peering\_connection\_id or name but not both. Specifying both will result in an error!

CLI Example:

```

salt myminion boto_vpc.accept_vpc_peering_connection name=salt-vpc
# Specify a region
salt myminion boto_vpc.accept_vpc_peering_connection name=salt-vpc region=us-west-
↪2
# specify an id
salt myminion boto_vpc.accept_vpc_peering_connection conn_id=pcx-8a8939e3

```

```

salt.modules.boto_vpc.associate_dhcp_options_to_vpc(dhcp_options_id, vpc_id=None,
                                                    vpc_name=None, region=None,
                                                    key=None, keyid=None, pro-
                                                    file=None)

```

Given valid DHCP options id and a valid VPC id, associate the DHCP options record with the VPC.

Returns True if the DHCP options record were associated and returns False if the DHCP options record was not associated.

CLI Example:

```
salt myminion boto_vpc.associate_dhcp_options_to_vpc 'dhcp-a0bl34pp' 'vpc-6b1fe402'
```

`salt.modules.boto_vpc.associate_network_acl_to_subnet`(*network\_acl\_id=None*,  
*subnet\_id=None*, *network\_acl\_name=None*,  
*subnet\_name=None*, *region=None*, *key=None*,  
*keyid=None*, *profile=None*)

Given a network acl and subnet ids or names, associate a network acl to a subnet.

CLI Example:

```
salt myminion boto_vpc.associate_network_acl_to_subnet \  
network_acl_id='acl-5fb85d36' subnet_id='subnet-6a1fe403'
```

```
salt myminion boto_vpc.associate_network_acl_to_subnet \  
network_acl_id='myacl' subnet_id='mysubnet'
```

`salt.modules.boto_vpc.associate_route_table`(*route\_table\_id=None*, *subnet\_id=None*,  
*route\_table\_name=None*, *subnet\_name=None*, *region=None*, *key=None*,  
*keyid=None*, *profile=None*)

Given a route table and subnet name or id, associates the route table with the subnet.

CLI Example:

```
salt myminion boto_vpc.associate_route_table 'rtb-1f382e7d' 'subnet-6a1fe403'
```

```
salt myminion boto_vpc.associate_route_table route_table_name='myrtb' \  
subnet_name='mysubnet'
```

`salt.modules.boto_vpc.check_vpc`(*vpc\_id=None*, *vpc\_name=None*, *region=None*, *key=None*,  
*keyid=None*, *profile=None*)

Check whether a VPC with the given name or id exists. Returns the vpc\_id or None. Raises SaltInvocationError if both vpc\_id and vpc\_name are None. Optionally raise a CommandExecutionError if the VPC does not exist.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_vpc.check_vpc vpc_name=myvpc profile=awsprofile
```

`salt.modules.boto_vpc.create`(*cidr\_block*, *instance\_tenancy=None*, *vpc\_name=None*, *enable\_dns\_support=None*,  
*enable\_dns\_hostnames=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a valid CIDR block, create a VPC.

An optional `instance_tenancy` argument can be provided. If provided, the valid values are `'default'` or `'dedicated'`

An optional `vpc_name` argument can be provided.

Returns `{created: true}` if the VPC was created and returns `{created: False}` if the VPC was not created.

CLI Example:

```
salt myminion boto_vpc.create '10.0.0.0/24'
```

```
salt.modules.boto_vpc.create_customer_gateway(vpn_connection_type, ip_address,
                                              bgp_asn, customer_gateway_name=None,
                                              tags=None, region=None, key=None,
                                              keyid=None, profile=None)
```

Given a valid VPN connection type, a static IP address and a customer gateway's Border Gateway Protocol (BGP) Autonomous System Number, create a customer gateway.

Returns the customer gateway id if the customer gateway was created and returns False if the customer gateway was not created.

CLI Example:

```
salt myminion boto_vpc.create_customer_gateway 'ipsec.1', '12.1.2.3', 65534
```

```
salt.modules.boto_vpc.create_dhcp_options(domain_name=None, domain_name_servers=None, ntp_servers=None,
                                          netbios_name_servers=None, netbios_node_type=None,
                                          dhcp_options_name=None, tags=None,
                                          vpc_id=None, vpc_name=None, region=None,
                                          key=None, keyid=None, profile=None)
```

Given valid DHCP options, create a DHCP options record, optionally associating it with an existing VPC.

Returns True if the DHCP options record was created and returns False if the DHCP options record was not deleted.

Changed in version 2015.8.0: Added vpc\_name and vpc\_id arguments

CLI Example:

```
salt myminion boto_vpc.create_dhcp_options domain_name='example.com' \
    domain_name_servers='[1.2.3.4]' ntp_servers='[5.6.7.8]' \
    netbios_name_servers='[10.0.0.1]' netbios_node_type=1 \
    vpc_name='myvpc'
```

```
salt.modules.boto_vpc.create_internet_gateway(internet_gateway_name=None,
                                              vpc_id=None, vpc_name=None,
                                              tags=None, region=None, key=None,
                                              keyid=None, profile=None)
```

Create an Internet Gateway, optionally attaching it to an existing VPC.

Returns the internet gateway id if the internet gateway was created and returns False if the internet gateways was not created.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_vpc.create_internet_gateway \
    internet_gateway_name=myigw vpc_name=myvpc
```

```
salt.modules.boto_vpc.create_nat_gateway(subnet_id=None, subnet_name=None, allocation_id=None,
                                          region=None, key=None,
                                          keyid=None, profile=None)
```

Create a NAT Gateway within an existing subnet. If allocation\_id is specified, the elastic IP address it references is associated with the gateway. Otherwise, a new allocation\_id is created and used.

This function requires boto3 to be installed.

Returns the nat gateway id if the nat gateway was created and returns False if the nat gateway was not created.

New in version 2016.11.0.

CLI Example:

```
salt myminion boto_vpc.create_nat_gateway subnet_name=mysubnet
```

```
salt.modules.boto_vpc.create_network_acl(vpc_id=None, vpc_name=None, network_acl_name=None, subnet_id=None, subnet_name=None, tags=None, region=None, key=None, keyid=None, profile=None)
```

Given a vpc\_id, creates a network acl.

Returns the network acl id if successful, otherwise returns False.

Changed in version 2015.8.0: Added vpc\_name, subnet\_id, and subnet\_name arguments

CLI Example:

```
salt myminion boto_vpc.create_network_acl 'vpc-6b1fe402'
```

```
salt.modules.boto_vpc.create_network_acl_entry(network_acl_id=None, rule_number=None, protocol=None, rule_action=None, cidr_block=None, egress=None, network_acl_name=None, icmp_code=None, icmp_type=None, port_range_from=None, port_range_to=None, region=None, key=None, keyid=None, profile=None)
```

Creates a network acl entry.

CLI Example:

```
salt myminion boto_vpc.create_network_acl_entry 'acl-5fb85d36' '32767' \
'all' 'deny' '0.0.0.0/0' egress=true
```

```
salt.modules.boto_vpc.create_route(route_table_id=None, destination_cidr_block=None, route_table_name=None, gateway_id=None, internet_gateway_name=None, instance_id=None, interface_id=None, vpc_peering_connection_id=None, vpc_peering_connection_name=None, region=None, key=None, keyid=None, profile=None, nat_gateway_id=None, nat_gateway_subnet_name=None, nat_gateway_subnet_id=None)
```

Creates a route.

If a nat gateway is specified, boto3 must be installed

CLI Example:

```
salt myminion boto_vpc.create_route 'rtb-1f382e7d' '10.0.0.0/16' gateway_id='vgw-
↪a1b2c3'
```

```
salt.modules.boto_vpc.create_route_table(vpc_id=None, vpc_name=None, route_table_name=None, tags=None, region=None, key=None, keyid=None, profile=None)
```

Creates a route table.

Changed in version 2015.8.0: Added vpc\_name argument

CLI Examples:

```
salt myminion boto_vpc.create_route_table vpc_id='vpc-6b1fe402' \  
    route_table_name='myroutetable'  
salt myminion boto_vpc.create_route_table vpc_name='myvpc' \  
    route_table_name='myroutetable'
```

`salt.modules.boto_vpc.create_subnet` (*vpc\_id=None, cidr\_block=None, vpc\_name=None, availability\_zone=None, subnet\_name=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Given a valid VPC ID or Name and a CIDR block, create a subnet for the VPC.

An optional availability zone argument can be provided.

Returns True if the VPC subnet was created and returns False if the VPC subnet was not created.

Changed in version 2015.8.0: Added vpc\_name argument

CLI Examples:

```
salt myminion boto_vpc.create_subnet vpc_id='vpc-6b1fe402' \  
    subnet_name='mysubnet' cidr_block='10.0.0.0/25'  
salt myminion boto_vpc.create_subnet vpc_name='myvpc' \  
    subnet_name='mysubnet', cidr_block='10.0.0.0/25'
```

`salt.modules.boto_vpc.customer_gateway_exists` (*customer\_gateway\_id=None, customer\_gateway\_name=None, region=None, key=None, keyid=None, profile=None*)

Given a customer gateway ID, check if the customer gateway ID exists.

Returns True if the customer gateway ID exists; Returns False otherwise.

CLI Example:

```
salt myminion boto_vpc.customer_gateway_exists cgw-b6a247df  
salt myminion boto_vpc.customer_gateway_exists customer_gateway_name=mycgw
```

`salt.modules.boto_vpc.delete` (*vpc\_id=None, name=None, vpc\_name=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Given a VPC ID or VPC name, delete the VPC.

Returns {deleted: true} if the VPC was deleted and returns {deleted: false} if the VPC was not deleted.

CLI Example:

```
salt myminion boto_vpc.delete vpc_id='vpc-6b1fe402'  
salt myminion boto_vpc.delete name='myvpc'
```

`salt.modules.boto_vpc.delete_customer_gateway` (*customer\_gateway\_id=None, customer\_gateway\_name=None, region=None, key=None, keyid=None, profile=None*)

Given a customer gateway ID or name, delete the customer gateway.

Returns True if the customer gateway was deleted and returns False if the customer gateway was not deleted.

Changed in version 2015.8.0: Added customer\_gateway\_name argument

CLI Example:

```
salt myminion boto_vpc.delete_customer_gateway 'cgw-b6a247df'
```

```
salt.modules.boto_vpc.delete_dhcp_options(dhcp_options_id=None,  
dhcp_options_name=None, region=None,  
key=None, keyid=None, profile=None)
```

Delete dhcp options by id or name.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_vpc.delete_dhcp_options 'dopt-b6a247df'
```

```
salt.modules.boto_vpc.delete_internet_gateway(internet_gateway_id=None, internet_gateway_name=None, detach=False,  
region=None, key=None, keyid=None,  
profile=None)
```

Delete an internet gateway (by name or id).

Returns True if the internet gateway was deleted and otherwise False.

New in version 2015.8.0.

CLI Examples:

```
salt myminion boto_vpc.delete_internet_gateway internet_gateway_id=igw-1a2b3c  
salt myminion boto_vpc.delete_internet_gateway internet_gateway_name=myigw
```

```
salt.modules.boto_vpc.delete_nat_gateway(nat_gateway_id, release_eips=False, region=None, key=None, keyid=None, profile=None,  
wait_for_delete=False, wait_for_delete_retries=5)
```

Delete a nat gateway (by id).

Returns True if the internet gateway was deleted and otherwise False.

This function requires boto3 to be installed.

New in version 2016.11.0.

**nat\_gateway\_id** Id of the NAT Gateway

**releaes\_eips** whether to release the elastic IPs associated with the given NAT Gateway Id

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**wait\_for\_delete** whether to wait for delete of the NAT gateway to be in failed or deleted state after issuing the delete call.

**wait\_for\_delete\_retries** NAT gateway may take some time to be go into deleted or failed state. During the deletion process, subsequent release of elastic IPs may fail; this state will automatically retry this number of times to ensure the NAT gateway is in deleted or failed state before proceeding.

CLI Examples:

```
salt myminion boto_vpc.delete_nat_gateway nat_gateway_id=igw-1a2b3c
```

```
salt.modules.boto_vpc.delete_network_acl(network_acl_id=None, network_acl_name=None, disassociate=False, region=None, key=None,  
keyid=None, profile=None)
```

Delete a network acl based on the network\_acl\_id or network\_acl\_name provided.

CLI Examples:

```
salt myminion boto_vpc.delete_network_acl network_acl_id='acl-5fb85d36' \
disassociate=false
```

```
salt myminion boto_vpc.delete_network_acl network_acl_name='myacl' \
disassociate=true
```

```
salt.modules.boto_vpc.delete_network_acl_entry(network_acl_id=None,
                                                rule_number=None, egress=None,
                                                network_acl_name=None, region=None,
                                                key=None, keyid=None, profile=None)
```

Deletes a network acl entry.

CLI Example:

```
salt myminion boto_vpc.delete_network_acl_entry 'acl-5fb85d36' '32767'
```

```
salt.modules.boto_vpc.delete_route(route_table_id=None, destination_cidr_block=None,
                                   route_table_name=None, region=None, key=None,
                                   keyid=None, profile=None)
```

Deletes a route.

CLI Example:

```
salt myminion boto_vpc.delete_route 'rtb-1f382e7d' '10.0.0.0/16'
```

```
salt.modules.boto_vpc.delete_route_table(route_table_id=None, route_table_name=None,
                                          region=None, key=None, keyid=None, pro-
                                          file=None)
```

Deletes a route table.

CLI Examples:

```
salt myminion boto_vpc.delete_route_table route_table_id='rtb-1f382e7d'
salt myminion boto_vpc.delete_route_table route_table_name='myroutetable'
```

```
salt.modules.boto_vpc.delete_subnet(subnet_id=None, subnet_name=None, region=None,
                                   key=None, keyid=None, profile=None)
```

Given a subnet ID or name, delete the subnet.

Returns True if the subnet was deleted and returns False if the subnet was not deleted.

Changed in version 2015.8.0: Added subnet\_name argument

CLI Example:

```
salt myminion boto_vpc.delete_subnet 'subnet-6a1fe403'
```

```
salt.modules.boto_vpc.delete_vpc_peering_connection(conn_id=None,
                                                     conn_name=None, region=None,
                                                     key=None, keyid=None, pro-
                                                     file=None, dry_run=False)
```

Delete a VPC peering connection.

New in version 2016.11.0.

**conn\_id** The connection ID to check. Exclusive with conn\_name.

**conn\_name** The connection name to check. Exclusive with conn\_id.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**dry\_run** If True, skip application and simply return projected status.

CLI Example:

```
# Create a named VPC peering connection
salt myminion boto_vpc.delete_vpc_peering_connection conn_name=salt-vpc
# Specify a region
salt myminion boto_vpc.delete_vpc_peering_connection conn_name=salt-vpc region=us-
west-2
# specify an id
salt myminion boto_vpc.delete_vpc_peering_connection conn_id=pcx-8a8939e3
```

**salt.modules.boto\_vpc.describe**(*vpc\_id=None, vpc\_name=None, region=None, key=None, keyid=None, profile=None*)

Given a VPC ID describe its properties.

Returns a dictionary of interesting properties.

Changed in version 2015.8.0: Added vpc\_name argument

CLI Example:

```
salt myminion boto_vpc.describe vpc_id=vpc-123456
salt myminion boto_vpc.describe vpc_name=myvpc
```

**salt.modules.boto\_vpc.describe\_nat\_gateways**(*nat\_gateway\_id=None, subnet\_id=None, subnet\_name=None, vpc\_id=None, vpc\_name=None, states=(`pending`, `available`), region=None, key=None, keyid=None, profile=None*)

Return a description of nat gateways matching the selection criteria

This function requires boto3 to be installed.

CLI Example:

```
salt myminion boto_vpc.describe_nat_gateways nat_gateway_id='nat-03b02643b43216fe7
↪'
salt myminion boto_vpc.describe_nat_gateways subnet_id='subnet-5b05942d'
```

**salt.modules.boto\_vpc.describe\_route\_table**(*route\_table\_id=None, route\_table\_name=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Given route table properties, return route table details if matching table(s) exist.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_vpc.describe_route_table route_table_id='rtb-1f382e7d'
```

**salt.modules.boto\_vpc.describe\_route\_tables**(*route\_table\_id=None, route\_table\_name=None, vpc\_id=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Given route table properties, return details of all matching route tables.

This function requires boto3 to be installed.

New in version 2016.11.0.

CLI Example:

```
salt myminion boto_vpc.describe_route_tables vpc_id='vpc-a6a9efc3'
```

`salt.modules.boto_vpc.describe_subnet`(*subnet\_id=None, subnet\_name=None, region=None, key=None, keyid=None, profile=None*)

Given a subnet id or name, describe its properties.

Returns a dictionary of interesting properties.

New in version 2015.8.0.

CLI Examples:

```
salt myminion boto_vpc.describe_subnet subnet_id=subnet-123456
salt myminion boto_vpc.describe_subnet subnet_name=mysubnet
```

`salt.modules.boto_vpc.describe_subnets`(*subnet\_ids=None, subnet\_names=None, vpc\_id=None, cidr=None, region=None, key=None, keyid=None, profile=None*)

Given a VPC ID or subnet CIDR, returns a list of associated subnets and their details. Return all subnets if VPC ID or CIDR are not provided. If a subnet id or CIDR is provided, only its associated subnet details will be returned.

New in version 2015.8.0.

CLI Examples:

```
salt myminion boto_vpc.describe_subnets
```

```
salt myminion boto_vpc.describe_subnets subnet_ids=['subnet-ba1987ab', 'subnet-↪ba1987cd']
```

```
salt myminion boto_vpc.describe_subnets vpc_id=vpc-123456
```

```
salt myminion boto_vpc.describe_subnets cidr=10.0.0.0/21
```

`salt.modules.boto_vpc.describe_vpc_peering_connection`(*name, region=None, key=None, keyid=None, profile=None*)

Returns any VPC peering connection id(s) for the given VPC peering connection name.

VPC peering connection ids are only returned for connections that are in the active, pending-acceptance or provisioning state.

New in version 2016.11.0.

#### Parameters

- **name** -- The string name for this VPC peering connection
- **region** -- The aws region to use
- **key** -- Your aws key
- **keyid** -- The key id associated with this aws account
- **profile** -- The profile to use

Returns dict

CLI Example:

```
salt myminion boto_vpc.describe_vpc_peering_connection salt-vpc
# Specify a region
salt myminion boto_vpc.describe_vpc_peering_connection salt-vpc region=us-west-2
```

`salt.modules.boto_vpc.describe_vpcs` (*vpc\_id=None, name=None, cidr=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Describe all VPCs, matching the filter criteria if provided.

Returns a a list of dictionaries with interesting properties.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_vpc.describe_vpcs
```

`salt.modules.boto_vpc.dhcp_options_exists` (*dhcp\_options\_id=None, name=None, dhcp\_options\_name=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Check if a dhcp option exists.

Returns True if the dhcp option exists; Returns False otherwise.

CLI Example:

```
salt myminion boto_vpc.dhcp_options_exists dhcp_options_id='dhcp-a0bl34pp'
```

`salt.modules.boto_vpc.disassociate_network_acl` (*subnet\_id=None, vpc\_id=None, subnet\_name=None, vpc\_name=None, region=None, key=None, keyid=None, profile=None*)

Given a subnet ID, disassociates a network acl.

CLI Example:

```
salt myminion boto_vpc.disassociate_network_acl 'subnet-6a1fe403'
```

`salt.modules.boto_vpc.disassociate_route_table` (*association\_id, region=None, key=None, keyid=None, profile=None*)

Dissociates a route table.

**association\_id** The Route Table Association ID to disassociate

CLI Example:

```
salt myminion boto_vpc.disassociate_route_table 'rtbassoc-d8ccddba'
```

`salt.modules.boto_vpc.exists` (*vpc\_id=None, name=None, cidr=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Given a VPC ID, check to see if the given VPC ID exists.

Returns True if the given VPC ID exists and returns False if the given VPC ID does not exist.

CLI Example:

```
salt myminion boto_vpc.exists myvpc
```

`salt.modules.boto_vpc.get_dhcp_options`(*dhcp\_options\_name=None, dhcp\_options\_id=None, region=None, key=None, keyid=None, profile=None*)

Return a dict with the current values of the requested DHCP options set

CLI Example:

```
salt myminion boto_vpc.get_dhcp_options 'myfunnydhcptionsname'
```

New in version 2016.3.0.

`salt.modules.boto_vpc.get_id`(*name=None, cidr=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Given VPC properties, return the VPC id if a match is found.

CLI Example:

```
salt myminion boto_vpc.get_id myvpc
```

`salt.modules.boto_vpc.get_resource_id`(*resource, name=None, resource\_id=None, region=None, key=None, keyid=None, profile=None*)

Get an AWS id for a VPC resource by type and name.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_vpc.get_resource_id internet_gateway myigw
```

`salt.modules.boto_vpc.get_subnet_association`(*subnets, region=None, key=None, keyid=None, profile=None*)

Given a subnet (aka: a vpc zone identifier) or list of subnets, returns vpc association.

Returns a VPC ID if the given subnets are associated with the same VPC ID. Returns False on an error or if the given subnets are associated with different VPC IDs.

CLI Examples:

```
salt myminion boto_vpc.get_subnet_association subnet-61b47516
```

```
salt myminion boto_vpc.get_subnet_association ['subnet-61b47516', 'subnet-2cb9785b  
↪']
```

`salt.modules.boto_vpc.is_peering_connection_pending`(*conn\_id=None, conn\_name=None, region=None, key=None, keyid=None, profile=None*)

Check if a VPC peering connection is in the pending state.

New in version 2016.11.0.

**conn\_id** The connection ID to check. Exclusive with `conn_name`.

**conn\_name** The connection name to check. Exclusive with `conn_id`.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

CLI Example:

```

salt myminion boto_vpc.is_peering_connection_pending conn_name=salt-vpc
# Specify a region
salt myminion boto_vpc.is_peering_connection_pending conn_name=salt-vpc region=us-
↳west-2
# specify an id
salt myminion boto_vpc.is_peering_connection_pending conn_id=pcx-8a8939e3

```

```

salt.modules.boto_vpc.nat_gateway_exists(nat_gateway_id=None, subnet_id=None, sub-
net_name=None, vpc_id=None, vpc_name=None,
states=('pending', 'available'), region=None,
key=None, keyid=None, profile=None)

```

Checks if a nat gateway exists.

This function requires boto3 to be installed.

New in version 2016.11.0.

CLI Example:

```

salt myminion boto_vpc.nat_gateway_exists nat_gateway_id='nat-03b02643b43216fe7'
salt myminion boto_vpc.nat_gateway_exists subnet_id='subnet-5b05942d'

```

```

salt.modules.boto_vpc.network_acl_exists(network_acl_id=None, name=None, net-
work_acl_name=None, tags=None, region=None,
key=None, keyid=None, profile=None)

```

Checks if a network acl exists.

Returns True if the network acl exists or returns False if it doesn't exist.

CLI Example:

```

salt myminion boto_vpc.network_acl_exists network_acl_id='acl-5fb85d36'

```

```

salt.modules.boto_vpc.peering_connection_pending_from_vpc(conn_id=None,
conn_name=None,
vpc_id=None,
vpc_name=None, re-
gion=None, key=None,
keyid=None, pro-
file=None)

```

Check if a VPC peering connection is in the pending state, and requested from the given VPC.

New in version 2016.11.0.

**conn\_id** The connection ID to check. Exclusive with conn\_name.

**conn\_name** The connection name to check. Exclusive with conn\_id.

**vpc\_id** Is this the ID of the requesting VPC for this peering connection. Exclusive with vpc\_name.

**vpc\_name** Is this the Name of the requesting VPC for this peering connection. Exclusive with vpc\_id.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

CLI Example:

```

salt myminion boto_vpc.is_peering_connection_pending name=salt-vpc

```

`salt.modules.boto_vpc.replace_network_acl_entry` (*network\_acl\_id=None*,  
*rule\_number=None*, *protocol=None*,  
*rule\_action=None*, *cidr\_block=None*,  
*egress=None*, *network\_acl\_name=None*,  
*icmp\_code=None*, *icmp\_type=None*,  
*port\_range\_from=None*,  
*port\_range\_to=None*, *region=None*,  
*key=None*, *keyid=None*, *profile=None*)

Replaces a network acl entry.

CLI Example:

```
salt myminion boto_vpc.replace_network_acl_entry 'acl-5fb85d36' '32767' \
'all' 'deny' '0.0.0.0/0' egress=true
```

`salt.modules.boto_vpc.replace_route` (*route\_table\_id=None*, *destination\_cidr\_block=None*,  
*route\_table\_name=None*, *gateway\_id=None*,  
*instance\_id=None*, *interface\_id=None*, *re-*  
*gion=None*, *key=None*, *keyid=None*, *profile=None*,  
*vpc\_peering\_connection\_id=None*)

Replaces a route.

CLI Example:

```
salt myminion boto_vpc.replace_route 'rtb-1f382e7d' '10.0.0.0/16' gateway_id='vgw-
↪a1b2c3'
```

`salt.modules.boto_vpc.replace_route_table_association` (*association\_id*, *route\_table\_id*,  
*region=None*, *key=None*,  
*keyid=None*, *profile=None*)

Replaces a route table association.

CLI Example:

```
salt myminion boto_vpc.replace_route_table_association 'rtbassoc-d8ccddba' 'rtb-
↪1f382e7d'
```

`salt.modules.boto_vpc.request_vpc_peering_connection` (*requester\_vpc\_id=None*, *re-*  
*quester\_vpc\_name=None*,  
*peer\_vpc\_id=None*,  
*peer\_vpc\_name=None*,  
*name=None*,  
*peer\_owner\_id=None*, *re-*  
*gion=None*, *key=None*,  
*keyid=None*, *profile=None*,  
*dry\_run=False*)

Request a VPC peering connection between two VPCs.

New in version 2016.11.0.

**requester\_vpc\_id** ID of the requesting VPC. Exclusive with `requester_vpc_name`.

**requester\_vpc\_name** Name tag of the requesting VPC. Exclusive with `requester_vpc_id`.

**peer\_vpc\_id** ID of the VPC to create VPC peering connection with. This can be a VPC in another account. Exclusive with `peer_vpc_name`.

**peer\_vpc\_name** Name tag of the VPC to create VPC peering connection with. This can only be a VPC in the same account, else resolving it into a vpc ID will almost certainly fail. Exclusive with `peer_vpc_id`.

**name** The name to use for this VPC peering connection.

**peer\_owner\_id** ID of the owner of the peer VPC. Defaults to your account ID, so a value is required if peering with a VPC in a different account.

**region** Region to connect to.  
**key** Secret key to be used.  
**keyid** Access key to be used.  
**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.  
**dry\_run** If True, skip application and return status.  
 CLI Example:

```
# Create a named VPC peering connection
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da
  ↳name=my_vpc_connection
# Without a name
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da
# Specify a region
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da
  ↳region=us-west-2
```

`salt.modules.boto_vpc.resource_exists`(*resource*, *name=None*, *resource\_id=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a resource type and name, return {exists: true} if it exists, {exists: false} if it does not exist, or {error: {message: error text}} on error.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_vpc.resource_exists internet_gateway myigw
```

`salt.modules.boto_vpc.route_exists`(*destination\_cidr\_block*, *route\_table\_name=None*, *route\_table\_id=None*, *gateway\_id=None*, *instance\_id=None*, *interface\_id=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *vpc\_peering\_connection\_id=None*)

Checks if a route exists.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_vpc.route_exists destination_cidr_block='10.0.0.0/20' gateway_
  ↳id='local' route_table_name='test'
```

`salt.modules.boto_vpc.route_table_exists`(*route\_table\_id=None*, *name=None*, *route\_table\_name=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Checks if a route table exists.

CLI Example:

```
salt myminion boto_vpc.route_table_exists route_table_id='rtb-1f382e7d'
```

`salt.modules.boto_vpc.subnet_exists`(*subnet\_id=None*, *name=None*, *subnet\_name=None*, *cidr=None*, *tags=None*, *zones=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check if a subnet exists.

Returns True if the subnet exists, otherwise returns False.

Changed in version 2015.8.0: Added `subnet_name` argument  
 Deprecated `name` argument

CLI Example:

```
salt myminion boto_vpc.subnet_exists subnet_id='subnet-6a1fe403'
```

## 14.7.54 salt.modules.bower

### Manage and query Bower packages

This module manages the installed packages using Bower. Note that npm, git and bower must be installed for this module to be available.

**salt.modules.bower.install**(*pkg, dir, pkgs=None, runas=None, env=None*)

Install a Bower package.

If no package is specified, the dependencies (from bower.json) of the package in the given directory will be installed.

**pkg** A package name in any format accepted by Bower, including a version identifier

**dir** The target directory in which to install the package

**pkgs** A list of package names in the same format as the **pkg** parameter

**runas** The user to run Bower with

**env** Environment variables to set when invoking Bower. Uses the same **env** format as the `cmd.run` execution function.

CLI Example:

```
salt '*' bower.install underscore /path/to/project
salt '*' bower.install jquery#2.0 /path/to/project
```

**salt.modules.bower.list**(*dir, runas=None, env=None*)

List installed Bower packages.

**dir** The directory whose packages will be listed

**runas** The user to run Bower with

**env** Environment variables to set when invoking Bower. Uses the same **env** format as the `cmd.run` execution function.

CLI Example:

```
salt '*' bower.list /path/to/project
```

**salt.modules.bower.prune**(*dir, runas=None, env=None*)

New in version 2017.7.0.

Remove extraneous local Bower packages, i.e. those not referenced in bower.json

**dir** The directory whose packages will be pruned

**runas** The user to run Bower with

**env** Environment variables to set when invoking Bower. Uses the same **env** format as the `cmd.run` execution function.

CLI Example:

```
salt '*' bower.prune /path/to/project
```

**salt.modules.bower.uninstall**(*pkg, dir, runas=None, env=None*)

Uninstall a Bower package.

**pkg** A package name in any format accepted by Bower

**dir** The target directory from which to uninstall the package

**runas** The user to run Bower with

**env** Environment variables to set when invoking Bower. Uses the same env format as the `cmd.run` execution function.

CLI Example:

```
salt '*' bower.uninstall underscore /path/to/project
```

### 14.7.55 salt.modules.bridge

Module for gathering and managing bridging information

**salt.modules.bridge.add**(*br=None*)

Creates a bridge

CLI Example:

```
salt '*' bridge.add br0
```

**salt.modules.bridge.addif**(*br=None, iface=None*)

Adds an interface to a bridge

CLI Example:

```
salt '*' bridge.addif br0 eth0
```

**salt.modules.bridge.delete**(*br=None*)

Deletes a bridge

CLI Example:

```
salt '*' bridge.delete br0
```

**salt.modules.bridge.delif**(*br=None, iface=None*)

Removes an interface from a bridge

CLI Example:

```
salt '*' bridge.delif br0 eth0
```

**salt.modules.bridge.find\_interfaces**(*\*args*)

Returns the bridge to which the interfaces are bond to

CLI Example:

```
salt '*' bridge.find_interfaces eth0 [eth1...]
```

**salt.modules.bridge.interfaces**(*br=None*)

Returns interfaces attached to a bridge

CLI Example:

```
salt '*' bridge.interfaces br0
```

**salt.modules.bridge.list**()

Returns the machine's bridges list

CLI Example:

```
salt '*' bridge.list
```

`salt.modules.bridge.show`(*br=None*)

Returns bridges interfaces along with enslaved physical interfaces. If no interface is given, all bridges are shown, else only the specified bridge values are returned.

CLI Example:

```
salt '*' bridge.show
salt '*' bridge.show br0
```

`salt.modules.bridge.stp`(*br=None, state='disable', iface=None*)

Sets Spanning Tree Protocol state for a bridge

CLI Example:

```
salt '*' bridge.stp br0 enable
salt '*' bridge.stp br0 disable
```

For BSD-like operating systems, it is required to add the interface on which to enable the STP.

CLI Example:

```
salt '*' bridge.stp bridge0 enable fxp0
salt '*' bridge.stp bridge0 disable fxp0
```

## 14.7.56 `salt.modules.bsd_shadow`

Manage the password database on BSD systems

---

**Important:** If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to `'shadow.info' is not available`), see [here](#).

---

`salt.modules.bsd_shadow.default_hash`()

Returns the default hash used for unset passwords

CLI Example:

```
salt '*' shadow.default_hash
```

`salt.modules.bsd_shadow.del_password`(*name*)

New in version 2015.8.2.

Delete the password from name user

CLI Example:

```
salt '*' shadow.del_password username
```

`salt.modules.bsd_shadow.info`(*name*)

Return information for the specified user

CLI Example:

```
salt '*' shadow.info someuser
```

`salt.modules.bsd_shadow.set_change`(*name, change*)

Sets the time at which the password expires (in seconds since the UNIX epoch). See `man 8 usermod` on NetBSD and OpenBSD or `man 8 pw` on FreeBSD.

A value of 0 sets the password to never expire.

CLI Example:

```
salt '*' shadow.set_change username 1419980400
```

`salt.modules.bsd_shadow.set_expire`(*name*, *expire*)

Sets the time at which the account expires (in seconds since the UNIX epoch). See `man 8 usermod` on NetBSD and OpenBSD or `man 8 pw` on FreeBSD.

A value of 0 sets the account to never expire.

CLI Example:

```
salt '*' shadow.set_expire username 1419980400
```

`salt.modules.bsd_shadow.set_password`(*name*, *password*)

Set the password for a named user. The password must be a properly defined hash. The password hash can be generated with this command:

```
python -c "import crypt; print crypt.crypt('password',ciphersalt)"
```

---

**Note:** When constructing the `ciphersalt` string, you must escape any dollar signs, to avoid them being interpolated by the shell.

---

'password' is, of course, the password for which you want to generate a hash.

`ciphersalt` is a combination of a cipher identifier, an optional number of rounds, and the cryptographic salt. The arrangement and format of these fields depends on the cipher and which flavor of BSD you are using. For more information on this, see the manpage for `crypt(3)`. On NetBSD, additional information is available in `passwd.conf(5)`.

It is important to make sure that a supported cipher is used.

CLI Example:

```
salt '*' shadow.set_password someuser '$1$UYCIxa628.9qXjpQCjM4a..'
```

### 14.7.57 salt.modules.btrfs

Module for managing BTRFS file systems.

`salt.modules.btrfs.add`(*mountpoint*, *\*devices*, *\*\*kwargs*)

Add a devices to a BTRFS filesystem.

General options:

- nodiscard**: Do not perform whole device TRIM
- force**: Force overwrite existing filesystem on the disk

CLI Example:

```
salt '*' btrfs.add /mountpoint /dev/sda1 /dev/sda2
```

`salt.modules.btrfs.convert`(*device*, *permanent=False*, *keepIf=False*)

Convert ext2/3/4 to BTRFS. Device should be mounted.

Filesystem can be converted temporarily so the further processing and rollback is possible, or permanently, where previous extended filesystem image gets deleted. Please note, permanent conversion takes a while as BTRFS filesystem needs to be properly rebalanced afterwards.

General options:

- permanent**: Specify if the migration should be permanent (false by default)
- keeplf**: Keep **lost+found** of the partition (removed by default, but still in the image, if not permanent migration)

CLI Example:

```
salt '*' btrfs.convert /dev/sda1
salt '*' btrfs.convert /dev/sda1 permanent=True
```

`salt.modules.btrfs.defragment`(*path*)

Defragment mounted BTRFS filesystem. In order to defragment a filesystem, device should be properly mounted and writable.

If passed a device name, then defragmented whole filesystem, mounted on in. If passed a mount point of the filesystem, then only this mount point is defragmented.

CLI Example:

```
salt '*' btrfs.defragment /dev/sda1
salt '*' btrfs.defragment /path/on/filesystem
```

`salt.modules.btrfs.delete`(*mountpoint*, *\*devices*, *\*\*kwargs*)

Remove devices from a BTRFS filesystem.

CLI Example:

```
salt '*' btrfs.delete /mountpoint /dev/sda1 /dev/sda2
```

`salt.modules.btrfs.devices`()

Get known BTRFS formatted devices on the system.

CLI Example:

```
salt '*' btrfs.devices
```

`salt.modules.btrfs.features`()

List currently available BTRFS features.

CLI Example:

```
salt '*' btrfs.mkfs_features
```

`salt.modules.btrfs.info`(*device*)

Get BTRFS filesystem information.

CLI Example:

```
salt '*' btrfs.info /dev/sda1
```

`salt.modules.btrfs.mkfs`(*\*devices*, *\*\*kwargs*)

Create a file system on the specified device. By default wipes out with force.

General options:

- allocsize**: Specify the BTRFS offset from the start of the device.
- bytecount**: Specify the size of the resultant filesystem.
- nodesize**: Node size.
- leafsize**: Specify the nodesize, the tree block size in which btrfs stores data.
- noforce**: Prevent force overwrite when an existing filesystem is detected on the device.
- sectorsize**: Specify the sectorsize, the minimum data block allocation unit.

- nodiscard**: Do not perform whole device TRIM operation by default.
- uuid**: Pass UUID or pass True to generate one.

Options:

- dto**: (**raid0|raid1|raid5|raid6|raid10|single|dup**) Specify how the data must be spanned across the devices specified.
- mtto**: (**raid0|raid1|raid5|raid6|raid10|single|dup**) Specify how metadata must be spanned across the devices specified.
- fts**: Features (call `salt <host> btrfs.features` for full list of available features)

See the `mkfs.btrfs(8)` manpage for a more complete description of corresponding options description.

CLI Example:

```
salt '*' btrfs.mkfs /dev/sda1
salt '*' btrfs.mkfs /dev/sda1 noforce=True
```

`salt.modules.btrfs.properties` (*obj*, *type=None*, *set=None*)

List properties for given btrfs object. The object can be path of BTRFS device, mount point, or any directories/files inside the BTRFS filesystem.

General options:

- type**: Possible types are `s[ubvol]`, `f[ilesystem]`, `i[node]` and `d[evice]`.
- force**: Force overwrite existing filesystem on the disk
- set**: `<key=value,key1=value1...>` Options for a filesystem properties.

CLI Example:

```
salt '*' btrfs.properties /mountpoint
salt '*' btrfs.properties /dev/sda1 type=subvol set='ro=false,label="My Storage"'
```

`salt.modules.btrfs.resize` (*mountpoint*, *size*)

Resize filesystem.

General options:

- mountpoint**: Specify the BTRFS mountpoint to resize.
- size**: (`[+/-]<newsiz>[kKmMgGtTpPeE]|max`) Specify the new size of the target.

CLI Example:

```
salt '*' btrfs.resize /mountpoint size=+1g
salt '*' btrfs.resize /dev/sda1 size=max
```

`salt.modules.btrfs.usage` (*path*)

Show in which disk the chunks are allocated.

CLI Example:

```
salt '*' btrfs.usage /your/mountpoint
```

`salt.modules.btrfs.version` ()

Return BTRFS version.

CLI Example:

```
salt '*' btrfs.version
```

## 14.7.58 salt.modules.cabal

### Manage and query Cabal packages

New in version 2015.8.0.

`salt.modules.cabal.install` (*pkg=None, pkgs=None, user=None, install\_global=False, env=None*)

Install a cabal package.

**pkg** A package name in format accepted by cabal-install. See: <https://wiki.haskell.org/Cabal-Install>

**pkgs** A list of packages names in same format as `pkg`

**user** The user to run cabal install with

**install\_global** Install package globally instead of locally

**env** Environment variables to set when invoking cabal. Uses the same `env` format as the `cmd.run` execution function

CLI Example:

```
salt '*' cabal.install shellcheck
salt '*' cabal.install shellcheck-0.3.5
```

`salt.modules.cabal.list` (*pkg=None, user=None, installed=False, env=None*)

List packages matching a search string.

**pkg** Search string for matching package names

**user** The user to run cabal list with

**installed** If True, only return installed packages.

**env** Environment variables to set when invoking cabal. Uses the same `env` format as the `cmd.run` execution function

CLI example:

```
salt '*' cabal.list
salt '*' cabal.list ShellCheck
```

`salt.modules.cabal.uninstall` (*pkg, user=None, env=None*)

Uninstall a cabal package.

**pkg** The package to uninstall

**user** The user to run `ghc-pkg unregister` with

**env** Environment variables to set when invoking cabal. Uses the same `env` format as the `cmd.run` execution function

CLI Example:

```
salt '*' cabal.uninstall ShellCheck
```

`salt.modules.cabal.update` (*user=None, env=None*)

Updates list of known packages.

**user** The user to run cabal update with

**env** Environment variables to set when invoking cabal. Uses the same `env` format as the `cmd.run` execution function.

CLI Example:

```
salt '*' cabal.update
```

## 14.7.59 salt.modules.campirca\_acl module

### Capirca ACL

Generate ACL (firewall) configuration for network devices.

New in version 2017.7.0.

**codeauthor** Mircea Ulinic <mircea@cloudflare.com> & Robert Ankeny <robankeny@google.com>

**maturity** new

**depends** capirca

**platform** unix

### Dependencies

The firewall configuration is generated by [Capirca](#).

Capirca is not yet available on PyPI therefore it has to be installed directly from Git: `pip install -e git+git@github.com:google/campirca.git#egg=aclgen`.

```
salt.modules.campirca_acl.get_filter_config(platform, filter_name, filter_options=None,
                                           terms=None,          prepend=True,    pil-
                                           lar_key='acl',          pillarenv=None,
                                           saltenv=None,          merge_pillar=True,
                                           only_lower_merge=False, revision_id=None,
                                           revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d')
```

Return the configuration of a policy filter.

**platform** The name of the Capirca platform.

**filter\_name** The name of the policy filter.

**filter\_options** Additional filter options. These options are platform-specific. See the complete list of [options](#).

**terms** List of terms for this policy filter. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.

**prepend: True** When `merge_pillar` is set as `True`, the final list of terms generated by merging the terms from `terms` with those defined in the pillar (if any): new terms are prepended at the beginning, while existing ones will preserve the position. To add the new terms at the end of the list, set this argument to `False`.

**pillar\_key: acl** The key in the pillar containing the default attributes values. Default: `acl`.

**pillarenv** Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv** Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

**merge\_pillar: True** Merge the CLI variables with the pillar. Default: `True`.

**only\_lower\_merge: False** Specify if it should merge only the terms fields. Otherwise it will try to merge also filters fields. Default: `False`.

**revision\_id** Add a comment in the filter config having the description for the changes applied.

**revision\_no** The revision count.

**revision\_date: True** Boolean flag: display the date when the filter configuration was generated. Default: `True`.

**revision\_date\_format: %Y/%m/%d** The date format to be used when generating the perform data. Default: `%Y/%m/%d` (<year>/<month>/<day>).

CLI Example:

```
salt '*' capirca.get_filter_config ciscoxr my-filter pillar_key=netacl
```

Output Example:

```
! $Id:$
! $Date:$
! $Revision:$
no ipv4 access-list my-filter
ipv4 access-list my-filter
 remark $Id:$
 remark my-term
deny ipv4 any eq 1234 any
deny ipv4 any eq 1235 any
 remark my-other-term
permit tcp any range 5678 5680 any
exit
```

The filter configuration has been loaded from the pillar, having the following structure:

```
netacl:
- my-filter:
  terms:
  - my-term:
    source_port: [1234, 1235]
    action: reject
  - my-other-term:
    source_port:
    - [5678, 5680]
    protocol: tcp
    action: accept
```

`salt.modules.capirca_acl.get_filter_pillar`(*filter\_name*, *pillar\_key='acl'*, *pillarenv=None*, *saltenv=None*)

Helper that can be used inside a state SLS, in order to get the filter configuration given its name.

**filter\_name** The name of the filter.

**pillar\_key** The root key of the whole policy config.

**pillarenv** Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv** Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

`salt.modules.capirca_acl.get_policy_config`(*platform*, *filters=None*, *prepend=True*, *pillar\_key='acl'*, *pillarenv=None*, *saltenv=None*, *merge\_pillar=True*, *only\_lower\_merge=False*, *revision\_id=None*, *revision\_no=None*, *revision\_date=True*, *revision\_date\_format='%Y/%m/%d'*)

Return the configuration of the whole policy.

**platform** The name of the Capirca platform.

**filters** List of filters for this policy. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.

**prepend: True** When `merge_pillar` is set as `True`, the final list of filters generated by merging the filters from `filters` with those defined in the pillar (if any): new filters are prepended at the beginning, while existing ones will preserve the position. To add the new filters at the end of the list, set this argument to `False`.

**pillar\_key: acl** The key in the pillar containing the default attributes values. Default: `acl`.

**pillarenv** Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv** Included only for compatibility with *pillarenv\_from\_saltenv*, and is otherwise ignored.

**merge\_pillar: True** Merge the CLI variables with the pillar. Default: True.

**only\_lower\_merge: False** Specify if it should merge only the filters and terms fields. Otherwise it will try to merge everything at the policy level. Default: False.

**revision\_id** Add a comment in the policy config having the description for the changes applied.

**revision\_no** The revision count.

**revision\_date: True** Boolean flag: display the date when the policy configuration was generated. Default: True.

**revision\_date\_format: %Y/%m/%d** The date format to be used when generating the performe data. Default: %Y/%m/%d (<year>/<month>/<day>).

CLI Example:

```
salt '*' capirca.get_policy_config juniper pillar_key=netacl
```

Output Example:

```
firewall {
  family inet {
    replace:
    /*
    ** $Id:$
    ** $Date:$
    ** $Revision:$
    **
    */
    filter my-filter {
      term my-term {
        from {
          source-port [ 1234 1235 ];
        }
        then {
          reject;
        }
      }
      term my-other-term {
        from {
          protocol tcp;
          source-port 5678-5680;
        }
        then accept;
      }
    }
  }
}
firewall {
  family inet {
    replace:
    /*
    ** $Id:$
    ** $Date:$
    ** $Revision:$
    **
    */
    filter my-other-filter {
      interface-specific;
      term dummy-term {
```

```
        from {
            protocol [ tcp udp ];
        }
        then {
            reject;
        }
    }
}
}
```

The policy configuration has been loaded from the pillar, having the following structure:

```
netacl:
- my-filter:
  options:
    - not-interface-specific
  terms:
    - my-term:
      source_port: [1234, 1235]
      action: reject
    - my-other-term:
      source_port:
        - [5678, 5680]
      protocol: tcp
      action: accept
- my-other-filter:
  terms:
    - dummy-term:
      protocol:
        - tcp
        - udp
      action: reject
```

`salt.modules.campirca_acl.get_term_config(platform, filter_name, term_name, filter_options=None, pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=True, revision_id=None, revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d', source_service=None, destination_service=None, **term_fields)`

Return the configuration of a single policy term.

**platform** The name of the Capirca platform.

**filter\_name** The name of the policy filter.

**term\_name** The name of the term.

**filter\_options** Additional filter options. These options are platform-specific. E.g.: `inet6`, `bridge`, `object-group`, See the complete list of [options](#).

**pillar\_key**: **acl** The key in the pillar containing the default attributes values. Default: `acl`. If the pillar contains the following structure:

```
firewall:
- my-filter:
  terms:
    - my-term:
      source_port: 1234
      source_address:
```

<ul style="list-style-type: none"> <li>- 1.2.3.4/32</li> <li>- 5.6.7.8/32</li> </ul>
--

The `pillar_key` field would be specified as `firewall`.

**pillarenv** Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv** Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

**merge\_pillar: True** Merge the CLI variables with the pillar. Default: True.

**revision\_id** Add a comment in the term config having the description for the changes applied.

**revision\_no** The revision count.

**revision\_date: True** Boolean flag: display the date when the term configuration was generated. Default: True.

**revision\_date\_format: %Y/%m/%d** The date format to be used when generating the perforce data. Default: %Y/%m/%d (<year>/<month>/<day>).

**source\_service** A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a `source_port` and `protocol`.

As this module is available on Unix platforms only, it reads the [IANA](#) port assignment from `/etc/services`.

If the user requires additional shortcuts to be referenced, they can add entries under `/etc/services`, which can be managed using the `file state`.

**destination\_service** A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a `destination_port` and `protocol`. Allows the same options as `source_service`.

**\*\*term\_fields** Term attributes. To see what fields are supported, please consult the list of supported [keywords](#). Some platforms have few other [optional](#) keywords.

---

**Note:** The following fields are accepted:

- action
- address
- address\_exclude
- comment
- counter
- expiration
- destination\_address
- destination\_address\_exclude
- destination\_port
- destination\_prefix
- forwarding\_class
- forwarding\_class\_except
- logging
- log\_name
- loss\_priority
- option
- policer
- port
- precedence
- principals
- protocol
- protocol\_except
- qos
- pan\_application
- routing\_instance

- source\_address
  - source\_address\_exclude
  - source\_port
  - source\_prefix
  - verbatim
  - packet\_length
  - fragment\_offset
  - hop\_limit
  - icmp\_type
  - ether\_type
  - traffic\_class\_count
  - traffic\_type
  - translated
  - dscp\_set
  - dscp\_match
  - dscp\_except
  - next\_ip
  - flexible\_match\_range
  - source\_prefix\_except
  - destination\_prefix\_except
  - vpn
  - source\_tag
  - destination\_tag
  - source\_interface
  - destination\_interface
  - flattened
  - flattened\_addr
  - flattened\_saddr
  - flattened\_daddr
- 

**Note:** The following fields can be also a single value and a list of values:

- action
- address
- address\_exclude
- comment
- destination\_address
- destination\_address\_exclude
- destination\_port
- destination\_prefix
- forwarding\_class
- forwarding\_class\_except
- logging
- option
- port
- precedence
- principals
- protocol
- protocol\_except
- pan\_application
- source\_address
- source\_address\_exclude
- source\_port

- source\_prefix
- verbatim
- icmp\_type
- ether\_type
- traffic\_type
- dscp\_match
- dscp\_except
- flexible\_match\_range
- source\_prefix\_except
- destination\_prefix\_except
- source\_tag
- destination\_tag
- source\_service
- destination\_service

Example: `destination_address` can be either defined as:

```
destination_address: 172.17.17.1/24
```

or as a list of destination IP addresses:

```
destination_address:
- 172.17.17.1/24
- 172.17.19.1/24
```

or a list of services to be matched:

```
source_service:
- ntp
- snmp
- ldap
- bgpd
```

**Note:** The port fields `source_port` and `destination_port` can be used as above to select either a single value, either a list of values, but also they can select port ranges. Example:

```
source_port:
- [1000, 2000]
- [3000, 4000]
```

With the configuration above, the user is able to select the 1000-2000 and 3000-4000 source port ranges.

CLI Example:

```
salt '*' capirca.get_term_config arista filter-name term-name source_address=1.2.
↳3.4 destination_address=5.6.7.8 action=accept
```

Output Example:

```
! $Date: 2017/03/22 $
no ip access-list filter-name
ip access-list filter-name
  remark term-name
  permit ip host 1.2.3.4 host 5.6.7.8
exit
```

`salt.modules.capirca_acl.get_term_pillar`(*filter\_name*, *term\_name*, *pillar\_key*='acl', *pillarenv*=None, *saltenv*=None)

Helper that can be used inside a state SLS, in order to get the term configuration given its name, under a certain filter uniquely identified by its name.

**filter\_name** The name of the filter.

**term\_name** The name of the term.

**pillar\_key: acl** The root key of the whole policy config. Default: `acl`.

**pillarenv** Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv** Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

## 14.7.60 salt.modules.cassandra

Cassandra NoSQL Database Module

**depends**

- pycassa Cassandra Python adapter

**configuration** The location of the `nodetool` command, host, and thrift port needs to be specified via pillar:

```
cassandra.nodetool: /usr/local/bin/nodetool
cassandra.host: localhost
cassandra.thrift_port: 9160
```

`salt.modules.cassandra.column_families`(*keyspace*=None)

Return existing column families for all keyspaces or just the provided one.

CLI Example:

```
salt '*' cassandra.column_families
salt '*' cassandra.column_families <keyspace>
```

`salt.modules.cassandra.column_family_definition`(*keyspace*, *column\_family*)

Return a dictionary of column family definitions for the given keyspace/column\_family

CLI Example:

```
salt '*' cassandra.column_family_definition <keyspace> <column_family>
```

`salt.modules.cassandra.compactionstats`()

Return compactionstats info

CLI Example:

```
salt '*' cassandra.compactionstats
```

`salt.modules.cassandra.info`()

Return cassandra node info

CLI Example:

```
salt '*' cassandra.info
```

`salt.modules.cassandra.keyspaces`()

Return existing keyspaces

CLI Example:

```
salt '*' cassandra.keyspaces
```

`salt.modules.cassandra.netstats()`

Return netstats info

CLI Example:

```
salt '*' cassandra.netstats
```

`salt.modules.cassandra.ring()`

Return cassandra ring info

CLI Example:

```
salt '*' cassandra.ring
```

`salt.modules.cassandra.tpstats()`

Return tpstats info

CLI Example:

```
salt '*' cassandra.tpstats
```

`salt.modules.cassandra.version()`

Return the cassandra version

CLI Example:

```
salt '*' cassandra.version
```

## 14.7.61 salt.modules.cassandra\_cql

Cassandra Database Module

New in version 2015.5.0.

**depends** DataStax Python Driver for Apache Cassandra <https://github.com/datastax/python-driver> pip  
install cassandra-driver

**referenced by** Salt's `cassandra_cql` returner

**configuration** The Cassandra cluster members and connection port can either be specified in the master or minion config, the minion's pillar or be passed to the module.

Example configuration in the config for a single node:

```
cassandra:
  cluster: 192.168.50.10
  port: 9000
```

Example configuration in the config for a cluster:

```
cassandra:
  cluster:
    - 192.168.50.10
    - 192.168.50.11
    - 192.168.50.12
  port: 9000
  username: cas_admin
```

Changed in version 2016.11.0.

Added support for `ssl_options` and `protocol_version`.

Example configuration with `ssl_options`:

If `ssl_options` are present in `cassandra` config the `cassandra_cql` returner will use SSL. SSL isn't used if `ssl_options` isn't specified.

```
cassandra:
  cluster:
    - 192.168.50.10
    - 192.168.50.11
    - 192.168.50.12
  port: 9000
  username: cas_admin

  ssl_options:
    ca_certs: /etc/ssl/certs/ca-bundle.trust.crt

    # SSL version should be one from the ssl module
    # This is an optional parameter
    ssl_version: PROTOCOL_TLSv1
```

Additionally you can also specify the `protocol_version` to use.

```
cassandra:
  cluster:
    - 192.168.50.10
    - 192.168.50.11
    - 192.168.50.12
  port: 9000
  username: cas_admin

  # defaults to 4, if not set
  protocol_version: 3
```

`salt.modules.cassandra_cql.cql_query` (*query*, *contact\_points=None*, *port=None*, *cql\_user=None*, *cql\_pass=None*)

Run a query on a Cassandra cluster and return a dictionary.

#### Parameters

- **query** (*str*) -- The query to execute.
- **contact\_points** (*str* | *list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql\_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql\_pass** (*str*) -- The Cassandra user password if authentication is turned on.
- **port** (*int*) -- The Cassandra cluster port, defaults to None.
- **params** (*str*) -- The parameters for the query, optional.

**Returns** A dictionary from the return values of the query

**Return type** `list[dict]`

CLI Example:

```
salt '*' cql_query "SELECT * FROM users_by_name WHERE first_name = 'jane'"
```

```

salt.modules.cassandra_cql.cql_query_with_prepare(query, statement_name, state-
                                                    statement_arguments, async=False,
                                                    callback_errors=None, con-
                                                    tact_points=None, port=None,
                                                    cql_user=None, cql_pass=None)

```

Run a query on a Cassandra cluster and return a dictionary.

This function should not be used asynchronously for SELECTs -- it will not return anything and we don't currently have a mechanism for handling a future that will return results.

#### Parameters

- **query** (*str*) -- The query to execute.
- **statement\_name** (*str*) -- Name to assign the prepared statement in the `__context__` dictionary
- **statement\_arguments** (*list[str]*) -- Bind parameters for the SQL statement
- **async** (*bool*) -- Run this query in asynchronous mode
- **callback\_errors** (*Function callable*) -- Function to call after query runs if there is an error
- **contact\_points** (*str | list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql\_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql\_pass** (*str*) -- The Cassandra user password if authentication is turned on.
- **port** (*int*) -- The Cassandra cluster port, defaults to None.
- **params** (*str*) -- The parameters for the query, optional.

**Returns** A dictionary from the return values of the query

**Return type** list[dict]

CLI Example:

```

# Insert data asynchronously
salt this-node cassandra_cql.cql_query_with_prepare "name_insert" "INSERT INTO
↳USERS (first_name, last_name) VALUES (?, ?)" statement_arguments=[
↳'John','Doe'], async=True

# Select data, should not be asynchronous because there is not currently a
↳facility to return data from a future
salt this-node cassandra_cql.cql_query_with_prepare "name_select" "SELECT * FROM
↳USERS WHERE first_name=?" statement_arguments=['John']

```

```

salt.modules.cassandra_cql.create_keyspace(keyspace, replication
                                                    strategy='SimpleStrategy', replica-
                                                    tion_factor=1, replication_datacenters=None,
                                                    contact_points=None, port=None,
                                                    cql_user=None, cql_pass=None)

```

Create a new keyspace in Cassandra.

#### Parameters

- **keyspace** (*str*) -- The keyspace name
- **replication\_strategy** (*str*) -- either *SimpleStrategy* or *NetworkTopologyStrategy*

- **replication\_factor** (*int*) -- number of replicas of data on multiple nodes. not used if using NetworkTopologyStrategy
- **replication\_datacenters** (*str* | *dict[str, int]*) -- string or dict of datacenter names to replication factors, required if using NetworkTopologyStrategy (will be a dict if coming from state file).
- **contact\_points** (*str* | *list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql\_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql\_pass** (*str*) -- The Cassandra user password if authentication is turned on.
- **port** (*int*) -- The Cassandra cluster port, defaults to None.

**Returns** The info for the keyspace or False if it does not exist.

**Return type** `dict`

CLI Example:

```
# CLI Example:
salt 'minion1' cassandra_cql.create_keyspace keyspace=newkeyspace

salt 'minion1' cassandra_cql.create_keyspace keyspace=newkeyspace replication_
↪strategy=NetworkTopologyStrategy replication_datacenters='{"datacenter_1
↪": 3, "datacenter_2": 2}'
```

`salt.modules.cassandra_cql.create_user` (*username*, *password*, *superuser=False*, *contact\_points=None*, *port=None*, *cql\_user=None*, *cql\_pass=None*)

Create a new cassandra user with credentials and superuser status.

**Parameters**

- **username** (*str*) -- The name of the new user.
- **password** (*str*) -- The password of the new user.
- **superuser** (*bool*) -- Is the new user going to be a superuser? default: False
- **contact\_points** (*str* | *list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql\_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql\_pass** (*str*) -- The Cassandra user password if authentication is turned on.
- **port** (*int*) -- The Cassandra cluster port, defaults to None.

**Returns**

**Return type**

CLI Example:

```
salt 'minion1' cassandra_cql.create_user username=joe password=secret

salt 'minion1' cassandra_cql.create_user username=joe password=secret
↪superuser=True

salt 'minion1' cassandra_cql.create_user username=joe password=secret
↪superuser=True contact_points=minion1
```

```
salt.modules.cassandra_cql.drop_keyspace(keyspace, contact_points=None, port=None,
                                         cql_user=None, cql_pass=None)
```

Drop a keyspace if it exists in a Cassandra cluster.

#### Parameters

- **keyspace** (*str*) -- The keyspace to drop.
- **contact\_points** (*str* | *list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql\_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql\_pass** (*str*) -- The Cassandra user password if authentication is turned on.
- **port** (*int*) -- The Cassandra cluster port, defaults to None.

**Returns** The info for the keyspace or False if it does not exist.

**Return type** `dict`

CLI Example:

```
salt 'minion1' cassandra_cql.drop_keyspace keyspace=test
salt 'minion1' cassandra_cql.drop_keyspace keyspace=test contact_points=minion1
```

```
salt.modules.cassandra_cql.grant_permission(username, resource=None, re-
                                           source_type='keyspace', permission=None,
                                           contact_points=None, port=None,
                                           cql_user=None, cql_pass=None)
```

Grant permissions to a user.

#### Parameters

- **username** (*str*) -- The name of the user to grant permissions to.
- **resource** (*str*) -- The resource (keyspace or table), if None, permissions for all resources are granted.
- **resource\_type** (*str*) -- The resource\_type (keyspace or table), defaults to 'keyspace'.
- **permission** (*str*) -- A permission name (e.g. select), if None, all permissions are granted.
- **contact\_points** (*str* | *list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql\_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql\_pass** (*str*) -- The Cassandra user password if authentication is turned on.
- **port** (*int*) -- The Cassandra cluster port, defaults to None.

**Returns**

**Return type**

CLI Example:

```
salt 'minion1' cassandra_cql.grant_permission
salt 'minion1' cassandra_cql.grant_permission username=joe resource=test_keyspace
↳ permission=select
salt 'minion1' cassandra_cql.grant_permission username=joe resource=test_table
↳ resource_type=table permission=select contact_points=minion1
```

`salt.modules.cassandra_cql.info`(*contact\_points=None, port=None, cql\_user=None, cql\_pass=None*)

Show the Cassandra information for this cluster.

**Parameters**

- **contact\_points** (*str* | *list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql\_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql\_pass** (*str*) -- The Cassandra user password if authentication is turned on.
- **port** (*int*) -- The Cassandra cluster port, defaults to None.

**Returns** The information for this Cassandra cluster.

**Return type** `dict`

CLI Example:

```
salt 'minion1' cassandra_cql.info
salt 'minion1' cassandra_cql.info contact_points=minion1
```

`salt.modules.cassandra_cql.keyspace_exists`(*keyspace, contact\_points=None, port=None, cql\_user=None, cql\_pass=None*)

Check if a keyspace exists in a Cassandra cluster.

:param keyspace The keyspace name to check for. :type keyspace: str :param contact\_points: The Cassandra cluster addresses, can either be a string or a list of IPs. :type contact\_points: str | list[str] :param cql\_user: The Cassandra user if authentication is turned on. :type cql\_user: str :param cql\_pass: The Cassandra user password if authentication is turned on. :type cql\_pass: str :param port: The Cassandra cluster port, defaults to None. :type port: int :return: The info for the keyspace or False if it does not exist. :rtype: dict

CLI Example:

```
salt 'minion1' cassandra_cql.keyspace_exists keyspace=system
salt 'minion1' cassandra_cql.list_keyspaces keyspace=system contact_points=minion1
```

`salt.modules.cassandra_cql.list_column_families`(*keyspace=None, contact\_points=None, port=None, cql\_user=None, cql\_pass=None*)

List column families in a Cassandra cluster for all keyspaces or just the provided one.

**Parameters**

- **keyspace** (*str*) -- The keyspace to provide the column families for, optional.
- **contact\_points** (*str* | *list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql\_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql\_pass** (*str*) -- The Cassandra user password if authentication is turned on.
- **port** (*int*) -- The Cassandra cluster port, defaults to None.

**Returns** The column families in this Cassandra cluster.

**Return type** `list[dict]`

CLI Example:

```

salt 'minion1' cassandra_cql.list_column_families

salt 'minion1' cassandra_cql.list_column_families contact_points=minion1

salt 'minion1' cassandra_cql.list_column_families keyspace=system

```

`salt.modules.cassandra_cql.list_keyspaces` (*contact\_points=None*, *port=None*, *cql\_user=None*, *cql\_pass=None*)

List keyspaces in a Cassandra cluster.

#### Parameters

- **contact\_points** (*str* | *list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql\_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql\_pass** (*str*) -- The Cassandra user password if authentication is turned on.
- **port** (*int*) -- The Cassandra cluster port, defaults to None.

**Returns** The keyspaces in this Cassandra cluster.

**Return type** `list[dict]`

CLI Example:

```

salt 'minion1' cassandra_cql.list_keyspaces

salt 'minion1' cassandra_cql.list_keyspaces contact_points=minion1 port=9000

```

`salt.modules.cassandra_cql.list_permissions` (*username=None*, *resource=None*, *resource\_type='keyspace'*, *permission=None*, *contact\_points=None*, *port=None*, *cql\_user=None*, *cql\_pass=None*)

List permissions.

#### Parameters

- **username** (*str*) -- The name of the user to list permissions for.
- **resource** (*str*) -- The resource (keyspace or table), if None, permissions for all resources are listed.
- **resource\_type** (*str*) -- The resource\_type (keyspace or table), defaults to 'keyspace'.
- **permission** (*str*) -- A permission name (e.g. select), if None, all permissions are listed.
- **contact\_points** (*str* | *list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql\_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql\_pass** (*str*) -- The Cassandra user password if authentication is turned on.
- **port** (*int*) -- The Cassandra cluster port, defaults to None.

**Returns** Dictionary of permissions.

**Return type** `dict`

CLI Example:

```

salt 'minion1' cassandra_cql.list_permissions

salt 'minion1' cassandra_cql.list_permissions username=joe resource=test_keyspace
↳permission=select

salt 'minion1' cassandra_cql.list_permissions username=joe resource=test_table
↳resource_type=table permission=select contact_points=minion1

```

`salt.modules.cassandra_cql.list_users`(*contact\_points=None, port=None, cql\_user=None, cql\_pass=None*)

List existing users in this Cassandra cluster.

#### Parameters

- **contact\_points** (*str* | *list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **port** (*int*) -- The Cassandra cluster port, defaults to None.
- **cql\_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql\_pass** (*str*) -- The Cassandra user password if authentication is turned on.

**Returns** The list of existing users.

**Return type** `dict`

CLI Example:

```

salt 'minion1' cassandra_cql.list_users

salt 'minion1' cassandra_cql.list_users contact_points=minion1

```

`salt.modules.cassandra_cql.version`(*contact\_points=None, port=None, cql\_user=None, cql\_pass=None*)

Show the Cassandra version.

#### Parameters

- **contact\_points** (*str* | *list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql\_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql\_pass** (*str*) -- The Cassandra user password if authentication is turned on.
- **port** (*int*) -- The Cassandra cluster port, defaults to None.

**Returns** The version for this Cassandra cluster.

**Return type** `str`

CLI Example:

```

salt 'minion1' cassandra_cql.version

salt 'minion1' cassandra_cql.version contact_points=minion1

```

## 14.7.62 salt.modules.celery module

Support for scheduling celery tasks. The worker is independent of salt and thus can run in a different virtualenv or on a different python version, as long as broker, backend and serializer configurations match. Also note that celery and packages required by the celery broker, e.g. redis must be installed to load the salt celery execution module.

---

**Note:** A new app (and thus new connections) is created for each task execution

---

`salt.modules.celery.run_task(task_name, args=None, kwargs=None, broker=None, backend=None, wait_for_result=False, timeout=None, propagate=True, interval=0.5, no_ack=True, raise_timeout=True, config=None)`

Execute celery tasks. For celery specific parameters see celery documentation.

CLI Example:

```
salt '*' celery.run_task tasks.sleep args=[4] broker=redis://localhost \
backend=redis://localhost wait_for_result=true
```

**task\_name** The task name, e.g. tasks.sleep

**args** Task arguments as a list

**kwargs** Task keyword arguments

**broker** Broker for celeryapp, see celery documentation

**backend** Result backend for celeryapp, see celery documentation

**wait\_for\_result** Wait until task result is read from result backend and return result, Default: False

**timeout** Timeout waiting for result from celery, see celery AsyncResult.get documentation

**propagate** Propagate exceptions from celery task, see celery AsyncResult.get documentation, Default: True

**interval** Interval to check for task result, see celery AsyncResult.get documentation, Default: 0.5

**no\_ack** see celery AsyncResult.get documentation. Default: True

**raise\_timeout** Raise timeout exception if waiting for task result times out. Default: False

**config** Config dict for celery app, See celery documentation

### 14.7.63 salt.modules.ceph module

Module to provide ceph control with salt.

**depends**

- ceph\_cfg Python module

New in version 2016.11.0.

`salt.modules.ceph.ceph_version()`

Get the version of ceph installed

`salt.modules.ceph.cluster_quorum(**kwargs)`

Get the cluster's quorum status

CLI Example:

```
salt '*' ceph.cluster_quorum \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```

Notes: Get the cluster quorum status.

Scope: Cluster wide

Arguments:

**cluster\_uuid** Set the cluster UUID. Defaults to value found in ceph config file.

**cluster\_name** Set the cluster name. Defaults to ``ceph``.

`salt.modules.ceph.cluster_status(**kwargs)`

Get the cluster status

CLI Example:

```
salt '*' ceph.cluster_status \  
    'cluster_name'='ceph' \  
    'cluster_uuid'='cluster_uuid'
```

Notes: Get the cluster status including health if in quorum.

Scope: Cluster wide

Arguments:

**cluster\_uuid** Set the cluster UUID. Defaults to value found in ceph config file.

**cluster\_name** Set the cluster name. Defaults to ``ceph``.

`salt.modules.ceph.keyring_auth_add(**kwargs)`

Add keyring to authorised list

CLI Example:

```
salt '*' ceph.keyring_auth_add \  
    'keyring_type'='admin' \  
    'cluster_name'='ceph' \  
    'cluster_uuid'='cluster_uuid'
```

Notes:

**keyring\_type** Required parameter Can be set to:

admin, mon, osd, rgw, mds

**cluster\_uuid** Set the cluster UUID. Defaults to value found in ceph config file.

**cluster\_name** Set the cluster name. Defaults to ``ceph``.

`salt.modules.ceph.keyring_auth_del(**kwargs)`

Remove keyring from authorised list

CLI Example:

```
salt '*' ceph.keyring_osd_auth_del \  
    'keyring_type'='admin' \  
    'cluster_name'='ceph' \  
    'cluster_uuid'='cluster_uuid'
```

Notes:

**keyring\_type** Required parameter Can be set to:

admin, mon, osd, rgw, mds

**cluster\_uuid** Set the cluster UUID. Defaults to value found in ceph config file.

**cluster\_name** Set the cluster name. Defaults to ``ceph``.

`salt.modules.ceph.keyring_auth_list(**kwargs)`

List all cephx authorization keys

CLI Example:

```
salt '*' ceph.keyring_auth_list \  
    'cluster_name'='ceph' \  
    'cluster_uuid'='cluster_uuid'
```

Notes:

**cluster\_name** Set the cluster name. Defaults to ``ceph``.

**cluster\_uuid** Set the cluster UUID. Defaults to value found in ceph config file.

`salt.modules.ceph.keyring_create(**kwargs)`

Create keyring for cluster

CLI Example:

```
salt '*' ceph.keyring_create \
    'keyring_type'='admin' \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```

Notes:

**keyring\_type** Required parameter Can be set to:

admin, mon, osd, rgw, mds

**cluster\_uuid** Set the cluster UUID. Defaults to value found in ceph config file.

**cluster\_name** Set the cluster name. Defaults to ``ceph``.

`salt.modules.ceph.keyring_present(**kwargs)`

Is keyring on disk

CLI Example:

```
salt '*' ceph.keyring_present \
    'keyring_type'='admin' \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```

Notes:

**keyring\_type** Required parameter Can be set to:

admin, mon, osd, rgw, mds

**cluster\_uuid** Set the cluster UUID. Defaults to value found in ceph config file.

**cluster\_name** Set the cluster name. Defaults to ``ceph``.

`salt.modules.ceph.keyring_purge(**kwargs)`

Delete keyring for cluster

CLI Example:

```
salt '*' ceph.keyring_purge \
    'keyring_type'='admin' \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```

Notes:

**keyring\_type** Required parameter Can be set to:

admin, mon, osd, rgw, mds

**cluster\_uuid** Set the cluster UUID. Defaults to value found in ceph config file.

**cluster\_name** Set the cluster name. Defaults to ``ceph``.

If no ceph config file is found, this command will fail.

`salt.modules.ceph.keyring_save(**kwargs)`

Create save keyring locally

CLI Example:

```
salt '*' ceph.keyring_save \
    'keyring_type'='admin' \
    'cluster_name'='ceph' \
```

```
'cluster_uuid'='cluster_uuid' \  
''
```

Notes:

**keyring\_type** Required parameter Can be set to:

admin, mon, osd, rgw, mds

**cluster\_uuid** Set the cluster UUID. Defaults to value found in ceph config file.

**cluster\_name** Set the cluster name. Defaults to ``ceph".

`salt.modules.ceph.mds_create(**kwargs)`

Create a mds

CLI Example:

```
salt '*' ceph.mds_create \  
  'name' = 'mds.name' \  
  'port' = 1000, \  
  'addr' = 'fqdn.example.org' \  
  'cluster_name'='ceph' \  
  'cluster_uuid'='cluster_uuid'
```

Notes:

**name:** Required parameter Set the rgw client name. Must start with `mds!`

**port:** Required parameter Port for the mds to listen to.

**addr:** Required parameter Address or IP address for the mds to listen to.

**cluster\_uuid** Set the cluster UUID. Defaults to value found in ceph config file.

**cluster\_name** Set the cluster name. Defaults to ``ceph".

`salt.modules.ceph.mds_destroy(**kwargs)`

Remove a mds

CLI Example:

```
salt '*' ceph.mds_destroy \  
  'name' = 'mds.name' \  
  'cluster_name'='ceph' \  
  'cluster_uuid'='cluster_uuid'
```

Notes:

**name:** Required parameter Set the rgw client name. Must start with `mds!`

**cluster\_uuid** Set the cluster UUID. Defaults to value found in ceph config file.

**cluster\_name** Set the cluster name. Defaults to ``ceph".

`salt.modules.ceph.mon_active(**kwargs)`

Is mon daemon running

CLI Example:

```
salt '*' ceph.mon_active \  
  'cluster_name'='ceph' \  
  'cluster_uuid'='cluster_uuid'
```

Notes:

**cluster\_uuid** Set the cluster UUID. Defaults to value found in ceph config file.

**cluster\_name** Set the cluster name. Defaults to ``ceph".

`salt.modules.ceph.mon_create(**kwargs)`

Create a mon node

CLI Example:

```
salt '*' ceph.mon_create \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```

Notes:

**cluster\_uuid** Set the cluster UUID. Defaults to value found in ceph config file.

**cluster\_name** Set the cluster name. Defaults to ``ceph``.

`salt.modules.ceph.mon_is(**kwargs)`

Is this a mon node

CLI Example:

```
salt '*' ceph.mon_is \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```

Notes:

**cluster\_name** Set the cluster name. Defaults to ``ceph``.

**cluster\_uuid** Set the cluster UUID. Defaults to value found in ceph config file.

`salt.modules.ceph.mon_quorum(**kwargs)`

Is mon daemon in quorum

CLI Example:

```
salt '*' ceph.mon_quorum \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```

Notes:

**cluster\_uuid** Set the cluster UUID. Defaults to value found in ceph config file.

**cluster\_name** Set the cluster name. Defaults to ``ceph``.

`salt.modules.ceph.mon_status(**kwargs)`

Get status from mon daemon

CLI Example:

```
salt '*' ceph.mon_status \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```

Notes:

**cluster\_uuid** Set the cluster UUID. Defaults to value found in ceph config file.

**cluster\_name** Set the cluster name. Defaults to ``ceph``.

`salt.modules.ceph.osd_activate(**kwargs)`

Activate an OSD

CLI Example:

```
salt '*' ceph.osd_activate 'osd_dev'='/dev/vdc'
```

`salt.modules.ceph.osd_discover()`

List all OSD by cluster

CLI Example:

```
salt '*' ceph.osd_discover
```

`salt.modules.ceph.osd_prepare(**kwargs)`

prepare an OSD

CLI Example:

```
salt '*' ceph.osd_prepare 'osd_dev'='/dev/vdc' \  
    'journal_dev'='device' \  
    'cluster_name'='ceph' \  
    'cluster_uuid'='cluster_uuid' \  
    'osd_fs_type'='xfs' \  
    'osd_uuid'='2a143b73-6d85-4389-a9e9-b8a78d9e1e07' \  
    'journal_uuid'='4562a5db-ff6f-4268-811d-12fd4a09ae98'
```

Notes:

**cluster\_uuid** Set the device to store the osd data on.

**journal\_dev** Set the journal device. defaults to `osd_dev`.

**cluster\_name** Set the cluster name. Defaults to ```ceph```.

**cluster\_uuid** Set the cluster data will be added too. Defaults to the value found in local config.

**osd\_fs\_type** set the file system to store OSD data with. Defaults to ```xfs```.

**osd\_uuid** set the OSD data UUID. If set will return if OSD with data UUID already exists.

**journal\_uuid** set the OSD journal UUID. If set will return if OSD with journal UUID already exists.

`salt.modules.ceph.partition_is(dev)`

Check whether a given device path is a partition or a full disk.

CLI Example:

```
salt ``*`` ceph.partition_is /dev/sdc1
```

`salt.modules.ceph.partition_list()`

List partitions by disk

CLI Example:

```
salt '*' ceph.partition_list
```

`salt.modules.ceph.partition_list_journal()`

List all OSD journal partitions by partition

CLI Example:

```
salt '*' ceph.partition_list_journal
```

`salt.modules.ceph.partition_list_osd()`

List all OSD data partitions by partition

CLI Example:

```
salt '*' ceph.partition_list_osd
```

`salt.modules.ceph.pool_add(pool_name, **kwargs)`

Create a pool

CLI Example:

```
salt '*' ceph.pool_add pool_name \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```

Notes:

**cluster\_name** Set the cluster name. Defaults to ``ceph``.

**cluster\_uuid** Set the cluster UUID. Defaults to value found in ceph config file.

**pg\_num** Default to 8

**pgp\_num** Default to pg\_num

**pool\_type** can take values ``replicated`` or ``erasure``

**erasure\_code\_profile** Set the ``erasure\_code\_profile``

**crush\_ruleset** Set the crush map rule set

**salt.modules.ceph.pool\_del**(*pool\_name*, *\*\*kwargs*)

Delete a pool

CLI Example:

```
salt '*' ceph.pool_del pool_name \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```

Notes:

**cluster\_name** Set the cluster name. Defaults to ``ceph``.

**cluster\_uuid** Set the cluster UUID. Defaults to value found in ceph config file.

**salt.modules.ceph.pool\_list**(*\*\*kwargs*)

List all pools

CLI Example:

```
salt '*' ceph.pool_list \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```

Notes:

**cluster\_name** Set the cluster name. Defaults to ``ceph``.

**cluster\_uuid** Set the cluster UUID. Defaults to value found in ceph config file.

**salt.modules.ceph.purge**(*\*\*kwargs*)

purge ceph configuration on the node

CLI Example:

```
salt '*' ceph.purge \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```

Notes:

**cluster\_name** Set the cluster name. Defaults to ``ceph``.

**cluster\_uuid** Set the cluster UUID. Defaults to value found in ceph config file.

**salt.modules.ceph.rgw\_create**(*\*\*kwargs*)

Create a rgw

CLI Example:

```
salt '*' ceph.rgw_create \
    'name' = 'rgw.name' \
```

```
'cluster_name'='ceph' \  
'cluster_uuid'='cluster_uuid'
```

Notes:

**name:** Required parameter Set the rgw client name. Must start with `rgw`.

**cluster\_uuid** Set the cluster UUID. Defaults to value found in ceph config file.

**cluster\_name** Set the cluster name. Defaults to ``ceph`.

`salt.modules.ceph.rgw_destroy(**kwargs)`

Remove a rgw

CLI Example:

```
salt '*' ceph.rgw_destroy \  
  'name' = 'rgw.name' \  
  'cluster_name'='ceph' \  
  'cluster_uuid'='cluster_uuid'
```

Notes:

**name:** Required parameter Set the rgw client name. Must start with `rgw`.

**cluster\_uuid** Set the cluster UUID. Defaults to value found in ceph config file.

**cluster\_name** Set the cluster name. Defaults to ``ceph`.

`salt.modules.ceph.rgw_pools_create(**kwargs)`

Create pools for rgw

CLI Example:

```
salt '*' ceph.rgw_pools_create
```

Notes:

**cluster\_uuid** Set the cluster UUID. Defaults to value found in ceph config file.

**cluster\_name** Set the cluster name. Defaults to ``ceph`.

`salt.modules.ceph.rgw_pools_missing(**kwargs)`

Show pools missing for rgw

CLI Example:

```
salt '*' ceph.rgw_pools_missing
```

Notes:

**cluster\_uuid** Set the cluster UUID. Defaults to value found in ceph config file.

**cluster\_name** Set the cluster name. Defaults to ``ceph`.

`salt.modules.ceph.zap(target=None, **kwargs)`

Destroy the partition table and content of a given disk.

```
salt '*' ceph.osd_prepare 'dev'='/dev/vdc' \  
  'cluster_name'='ceph' \  
  'cluster_uuid'='cluster_uuid'
```

Notes:

**dev** The block device to format.

**cluster\_name** Set the cluster name. Defaults to ``ceph`.

**cluster\_uuid** Set the cluster date will be added too. Defaults to the value found in local config.

### 14.7.64 salt.modules.chassis

Glue execution module to link to the *fx2 proxymodule*.

Depends: *iDRAC Remote execution module (salt.modules.dracr)*

For documentation on commands that you can direct to a Dell chassis via proxy, look in the documentation for *salt.modules.dracr*.

This execution module calls through to a function in the fx2 proxy module called `chconfig`. That function looks up the function passed in the `cmd` parameter in *salt.modules.dracr* and calls it.

New in version 2015.8.2.

### 14.7.65 salt.modules.chef

Execute chef in server or solo mode

`salt.modules.chef.client` (*whyrun=False, localmode=False, logfile=None, \*\*kwargs*)  
Execute a chef client run and return a dict with the stderr, stdout, return code, and pid.

CLI Example:

```
salt '*' chef.client server=https://localhost
```

**server** The chef server URL

**client\_key** Set the client key file location

**config** The configuration file to use

**config-file-jail** Directory under which config files are allowed to be loaded (no client.rb or knife.rb outside this path will be loaded).

**environment** Set the Chef Environment on the node

**group** Group to set privilege to

**json-attributes** Load attributes from a JSON file or URL

**localmode** Point chef-client at local repository if True

**log\_level** Set the log level (debug, info, warn, error, fatal)

**logfile** Set the log file location

**node-name** The node name for this client

**override-runlist** Replace current run list with specified items for a single run

**pid** Set the PID file location, defaults to /tmp/chef-client.pid

**run-lock-timeout** Set maximum duration to wait for another client run to finish, default is indefinitely.

**runlist** Permanently replace current run list with specified items

**user** User to set privilege to

**validation\_key** Set the validation key file location, used for registering new clients

**whyrun** Enable whyrun mode when set to True

`salt.modules.chef.solo` (*whyrun=False, logfile=None, \*\*kwargs*)  
Execute a chef solo run and return a dict with the stderr, stdout, return code, and pid.

CLI Example:

```
salt '*' chef.solo override-runlist=test
```

**config** The configuration file to use

**environment** Set the Chef Environment on the node

**group** Group to set privilege to

**json-attributes** Load attributes from a JSON file or URL

**log\_level** Set the log level (debug, info, warn, error, fatal)

**logfile** Set the log file location

**node-name** The node name for this client  
**override-runlist** Replace current run list with specified items for a single run  
**recipe-url** Pull down a remote gzipped tarball of recipes and untar it to the cookbook cache  
**run-lock-timeout** Set maximum duration to wait for another client run to finish, default is indefinitely.  
**user** User to set privilege to  
**whyrun** Enable whyrun mode when set to True

## 14.7.66 salt.modules.chocolatey

A dead simple module wrapping calls to the Chocolatey package manager (<http://chocolatey.org>)

New in version 2014.1.0.

**salt.modules.chocolatey.add\_source**(*name, source\_location, username=None, password=None*)

Instructs Chocolatey to add a source.

**name** The name of the source to be added as a chocolatey repository.

**source** Location of the source you want to work with.

**username** Provide username for chocolatey sources that need authentication credentials.

**password** Provide password for chocolatey sources that need authentication credentials.

CLI Example:

```
salt '*' chocolatey.add_source <source name> <source_location>
salt '*' chocolatey.add_source <source name> <source_location> user=<user>
↳password=<password>
```

**salt.modules.chocolatey.bootstrap**(*force=False*)

Download and install the latest version of the Chocolatey package manager via the official bootstrap.

Chocolatey requires Windows PowerShell and the .NET v4.0 runtime. Depending on the host's version of Windows, chocolatey.bootstrap will attempt to ensure these prerequisites are met by downloading and executing the appropriate installers from Microsoft.

Note that if PowerShell is installed, you may have to restart the host machine for Chocolatey to work.

**force** Run the bootstrap process even if Chocolatey is found in the path.

CLI Example:

```
salt '*' chocolatey.bootstrap
salt '*' chocolatey.bootstrap force=True
```

**salt.modules.chocolatey.chocolatey\_version**()

Returns the version of Chocolatey installed on the minion.

CLI Example:

```
salt '*' chocolatey.chocolatey_version
```

**salt.modules.chocolatey.disable\_source**(*name*)

Instructs Chocolatey to disable a source.

**name** Name of the source repository to disable.

CLI Example:

```
salt '*' chocolatey.disable_source <name>
```

**salt.modules.chocolatey.enable\_source**(*name*)

Instructs Chocolatey to enable a source.

**name** Name of the source repository to enable.

CLI Example:

```
salt '*' chocolatey.enable_source <name>
```

```
salt.modules.chocolatey.install(name, version=None, source=None, force=False,
                                pre_versions=False, install_args=None, override_args=False,
                                force_x86=False, package_args=None, allow_multiple=False)
```

Instructs Chocolatey to install a package.

#### Parameters

- **name** (*str*) -- The name of the package to be installed. Only accepts a single argument. Required.
- **version** (*str*) -- Install a specific version of the package. Defaults to latest version. Default is None.
- **source** (*str*) -- Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed. Default is None.

Alternate Sources:

- cygwin
- python
- ruby
- webpi
- windowsfeatures

- **force** (*bool*) -- Reinstall the current version of an existing package. Do not use with `allow_multiple`. Default is False.
- **pre\_versions** (*bool*) -- Include pre-release packages. Default is False.
- **install\_args** (*str*) -- A list of install arguments you want to pass to the installation process i.e product key or feature list. Default is None.
- **override\_args** (*bool*) -- Set to true if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False `install_args` will be appended to the end of the default arguments. Default is None.
- **force\_x86** (*bool*) -- Force x86 (32bit) installation on 64 bit systems. Default is False.
- **package\_args** (*str*) -- Arguments you want to pass to the package. Default is None.
- **allow\_multiple** (*bool*) -- Allow multiple versions of the package to be installed. Do not use with `force`. Does not work with all packages. Default is False.

New in version 2017.7.0.

**Returns** The output of the `chocolatey` command

**Return type** *str*

CLI Example:

```
salt '*' chocolatey.install <package name>
salt '*' chocolatey.install <package name> version=<package version>
salt '*' chocolatey.install <package name> install_args=<args> override_args=True
```

```
salt.modules.chocolatey.install_cygwin(name, install_args=None, override_args=False)
```

Instructs Chocolatey to install a package via Cygwin.

**name** The name of the package to be installed. Only accepts a single argument.  
**install\_args** A list of install arguments you want to pass to the installation process i.e product key or feature list  
**override\_args** Set to true if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install\_args will be appended to the end of the default arguments

CLI Example:

```
salt '*' chocolatey.install_cygwin <package name>
salt '*' chocolatey.install_cygwin <package name> install_args=<args> override_
↳args=True
```

`salt.modules.chocolatey.install_gem`(*name*, *version=None*, *install\_args=None*, *override\_args=False*)

Instructs Chocolatey to install a package via Ruby's Gems.

**name** The name of the package to be installed. Only accepts a single argument.  
**version** Install a specific version of the package. Defaults to latest version available.  
**install\_args** A list of install arguments you want to pass to the installation process i.e product key or feature list  
**override\_args** Set to true if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install\_args will be appended to the end of the default arguments

CLI Example:

```
salt '*' chocolatey.install_gem <package name>
salt '*' chocolatey.install_gem <package name> version=<package version>
salt '*' chocolatey.install_gem <package name> install_args=<args> override_
↳args=True
```

`salt.modules.chocolatey.install_missing`(*name*, *version=None*, *source=None*)

Instructs Chocolatey to install a package if it doesn't already exist.

Changed in version 2014.7.0: If the minion has Chocolatey >= 0.9.8.24 installed, this function calls `chocolatey.install` instead, as `installmissing` is deprecated as of that version and will be removed in Chocolatey 1.0.

**name** The name of the package to be installed. Only accepts a single argument.  
**version** Install a specific version of the package. Defaults to latest version available.  
**source** Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed.

CLI Example:

```
salt '*' chocolatey.install_missing <package name>
salt '*' chocolatey.install_missing <package name> version=<package version>
```

`salt.modules.chocolatey.install_python`(*name*, *version=None*, *install\_args=None*, *override\_args=False*)

Instructs Chocolatey to install a package via Python's `easy_install`.

**name** The name of the package to be installed. Only accepts a single argument.  
**version** Install a specific version of the package. Defaults to latest version available.  
**install\_args** A list of install arguments you want to pass to the installation process i.e product key or feature list  
**override\_args** Set to true if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install\_args will be appended to the end of the default arguments

CLI Example:

```

salt '*' chocolatey.install_python <package name>
salt '*' chocolatey.install_python <package name> version=<package version>
salt '*' chocolatey.install_python <package name> install_args=<args> override_
↳args=True

```

`salt.modules.chocolatey.install_webpi` (*name*, *install\_args=None*, *override\_args=False*)

Instructs Chocolatey to install a package via the Microsoft Web PI service.

**name** The name of the package to be installed. Only accepts a single argument.

**install\_args** A list of install arguments you want to pass to the installation process i.e product key or feature list

**override\_args** Set to true if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False `install_args` will be appended to the end of the default arguments

CLI Example:

```

salt '*' chocolatey.install_webpi <package name>
salt '*' chocolatey.install_webpi <package name> install_args=<args> override_
↳args=True

```

`salt.modules.chocolatey.install_windowsfeatures` (*name*)

Instructs Chocolatey to install a Windows Feature via the Deployment Image Servicing and Management tool.

**name** The name of the feature to be installed. Only accepts a single argument.

CLI Example:

```

salt '*' chocolatey.install_windowsfeatures <package name>

```

`salt.modules.chocolatey.list` (*narrow=None*, *all\_versions=False*, *pre\_versions=False*, *source=None*, *local\_only=False*, *exact=False*)

Instructs Chocolatey to pull a vague package list from the repository.

#### Parameters

- **narrow** (*str*) -- Term used to narrow down results. Searches against name/description/tag. Default is None.
- **all\_versions** (*bool*) -- Display all available package versions in results. Default is False.
- **pre\_versions** (*bool*) -- Display pre-release packages in results. Default is False.
- **source** (*str*) -- Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed if None is passed. Default is None.
- **local\_only** (*bool*) -- Display packages only installed locally. Default is False.
- **exact** (*bool*) -- Display only packages that match `narrow` exactly. Default is False.

New in version 2017.7.0.

**Returns** A dictionary of results.

**Return type** `dict`

CLI Example:

```

salt '*' chocolatey.list <narrow>
salt '*' chocolatey.list <narrow> all_versions=True

```

`salt.modules.chocolatey.list_webpi` ()

Instructs Chocolatey to pull a full package list from the Microsoft Web PI repository.

**Returns** List of webpi packages

**Return type** `str`

CLI Example:

```
salt '*' chocolatey.list_webpi
```

`salt.modules.chocolatey.list_windowsfeatures()`

Instructs Chocolatey to pull a full package list from the Windows Features list, via the Deployment Image Servicing and Management tool.

**Returns** List of Windows Features

**Return type** `str`

CLI Example:

```
salt '*' chocolatey.list_windowsfeatures
```

`salt.modules.chocolatey.uninstall(name, version=None, uninstall_args=None, override_args=False)`

Instructs Chocolatey to uninstall a package.

**name** The name of the package to be uninstalled. Only accepts a single argument.

**version** Uninstalls a specific version of the package. Defaults to latest version installed.

**uninstall\_args** A list of uninstall arguments you want to pass to the uninstallation process i.e product key or feature list

**override\_args** Set to true if you want to override the original uninstall arguments (for the native uninstaller) in the package and use your own. When this is set to False `uninstall_args` will be appended to the end of the default arguments

CLI Example:

```
salt '*' chocolatey.uninstall <package name>
salt '*' chocolatey.uninstall <package name> version=<package version>
salt '*' chocolatey.uninstall <package name> version=<package version> uninstall_
↳args=<args> override_args=True
```

`salt.modules.chocolatey.update(name, source=None, pre_versions=False)`

Instructs Chocolatey to update packages on the system.

**name** The name of the package to update, or ``all`` to update everything installed on the system.

**source** Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed.

**pre\_versions** Include pre-release packages in comparison. Defaults to False.

CLI Example:

```
salt "*" chocolatey.update all
salt "*" chocolatey.update <package name> pre_versions=True
```

`salt.modules.chocolatey.upgrade(name, version=None, source=None, force=False, pre_versions=False, install_args=None, override_args=False, force_x86=False, package_args=None)`

New in version 2016.3.4.

Instructs Chocolatey to upgrade packages on the system. (update is being deprecated)

**Parameters**

- **name** (`str`) -- The name of the package to update, or ``all`` to update everything installed on the system.
- **version** (`str`) -- Install a specific version of the package. Defaults to latest version.

- **source** (*str*) -- Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed.
- **force** (*bool*) -- Reinstall the **same** version already installed
- **pre\_versions** (*bool*) -- Include pre-release packages in comparison. Defaults to False.
- **install\_args** (*str*) -- A list of install arguments you want to pass to the installation process i.e product key or feature list
- **override\_args** (*str*) -- Set to true if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install\_args will be appended to the end of the default arguments
- **force\_x86** -- Force x86 (32bit) installation on 64 bit systems. Defaults to false.
- **package\_args** -- A list of arguments you want to pass to the package

**Returns** Results of the chocolatey command

**Return type** *str*

CLI Example:

```
salt "*" chocolatey.upgrade all
salt "*" chocolatey.upgrade <package name> pre_versions=True
```

`salt.modules.chocolatey.version`(*name*, *check\_remote=False*, *source=None*, *pre\_versions=False*)

Instructs Chocolatey to check an installed package version, and optionally compare it to one available from a remote feed.

**Parameters**

- **name** (*str*) -- The name of the package to check. Required.
- **check\_remote** (*bool*) -- Get the version number of the latest package from the remote feed. Default is False.
- **source** (*str*) -- Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed. Default is None.
- **pre\_versions** (*bool*) -- Include pre-release packages in comparison. Default is False.

**Returns** A dictionary of currently installed software and versions

**Return type** *dict*

CLI Example:

```
salt "*" chocolatey.version <package name>
salt "*" chocolatey.version <package name> check_remote=True
```

### 14.7.67 salt.modules.chronos module

Module providing a simple management interface to a chronos cluster.

Currently this only works when run through a proxy minion.

New in version 2015.8.2.

`salt.modules.chronos.has_job`(*name*)

Return whether the given job is currently configured.

CLI Example:

```
salt chronos-minion-id chronos.has_job my-job
```

`salt.modules.chronos.job(name)`

Return the current server configuration for the specified job.

CLI Example:

```
salt chronos-minion-id chronos.job my-job
```

`salt.modules.chronos.jobs()`

Return a list of the currently installed job names.

CLI Example:

```
salt chronos-minion-id chronos.jobs
```

`salt.modules.chronos.rm_job(name)`

Remove the specified job from the server.

CLI Example:

```
salt chronos-minion-id chronos.rm_job my-job
```

`salt.modules.chronos.update_job(name, config)`

Update the specified job with the given configuration.

CLI Example:

```
salt chronos-minion-id chronos.update_job my-job '<config yaml>'
```

## 14.7.68 salt.modules.cisconso

Execution module for Cisco Network Services Orchestrator Proxy minions

For documentation on setting up the cisconso proxy minion look in the documentation for [salt.proxy.cisconso](#).

`salt.modules.cisconso.apply_rollback(datastore, name)`

Apply a system rollback

Parameters

- **datastore** (DatastoreType (str enum).) -- The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **name** (str) -- an ID of the rollback to restore

```
salt cisco-nso cisconso.apply_rollback 52
```

`salt.modules.cisconso.get_data(datastore, path)`

Get the configuration of the device tree at the given path

Parameters

- **datastore** (DatastoreType (str enum).) -- The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **path** (list, str OR tuple) -- The device path to set the value at, a list of element names in order, / separated

**Returns** The network configuration at that tree

**Return type** dict

```
salt cisco-nso cisco.get_data running 'devices/ex0'
```

**salt.modules.cisco.get\_rollback**(*name*)

Get the backup of stored a configuration rollback

**Parameters** **name** (str) -- Typically an ID of the backup

**Return type** str

**Returns** the contents of the rollback snapshot

```
salt cisco-nso cisco.get_rollback 52
```

**salt.modules.cisco.get\_rollbacks**()

Get a list of stored configuration rollbacks

```
salt cisco-nso cisco.get_rollbacks
```

**salt.modules.cisco.info**()

Return system information for grains of the NSO proxy minion

```
salt '*' cisco.info
```

**salt.modules.cisco.set\_data\_value**(*datastore*, *path*, *data*)

Get a data entry in a datastore

**Parameters**

- **datastore** (DatastoreType (str enum).) -- The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **path** (list, str OR tuple) -- The device path to set the value at, a list of element names in order, / separated
- **data** (dict) -- The new value at the given path

**Return type** bool

**Returns** True if successful, otherwise error.

```
salt cisco-nso cisco.set_data_value running 'devices/ex0/routes' 10.0.0.20/24
```

## 14.7.69 salt.modules.cloud

Salt-specific interface for calling Salt Cloud directly

**salt.modules.cloud.action**(*fun=None*, *cloudmap=None*, *names=None*, *provider=None*, *instance=None*, *\*\*kwargs*)

Execute a single action on the given provider/instance

CLI Example:

```
salt minionname cloud.action start instance=myinstance
salt minionname cloud.action stop instance=myinstance
salt minionname cloud.action show_image provider=my-ec2-config image=ami-1624987f
```

**salt.modules.cloud.create**(*provider, names, opts=None, \*\*kwargs*)  
Create an instance using Salt Cloud

CLI Example:

```
salt minionname cloud.create my-ec2-config myinstance image=ami-1624987f size='t1.
↳micro' ssh_username=ec2-user securitygroup=default delvol_on_destroy=True
```

**salt.modules.cloud.destroy**(*names*)  
Destroy the named VM(s)

CLI Example:

```
salt minionname cloud.destroy myinstance
```

**salt.modules.cloud.full\_query**(*query\_type='list\_nodes\_full'*)  
List all available cloud provider data

CLI Example:

```
salt minionname cloud.full_query
```

**salt.modules.cloud.get\_instance**(*name, provider=None*)  
Return details on an instance.

Similar to the cloud action show\_instance but returns only the instance details.

CLI Example:

```
salt minionname cloud.get_instance myinstance
```

SLS Example:

```
{{ salt['cloud.get_instance']('myinstance')['mac_address'] }}
```

**salt.modules.cloud.has\_instance**(*name, provider=None*)  
Return true if the instance is found on a provider

CLI Example:

```
salt minionname cloud.has_instance myinstance
```

**salt.modules.cloud.list\_images**(*provider='all'*)  
List cloud provider images for the given providers

CLI Example:

```
salt minionname cloud.list_images my-gce-config
```

**salt.modules.cloud.list\_locations**(*provider='all'*)  
List cloud provider locations for the given providers

CLI Example:

```
salt minionname cloud.list_locations my-gce-config
```

**salt.modules.cloud.list\_sizes**(*provider='all'*)  
List cloud provider sizes for the given providers

CLI Example:

```
salt minionname cloud.list_sizes my-gce-config
```

`salt.modules.cloud.map_run`(*path=None, \*\*kwargs*)

Execute a salt cloud map file

CLI Examples:

```
salt minionname cloud.map_run /path/to/cloud.map
salt minionname cloud.map_run map_data='<actual map data>'
```

`salt.modules.cloud.network_create`(*provider, names, \*\*kwargs*)

Create private network

CLI Example:

```
salt minionname cloud.network_create my-nova names=['salt'] cidr='192.168.100.0/24
↪'
```

`salt.modules.cloud.network_list`(*provider*)

List private networks

CLI Example:

```
salt minionname cloud.network_list my-nova
```

`salt.modules.cloud.profile`(*profile, names, vm\_overrides=None, opts=None, \*\*kwargs*)

Spin up an instance using Salt Cloud

CLI Example:

```
salt minionname cloud.profile my-gce-config myinstance
```

`salt.modules.cloud.query`(*query\_type='list\_nodes'*)

List cloud provider data for all providers

CLI Examples:

```
salt minionname cloud.query
salt minionname cloud.query list_nodes_full
salt minionname cloud.query list_nodes_select
```

`salt.modules.cloud.select_query`(*query\_type='list\_nodes\_select'*)

List selected nodes

CLI Example:

```
salt minionname cloud.select_query
```

`salt.modules.cloud.virtual_interface_create`(*provider, names, \*\*kwargs*)

Attach private interfaces to a server

CLI Example:

```
salt minionname cloud.virtual_interface_create my-nova names=['salt-master'] net_
↪name='salt'
```

`salt.modules.cloud.virtual_interface_list`(*provider, names, \*\*kwargs*)

List virtual interfaces on a server

CLI Example:

```
salt minionname cloud.virtual_interface_list my-nova names=['salt-master']
```

`salt.modules.cloud.volume_attach(provider, names, **kwargs)`

Attach volume to a server

CLI Example:

```
salt minionname cloud.volume_attach my-nova myblock server_name=myserver device='/dev/xvdf'
```

`salt.modules.cloud.volume_create(provider, names, **kwargs)`

Create volume

CLI Example:

```
salt minionname cloud.volume_create my-nova myblock size=100 voltype=SSD
```

`salt.modules.cloud.volume_delete(provider, names, **kwargs)`

Delete volume

CLI Example:

```
salt minionname cloud.volume_delete my-nova myblock
```

`salt.modules.cloud.volume_detach(provider, names, **kwargs)`

Detach volume from a server

CLI Example:

```
salt minionname cloud.volume_detach my-nova myblock server_name=myserver
```

`salt.modules.cloud.volume_list(provider)`

List block storage volumes

CLI Example:

```
salt minionname cloud.volume_list my-nova
```

### 14.7.70 salt.modules.cmdmod

A module for shelling out.

Keep in mind that this module is insecure, in that it can give whomever has access to the master root execution access to all salt minions.

`salt.modules.cmdmod.exec_code(lang, code, cwd=None)`

Pass in two strings, the first naming the executable language, aka - python2, python3, ruby, perl, lua, etc. the second string containing the code you wish to execute. The stdout will be returned.

CLI Example:

```
salt '*' cmd.exec_code ruby 'puts "cheese"'
```

`salt.modules.cmdmod.exec_code_all(lang, code, cwd=None)`

Pass in two strings, the first naming the executable language, aka - python2, python3, ruby, perl, lua, etc. the second string containing the code you wish to execute. All cmd artifacts (stdout, stderr, retcode, pid) will be returned.

CLI Example:

```
salt '*' cmd.exec_code_all ruby 'puts "cheese"'
```

`salt.modules.cmdmod.has_exec(cmd)`

Returns true if the executable is available on the minion, false otherwise

CLI Example:

```
salt '*' cmd.has_exec cat
```

`salt.modules.cmdmod.powershell(cmd, cwd=None, stdin=None, runas=None, shell='/bin/sh', env=None, clean_env=False, template=None, rstrip=True, umask=None, output_loglevel='debug', quiet=False, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv='base', use_vt=False, password=None, depth=None, encode_cmd=False, **kwargs)`

Execute the passed PowerShell command and return the output as a dictionary.

Other `cmd.*` functions return the raw text output of the command. This function appends `| ConvertTo-JSON` to the command and then parses the JSON into a Python dictionary. If you want the raw textual result of your PowerShell command you should use `cmd.run` with the `shell=powershell` option.

For example:

```
salt '*' cmd.run '$PSVersionTable.CLRVersion' shell=powershell
salt '*' cmd.run 'Get-NetTCPConnection' shell=powershell
```

New in version 2016.3.0.

**Warning:** This passes the `cmd` argument directly to PowerShell without any further processing! Be absolutely sure that you have properly sanitized the command passed to this function and do not use untrusted inputs.

Note that `env` represents the environment variables for the command, and should be formatted as a dict, or a YAML string which resolves to a dict.

In addition to the normal `cmd.run` parameters, this command offers the `depth` parameter to change the Windows default depth for the `ConvertTo-JSON` powershell command. The Windows default is 2. If you need more depth, set that here.

**Note:** For some commands, setting the depth to a value greater than 4 greatly increases the time it takes for the command to return and in many cases returns useless data.

#### Parameters

- **cmd** (*str*) -- The powershell command to run.
- **cwd** (*str*) -- The current working directory to execute the command in. Defaults to the home directory of the user specified by `runas`.
- **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.:
- **runas** (*str*) -- User to run command as. If running on a Windows minion you must also pass a password. The target user account must be in the Administrators group.

- **password** (*str*) -- Windows only. Required when specifying runas. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.0.

- **shell** (*str*) -- Shell to execute under. Defaults to the system default shell.
- **python\_shell** (*bool*) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection
- **env** (*list*) -- A list of environment variables to be set prior to execution.

Example:

```
salt://scripts/foo.sh:
  cmd.script:
    - env:
      - BATCH: 'yes'
```

**Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean True and False values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So \$PATH in the following example is a literal ` \$PATH`:

```
salt://scripts/bar.sh:
  cmd.script:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing \$PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

- **clean\_env** (*bool*) -- Attempt to clean out all other shell environment variables and set only those provided in the `env` argument to this function.
- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported
- **rstrip** (*bool*) -- Strip all whitespace off the end of output before it is returned.
- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **output\_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless quiet is used for this value.
- **timeout** (*int*) -- A timeout in seconds for the executed process to return.

- **use\_vt** (*bool*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.
  - **reset\_system\_locale** (*bool*) -- Resets the system locale
  - **ignore\_retcode** (*bool*) -- Ignore the return code
  - **saltenv** (*str*) -- The salt environment to use. Default is `base`
  - **depth** (*int*) -- The number of levels of contained objects to be included. Default is 2. Values greater than 4 seem to greatly increase the time it takes for the command to complete for some commands. eg: `dir`
- New in version 2016.3.4.
- **encode\_cmd** (*bool*) -- Encode the command before executing. Use in cases where characters may be dropped or incorrectly converted when executed. Default is False.

#### Returns

**dict** A dictionary of data returned by the powershell command.

CLI Example:

```
salt '*' cmd.powershell "$PSVersionTable.CLRVersion"
```

```
salt.modules.cmdmod.retcode(cmd, cwd=None, stdin=None, runas=None, shell='/bin/sh',
python_shell=None, env=None, clean_env=False, template=None,
umask=None, output_loglevel='debug', log_callback=None, time-
out=None, reset_system_locale=True, ignore_retcode=False,
saltenv='base', use_vt=False, password=None, **kwargs)
```

Execute a shell command and return the command's return code.

#### Parameters

- **cmd** (*str*) -- The command to run. ex: ``ls -lart /home``
  - **cwd** (*str*) -- The current working directory to execute the command in. Defaults to the home directory of the user specified by `runas`.
  - **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.:
  - **runas** (*str*) -- User to run command as. If running on a Windows minion you must also pass a password. The target user account must be in the Administrators group.
  - **password** (*str*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.
- New in version 2016.3.0.
- **shell** (*str*) -- Shell to execute under. Defaults to the system default shell.
  - **python\_shell** (*bool*) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection
  - **env** (*list*) -- A list of environment variables to be set prior to execution.

Example:

```
salt://scripts/foo.sh:
cmd.script:
- env:
- BATCH: 'yes'
```

**Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So `$PATH` in the following example is a literal ``$PATH'`:

```
salt://scripts/bar.sh:
  cmd.script:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing `$PATH` by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/
↳usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':
↳') }}
```

- **clean\_env** (*bool*) -- Attempt to clean out all other shell environment variables and set only those provided in the ``env'` argument to this function.
- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently `jinja`, `mako`, and `wempy` are supported
- **rstrip** (*bool*) -- Strip all whitespace off the end of output before it is returned.
- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **output\_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: `DEBUG`) regardless, unless `quiet` is used for this value.
- **timeout** (*int*) -- A timeout in seconds for the executed process to return.
- **use\_vt** (*bool*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

---

**Note:** `env` represents the environment variables for the command, and should be formatted as a dict, or a YAML string which resolves to a dict.

---

**Return type** `int`

**Return type** `None`

**Returns** Return Code as an `int` or `None` if there was an exception.

CLI Example:

```
salt '*' cmd.retcode "file /bin/bash"
```

The `template` arg can be set to ``jinja'` or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.retcode template=jinja "file {{grains.pythonpath[0]}}/python"
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input:

```
salt '*' cmd.retcode "grep f" stdin='one\ntwo\nthree\nfour\nfive\n'
```

```
salt.modules.cmdmod.run(cmd, cwd=None, stdin=None, runas=None, shell='/bin/sh',
python_shell=None, env=None, clean_env=False, template=None,
rstrip=True, umask=None, output_loglevel='debug', log_callback=None,
timeout=None, reset_system_locale=True, ignore_retcode=False,
saltenv='base', use_vt=False, bg=False, password=None, encoded_cmd=False,
**kwargs)
```

Execute the passed command and return the output as a string

Note that `env` represents the environment variables for the command, and should be formatted as a dict, or a YAML string which resolves to a dict.

#### Parameters

- **cmd** (*str*) -- The command to run. ex: `ls -lart /home`
- **cwd** (*str*) -- The current working directory to execute the command in. Defaults to the home directory of the user specified by `runas`.
- **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas** (*str*) -- User to run command as. If running on a Windows minion you must also pass a password. The target user account must be in the Administrators group.
- **password** (*str*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.0.

- **shell** (*str*) -- Shell to execute under. Defaults to the system default shell.
- **python\_shell** (*bool*) -- If `False`, let python handle the positional arguments. Set to `True` to use shell features, such as pipes or redirection.
- **bg** (*bool*) -- If `True`, run command in background and do not await or deliver it's results

New in version 2016.3.0.

- **env** (*list*) -- A list of environment variables to be set prior to execution.

Example:

```
salt://scripts/foo.sh:
cmd.script:
- env:
  - BATCH: 'yes'
```

**Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So \$PATH in the following example is a literal `PATH`:

```
salt://scripts/bar.sh:
  cmd.script:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing \$PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/
↳usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':
↳') }}
```

- **clean\_env** (*bool*) -- Attempt to clean out all other shell environment variables and set only those provided in the `env` argument to this function.
- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported
- **rstrip** (*bool*) -- Strip all whitespace off the end of output before it is returned.
- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **output\_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless quiet is used for this value.
- **timeout** (*int*) -- A timeout in seconds for the executed process to return.
- **use\_vt** (*bool*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.
- **encoded\_cmd** (*bool*) -- Specify if the supplied command is encoded. Only applies to shell `powershell`.

**Warning:** This function does not process commands through a shell unless the `python_shell` flag is set to True. This means that any shell-specific functionality such as `echo` or the use of pipes, redirection or `&&`, should either be migrated to `cmd.shell` or have the `python_shell=True` flag set here.

The use of `python_shell=True` means that the shell will accept `_any_` input including potentially malicious commands such as ``good_command;rm -rf /``. Be absolutely certain that you have sanitized your input prior to using `python_shell=True`

CLI Example:

```
salt '*' cmd.run "ls -l | awk '/foo/{print \\$2}'"
```

The `template` arg can be set to `jinja` or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.run template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/{print \\$2}'
↳"
```

Specify an alternate shell with the shell parameter:

```
salt '*' cmd.run "Get-ChildItem C:\\ \" shell='powershell'
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.:

```
salt '*' cmd.run "grep f" stdin='one\\ntwo\\nthree\\nfour\\nfive\\n'
```

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt '*' cmd.run cmd='sed -e s/=/:/g'
```

```
salt.modules.cmdmod.run_all(cmd, cwd=None, stdin=None, runas=None, shell='/bin/sh',
python_shell=None, env=None, clean_env=False, template=None, rstrip=True, umask=None, output_loglevel='debug',
log_callback=None, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv='base', use_vt=False, redirect_stderr=False, password=None, **kwargs)
```

Execute the passed command and return a dict of return data

#### Parameters

- **cmd** (*str*) -- The command to run. ex: `'ls -lart /home'`
- **cwd** (*str*) -- The current working directory to execute the command in. Defaults to the home directory of the user specified by `runas`.
- **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.:
- **runas** (*str*) -- User to run command as. If running on a Windows minion you must also pass a password. The target user account must be in the Administrators group.
- **password** (*str*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.  
New in version 2016.3.0.
- **shell** (*str*) -- Shell to execute under. Defaults to the system default shell.
- **python\_shell** (*bool*) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection
- **env** (*list*) -- A list of environment variables to be set prior to execution.

Example:

```
salt://scripts/foo.sh:
  cmd.script:
    - env:
      - BATCH: 'yes'
```

**Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So \$PATH in the following example is a literal ` \$PATH`:

```
salt://scripts/bar.sh:
  cmd.script:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing \$PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/
↳usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':
↳') }}
```

- **clean\_env** (*bool*) -- Attempt to clean out all other shell environment variables and set only those provided in the `env` argument to this function.
- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported
- **rstrip** (*bool*) -- Strip all whitespace off the end of output before it is returned.
- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **output\_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless quiet is used for this value.
- **timeout** (*int*) -- A timeout in seconds for the executed process to return.
- **use\_vt** (*bool*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

---

**Note:** env represents the environment variables for the command, and should be formatted as a dict, or a YAML string which resolves to a dict.

---

#### Parameters

- **redirect\_stderr** (*bool*) -- If set to True, then stderr will be redirected to stdout. This is helpful for cases where obtaining both the retcode and output is desired, but it is not desired to have the output separated into both stdout and stderr.

New in version 2015.8.2.

- **password** (*str*) -- Windows only. Required when specifying runas. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.0.

- **bg** (*bool*) -- If True, run command in background and do not await or deliver it's results

New in version 2016.3.6.

CLI Example:

```
salt '*' cmd.run_all "ls -l | awk '/foo/{print \$2}'"
```

The template arg can be set to 'jinja' or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.run_all template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/{print \
↪$2}'"
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.:

```
salt '*' cmd.run_all "grep f" stdin='one\ntwo\nthree\nfour\nfive\n'
```

```
salt.modules.cmdmod.run_bg(cmd, cwd=None, runas=None, shell='/bin/sh', python_shell=None,
                             env=None, clean_env=False, template=None, umask=None,
                             timeout=None, output_loglevel='debug', log_callback=None, re-
                             set_system_locale=True, ignore_retcode=False, saltenv='base', pass-
                             word=None, **kwargs)
```

Execute the passed command in the background and return it's PID

Note that `env` represents the environment variables for the command, and should be formatted as a dict, or a YAML string which resolves to a dict.

#### Parameters

- **cmd** (*str*) -- The command to run. ex: 'ls -lart /home'
- **cwd** (*str*) -- The current working directory to execute the command in. Defaults to the home directory of the user specified by `runas`.
- **output\_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless `quiet` is used for this value.
- **runas** (*str*) -- User to run command as. If running on a Windows minion you must also pass a password. The target user account must be in the Administrators group.
- **password** (*str*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.  
New in version 2016.3.0.
- **shell** (*str*) -- Shell to execute under. Defaults to the system default shell.
- **python\_shell** (*bool*) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection
- **env** (*list*) -- A list of environment variables to be set prior to execution.

Example:

```
salt://scripts/foo.sh:
  cmd.script:
    - env:
      - BATCH: 'yes'
```

**Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean True and False

values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So \$PATH in the following example is a literal ` \$PATH`:

```
salt://scripts/bar.sh:
  cmd.script:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing \$PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/
↳usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':
↳') }}
```

- **clean\_env** (*bool*) -- Attempt to clean out all other shell environment variables and set only those provided in the `env` argument to this function.
- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported
- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **timeout** (*int*) -- A timeout in seconds for the executed process to return.

**Warning:** This function does not process commands through a shell unless the `python_shell` flag is set to `True`. This means that any shell-specific functionality such as `echo` or the use of pipes, redirection or `&&`, should either be migrated to `cmd.shell` or have the `python_shell=True` flag set here.

The use of `python_shell=True` means that the shell will accept `_any_` input including potentially malicious commands such as ``good_command;rm -rf /``. Be absolutely certain that you have sanitized your input prior to using `python_shell=True`

CLI Example:

```
salt '*' cmd.run_bg "fstrim-all"
```

The `template` arg can be set to `jinja` or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.run_bg template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/{print \
↳$2}'"
```

Specify an alternate shell with the `shell` parameter:

```
salt '*' cmd.run_bg "Get-ChildItem C:\\ " shell='powershell'
```

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote

shell command by manually specifying the kwarg:

```
salt '*' cmd.run_bg cmd='ls -lR / | sed -e s/=/:/g > /tmp/dontwait'
```

`salt.modules.cmdmod.run_chroot`(*root*, *cmd*, *cwd=None*, *stdin=None*, *runas=None*, *shell='/bin/sh'*, *python\_shell=True*, *env=None*, *clean\_env=False*, *template=None*, *rstrip=True*, *umask=None*, *output\_loglevel='quiet'*, *log\_callback=None*, *quiet=False*, *timeout=None*, *reset\_system\_locale=True*, *ignore\_retcode=False*, *saltenv='base'*, *use\_vt=False*, *bg=False*, *\*\*kwargs*)

New in version 2014.7.0.

This function runs `cmd.run_all` wrapped within a chroot, with dev and proc mounted in the chroot `root` Path to the root of the jail to use.

**cmd** The command to run. ex: ``ls -lart /home``

**cwd** The current working directory to execute the command in. defaults to `/root`

**stdin** A string of standard input can be specified for the command to be run using the `stdin` parameter.

This can be useful in cases where sensitive information must be read from standard input.:

**runas** User to run script as.

**shell** Shell to execute under. Defaults to the system default shell.

**python\_shell** If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection

**env**

A list of environment variables to be set prior to execution. Example:

```
salt://scripts/foo.sh:
  cmd.script:
    - env:
      - BATCH: 'yes'
```

**Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So `$PATH` in the following example is a literal ``$PATH``:

```
salt://scripts/bar.sh:
  cmd.script:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing `$PATH` by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

**clean\_env:** Attempt to clean out all other shell environment variables and set only those provided in the ``env`` argument to this function.

**template** If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported

**rstrip** Strip all whitespace off the end of output before it is returned.

**umask** The umask (in octal) to use when running the command.

**output\_loglevel** Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless `quiet` is used for this value.

**timeout** A timeout in seconds for the executed process to return.

**use\_vt** Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

CLI Example:

```
salt '*' cmd.run_chroot /var/lib/lxc/container_name/rootfs 'sh /tmp/bootstrap.sh'
```

```
salt.modules.cmdmod.run_stderr(cmd, cwd=None, stdin=None, runas=None, shell='/bin/sh',
                               python_shell=None, env=None, clean_env=False, template=None,
                               rstrip=True, umask=None, output_loglevel='debug',
                               log_callback=None, timeout=None, reset_system_locale=True,
                               ignore_retcode=False, saltenv='base', use_vt=False, password=None,
                               **kwargs)
```

Execute a command and only return the standard error

#### Parameters

- **cmd** (*str*) -- The command to run. ex: ``ls -lart /home``
- **cwd** (*str*) -- The current working directory to execute the command in. Defaults to the home directory of the user specified by `runas`.
- **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.:
- **runas** (*str*) -- User to run command as. If running on a Windows minion you must also pass a password. The target user account must be in the Administrators group.
- **password** (*str*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.  
New in version 2016.3.0.
- **shell** (*str*) -- Shell to execute under. Defaults to the system default shell.
- **python\_shell** (*bool*) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection
- **env** (*list*) -- A list of environment variables to be set prior to execution.

Example:

```
salt://scripts/foo.sh:
  cmd.script:
    - env:
      - BATCH: 'yes'
```

**Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So \$PATH in the following example is a literal ` \$PATH`:

```
salt://scripts/bar.sh:
  cmd.script:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing \$PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/
↳usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':
↳') }}
```

- **clean\_env** (*bool*) -- Attempt to clean out all other shell environment variables and set only those provided in the `env` argument to this function.
- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported
- **rstrip** (*bool*) -- Strip all whitespace off the end of output before it is returned.
- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **output\_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless quiet is used for this value.
- **timeout** (*int*) -- A timeout in seconds for the executed process to return.
- **use\_vt** (*bool*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

---

**Note:** env represents the environment variables for the command, and should be formatted as a dict, or a YAML string which resolves to a dict.

---

CLI Example:

```
salt '*' cmd.run_stderr "ls -l | awk '/foo/{print \$2}'"
```

The template arg can be set to `jinja` or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.run_stderr template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/
↳{print \$2}'"
```

A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input:

```
salt '*' cmd.run_stderr "grep f" stdin='one\ntwo\nthree\nfour\nfive\n'
```

```
salt.modules.cmdmod.run_stdout(cmd, cwd=None, stdin=None, runas=None, shell='/bin/sh',
                               python_shell=None, env=None, clean_env=False, template=None,
                               rstrip=True, umask=None, output_loglevel='debug',
                               log_callback=None, timeout=None, reset_system_locale=True,
                               ignore_retcode=False, saltenv='base', use_vt=False, password=None,
                               **kwargs)
```

Execute a command, and only return the standard out

#### Parameters

- **cmd** (*str*) -- The command to run. ex: ``ls -lart /home``
- **cwd** (*str*) -- The current working directory to execute the command in. Defaults to the home directory of the user specified by `runas`.
- **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.:
- **runas** (*str*) -- User to run command as. If running on a Windows minion you must also pass a password. The target user account must be in the Administrators group.
- **password** (*str*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.0.

- **shell** (*str*) -- Shell to execute under. Defaults to the system default shell.
- **python\_shell** (*bool*) -- If `False`, let python handle the positional arguments. Set to `True` to use shell features, such as pipes or redirection
- **env** (*list*) -- A list of environment variables to be set prior to execution.

Example:

```
salt://scripts/foo.sh:
  cmd.script:
    - env:
      - BATCH: 'yes'
```

**Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So `$PATH` in the following example is a literal ``$PATH``:

```
salt://scripts/bar.sh:
  cmd.script:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing `$PATH` by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
```

```
- name: ls -l /
- env:
  - PATH: {{ [current_path, '/my/special/bin']|join(':
↵') ]}}
```

- **clean\_env** (*bool*) -- Attempt to clean out all other shell environment variables and set only those provided in the `env` argument to this function.
- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported
- **rstrip** (*bool*) -- Strip all whitespace off the end of output before it is returned.
- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **output\_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless `quiet` is used for this value.
- **timeout** (*int*) -- A timeout in seconds for the executed process to return.
- **use\_vt** (*bool*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

**Note:** `env` represents the environment variables for the command, and should be formatted as a dict, or a YAML string which resolves to a dict.

CLI Example:

```
salt '*' cmd.run_stdout "ls -l | awk '/foo/{print \$2}'"
```

The `template` arg can be set to `jinja` or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.run_stdout template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/
↵{print \$2}'"
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input:

```
salt '*' cmd.run_stdout "grep f" stdin='one\ntwo\nthree\nfour\nfive\n'
```

`salt.modules.cmdmod.script` (*source*, *args=None*, *cwd=None*, *stdin=None*, *runas=None*, *shell='/bin/sh'*, *python\_shell=None*, *env=None*, *template=None*, *umask=None*, *output\_loglevel='debug'*, *log\_callback=None*, *quiet=False*, *timeout=None*, *reset\_system\_locale=True*, *saltenv='base'*, *use\_vt=False*, *bg=False*, *password=None*, *\*\*kwargs*)

Download a script from a remote location and execute the script locally. The script can be located on the salt master file server or on an HTTP/FTP server.

The script will be executed directly, so it can be written in any available programming language.

#### Parameters

- **source** (*str*) -- The location of the script to download. If the file is located on the master in the directory named `spam`, and is called `eggs`, the source string is `salt://spam/eggs`

- **args** (*str*) -- String of command line args to pass to the script. Only used if no args are specified as part of the *name* argument. To pass a string containing spaces in YAML, you will need to doubly-quote it: ``arg1 `arg two' arg3``
- **cwd** (*str*) -- The current working directory to execute the command in. Defaults to the home directory of the user specified by *runas*.
- **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the *stdin* parameter. This can be useful in cases where sensitive information must be read from standard input.:
- **runas** (*str*) -- User to run script as. If running on a Windows minion you must also pass a password. The target user account must be in the Administrators group.
- **password** (*str*) -- Windows only. Required when specifying *runas*. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.0.

- **shell** (*str*) -- Shell to execute under. Defaults to the system default shell.
- **python\_shell** (*bool*) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection
- **bg** (*bool*) -- If True, run script in background and do not await or deliver it's results
- **env** (*list*) -- A list of environment variables to be set prior to execution.

Example:

```
salt://scripts/foo.sh:
  cmd.script:
    - env:
      - BATCH: 'yes'
```

**Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean True and False values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So \$PATH in the following example is a literal `PATH':

```
salt://scripts/bar.sh:
  cmd.script:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing \$PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported
- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **output\_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless quiet is used for this value.
- **quiet** (*bool*) -- The command will be executed quietly, meaning no log entries of the actual command or its return data. This is deprecated as of the 2014.1.0 release, and is being replaced with `output_loglevel: quiet`.
- **timeout** (*int*) -- If the command has not terminated after timeout seconds, send the subprocess sigterm, and if sigterm is ignored, follow up with sigkill
- **use\_vt** (*bool*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

CLI Example:

```
salt '*' cmd.script salt://scripts/runme.sh
salt '*' cmd.script salt://scripts/runme.sh 'arg1 arg2 "arg 3"'
salt '*' cmd.script salt://scripts/windows_task.ps1 args=' -Input c:\tmp\infile.
↳txt' shell='powershell'
```

```
salt '*' cmd.script salt://scripts/runme.sh stdin='one\ntwo\nthree\nfour\nfive\n'
```

```
salt.modules.cmdmod.script_retcode(source, args=None, cwd=None, stdin=None, runas=None,
shell='/bin/sh', python_shell=None, env=None,
template='jinja', umask=None, timeout=None,
reset_system_locale=True, saltenv='base', out-
put_loglevel='debug', log_callback=None, use_vt=False,
password=None, **kwargs)
```

Download a script from a remote location and execute the script locally. The script can be located on the salt master file server or on an HTTP/FTP server.

The script will be executed directly, so it can be written in any available programming language.

The script can also be formatted as a template, the default is jinja.

Only evaluate the script return code and do not block for terminal output

#### Parameters

- **source** (*str*) -- The location of the script to download. If the file is located on the master in the directory named spam, and is called eggs, the source string is `salt://spam/eggs`
- **args** (*str*) -- String of command line args to pass to the script. Only used if no args are specified as part of the *name* argument. To pass a string containing spaces in YAML, you will need to doubly-quote it: ``arg1 `arg two' arg3''
- **cwd** (*str*) -- The current working directory to execute the command in. Defaults to the home directory of the user specified by runas.
- **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas** (*str*) -- User to run script as. If running on a Windows minion you must also pass a password. The target user account must be in the Administrators group.

- **password** (*str*) -- Windows only. Required when specifying runas. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.0.

- **shell** (*str*) -- Shell to execute under. Defaults to the system default shell.
- **python\_shell** (*bool*) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection
- **env** (*list*) -- A list of environment variables to be set prior to execution.

Example:

```
salt://scripts/foo.sh:
  cmd.script:
    - env:
      - BATCH: 'yes'
```

**Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean True and False values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So \$PATH in the following example is a literal ` \$PATH`:

```
salt://scripts/bar.sh:
  cmd.script:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing \$PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported
- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **output\_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless quiet is used for this value.
- **quiet** (*bool*) -- The command will be executed quietly, meaning no log entries of the actual command or its return data. This is deprecated as of the **2014.1.0** release, and is being replaced with `output_loglevel: quiet`.
- **timeout** (*int*) -- If the command has not terminated after timeout seconds, send the subprocess sigterm, and if sigterm is ignored, follow up with sigkill

- **use\_vt** (*bool*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

CLI Example:

```
salt '*' cmd.script_retcodesalt://scripts/runme.sh
salt '*' cmd.script_retcodesalt://scripts/runme.sh 'arg1 arg2 "arg 3"'
salt '*' cmd.script_retcodesalt://scripts/windows_task.ps1 args=' -Input c:
↳\tmp\infile.txt' shell='powershell'
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input:

```
salt '*' cmd.script_retcodesalt://scripts/runme.sh stdin=
↳'one\ntwo\nthree\nfour\nfive\n'
```

`salt.modules.cmdmod.shell`(*cmd*, *cwd=None*, *stdin=None*, *runas=None*, *shell='/bin/sh'*, *env=None*, *clean\_env=False*, *template=None*, *rstrip=True*, *umask=None*, *output\_loglevel='debug'*, *log\_callback=None*, *quiet=False*, *timeout=None*, *reset\_system\_locale=True*, *ignore\_retcodes=False*, *saltenv='base'*, *use\_vt=False*, *bg=False*, *password=None*, *\*\*kwargs*)

Execute the passed command and return the output as a string.

New in version 2015.5.0.

#### Parameters

- **cmd** (*str*) -- The command to run. ex: `'ls -lart /home'`
- **cwd** (*str*) -- The current working directory to execute the command in. Defaults to the home directory of the user specified by `runas`.
- **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas** (*str*) -- User to run command as. If running on a Windows minion you must also pass a password. The target user account must be in the Administrators group.
- **password** (*str*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.0.

- **shell** (*int*) -- Shell to execute under. Defaults to the system default shell.
- **bg** (*bool*) -- If True, run command in background and do not await or deliver its results
- **env** (*list*) -- A list of environment variables to be set prior to execution.

Example:

```
salt://scripts/foo.sh:
cmd.script:
- env:
- BATCH: 'yes'
```

**Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean True and False

values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So \$PATH in the following example is a literal ` \$PATH`:

```
salt://scripts/bar.sh:
  cmd.script:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing \$PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

- **clean\_env** (*bool*) -- Attempt to clean out all other shell environment variables and set only those provided in the `env` argument to this function.
- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported
- **rstrip** (*bool*) -- Strip all whitespace off the end of output before it is returned.
- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **output\_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless quiet is used for this value.
- **timeout** (*int*) -- A timeout in seconds for the executed process to return.
- **use\_vt** (*bool*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

**Warning:** This passes the cmd argument directly to the shell without any further processing! Be absolutely sure that you have properly sanitized the command passed to this function and do not use untrusted inputs.

**Note:** env represents the environment variables for the command, and should be formatted as a dict, or a YAML string which resolves to a dict.

CLI Example:

```
salt '*' cmd.shell "ls -l | awk '/foo/{print \$2}'"
```

The template arg can be set to `jinja` or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.shell template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/{print \
↪$2}'"
```

Specify an alternate shell with the shell parameter:

```
salt '*' cmd.shell "Get-ChildItem C:\ " shell='powershell'
```

A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input.:

```
salt '*' cmd.shell "grep f" stdin='one\ntwo\nthree\nfour\nfive\n'
```

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format key=val. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt '*' cmd.shell cmd='sed -e s/=/:/g'
```

`salt.modules.cmdmod.shell_info(shell, list_modules=False)`

New in version 2016.11.0.

Provides information about a shell or script languages which often use #!. The values returned are dependent on the shell or scripting languages all return the installed, path, version, version\_raw

#### Parameters

- **shell** (*str*) -- Name of the shell. Support shells/script languages include
- **cmd**, **perl**, **php**, **powershell**, **python**, **ruby** and **zsh** (*bash*,) --
- **list\_modules** (*bool*) -- True to list modules available to the shell.
- **only lists powershell modules.** (*Currently*) --

**Returns** A dictionary of information about the shell

**Return type** dict

```
{'version': '<2 or 3 numeric components dot-separated>',
 'version_raw': '<full version string>',
 'path': '<full path to binary>',
 'installed': <True, False or None>,
 '<attribute>': '<attribute value>'}
```

#### Note:

- installed is always returned, if None or False also returns error and may also return stdout for diagnostics.
- version is for use in determine if a shell/script language has a particular feature set, not for package management.
- The shell must be within the executable search path.

CLI Example:

```
salt '*' cmd.shell_info bash
salt '*' cmd.shell_info powershell
```

Codeauthor Damon Atkins <<https://github.com/damon-atkins>>

`salt.modules.cmdmod.shells()`

Lists the valid shells on this system via the `/etc/shells` file

New in version 2015.5.0.

CLI Example:

```
salt '*' cmd.shells
```

`salt.modules.cmdmod.tty(device, echo='')`

Echo a string to a specific tty

CLI Example:

```
salt '*' cmd.tty tty0 'This is a test'
salt '*' cmd.tty pts3 'This is a test'
```

`salt.modules.cmdmod.which(cmd)`

Returns the path of an executable available on the minion, None otherwise

CLI Example:

```
salt '*' cmd.which cat
```

`salt.modules.cmdmod.which_bin(cmds)`

Returns the first command found in a list of commands

CLI Example:

```
salt '*' cmd.which_bin '[pip2, pip, pip-python]'
```

### 14.7.71 salt.modules.composer

Use composer to install PHP dependencies for a directory

`salt.modules.composer.did_composer_install(dir)`

Test to see if the vendor directory exists in this directory

**dir** Directory location of the composer.json file

CLI Example:

```
salt '*' composer.did_composer_install /var/www/application
```

`salt.modules.composer.install(directory, composer=None, php=None, runas=None, prefer_source=None, prefer_dist=None, no_scripts=None, no_plugins=None, optimize=None, no_dev=None, quiet=False, composer_home='/root')`

Install composer dependencies for a directory.

If composer has not been installed globally making it available in the system PATH & making it executable, the composer and php parameters will need to be set to the location of the executables.

**directory** Directory location of the composer.json file.

**composer** Location of the composer.phar file. If not set composer will just execute ``composer" as if it is installed globally. (i.e. /path/to/composer.phar)

**php** Location of the php executable to use with composer. (i.e. /usr/bin/php)

**runas** Which system user to run composer as.

**prefer\_source** --prefer-source option of composer.

**prefer\_dist** --prefer-dist option of composer.

**no\_scripts** --no-scripts option of composer.

**no\_plugins** --no-plugins option of composer.  
**optimize** --optimize-autoloader option of composer. Recommended for production.  
**no\_dev** --no-dev option for composer. Recommended for production.  
**quiet** --quiet option for composer. Whether or not to return output from composer.  
**composer\_home** \$COMPOSER\_HOME environment variable  
 CLI Example:

```
salt '*' composer.install /var/www/application
salt '*' composer.install /var/www/application no_dev=True optimize=True
```

**salt.modules.composer.selfupdate**(*composer=None, php=None, runas=None, quiet=False, composer\_home='/root'*)

Update composer itself.

If composer has not been installed globally making it available in the system PATH & making it executable, the composer and php parameters will need to be set to the location of the executables.

**composer** Location of the composer.phar file. If not set composer will just execute ``composer" as if it is installed globally. (i.e. /path/to/composer.phar)

**php** Location of the php executable to use with composer. (i.e. /usr/bin/php)

**runas** Which system user to run composer as.

**quiet** --quiet option for composer. Whether or not to return output from composer.

**composer\_home** \$COMPOSER\_HOME environment variable

CLI Example:

```
salt '*' composer.selfupdate
```

**salt.modules.composer.update**(*directory, composer=None, php=None, runas=None, prefer\_source=None, prefer\_dist=None, no\_scripts=None, no\_plugins=None, optimize=None, no\_dev=None, quiet=False, composer\_home='/root'*)

Update composer dependencies for a directory.

If *composer install* has not yet been run, this runs *composer install* instead.

If composer has not been installed globally making it available in the system PATH & making it executable, the composer and php parameters will need to be set to the location of the executables.

**directory** Directory location of the composer.json file.

**composer** Location of the composer.phar file. If not set composer will just execute ``composer" as if it is installed globally. (i.e. /path/to/composer.phar)

**php** Location of the php executable to use with composer. (i.e. /usr/bin/php)

**runas** Which system user to run composer as.

**prefer\_source** --prefer-source option of composer.

**prefer\_dist** --prefer-dist option of composer.

**no\_scripts** --no-scripts option of composer.

**no\_plugins** --no-plugins option of composer.

**optimize** --optimize-autoloader option of composer. Recommended for production.

**no\_dev** --no-dev option for composer. Recommended for production.

**quiet** --quiet option for composer. Whether or not to return output from composer.

**composer\_home** \$COMPOSER\_HOME environment variable

CLI Example:

```
salt '*' composer.update /var/www/application
salt '*' composer.update /var/www/application no_dev=True optimize=True
```

## 14.7.72 salt.modules.config

Return config information

`salt.modules.config.backup_mode(backup='')`

Return the backup mode

CLI Example:

```
salt '*' config.backup_mode
```

`salt.modules.config.dot_vals(value)`

Pass in a configuration value that should be preceded by the module name and a dot, this will return a list of all read key/value pairs

CLI Example:

```
salt '*' config.dot_vals host
```

`salt.modules.config.gather_bootstrap_script(bootstrap=None)`

Download the salt-bootstrap script, and return its location

**bootstrap** URL of alternate bootstrap script

CLI Example:

```
salt '*' config.gather_bootstrap_script
```

`salt.modules.config.get(key, default='', delimiter=':', merge=None)`

Attempt to retrieve the named value from the minion config file, pillar, grains or the master config. If the named value is not available, return the value specified by default. If not specified, the default is an empty string.

Values can also be retrieved from nested dictionaries. Assume the below data structure:

```
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the `apache` key, in the sub-dictionary corresponding to the `pkg` key, the following command can be used:

```
salt myminion config.get pkg:apache
```

The `:` (colon) is used to represent a nested dictionary level.

Changed in version 2015.5.0: The `delimiter` argument was added, to allow delimiters other than `:` to be used.

This function traverses these data stores in this order, returning the first match found:

- Minion configuration
- Minion's grains
- Minion's pillar data
- Master configuration (requires `pillar_opts` to be set to `True` in Minion config file in order to work)

This means that if there is a value that is going to be the same for the majority of minions, it can be configured in the Master config file, and then overridden using the grains, pillar, or Minion config file.

Adding config options to the Master or Minion configuration file is easy:

```
my-config-option: value
cafe-menu:
- egg and bacon
- egg sausage and bacon
```

- egg and spam
- egg bacon and spam
- egg bacon sausage and spam
- spam bacon sausage and spam
- spam egg spam spam bacon and spam
- spam sausage spam spam bacon spam tomato and spam

---

**Note:** Minion configuration options built into Salt (like those defined [here](#)) will *always* be defined in the Minion configuration and thus *cannot be overridden by grains or pillar data*. However, additional (user-defined) configuration options (as in the above example) will not be in the Minion configuration by default and thus can be overridden using grains/pillar data by leaving the option out of the minion config file.

---

## Arguments

**delimiter** New in version 2015.5.0.

Override the delimiter used to separate nested levels of a data structure.

**merge** New in version 2015.5.0.

If passed, this parameter will change the behavior of the function so that, instead of traversing each data store above in order and returning the first match, the data stores are first merged together and then searched. The pillar data is merged into the master config data, then the grains are merged, followed by the Minion config data. The resulting data structure is then searched for a match. This allows for configurations to be more flexible.

---

**Note:** The merging described above does not mean that grain data will end up in the Minion's pillar data, or pillar data will end up in the master config data, etc. The data is just combined for the purposes of searching an amalgam of the different data stores.

---

The supported merge strategies are as follows:

- **recurse** - If a key exists in both dictionaries, and the new value is not a dictionary, it is replaced. Otherwise, the sub-dictionaries are merged together into a single dictionary, recursively on down, following the same criteria. For example:

```
>>> dict1 = {'foo': {'bar': 1, 'qux': True},
             'hosts': ['a', 'b', 'c'],
             'only_x': None}
>>> dict2 = {'foo': {'baz': 2, 'qux': False},
             'hosts': ['d', 'e', 'f'],
             'only_y': None}
>>> merged
{'foo': {'bar': 1, 'baz': 2, 'qux': False},
 'hosts': ['d', 'e', 'f'],
 'only_dict1': None,
 'only_dict2': None}
```

- **overwrite** - If a key exists in the top level of both dictionaries, the new value completely overwrites the old. For example:

```
>>> dict1 = {'foo': {'bar': 1, 'qux': True},
             'hosts': ['a', 'b', 'c'],
             'only_x': None}
>>> dict2 = {'foo': {'baz': 2, 'qux': False},
             'hosts': ['d', 'e', 'f'],
```

```
        'only_y': None}
>>> merged
{'foo': {'baz': 2, 'qux': False},
 'hosts': ['d', 'e', 'f'],
 'only_dict1': None,
 'only_dict2': None}
```

CLI Example:

```
salt '*' config.get pkg:apache
salt '*' config.get lxc.container_profile:centos merge=recurse
```

`salt.modules.config.manage_mode(mode)`

Return a mode value, normalized to a string

CLI Example:

```
salt '*' config.manage_mode
```

`salt.modules.config.merge(value, default='', omit_opts=False, omit_master=False, omit_pillar=False)`

Retrieves an option based on key, merging all matches.

Same as `option()` except that it merges all matches, rather than taking the first match.

CLI Example:

```
salt '*' config.merge schedule
```

`salt.modules.config.option(value, default='', omit_opts=False, omit_master=False, omit_pillar=False)`

Pass in a generic option and receive the value that will be assigned

CLI Example:

```
salt '*' config.option redis.host
```

`salt.modules.config.valid_fileproto(uri)`

Returns a boolean value based on whether or not the URI passed has a valid remote file protocol designation

CLI Example:

```
salt '*' config.valid_fileproto salt://path/to/file
```

### 14.7.73 salt.modules.consul

Interact with Consul

<https://www.consul.io>

`salt.modules.consul.acl_clone(consul_url=None, **kwargs)`

Information about an ACL token.

**Parameters**

- **consul\_url** -- The Consul server URL.
- **id** -- Unique identifier for the ACL to update.

**Returns** Boolean, message of success or failure, and new ID of cloned ACL.

CLI Example:

```
salt '*' consul.acl_info id='c1c4d223-91cb-3d1f-1ee8-f2af9e7b6716'
```

`salt.modules.consul.acl_create`(*consul\_url=None, \*\*kwargs*)

Create a new ACL token.

**Parameters**

- **consul\_url** -- The Consul server URL.
- **id** -- Unique identifier for the ACL to create leave it blank to let consul server generate one
- **name** -- Meaningful indicator of the ACL's purpose.
- **type** -- Type is either client or management. A management token is comparable to a root user and has the ability to perform any action including creating, modifying, and deleting ACLs.
- **rules** -- The Consul server URL.

**Returns** Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.acl_create
```

`salt.modules.consul.acl_delete`(*consul\_url=None, \*\*kwargs*)

Delete an ACL token.

**Parameters**

- **consul\_url** -- The Consul server URL.
- **id** -- Unique identifier for the ACL to update.

**Returns** Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.acl_delete id='c1c4d223-91cb-3d1f-1ee8-f2af9e7b6716'
```

`salt.modules.consul.acl_info`(*consul\_url=None, \*\*kwargs*)

Information about an ACL token.

**Parameters**

- **consul\_url** -- The Consul server URL.
- **id** -- Unique identifier for the ACL to update.

**Returns** Information about the ACL requested.

CLI Example:

```
salt '*' consul.acl_info id='c1c4d223-91cb-3d1f-1ee8-f2af9e7b6716'
```

`salt.modules.consul.acl_list`(*consul\_url=None, \*\*kwargs*)

List the ACL tokens.

**Parameters** **consul\_url** -- The Consul server URL.

**Returns** List of ACLs

CLI Example:

```
salt '*' consul.acl_list
```

`salt.modules.consul.acl_update` (*consul\_url=None, \*\*kwargs*)

Update an ACL token.

**Parameters**

- **consul\_url** -- The Consul server URL.
- **name** -- Meaningful indicator of the ACL's purpose.
- **id** -- Unique identifier for the ACL to update.
- **type** -- Type is either client or management. A management token is comparable to a root user and has the ability to perform any action including creating, modifying, and deleting ACLs.
- **rules** -- The Consul server URL.

**Returns** Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.acl_update
```

`salt.modules.consul.agent_check_deregister` (*consul\_url=None, checkid=None*)

The agent will take care of deregistering the check from the Catalog.

**Parameters**

- **consul\_url** -- The Consul server URL.
- **checkid** -- The ID of the check to deregister from Consul.

**Returns** Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_check_deregister checkid='Memory Utilization'
```

`salt.modules.consul.agent_check_fail` (*consul\_url=None, checkid=None, \*\*kwargs*)

This endpoint is used with a check that is of the TTL type. When this is called, the status of the check is set to critical and the TTL clock is reset.

**Parameters**

- **consul\_url** -- The Consul server URL.
- **checkid** -- The ID of the check to deregister from Consul.
- **note** -- A human-readable message with the status of the check.

**Returns** Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_check_fail checkid='redis_check1'
note='Forcing check into critical state.'
```

`salt.modules.consul.agent_check_pass` (*consul\_url=None, checkid=None, \*\*kwargs*)

This endpoint is used with a check that is of the TTL type. When this is called, the status of the check is set to passing and the TTL clock is reset.

**Parameters**

- **consul\_url** -- The Consul server URL.
- **checkid** -- The ID of the check to mark as passing.
- **note** -- A human-readable message with the status of the check.

**Returns** Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_check_pass checkid='redis_check1'
      note='Forcing check into passing state.'
```

`salt.modules.consul.agent_check_register` (*consul\_url=None, \*\*kwargs*)

The register endpoint is used to add a new check to the local agent.

**Parameters**

- **consul\_url** -- The Consul server URL.
- **name** -- The description of what the check is for.
- **id** -- The unique name to use for the check, if not provided `name` is used.
- **notes** -- Human readable description of the check.
- **script** -- If script is provided, the check type is a script, and Consul will evaluate that script based on the interval parameter.
- **http** -- Check will perform an HTTP GET request against the value of HTTP (expected to be a URL) based on the interval parameter.
- **ttl** -- If a TTL type is used, then the TTL update endpoint must be used periodically to update the state of the check.
- **interval** -- Interval at which the check should run.

**Returns** Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_check_register name='Memory Utilization'
      script='/usr/local/bin/check_mem.py' interval='15s'
```

`salt.modules.consul.agent_check_warn` (*consul\_url=None, checkid=None, \*\*kwargs*)

This endpoint is used with a check that is of the TTL type. When this is called, the status of the check is set to warning and the TTL clock is reset.

**Parameters**

- **consul\_url** -- The Consul server URL.
- **checkid** -- The ID of the check to deregister from Consul.
- **note** -- A human-readable message with the status of the check.

**Returns** Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_check_warn checkid='redis_check1'
      note='Forcing check into warning state.'
```

`salt.modules.consul.agent_checks` (*consul\_url=None*)

Returns the checks the local agent is managing

**Parameters** **consul\_url** -- The Consul server URL.

**Returns** Returns the checks the local agent is managing

CLI Example:

```
salt '*' consul.agent_checks
```

`salt.modules.consul.agent_join` (*consul\_url=None, address=None, \*\*kwargs*)

Triggers the local agent to join a node

**Parameters**

- **consul\_url** -- The Consul server URL.
- **address** -- The address for the agent to connect to.
- **wan** -- Causes the agent to attempt to join using the WAN pool.

**Returns** Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_join address='192.168.1.1'
```

**salt.modules.consul.agent\_leave** (*consul\_url=None, node=None*)

Used to instruct the agent to force a node into the left state.

**Parameters**

- **consul\_url** -- The Consul server URL.
- **node** -- The node the agent will force into left state

**Returns** Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_leave node='web1.example.com'
```

**salt.modules.consul.agent\_maintenance** (*consul\_url=None, \*\*kwargs*)

Manages node maintenance mode

**Parameters**

- **consul\_url** -- The Consul server URL.
- **enable** -- The enable flag is required. Acceptable values are either true (to enter maintenance mode) or false (to resume normal operation).
- **reason** -- If provided, its value should be a text string explaining the reason for placing the node into maintenance mode.

**Returns** Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_maintenance enable='False' reason='Upgrade in progress'
```

**salt.modules.consul.agent\_members** (*consul\_url=None, \*\*kwargs*)

Returns the members as seen by the local serf agent

**Parameters** **consul\_url** -- The Consul server URL.

**Returns** Returns the members as seen by the local serf agent

CLI Example:

```
salt '*' consul.agent_members
```

**salt.modules.consul.agent\_self** (*consul\_url=None*)

Returns the local node configuration

**Parameters** **consul\_url** -- The Consul server URL.

**Returns** Returns the local node configuration

CLI Example:

```
salt '*' consul.agent_self
```

`salt.modules.consul.agent_service_deregister` (*consul\_url=None, serviceid=None*)

Used to remove a service.

**Parameters**

- **consul\_url** -- The Consul server URL.
- **serviceid** -- A serviceid describing the service.

**Returns** Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_service_deregister serviceid='redis'
```

`salt.modules.consul.agent_service_maintenance` (*consul\_url=None, serviceid=None, \*\*kwargs*)

Used to place a service into maintenance mode.

**Parameters**

- **consul\_url** -- The Consul server URL.
- **serviceid** -- A name of the service.
- **enable** -- Whether the service should be enabled or disabled.
- **reason** -- A human readable message of why the service was enabled or disabled.

**Returns** Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_service_deregister serviceid='redis'
      enable='True' reason='Down for upgrade'
```

`salt.modules.consul.agent_service_register` (*consul\_url=None, \*\*kwargs*)

The used to add a new service, with an optional health check, to the local agent.

**Parameters**

- **consul\_url** -- The Consul server URL.
- **name** -- A name describing the service.
- **address** -- The address used by the service, defaults to the address of the agent.
- **port** -- The port used by the service.
- **id** -- Unique ID to identify the service, if not provided the value of the name parameter is used.
- **tags** -- Identifying tags for service, string or list.
- **script** -- If script is provided, the check type is a script, and Consul will evaluate that script based on the interval parameter.
- **http** -- Check will perform an HTTP GET request against the value of HTTP (expected to be a URL) based on the interval parameter.
- **check\_ttl** -- If a TTL type is used, then the TTL update endpoint must be used periodically to update the state of the check.
- **check\_interval** -- Interval at which the check should run.

**Returns** Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_service_register name='redis'
      tags='["master", "v1"]' address="127.0.0.1" port="8080"
      check_script="/usr/local/bin/check_redis.py" interval="10s"
```

`salt.modules.consul.agent_services`(*consul\_url=None*)

Returns the services the local agent is managing

**Parameters** `consul_url` -- The Consul server URL.

**Returns** Returns the services the local agent is managing

CLI Example:

```
salt '*' consul.agent_services
```

`salt.modules.consul.catalog_datacenters`(*consul\_url=None*)

Return list of available datacenters from catalog.

**Parameters** `consul_url` -- The Consul server URL.

**Returns** The list of available datacenters.

CLI Example:

```
salt '*' consul.catalog_datacenters
```

`salt.modules.consul.catalog_deregister`(*consul\_url=None, \*\*kwargs*)

Deregisters a node, service, or check

**Parameters**

- **consul\_url** -- The Consul server URL.
- **node** -- The node to deregister.
- **datacenter** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc" parameter.
- **checkid** -- The ID of the health check to deregister.
- **serviceid** -- The ID of the service to deregister.

**Returns** Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.catalog_register node='node1'
      serviceid='redis_server1' checkid='redis_check1'
```

`salt.modules.consul.catalog_node`(*consul\_url=None, node=None, \*\*kwargs*)

Information about the registered node.

**Parameters**

- **consul\_url** -- The Consul server URL.
- **node** -- The node to request information about.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc" parameter.

**Returns** Information about the requested node.

CLI Example:

```
salt '*' consul.catalog_service service='redis'
```

`salt.modules.consul.catalog_nodes`(*consul\_url=None, \*\*kwargs*)

Return list of available nodes from catalog.

**Parameters**

- **consul\_url** -- The Consul server URL.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc" parameter.

**Returns** The list of available nodes.

CLI Example:

```
salt '*' consul.catalog_nodes
```

`salt.modules.consul.catalog_register` (*consul\_url=None, \*\*kwargs*)

Registers a new node, service, or check

**Parameters**

- **consul\_url** -- The Consul server URL.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc" parameter.
- **node** -- The node to register.
- **address** -- The address of the node.
- **service** -- The service that will be registered.
- **service\_address** -- The address that the service listens on.
- **service\_port** -- The port for the service.
- **service\_id** -- A unique identifier for the service, if this is not provided ``name" will be used.
- **service\_tags** -- Any tags associated with the service.
- **check** -- The name of the health check to register
- **check\_status** -- The initial status of the check, must be one of unknown, passing, warning, or critical.
- **check\_service** -- The service that the check is performed against.
- **check\_id** -- Unique identifier for the service.
- **check\_notes** -- An opaque field that is meant to hold human-readable text.

**Returns** Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.catalog_register node='node1' address='192.168.1.1'
service='redis' service_address='127.0.0.1' service_port='8080'
service_id='redis_server1'
```

`salt.modules.consul.catalog_service` (*consul\_url=None, service=None, \*\*kwargs*)

Information about the registered service.

**Parameters**

- **consul\_url** -- The Consul server URL.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc" parameter.
- **tag** -- Filter returned services with tag parameter.

**Returns** Information about the requested service.

CLI Example:

```
salt '*' consul.catalog_service service='redis'
```

`salt.modules.consul.catalog_services`(*consul\_url=None, \*\*kwargs*)

Return list of available services rom catalog.

**Parameters**

- **consul\_url** -- The Consul server URL.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc" parameter.

**Returns** The list of available services.

CLI Example:

```
salt '*' consul.catalog_services
```

`salt.modules.consul.delete`(*consul\_url=None, key=None, \*\*kwargs*)

Delete values from Consul

**Parameters**

- **consul\_url** -- The Consul server URL.
- **key** -- The key to use as the starting point for the list.
- **recurse** -- Delete values recursively beginning at the value of key.
- **cas** -- This flag is used to turn the DELETE into a Check-And-Set operation.

**Returns** Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.delete key='web'
salt '*' consul.delete key='web' recurse='True'
```

`salt.modules.consul.event_fire`(*consul\_url=None, name=None, \*\*kwargs*)

List the ACL tokens.

**Parameters**

- **consul\_url** -- The Consul server URL.
- **name** -- The name of the event to fire.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc" parameter.
- **node** -- Filter by node name.
- **service** -- Filter by service name.
- **tag** -- Filter by tag name.

**Returns** List of ACLs

CLI Example:

```
salt '*' consul.event_fire name='deploy'
```

`salt.modules.consul.event_list`(*consul\_url=None, \*\*kwargs*)

List the recent events.

**Parameters**

- **consul\_url** -- The Consul server URL.
- **name** -- The name of the event to fire.

**Returns** List of ACLs

CLI Example:

```
salt '*' consul.event_list
```

`salt.modules.consul.get`(*consul\_url=None, key=None, recurse=False, decode=False, raw=False*)

Get key from Consul

**Parameters**

- **consul\_url** -- The Consul server URL.
- **key** -- The key to use as the starting point for the list.
- **recurse** -- Return values recursively beginning at the value of key.
- **decode** -- By default values are stored as Base64 encoded values, decode will return the whole key with the value decoded.
- **raw** -- Simply return the decoded value of the key.

**Returns** The keys in Consul.

CLI Example:

```
salt '*' consul.get key='web/key1'
salt '*' consul.list key='web' recurse='True'
salt '*' consul.list key='web' recurse='True' decode='True'
```

By default values stored in Consul are base64 encoded, passing the decode option will show them as the decoded values.

```
salt '*' consul.list key='web' recurse='True' decode='True' raw='True'
```

By default Consul will return other information about the key, the raw option will return only the raw value.

`salt.modules.consul.health_checks`(*consul\_url=None, service=None, \*\*kwargs*)

Health information about the registered service.

**Parameters**

- **consul\_url** -- The Consul server URL.
- **service** -- The service to request health information about.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc`` parameter.

**Returns** Health information about the requested node.

CLI Example:

```
salt '*' consul.health_checks service='redis1'
```

`salt.modules.consul.health_node`(*consul\_url=None, node=None, \*\*kwargs*)

Health information about the registered node.

**Parameters**

- **consul\_url** -- The Consul server URL.
- **node** -- The node to request health information about.

- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc" parameter.

**Returns** Health information about the requested node.

CLI Example:

```
salt '*' consul.health_node node='node1'
```

`salt.modules.consul.health_service`(*consul\_url=None, service=None, \*\*kwargs*)

Health information about the registered service.

**Parameters**

- **consul\_url** -- The Consul server URL.
- **service** -- The service to request health information about.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc" parameter.
- **tag** -- Filter returned services with tag parameter.
- **passing** -- Filter results to only nodes with all checks in the passing state.

**Returns** Health information about the requested node.

CLI Example:

```
salt '*' consul.health_service service='redis1'
salt '*' consul.health_service service='redis1' passing='True'
```

`salt.modules.consul.health_state`(*consul\_url=None, state=None, \*\*kwargs*)

Returns the checks in the state provided on the path.

**Parameters**

- **consul\_url** -- The Consul server URL.
- **state** -- The state to show checks for. The supported states are any, unknown, passing, warning, or critical. The any state is a wildcard that can be used to return all checks.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc" parameter.

**Returns** The checks in the provided state.

CLI Example:

```
salt '*' consul.health_state state='redis1'
salt '*' consul.health_state service='redis1' passing='True'
```

`salt.modules.consul.list`(*consul\_url=None, key=None, \*\*kwargs*)

List keys in Consul

**Parameters**

- **consul\_url** -- The Consul server URL.
- **key** -- The key to use as the starting point for the list.

**Returns** The list of keys.

CLI Example:

```
salt '*' consul.list

salt '*' consul.list key='web'
```

`salt.modules.consul.put`(*consul\_url=None, key=None, value=None, \*\*kwargs*)

Put values into Consul

#### Parameters

- **consul\_url** -- The Consul server URL.
- **key** -- The key to use as the starting point for the list.
- **value** -- The value to set the key to.
- **flags** -- This can be used to specify an unsigned value between 0 and 2<sup>64</sup>-1. Clients can choose to use this however makes sense for their application.
- **cas** -- This flag is used to turn the PUT into a Check-And-Set operation.
- **acquire** -- This flag is used to turn the PUT into a lock acquisition operation.
- **release** -- This flag is used to turn the PUT into a lock release operation.

**Returns** Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.put key='web/key1' value="Hello there"

salt '*' consul.put key='web/key1' value="Hello there"
                    acquire='d5d371f4-c380-5280-12fd-8810be175592'

salt '*' consul.put key='web/key1' value="Hello there"
                    release='d5d371f4-c380-5280-12fd-8810be175592'
```

`salt.modules.consul.session_create`(*consul\_url=None, \*\*kwargs*)

Used to create a session.

#### Parameters

- **consul\_url** -- The Consul server URL.
- **lockdelay** -- Duration string using a ``s" suffix for seconds. The default is 15s.
- **node** -- Must refer to a node that is already registered, if specified. By default, the agent's own node name is used.
- **name** -- A human-readable name for the session
- **checks** -- A list of associated health checks. It is highly recommended that, if you override this list, you include the default ``serfHealth".
- **behavior** -- Can be set to either release or delete. This controls the behavior when a session is invalidated. By default, this is release, causing any locks that are held to be released. Changing this to delete causes any locks that are held to be deleted. delete is useful for creating ephemeral key/value entries.
- **ttl** -- Session is invalidated if it is not renewed before the TTL expires

**Returns** Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.session_create node='node1' name='my-session'
                    behavior='delete' ttl='3600s'
```

`salt.modules.consul.session_destroy` (*consul\_url=None, session=None, \*\*kwargs*)

Destroy session

**Parameters**

- **consul\_url** -- The Consul server URL.
- **session** -- The ID of the session to destroy.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc" parameter.

**Returns** Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.session_destroy session='c1c4d223-91cb-3d1f-1ee8-f2af9e7b6716'
```

`salt.modules.consul.session_info` (*consul\_url=None, session=None, \*\*kwargs*)

Information about a session

**Parameters**

- **consul\_url** -- The Consul server URL.
- **session** -- The ID of the session to return information about.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc" parameter.

**Returns** Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.session_info session='c1c4d223-91cb-3d1f-1ee8-f2af9e7b6716'
```

`salt.modules.consul.session_list` (*consul\_url=None, return\_list=False, \*\*kwargs*)

Used to list sessions.

**Parameters**

- **consul\_url** -- The Consul server URL.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc" parameter.
- **return\_list** -- By default, all information about the sessions is returned, using the return\_list parameter will return a list of session IDs.

**Returns** A list of all available sessions.

CLI Example:

```
salt '*' consul.session_list
```

`salt.modules.consul.status_leader` (*consul\_url=None*)

Returns the current Raft leader

**Parameters** **consul\_url** -- The Consul server URL.

**Returns** The address of the Raft leader.

CLI Example:

```
salt '*' consul.status_leader
```

`salt.modules.consul.status_peers` (*consul\_url*)

Returns the current Raft peer set

**Parameters** **consul\_url** -- The Consul server URL.

**Returns** Retrieves the Raft peers for the datacenter in which the the agent is running.  
 CLI Example:

```
salt '*' consul.status_peers
```

#### 14.7.74 salt.modules.container\_resource

Common resources for LXC and systemd-nspawn containers

New in version 2015.8.0.

These functions are not designed to be called directly, but instead from the `lxc`, `nspawn`, and `docker` execution modules. They provide for common logic to be re-used for common actions.

`salt.modules.container_resource.cache_file`(*source*)

Wrapper for `cp.cache_file` which raises an error if the file was unable to be cached.

CLI Example:

```
salt myminion container_resource.cache_file salt://foo/bar/baz.txt
```

`salt.modules.container_resource.copy_to`(*\*args*, *\*\*kwargs*)

Common logic for copying files to containers

**path** path to the container parent (for LXC only) default: `/var/lib/lxc` (system default)

CLI Example:

```
salt myminion container_resource.copy_to mycontainer /local/file/path /container/
↳file/path container_type=docker exec_driver=nsenter
```

`salt.modules.container_resource.run`(*\*args*, *\*\*kwargs*)

Common logic for running shell commands in containers

**path** path to the container parent (for LXC only) default: `/var/lib/lxc` (system default)

CLI Example:

```
salt myminion container_resource.run mycontainer 'ps aux' container_type=docker
↳exec_driver=nsenter output=stdout
```

#### 14.7.75 salt.modules.cp

Minion side functions for salt-cp

`salt.modules.cp.cache_dir`(*path*, *saltenv='base'*, *include\_empty=False*, *include\_pat=None*, *exclude\_pat=None*)

Download and cache everything under a directory from the master

**include\_pat** [None] Glob or regex to narrow down the files cached from the given path. If matching with a regex, the regex must be prefixed with `E@`, otherwise the expression will be interpreted as a glob.

New in version 2014.7.0.

**exclude\_pat** [None] Glob or regex to exclude certain files from being cached from the given path. If matching with a regex, the regex must be prefixed with `E@`, otherwise the expression will be interpreted as a glob.

---

**Note:** If used with `include_pat`, files matching this pattern will be excluded from the subset of files defined by `include_pat`.

---

New in version 2014.7.0.

CLI Examples:

```
salt '*' cp.cache_dir salt://path/to/dir
salt '*' cp.cache_dir salt://path/to/dir include_pat='E@*.py$'
```

`salt.modules.cp.cache_file`(*path*, *saltenv*='base')

Used to cache a single file on the Minion

Returns the location of the new cached file on the Minion.

CLI Example:

```
salt '*' cp.cache_file salt://path/to/file
```

There are two ways of defining the fileserver environment (a.k.a. `saltenv`) from which to cache the file. One is to use the `saltenv` parameter, and the other is to use a querystring syntax in the `salt://` URL. The below two examples are equivalent:

```
salt '*' cp.cache_file salt://foo/bar.conf saltenv=config
salt '*' cp.cache_file salt://foo/bar.conf?saltenv=config
```

If the path being cached is a `salt://` URI, and the path does not exist, then `False` will be returned.

---

**Note:** It may be necessary to quote the URL when using the querystring method, depending on the shell being used to run the command.

---

`salt.modules.cp.cache_files`(*paths*, *saltenv*='base')

Used to gather many files from the Master, the gathered files will be saved in the minion `cachedir` reflective to the paths retrieved from the Master

CLI Example:

```
salt '*' cp.cache_files salt://pathto/file1,salt://pathto/file1
```

There are two ways of defining the fileserver environment (a.k.a. `saltenv`) from which to cache the files. One is to use the `saltenv` parameter, and the other is to use a querystring syntax in the `salt://` URL. The below two examples are equivalent:

```
salt '*' cp.cache_files salt://foo/bar.conf,salt://foo/baz.conf saltenv=config
salt '*' cp.cache_files salt://foo/bar.conf?saltenv=config,salt://foo/baz.conf?
↳saltenv=config
```

The querystring method is less useful when all files are being cached from the same environment, but is a good way of caching files from multiple different environments in the same command. For example, the below command will cache the first file from the `config1` environment, and the second one from the `config2` environment.

```
salt '*' cp.cache_files salt://foo/bar.conf?saltenv=config1,salt://foo/bar.conf?
↳saltenv=config2
```

---

**Note:** It may be necessary to quote the URL when using the querystring method, depending on the shell being used to run the command.

---

`salt.modules.cp.cache_local_file`(*path*)

Cache a local file on the minion in the `localfiles` cache

CLI Example:

```
salt '*' cp.cache_local_file /etc/hosts
```

`salt.modules.cp.cache_master` (*saltenv='base'*)  
Retrieve all of the files on the master and cache them locally

CLI Example:

```
salt '*' cp.cache_master
```

`salt.modules.cp.get_dir` (*path, dest, saltenv='base', template=None, gzip=None, \*\*kwargs*)  
Used to recursively copy a directory from the salt master

CLI Example:

```
salt '*' cp.get_dir salt://path/to/dir/ /minion/dest
```

`get_dir` supports the same `template` and `gzip` arguments as `get_file`.

`salt.modules.cp.get_file` (*path, dest, saltenv='base', makedirs=False, template=None, gzip=None, \*\*kwargs*)  
Used to get a single file from the salt master

CLI Example:

```
salt '*' cp.get_file salt://path/to/file /minion/dest
```

Template rendering can be enabled on both the source and destination file names like so:

```
salt '*' cp.get_file "salt://{{grains.os}}/vimrc" /etc/vimrc template=jinja
```

This example would instruct all Salt minions to download the `vimrc` from a directory with the same name as their `os` grain and copy it to `/etc/vimrc`

For larger files, the `cp.get_file` module also supports `gzip` compression. Because `gzip` is CPU-intensive, this should only be used in scenarios where the compression ratio is very high (e.g. pretty-printed JSON or YAML files).

Use the `gzip` named argument to enable it. Valid values are 1..9, where 1 is the lightest compression and 9 the heaviest. 1 uses the least CPU on the master (and minion), 9 uses the most.

There are two ways of defining the `fileservers` environment (a.k.a. `saltenv`) from which to retrieve the file. One is to use the `saltenv` parameter, and the other is to use a querystring syntax in the `salt://` URL. The below two examples are equivalent:

```
salt '*' cp.get_file salt://foo/bar.conf /etc/foo/bar.conf saltenv=config
salt '*' cp.get_file salt://foo/bar.conf?saltenv=config /etc/foo/bar.conf
```

**Note:** It may be necessary to quote the URL when using the querystring method, depending on the shell being used to run the command.

`salt.modules.cp.get_file_str` (*path, saltenv='base'*)  
Download a file from a URL to the Minion cache directory and return the contents of that file

Returns `False` if Salt was unable to cache a file from a URL.

CLI Example:

```
salt '*' cp.get_file_str salt://my/file
```

`salt.modules.cp.get_template`(*path*, *dest*, *template*='jinja', *saltenv*='base', *makedirs*=False, *\*\*kwargs*)

Render a file as a template before setting it down. Warning, order is not the same as in `fileclient.cp` for non breaking old API.

CLI Example:

```
salt '*' cp.get_template salt://path/to/template /minion/dest
```

`salt.modules.cp.get_url`(*path*, *dest*='', *saltenv*='base', *makedirs*=False)

Used to get a single file from a URL.

**path** A URL to download a file from. Supported URL schemes are: `salt://`, `http://`, `https://`, `ftp://`, `s3://`, `swift://` and `file://` (local filesystem). If no scheme was specified, this is equivalent of using `file://`. If a `file://` URL is given, the function just returns absolute path to that file on a local filesystem. The function returns `False` if Salt was unable to fetch a file from a `salt://` URL.

**dest** The default behaviour is to write the fetched file to the given destination path. If this parameter is omitted or set as empty string (''), the function places the remote file on the local filesystem inside the Minion cache directory and returns the path to that file.

---

**Note:** To simply return the file contents instead, set destination to `None`. This works with `salt://`, `http://`, `https://` and `file://` URLs. The files fetched by `http://` and `https://` will not be cached.

---

**saltenv** [base] Salt fileserver environment from which to retrieve the file. Ignored if `path` is not a `salt://` URL.

CLI Example:

```
salt '*' cp.get_url salt://my/file /tmp/this_file_is_mine
salt '*' cp.get_url http://www.slashdot.org /tmp/index.html
```

`salt.modules.cp.hash_file`(*path*, *saltenv*='base')

Return the hash of a file, to get the hash of a file on the salt master file server prepend the path with `salt://<file on server>` otherwise, prepend the file with `/` for a local file.

CLI Example:

```
salt '*' cp.hash_file salt://path/to/file
```

`salt.modules.cp.is_cached`(*path*, *saltenv*='base')

Return a boolean if the given path on the master has been cached on the minion

CLI Example:

```
salt '*' cp.is_cached salt://path/to/file
```

`salt.modules.cp.list_master`(*saltenv*='base', *prefix*='')

List all of the files stored on the master

CLI Example:

```
salt '*' cp.list_master
```

`salt.modules.cp.list_master_dirs`(*saltenv*='base', *prefix*='')

List all of the directories stored on the master

CLI Example:

```
salt '*' cp.list_master_dirs
```

`salt.modules.cp.list_master_symlinks` (*saltenv='base', prefix=''*)

List all of the symlinks stored on the master

CLI Example:

```
salt '*' cp.list_master_symlinks
```

`salt.modules.cp.list_minion` (*saltenv='base'*)

List all of the files cached on the minion

CLI Example:

```
salt '*' cp.list_minion
```

`salt.modules.cp.list_states` (*saltenv='base'*)

List all of the available state modules in an environment

CLI Example:

```
salt '*' cp.list_states
```

`salt.modules.cp.push` (*path, keep\_symlinks=False, upload\_path=None, remove\_source=False*)

WARNING Files pushed to the master will have global read permissions..

Push a file from the minion up to the master, the file will be saved to the salt master in the master's minion files cachedir (defaults to `/var/cache/salt/master/minions/minion-id/files`)

Since this feature allows a minion to push a file up to the master server it is disabled by default for security purposes. To enable, set `file_recv` to `True` in the master configuration file, and restart the master.

**keep\_symlinks** Keep the path value without resolving its canonical form

**upload\_path** Provide a different path inside the master's minion files cachedir

**remove\_source** Remove the source file on the minion

New in version 2016.3.0.

CLI Example:

```
salt '*' cp.push /etc/fstab
salt '*' cp.push /etc/system-release keep_symlinks=True
salt '*' cp.push /etc/fstab upload_path='/new/path/fstab'
salt '*' cp.push /tmp/filename remove_source=True
```

`salt.modules.cp.push_dir` (*path, glob=None, upload\_path=None*)

Push a directory from the minion up to the master, the files will be saved to the salt master in the master's minion files cachedir (defaults to `/var/cache/salt/master/minions/minion-id/files`). It also has a glob for matching specific files using globbing.

New in version 2014.7.0.

Since this feature allows a minion to push files up to the master server it is disabled by default for security purposes. To enable, set `file_recv` to `True` in the master configuration file, and restart the master.

**upload\_path** Provide a different path and directory name inside the master's minion files cachedir

CLI Example:

```
salt '*' cp.push /usr/lib/mysql
salt '*' cp.push /usr/lib/mysql upload_path='/newmysql/path'
salt '*' cp.push_dir /etc/modprobe.d/ glob='*.conf'
```

`salt.modules.cp.recv(files, dest)`

Used with salt-cp, pass the files dict, and the destination.

This function receives small fast copy files from the master via salt-cp. It does not work via the CLI.

`salt.modules.cp.recv_chunked(dest, chunk, append=False, compressed=True, mode=None)`

This function receives files copied to the minion using salt-cp and is not intended to be used directly on the CLI.

`salt.modules.cp.stat_file(path, saltenv='base', octal=True)`

Return the permissions of a file, to get the permissions of a file on the salt master file server prepend the path with salt://<file on server> otherwise, prepend the file with / for a local file.

CLI Example:

```
salt '*' cp.stat_file salt://path/to/file
```

### 14.7.76 salt.modules.cpan

Manage Perl modules using CPAN

New in version 2015.5.0.

`salt.modules.cpan.install(module)`

Install a Perl module from CPAN

CLI Example:

```
salt '*' cpan.install Template::Alloy
```

`salt.modules.cpan.list()`

List installed Perl modules, and the version installed

CLI Example:

```
salt '*' cpan.list
```

`salt.modules.cpan.remove(module, details=False)`

Attempt to remove a Perl module that was installed from CPAN. Because the cpan command doesn't actually support ``uninstall"-like functionality, this function will attempt to do what it can, with what it has from CPAN.

Until this function is declared stable, USE AT YOUR OWN RISK!

CLI Example:

```
salt '*' cpan.remove Old::Package
```

`salt.modules.cpan.show(module)`

Show information about a specific Perl module

CLI Example:

```
salt '*' cpan.show Template::Alloy
```

`salt.modules.cpan.show_config()`

Return a dict of CPAN configuration values

CLI Example:

```
salt '*' cpan.show_config
```

### 14.7.77 salt.modules.cron

Work with cron

**Note:** Salt does not escape cron metacharacters automatically. You should backslash-escape percent characters and any other metacharacters that might be interpreted incorrectly by the shell.

`salt.modules.cron.list_tab`(*user*)  
Return the contents of the specified user's crontab

CLI Example:

```
salt '*' cron.list_tab root
```

`salt.modules.cron.ls`(*user*)  
This function is an alias of `list_tab`.  
Return the contents of the specified user's crontab

CLI Example:

```
salt '*' cron.list_tab root
```

`salt.modules.cron.raw_cron`(*user*)  
Return the contents of the user's crontab

CLI Example:

```
salt '*' cron.raw_cron root
```

`salt.modules.cron.rm`(*user*, *cmd*, *minute=None*, *hour=None*, *daymonth=None*, *month=None*, *day-week=None*, *identifier=None*)  
This function is an alias of `rm_job`.

Remove a cron job for a specified user. If any of the day/time params are specified, the job will only be removed if the specified params match.

CLI Example:

```
salt '*' cron.rm_job root /usr/local/weekly
salt '*' cron.rm_job root /usr/bin/foo dayweek=1
```

`salt.modules.cron.rm_env`(*user*, *name*)  
Remove cron environment variable for a specified user.

CLI Example:

```
salt '*' cron.rm_env root MAILTO
```

`salt.modules.cron.rm_job`(*user*, *cmd*, *minute=None*, *hour=None*, *daymonth=None*, *month=None*, *day-week=None*, *identifier=None*)

Remove a cron job for a specified user. If any of the day/time params are specified, the job will only be removed if the specified params match.

CLI Example:

```
salt '*' cron.rm_job root /usr/local/weekly
salt '*' cron.rm_job root /usr/bin/foo dayweek=1
```

`salt.modules.cron.rm_special`(*user, special, cmd*)  
Remove a special cron job for a specified user.

CLI Example:

```
salt '*' cron.rm_job root @hourly /usr/bin/foo
```

`salt.modules.cron.set_env`(*user, name, value=None*)  
Set up an environment variable in the crontab.

CLI Example:

```
salt '*' cron.set_env root MAILTO user@example.com
```

`salt.modules.cron.set_job`(*user, minute, hour, daymonth, month, dayweek, cmd, commented=False, comment=None, identifier=None*)  
Sets a cron job up for a specified user.

CLI Example:

```
salt '*' cron.set_job root '*' '*' '*' '*' 1 /usr/local/weekly
```

`salt.modules.cron.set_special`(*user, special, cmd*)  
Set up a special command in the crontab.

CLI Example:

```
salt '*' cron.set_special root @hourly 'echo foobar'
```

`salt.modules.cron.write_cron_file`(*user, path*)  
Writes the contents of a file to a user's crontab

CLI Example:

```
salt '*' cron.write_cron_file root /tmp/new_cron
```

Changed in version 2015.8.9.

---

**Note:** Some OS' do not support specifying user via the *crontab* command i.e. (Solaris, AIX)

---

`salt.modules.cron.write_cron_file_verbose`(*user, path*)  
Writes the contents of a file to a user's crontab and return error message on error

CLI Example:

```
salt '*' cron.write_cron_file_verbose root /tmp/new_cron
```

Changed in version 2015.8.9.

---

**Note:** Some OS' do not support specifying user via the *crontab* command i.e. (Solaris, AIX)

---

## 14.7.78 salt.modules.csf

### Support for Config Server Firewall (CSF)

**maintainer** Mostafa Hussein <mostafa.hussein91@gmail.com>

**maturity** new

**platform** Linux

**salt.modules.csf.allow**(*ip*, *port=None*, *proto='tcp'*, *direction='in'*, *port\_origin='d'*, *ip\_origin='s'*, *ttl=None*, *comment=''*)

Add an rule to csf allowed hosts See `_access_rule()`. 1- Add an IP: CLI Example:

```
salt '*' csf.allow 127.0.0.1
salt '*' csf.allow 127.0.0.1 comment="Allow localhost"
```

**salt.modules.csf.allow\_port**(*port*, *proto='tcp'*, *direction='both'*)

Like `allow_ports`, but it will append to the existing entry instead of replacing it. Takes a single port instead of a list of ports.

CLI Example:

```
salt '*' csf.allow_port 22 proto='tcp' direction='in'
```

**salt.modules.csf.allow\_ports**(*ports*, *proto='tcp'*, *direction='in'*)

Fully replace the incoming or outgoing ports line in the `csf.conf` file - e.g. TCP\_IN, TCP\_OUT, UDP\_IN, UDP\_OUT, etc.

CLI Example:

```
salt '*' csf.allow_ports ports="[22,80,443,4505,4506]" proto='tcp' direction='in'
```

**salt.modules.csf.deny**(*ip*, *port=None*, *proto='tcp'*, *direction='in'*, *port\_origin='d'*, *ip\_origin='d'*, *ttl=None*, *comment=''*)

Add an rule to csf denied hosts See `_access_rule()`. 1- Deny an IP: CLI Example:

```
salt '*' csf.deny 127.0.0.1
salt '*' csf.deny 127.0.0.1 comment="Too localhosity"
```

**salt.modules.csf.disable**()

Disable csf permanently CLI Example:

```
salt '*' csf.disable
```

**salt.modules.csf.enable**()

Activate csf if not running CLI Example:

```
salt '*' csf.enable
```

**salt.modules.csf.exists**(*method*, *ip*, *port=None*, *proto='tcp'*, *direction='in'*, *port\_origin='d'*, *ip\_origin='d'*, *ttl=None*, *comment=''*)

Returns true a rule for the ip already exists based on the method supplied. Returns false if not found. CLI Example:

```
salt '*' csf.exists allow 1.2.3.4
salt '*' csf.exists tempdeny 1.2.3.4
```

`salt.modules.csf.get_ports(proto='tcp', direction='in')`

Lists ports from csf.conf based on direction and protocol. e.g. - TCP\_IN, TCP\_OUT, UDP\_IN, UDP\_OUT, etc..

CLI Example:

```
salt '*' csf.allow_port 22 proto='tcp' direction='in'
```

`salt.modules.csf.reload()`

Restart csf CLI Example:

```
salt '*' csf.reload
```

`salt.modules.csf.running()`

Check csf status CLI Example:

```
salt '*' csf.running
```

`salt.modules.csf.tempallow(ip=None, ttl=None, port=None, direction=None, comment='')`

Add an rule to the temporary ip allow list. See `_access_rule()`. 1- Add an IP: CLI Example:

```
salt '*' csf.tempallow 127.0.0.1 3600 port=22 direction='in' comment='# Temp dev  
↳ssh access'
```

`salt.modules.csf.tempdeny(ip=None, ttl=None, port=None, direction=None, comment='')`

Add a rule to the temporary ip deny list. See `_access_rule()`. 1- Add an IP: CLI Example:

```
salt '*' csf.tempdeny 127.0.0.1 300 port=22 direction='in' comment='# Brute force  
↳attempt'
```

`salt.modules.csf.unallow(ip)`

Remove a rule from the csf denied hosts See `_access_rule()`. 1- Deny an IP: CLI Example:

```
salt '*' csf.unallow 127.0.0.1
```

`salt.modules.csf.undeny(ip)`

Remove a rule from the csf denied hosts See `_access_rule()`. 1- Deny an IP: CLI Example:

```
salt '*' csf.undeny 127.0.0.1
```

## 14.7.79 salt.modules.cyg

Manage cygwin packages.

Module file to accompany the cyg state.

`salt.modules.cyg.check_valid_package(package, cyg_arch='x86_64', mirrors=None)`

Check if the package is valid on the given mirrors.

### Parameters

- **package** -- The name of the package
- **cyg\_arch** -- The cygwin architecture
- **mirrors** -- any mirrors to check

Returns (bool): True if Valid, otherwise False

CLI Example:

```
salt '*' cyg.check_valid_package <package name>
```

**salt.modules.cyg.install**(*packages=None, cyg\_arch='x86\_64', mirrors=None*)

Install one or several packages.

**packages** [None] The packages to install

**cyg\_arch** [x86\_64] Specify the architecture to install the package under Current options are x86 and x86\_64

CLI Example:

```
salt '*' cyg.install dos2unix
salt '*' cyg.install dos2unix mirrors=[{'http://mirror': 'http://url/to/public/
↳key}]
```

**salt.modules.cyg.list**(*package='', cyg\_arch='x86\_64'*)

List locally installed packages.

**package** [''] package name to check. else all

**cyg\_arch**: Cygwin architecture to use Options are x86 and x86\_64

CLI Example:

```
salt '*' cyg.list
```

**salt.modules.cyg.uninstall**(*packages, cyg\_arch='x86\_64', mirrors=None*)

Uninstall one or several packages.

**packages** The packages to uninstall.

**cyg\_arch** [x86\_64] Specify the architecture to remove the package from Current options are x86 and x86\_64

CLI Example:

```
salt '*' cyg.uninstall dos2unix
salt '*' cyg.uninstall dos2unix mirrors=[{'http://mirror': 'http://url/to/public/
↳key}]
```

**salt.modules.cyg.update**(*cyg\_arch='x86\_64', mirrors=None*)

Update all packages.

**cyg\_arch** [x86\_64] Specify the cygwin architecture update Current options are x86 and x86\_64

CLI Example:

```
salt '*' cyg.update
salt '*' cyg.update dos2unix mirrors=[{'http://mirror': 'http://url/to/public/key}
↳]
```

### 14.7.80 salt.modules.daemontools

daemontools service module. This module will create daemontools type service watcher.

This module is compatible with the *service* states, so it can be used to maintain services using the provider argument:

```
myservice:
  service.running:
    - provider: daemontools
```

**salt.modules.daemontools.available**(*name*)

Returns True if the specified service is available, otherwise returns False.

CLI Example:

```
salt '*' daemontools.available foo
```

`salt.modules.daemontools.disabled(name)`  
Return True if the named service is enabled, false otherwise  
New in version 2015.5.6.

CLI Example:

```
salt '*' daemontools.disabled <service name>
```

`salt.modules.daemontools.enabled(name, **kwargs)`  
Return True if the named service is enabled, false otherwise A service is considered enabled if in your service directory: - an executable `./run` file exist - a file named `down` does not exist

New in version 2015.5.7.

**name** Service name

CLI Example:

```
salt '*' daemontools.enabled <service name>
```

`salt.modules.daemontools.full_restart(name)`  
Calls `daemontools.restart()` function

CLI Example:

```
salt '*' daemontools.full_restart <service name>
```

`salt.modules.daemontools.get_all()`  
Return a list of all available services

CLI Example:

```
salt '*' daemontools.get_all
```

`salt.modules.daemontools.missing(name)`  
The inverse of `daemontools.available`. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```
salt '*' daemontools.missing foo
```

`salt.modules.daemontools.reload(name)`  
Wrapper for `term()`

CLI Example:

```
salt '*' daemontools.reload <service name>
```

`salt.modules.daemontools.restart(name)`  
Restart service via `daemontools`. This will stop/start service

CLI Example:

```
salt '*' daemontools.restart <service name>
```

`salt.modules.daemontools.start(name)`  
Starts service via `daemontools`

CLI Example:

```
salt '*' daemontools.start <service name>
```

`salt.modules.daemontools.status`(*name*, *sig=None*)  
Return the status for a service via daemontools, return pid if running

CLI Example:

```
salt '*' daemontools.status <service name>
```

`salt.modules.daemontools.stop`(*name*)  
Stops service via daemontools

CLI Example:

```
salt '*' daemontools.stop <service name>
```

`salt.modules.daemontools.term`(*name*)  
Send a TERM to service via daemontools

CLI Example:

```
salt '*' daemontools.term <service name>
```

### 14.7.81 salt.modules.data

Manage a local persistent data structure that can hold any arbitrary data specific to the minion

`salt.modules.data.cas`(*key*, *value*, *old\_value*)  
Check and set a value in the minion datastore

CLI Example:

```
salt '*' data.cas <key> <value> <old_value>
```

`salt.modules.data.clear`()  
Clear out all of the data in the minion datastore, this function is destructive!

CLI Example:

```
salt '*' data.clear
```

`salt.modules.data.dump`(*new\_data*)  
Replace the entire datastore with a passed data structure

CLI Example:

```
salt '*' data.dump '{"eggs': 'spam}'
```

`salt.modules.data.get`(*key*, *default=None*)  
Get a (list of) value(s) from the minion datastore

New in version 2015.8.0.

CLI Example:

```
salt '*' data.get key
salt '*' data.get '["key1", "key2"]'
```

`salt.modules.data.has_key(key)`  
Check if key is in the minion datastore  
New in version 2015.8.0.

CLI Example:

```
salt '*' data.has_key <mykey>
```

`salt.modules.data.items()`  
Get items from the minion datastore  
New in version 2015.8.0.

CLI Example:

```
salt '*' data.items
```

`salt.modules.data.keys()`  
Get all keys from the minion datastore  
New in version 2015.8.0.

CLI Example:

```
salt '*' data.keys
```

`salt.modules.data.load()`  
Return all of the data in the minion datastore

CLI Example:

```
salt '*' data.load
```

`salt.modules.data.pop(key, default=None)`  
Pop (return & delete) a value from the minion datastore  
New in version 2015.5.2.

CLI Example:

```
salt '*' data.pop <key> "there was no val"
```

`salt.modules.data.update(key, value)`  
Update a key with a value in the minion datastore

CLI Example:

```
salt '*' data.update <key> <value>
```

`salt.modules.data.values()`  
Get values from the minion datastore  
New in version 2015.8.0.

CLI Example:

```
salt '*' data.values
```

## 14.7.82 salt.modules.ddns

Support for RFC 2136 dynamic DNS updates.

### depends

- dnspython Python module

**configuration** If you want to use TSIG authentication for the server, there are a couple of optional configuration parameters made available to support this (the keyname is only needed if the keyring contains more than one key):

```
keyfile: keyring file (default=None)
keyname: key name in file (default=None)
keyalgorithm: algorithm used to create the key
               (default='HMAC-MD5.SIG-ALG.REG.INT').
               Other possible values: hmac-sha1, hmac-sha224, hmac-sha256,
               hmac-sha384, hmac-sha512
```

The keyring file needs to be in json format and the key name needs to end with an extra period in the file, similar to this:

```
{"keyname.": "keycontent"}
```

**salt.modules.ddns.add\_host**(zone, name, ttl, ip, nameserver='127.0.0.1', replace=True, timeout=5, port=53, \*\*kwargs)

Add, replace, or update the A and PTR (reverse) records for a host.

CLI Example:

```
salt ns1 ddns.add_host example.com host1 60 10.1.1.1
```

**salt.modules.ddns.delete**(zone, name, rdtype=None, data=None, nameserver='127.0.0.1', timeout=5, port=53, \*\*kwargs)

Delete a DNS record.

CLI Example:

```
salt ns1 ddns.delete example.com host1 A
```

**salt.modules.ddns.delete\_host**(zone, name, nameserver='127.0.0.1', timeout=5, port=53, \*\*kwargs)

Delete the forward and reverse records for a host.

Returns true if any records are deleted.

CLI Example:

```
salt ns1 ddns.delete_host example.com host1
```

**salt.modules.ddns.update**(zone, name, ttl, rdtype, data, nameserver='127.0.0.1', timeout=5, replace=False, port=53, \*\*kwargs)

Add, replace, or update a DNS record. nameserver must be an IP address and the minion running this module must have update privileges on that server. If replace is true, first deletes all records for this name and type.

CLI Example:

```
salt ns1 ddns.update example.com host1 60 A 10.0.0.1
```

### 14.7.83 salt.modules.deb\_apache

Support for Apache

Please note: The functions in here are Debian-specific. Placing them in this separate file will allow them to load only on Debian-based systems, while still loading under the `apache` namespace.

`salt.modules.deb_apache.a2disconf` (*conf*)

New in version 2016.3.0.

Runs `a2disconf` for the given `conf`.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.a2disconf security
```

`salt.modules.deb_apache.a2dismod` (*mod*)

Runs `a2dismod` for the given `mod`.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.a2dismod vhost_alias
```

`salt.modules.deb_apache.a2dissite` (*site*)

Runs `a2dissite` for the given `site`.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.a2dissite example.com
```

`salt.modules.deb_apache.a2enconf` (*conf*)

New in version 2016.3.0.

Runs `a2enconf` for the given `conf`.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.a2enconf security
```

`salt.modules.deb_apache.a2enmod` (*mod*)

Runs `a2enmod` for the given `mod`.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.a2enmod vhost_alias
```

`salt.modules.deb_apache.a2ensite` (*site*)

Runs `a2ensite` for the given `site`.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.a2ensite example.com
```

`salt.modules.deb_apache.check_conf_enabled(conf)`

New in version 2016.3.0.

Checks to see if the specific conf symlink is in `/etc/apache2/conf-enabled`.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.check_conf_enabled security
salt '*' apache.check_conf_enabled security.conf
```

`salt.modules.deb_apache.check_mod_enabled(mod)`

Checks to see if the specific mod symlink is in `/etc/apache2/mods-enabled`.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.check_mod_enabled status
salt '*' apache.check_mod_enabled status.load
salt '*' apache.check_mod_enabled status.conf
```

`salt.modules.deb_apache.check_site_enabled(site)`

Checks to see if the specific site symlink is in `/etc/apache2/sites-enabled`.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.check_site_enabled example.com
salt '*' apache.check_site_enabled example.com.conf
```

## 14.7.84 salt.modules.deb\_postgres

Module to provide Postgres compatibility to salt for debian family specific tools.

`salt.modules.deb_postgres.cluster_create(version, name='main', port=None, locale=None, encoding=None, datadir=None)`

Adds a cluster to the Postgres server.

CLI Example:

```
salt '*' postgres.cluster_create '9.3'
salt '*' postgres.cluster_create '9.3' 'main'
salt '*' postgres.cluster_create '9.3' locale='fr_FR'
```

`salt.modules.deb_postgres.cluster_exists(version, name='main')`

Checks if a given version and name of a cluster exists.

CLI Example:

```
salt '*' postgres.cluster_exists '9.3'
salt '*' postgres.cluster_exists '9.3' 'main'
```

`salt.modules.deb_postgres.cluster_list(verbose=False)`  
Return a list of cluster of Postgres server (tuples of version and name).

CLI Example:

```
salt '*' postgres.cluster_list
salt '*' postgres.cluster_list verbose=True
```

`salt.modules.deb_postgres.cluster_remove(version, name='main', stop=False)`  
Remove a cluster on a Postgres server. By default it doesn't try to stop the cluster.

CLI Example:

```
salt '*' postgres.cluster_remove '9.3'
salt '*' postgres.cluster_remove '9.3' 'main'
salt '*' postgres.cluster_remove '9.3' 'main' stop=True
```

### 14.7.85 salt.modules.debbuild

Debian Package builder system

New in version 2015.8.0.

This system allows for all of the components to build debs safely in chrooted environments. This also provides a function to generate debian repositories

This module implements the pkgbuild interface

`salt.modules.debbuild.build(runas, tgt, dest_dir, spec, sources, deps, env, template, saltenv='base', log_dir='/var/log/salt/pkgbuild')`

Given the package destination directory, the tarball containing debian files (e.g. control) and package sources, use pbuilder to safely build the platform package

CLI Example:

#### Debian

```
salt '*' pkgbuild.make_src_pkg deb-8-x86_64 /var/www/html https://raw.
↳githubusercontent.com/saltstack/libnacl/master/pkg/deb/python-libnacl.control
↳https://pypi.python.org/packages/source/l/libnacl/libnacl-1.3.5.tar.gz
```

This example command should build the libnacl package for Debian using pbuilder and place it in /var/www/html/ on the minion

`salt.modules.debbuild.make_repo(repodir, keyid=None, env=None, use_passphrase=False, gnupghome='/etc/salt/gpgkeys', runas='root', timeout=15.0)`

Make a package repository and optionally sign it and packages present

Given the repodir (directory to create repository in), create a Debian repository and optionally sign it and packages present. This state is best used with onchanges linked to your package building states.

**repodir** The directory to find packages that will be in the repository.

**keyid** Changed in version 2016.3.0.

Optional Key ID to use in signing packages and repository. Utilizes Public and Private keys associated with keyid which have been loaded into the minion's Pillar data. Leverages gpg-agent and gpg-preset-passphrase for caching keys, etc.

For example, contents from a Pillar data file with named Public and Private keys as follows:

```

gpg_pkg_priv_key: |
-----BEGIN PGP PRIVATE KEY BLOCK-----
Version: GnuPG v1

lQ0+BFciIfQBCADAPctzx7I5Rl32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b
w82PCE8Y1jF/9Uk2m3RKVWp3YcLlc7Ap3gj6V04ysvVz28UbnhPxsIk0lf2cq8qc
.
.
Ebe+8JCQTWqSXPRTzXmy/b5WXDeM79CkLWvuGpXFor76D+ECMRPv/rawukEcNptn
R50mgHqvYdEn04pWbn8JzQ09YX/Us0SMHBVzLC8eIi5ZIopzalvX
=JvW8
-----END PGP PRIVATE KEY BLOCK-----

gpg_pkg_priv_keyname: gpg_pkg_key.pem

gpg_pkg_pub_key: |
-----BEGIN PGP PUBLIC KEY BLOCK-----
Version: GnuPG v1

mQENBFciIfQBCADAPctzx7I5Rl32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b
w82PCE8Y1jF/9Uk2m3RKVWp3YcLlc7Ap3gj6V04ysvVz28UbnhPxsIk0lf2cq8qc
.
.
bYP7t5iwJmQzRMyFInYRt77wkJBPCpJc9FPNebL9vLzCn4zv0KQta+4alcWivvoP
4QIXE+/+trC6QRw2m2dHk6aAeq/J0Sc7ilZufwnNA71hf9SzRIwcFXMsLx4iLlki
inNqW9c=
=s1CX
-----END PGP PUBLIC KEY BLOCK-----

gpg_pkg_pub_keyname: gpg_pkg_key.pub

```

**env** Changed in version 2016.3.0.

A dictionary of environment variables to be utilized in creating the repository.

**use\_passphrase** [False] New in version 2016.3.0.

Use a passphrase with the signing key presented in `keyid`. Passphrase is received from Pillar data which could be passed on the command line with `pillar` parameter. For example:

```
pillar='{ "gpg_passphrase" : "my_passphrase" }'
```

**gnupghome** [/etc/salt/gpgkeys] New in version 2016.3.0.

Location where GPG related files are stored, used with `keyid`.

**runas** [root] New in version 2016.3.0.

User to create the repository as, and optionally sign packages.

---

**Note:** Ensure the user has correct permissions to any files and directories which are to be utilized.

---

**timeout** [15.0] New in version 2016.3.4.

Timeout in seconds to wait for the prompt for inputting the passphrase.

CLI Example:

```
salt '*' pkgbuild.make_repo /var/www/html
```

```
salt.modules.debbuild.make_src_pkg(dest_dir, spec, sources, env=None, template=None,
                                  saltenv='base')
```

Create a platform specific source package from the given platform spec/control file and sources

CLI Example:

#### Debian

```
salt '*' pkgbuild.make_src_pkg /var/www/html/ https://raw.githubusercontent.com/
↳saltstack/libnacl/master/pkg/deb/python-libnacl.control.tar.xz https://pypi.
↳python.org/packages/source/l/libnacl/libnacl-1.3.5.tar.gz
```

This example command should build the libnacl SOURCE package and place it in /var/www/html/ on the minion

### 14.7.86 salt.modules.debconfmod

Support for Debconf

`salt.modules.debconfmod.get_selections` (*fetchempty=True*)

Answers to debconf questions for all packages in the following format:

```
{'package': [['question', 'type', 'value'], ...]}
```

CLI Example:

```
salt '*' debconf.get_selections
```

`salt.modules.debconfmod.set` (*package, question, type, value, \*extra*)

Set answers to debconf questions for a package.

CLI Example:

```
salt '*' debconf.set <package> <question> <type> <value> [<value> ...]
```

`salt.modules.debconfmod.set_file` (*path, saltenv='base', \*\*kwargs*)

Set answers to debconf questions from a file.

CLI Example:

```
salt '*' debconf.set_file salt://pathto/pkg.selections
```

`salt.modules.debconfmod.set_template` (*path, template, context, defaults, saltenv='base', \*\*kwargs*)

Set answers to debconf questions from a template.

**path** location of the file containing the package selections

**template** template format

**context** variables to add to the template environment

**default** default values for the template environment

CLI Example:

```
salt '*' debconf.set_template salt://pathto/pkg.selections.jinja jinja None None
```

`salt.modules.debconfmod.show` (*name*)

Answers to debconf questions for a package in the following format:

```
[['question', 'type', 'value'], ...]
```

If debconf doesn't know about a package, we return None.

CLI Example:

```
salt '*' debconf.show <package name>
```

### 14.7.87 salt.modules.debian\_ip

The networking module for Debian based distros

References:

- <http://www.debian.org/doc/manuals/debian-reference/ch05.en.html>

`salt.modules.debian_ip.apply_network_settings(**settings)`

Apply global network configuration.

CLI Example:

```
salt '*' ip.apply_network_settings
```

`salt.modules.debian_ip.build_bond(iface, **settings)`

Create a bond script in /etc/modprobe.d with the passed settings and load the bonding kernel module.

CLI Example:

```
salt '*' ip.build_bond bond0 mode=balance-alb
```

`salt.modules.debian_ip.build_interface(iface, iface_type, enabled, **settings)`

Build an interface script for a network interface.

CLI Example:

```
salt '*' ip.build_interface eth0 eth <settings>
```

`salt.modules.debian_ip.build_network_settings(**settings)`

Build the global network script.

CLI Example:

```
salt '*' ip.build_network_settings <settings>
```

`salt.modules.debian_ip.build_routes(iface, **settings)`

Add route scripts for a network interface using up commands.

CLI Example:

```
salt '*' ip.build_routes eth0 <settings>
```

`salt.modules.debian_ip.down(iface, iface_type)`

Shutdown a network interface

CLI Example:

```
salt '*' ip.down eth0 eth
```

`salt.modules.debian_ip.get_bond(iface)`

Return the content of a bond script

CLI Example:

```
salt '*' ip.get_bond bond0
```

`salt.modules.debian_ip.get_interface(iface)`

Return the contents of an interface script

CLI Example:

```
salt '*' ip.get_interface eth0
```

`salt.modules.debian_ip.get_network_settings()`

Return the contents of the global network script.

CLI Example:

```
salt '*' ip.get_network_settings
```

`salt.modules.debian_ip.get_routes(iface)`

Return the routes for the interface

CLI Example:

```
salt '*' ip.get_routes eth0
```

`salt.modules.debian_ip.up(iface, iface_type)`

Start up a network interface

CLI Example:

```
salt '*' ip.up eth0 eth
```

### 14.7.88 salt.modules.debian\_service

Service support for Debian systems (uses update-rc.d and /sbin/service)

---

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `'service.start' is not available`), see [here](#).

---

`salt.modules.debian_service.available(name)`

Returns True if the specified service is available, otherwise returns False.

CLI Example:

```
salt '*' service.available sshd
```

`salt.modules.debian_service.disable(name, **kwargs)`

Disable the named service to start at boot

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.debian_service.disabled(name)`

Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.debian_service.enable(name, **kwargs)`

Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.debian_service.enabled(name, **kwargs)`

Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.debian_service.force_reload(name)`

Force-reload the named service

CLI Example:

```
salt '*' service.force_reload <service name>
```

`salt.modules.debian_service.get_all()`

Return all available boot services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.debian_service.get_disabled()`

Return a set of services that are installed but disabled

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.debian_service.get_enabled()`

Return a list of service that are enabled on boot

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.debian_service.missing(name)`

The inverse of `service.available`. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.debian_service.reload(name)`

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.debian_service.restart(name)`

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.debian_service.start(name)`

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.debian_service.status(name, sig=None)`

Return the status for a service, pass a signature to use to find the service via ps

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.debian_service.stop(name)`

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

### 14.7.89 salt.modules.defaults

`salt.modules.defaults.get(key, default='')`

`defaults.get` is used much like `pillar.get` except that it will read a default value for a pillar from `defaults.json` or `defaults.yaml` files that are stored in the root of a salt formula.

CLI Example:

```
salt '*' defaults.get core:users:root
```

The `defaults` is computed from pillar key. The first entry is considered as the formula namespace.

For example, querying `core:users:root` will try to load `salt://core/defaults.yaml` and `salt://core/defaults.json`.

`salt.modules.defaults.merge(dest, upd)`

Allows deep merging of dicts in formulas.

CLI Example: .. code-block:: bash

```
salt '*' default.merge a=b d=e
```

It is more typical to use this in a templating language in formulas, instead of directly on the command-line.

### 14.7.90 salt.modules.devmap

Device-Mapper module

`salt.modules.devmap.multipath_flush(device)`

Device-Mapper Multipath flush

CLI Example:

```
salt '*' devmap.multipath_flush mpath1
```

`salt.modules.devmap.multipath_list()`

Device-Mapper Multipath list

CLI Example:

```
salt '*' devmap.multipath_list
```

### 14.7.91 salt.modules.dig

Compendium of generic DNS utilities. The `dig` command line tool must be installed in order to use this module.

`salt.modules.dig.A(host, nameserver=None)`

Return the A record for host.

Always returns a list.

CLI Example:

```
salt ns1 dig.A www.google.com
```

`salt.modules.dig.AAAA(host, nameserver=None)`

Return the AAAA record for host.

Always returns a list.

CLI Example:

```
salt ns1 dig.AAAA www.google.com
```

`salt.modules.dig.MX(domain, resolve=False, nameserver=None)`

Return a list of lists for the MX of domain.

If the `resolve` argument is True, resolve IPs for the servers.

It's limited to one IP, because although in practice it's very rarely a round robin, it is an acceptable configuration and pulling just one IP lets the data be similar to the non-resolved version. If you think an MX has multiple IPs, don't use the resolver here, resolve them in a separate step.

CLI Example:

```
salt ns1 dig.MX google.com
```

`salt.modules.dig.NS(domain, resolve=True, nameserver=None)`

Return a list of IPs of the nameservers for domain

If `resolve` is False, don't resolve names.

CLI Example:

```
salt ns1 dig.NS google.com
```

`salt.modules.dig.SPF(domain, record='SPF', nameserver=None)`

Return the allowed IPv4 ranges in the SPF record for domain.

If record is SPF and the SPF record is empty, the TXT record will be searched automatically. If you know the domain uses TXT and not SPF, specifying that will save a lookup.

CLI Example:

```
salt ns1 dig.SPF google.com
```

`salt.modules.dig.TXT`(*host*, *nameserver=None*)

Return the TXT record for host.

Always returns a list.

CLI Example:

```
salt ns1 dig.TXT google.com
```

`salt.modules.dig.check_ip`(*addr*)

Check if address is a valid IP. returns True if valid, otherwise False.

CLI Example:

```
salt ns1 dig.check_ip 127.0.0.1
salt ns1 dig.check_ip 1111:2222:3333:4444:5555:6666:7777:8888
```

## 14.7.92 salt.modules.disk

Module for managing disks and blockdevices

`salt.modules.disk.blkid`(*device=None*)

Return block device attributes: UUID, LABEL, etc. This function only works on systems where blkid is available.

CLI Example:

```
salt '*' disk.blkid
salt '*' disk.blkid /dev/sda
```

`salt.modules.disk.dump`(*device*, *args=None*)

Return all contents of dumpe2fs for a specified device

CLI Example: .. code-block:: bash

```
salt '*' disk.dump /dev/sda1
```

`salt.modules.disk.format`(*device*, *fs\_type='ext4'*, *inode\_size=None*, *lazy\_itable\_init=None*, *force=False*)

Format a filesystem onto a device

New in version 2016.11.0.

**device** The device in which to create the new filesystem

**fs\_type** The type of filesystem to create

**inode\_size** Size of the inodes

This option is only enabled for ext and xfs filesystems

**lazy\_itable\_init** If enabled and the `uninit_bg` feature is enabled, the inode table will not be fully initialized by `mke2fs`. This speeds up filesystem initialization noticeably, but it requires the kernel to finish initializing the filesystem in the background when the filesystem is first mounted. If the option value is omitted, it defaults to 1 to enable lazy inode table zeroing.

This option is only enabled for ext filesystems

**force** Force `mke2fs` to create a filesystem, even if the specified device is not a partition on a block special device. This option is only enabled for ext and xfs filesystems

This option is dangerous, use it with caution.

CLI Example:

```
salt '*' disk.format /dev/sdX1
```

`salt.modules.disk.fstype`(*device*)

Return the filesystem name of the specified device

New in version 2016.11.0.

**device** The name of the device

CLI Example:

```
salt '*' disk.fstype /dev/sdX1
```

`salt.modules.disk.hdparms`(*disks, args=None*)

Retrieve all info's for all disks parse `em into a nice dict (which, considering hdparms output, is quite a hassle)

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' disk.hdparms /dev/sda
```

`salt.modules.disk.hpa`(*disks, size=None*)

Get/set Host Protected Area settings

T13 INCITS 346-2001 (1367D) defines the BEER (Boot Engineering Extension Record) and PARTIES (Protected Area Run Time Interface Extension Services), allowing for a Host Protected Area on a disk.

It's often used by OEMS to hide parts of a disk, and for overprovisioning SSD's

**Warning:** Setting the HPA might clobber your data, be very careful with this on active disks!

New in version 2016.3.0.

CLI Example:

```
salt '*' disk.hpa /dev/sda
salt '*' disk.hpa /dev/sda 5%
salt '*' disk.hpa /dev/sda 10543256
```

`salt.modules.disk.inodeusage`(*args=None*)

Return inode usage information for volumes mounted on this minion

CLI Example:

```
salt '*' disk.inodeusage
```

`salt.modules.disk.iostat`(*interval=1, count=5, disks=None*)

Gather and return (averaged) IO stats.

New in version 2016.3.0.

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' disk.iostat 1 5 disks=sda
```

`salt.modules.disk.percent`(*args=None*)

Return partition information for volumes mounted on this minion

CLI Example:

```
salt '*' disk.percent /var
```

`salt.modules.disk.resize2fs` (*device*)

Resizes the filesystem.

CLI Example: .. code-block:: bash  
salt '\*' disk.resize2fs /dev/sda1

`salt.modules.disk.smart_attributes` (*dev*, *attributes=None*, *values=None*)

Fetch SMART attributes Providing attributes will deliver only requested attributes Providing values will deliver only requested values for attributes

Default is the Backblaze recommended set (<https://www.backblaze.com/blog/hard-drive-smart-stats/>): (5,187,188,197,198)

New in version 2016.3.0.

CLI Example:

```
salt '*' disk.smart_attributes /dev/sda  
salt '*' disk.smart_attributes /dev/sda attributes=(5,187,188,197,198)
```

`salt.modules.disk.tune` (*device*, *\*\*kwargs*)

Set attributes for the specified device

CLI Example:

```
salt '*' disk.tune /dev/sda1 read-ahead=1024 read-write=True
```

Valid options are: read-ahead, filesystem-read-ahead, read-only, read-write.

See the `blockdev(8)` manpage for a more complete description of these options.

`salt.modules.disk.usage` (*args=None*)

Return usage information for volumes mounted on this minion

CLI Example:

```
salt '*' disk.usage
```

`salt.modules.disk.wipe` (*device*)

Remove the filesystem information

CLI Example:

```
salt '*' disk.wipe /dev/sda1
```

### 14.7.93 salt.modules.djangomod

Manage Django sites

`salt.modules.djangomod.collectstatic` (*settings\_module*, *bin\_env=None*, *no\_post\_process=False*, *ignore=None*, *dry\_run=False*, *clear=False*, *link=False*, *no\_default\_ignore=False*, *pythonpath=None*, *env=None*)

Collect static files from each of your applications into a single location that can easily be served in production.

CLI Example:

```
salt '*' django.collectstatic <settings_module>
```

`salt.modules.djangomod.command`(*settings\_module*, *command*, *bin\_env=None*, *pythonpath=None*, *env=None*, *\*args*, *\*\*kwargs*)  
Run arbitrary django management command

CLI Example:

```
salt '*' django.command <settings_module> <command>
```

`salt.modules.djangomod.createsuperuser`(*settings\_module*, *username*, *email*, *bin\_env=None*, *database=None*, *pythonpath=None*, *env=None*)  
Create a super user for the database. This function defaults to use the `--noinput` flag which prevents the creation of a password for the superuser.

CLI Example:

```
salt '*' django.createsuperuser <settings_module> user user@example.com
```

`salt.modules.djangomod.loaddata`(*settings\_module*, *fixtures*, *bin\_env=None*, *database=None*, *pythonpath=None*, *env=None*)  
Load fixture data

**Fixtures:** comma separated list of fixtures to load

CLI Example:

```
salt '*' django.loaddata <settings_module> <comma delimited list of fixtures>
```

`salt.modules.djangomod.syncdb`(*settings\_module*, *bin\_env=None*, *migrate=False*, *database=None*, *pythonpath=None*, *env=None*, *noinput=True*)  
Run syncdb

Execute the Django-Admin syncdb command, if South is available on the minion the `migrate` option can be passed as `True` calling the migrations to run after the syncdb completes

CLI Example:

```
salt '*' django.syncdb <settings_module>
```

## 14.7.94 salt.modules.dnsmasq

Module for managing dnsmasq

`salt.modules.dnsmasq.fullversion`()  
Shows installed version of dnsmasq and compile options.

CLI Example:

```
salt '*' dnsmasq.fullversion
```

`salt.modules.dnsmasq.get_config`(*config\_file='/etc/dnsmasq.conf'*)  
Dumps all options from the config file.  
**config file** The location of the config file from which to obtain contents. Defaults to `/etc/dnsmasq.conf`.

CLI Examples:

```
salt '*' dnsmasq.get_config
salt '*' dnsmasq.get_config config_file=/etc/dnsmasq.conf
```

`salt.modules.dnsmasq.set_config`(*config\_file*='/etc/dnsmasq.conf', *follow*=True, *\*\*kwargs*)

Sets a value or a set of values in the specified file. By default, if `conf-dir` is configured in this file, salt will attempt to set the option in any file inside the `conf-dir` where it has already been enabled. If it does not find it inside any files, it will append it to the main config file. Setting `follow` to False will turn off this behavior.

If a config option currently appears multiple times (such as `dhcp-host`, which is specified at least once per host), the new option will be added to the end of the main config file (and not to any includes). If you need an option added to a specific include file, specify it as the `config_file`.

#### Parameters

- **config\_file** (*string*) -- config file where settings should be updated / added.
- **follow** (*bool*) -- attempt to set the config option inside any file within the `conf-dir` where it has already been enabled.
- **kwargs** -- key value pairs that contain the configuration settings that you want set.

CLI Examples:

```
salt '*' dnsmasq.set_config domain=mydomain.com
salt '*' dnsmasq.set_config follow=False domain=mydomain.com
salt '*' dnsmasq.set_config config_file=/etc/dnsmasq.conf domain=mydomain.com
```

`salt.modules.dnsmasq.version`()

Shows installed version of dnsmasq.

CLI Example:

```
salt '*' dnsmasq.version
```

## 14.7.95 salt.modules.dnssutil

Compendium of generic DNS utilities.

---

**Note:** Some functions in the `dnssutil` execution module depend on `dig`.

---

`salt.modules.dnssutil.A`(*host*, *nameserver*=None)

Return the A record(s) for *host*.

Always returns a list.

CLI Example:

```
salt ns1 dnssutil.A www.google.com
```

`salt.modules.dnssutil.AAAA`(*host*, *nameserver*=None)

Return the AAAA record(s) for *host*.

Always returns a list.

New in version 2014.7.5.

CLI Example:

```
salt ns1 dnssutil.AAAA www.google.com
```

`salt.modules.dnssutil.MX`(*domain*, *resolve*=False, *nameserver*=None)

Return a list of lists for the MX of *domain*.

If the `resolve` argument is `True`, resolve IPs for the servers.

It's limited to one IP, because although in practice it's very rarely a round robin, it is an acceptable configuration and pulling just one IP lets the data be similar to the non-resolved version. If you think an MX has multiple IPs, don't use the resolver here, resolve them in a separate step.

CLI Example:

```
salt ns1 dnsutil.MX google.com
```

`salt.modules.dnsutil.NS`(*domain*, *resolve=True*, *nameserver=None*)

Return a list of IPs of the nameservers for *domain*

If `resolve` is `False`, don't resolve names.

CLI Example:

```
salt ns1 dnsutil.NS google.com
```

`salt.modules.dnsutil.SPF`(*domain*, *record='SPF'*, *nameserver=None*)

Return the allowed IPv4 ranges in the SPF record for *domain*.

If *record* is `SPF` and the SPF record is empty, the TXT record will be searched automatically. If you know the domain uses TXT and not SPF, specifying that will save a lookup.

CLI Example:

```
salt ns1 dnsutil.SPF google.com
```

`salt.modules.dnsutil.check_ip`(*ip\_addr*)

Check that string *ip\_addr* is a valid IP

CLI Example:

```
salt ns1 dnsutil.check_ip 127.0.0.1
```

`salt.modules.dnsutil.hosts_append`(*hostsfile='/etc/hosts'*, *ip\_addr=None*, *entries=None*)

Append a single line to the `/etc/hosts` file.

CLI Example:

```
salt '*' dnsutil.hosts_append /etc/hosts 127.0.0.1 ad1.yuk.co,ad2.yuk.co
```

`salt.modules.dnsutil.hosts_remove`(*hostsfile='/etc/hosts'*, *entries=None*)

Remove a host from the `/etc/hosts` file. If doing so will leave a line containing only an IP address, then the line will be deleted. This function will leave comments and blank lines intact.

CLI Examples:

```
salt '*' dnsutil.hosts_remove /etc/hosts ad1.yuk.co
salt '*' dnsutil.hosts_remove /etc/hosts ad2.yuk.co,ad1.yuk.co
```

`salt.modules.dnsutil.parse_hosts`(*hostsfile='/etc/hosts'*, *hosts=None*)

Parse `/etc/hosts` file.

CLI Example:

```
salt '*' dnsutil.parse_hosts
```

`salt.modules.dnsutil.parse_zone`(*zonefile=None*, *zone=None*)

Parses a zone file. Can be passed raw zone data on the API level.

CLI Example:

```
salt ns1 dnsutil.parse_zone /var/lib/named/example.com.zone
```

`salt.modules.dnsutil.serial(zone='', update=False)`

Return, store and update a dns serial for your zone files.

zone: a keyword for a specific zone

update: store an updated version of the serial in a grain

If update is False, the function will retrieve an existing serial or return the current date if no serial is stored. Nothing will be stored

If update is True, the function will set the serial to the current date if none exist or if the existing serial is for a previous date. If a serial for greater than the current date is already stored, the function will increment it.

This module stores the serial in a grain, you can explicitly set the stored value as a grain named `dnsserial_<zone_name>`.

CLI Example:

```
salt ns1 dnsutil.serial example.com
```

## 14.7.96 salt.modules.dockercompose module

Module to import docker-compose via saltstack

New in version 2016.3.0.

**maintainer** Jean Praloran <jeanpralo@gmail.com>

**maturity** new

**depends** docker-compose>=1.5

**platform** all

### Introduction

This module allows one to deal with docker-compose file in a directory.

This is a first version only, the following commands are missing at the moment but will be built later on if the community is interested in this module:

- run
- logs
- port
- scale

### Installation Prerequisites

This execution module requires at least version 1.4.0 of both `docker-compose` and `Docker`. `docker-compose` can easily be installed using `pip.install`:

```
salt myminion pip.install docker-compose>=1.5.0
```

### How to use this module?

In order to use the module if you have no docker-compose file on the server you can issue the command `create`, it takes two arguments the path where the docker-compose.yml will be stored and the content of this latter:

```
# salt-call -l debug dockercompose.create /tmp/toto '
database:
image: mongo:3.0
command: mongod --smallfiles --quiet --logpath=/dev/null
'
```

Then you can execute a list of method defined at the bottom with at least one argument (the path where the docker-compose.yml will be read) and an optional python list which corresponds to the services names:

```
# salt-call -l debug dockercompose.up /tmp/toto
# salt-call -l debug dockercompose.restart /tmp/toto '[database]'
# salt-call -l debug dockercompose.stop /tmp/toto
# salt-call -l debug dockercompose.rm /tmp/toto
```

### Docker-compose method supported

- up
- restart
- stop
- start
- pause
- unpause
- kill
- rm
- ps
- pull
- build

### Functions

- **docker-compose.yml management**
  - *dockercompose.create*
  - *dockercompose.get*
- **Manage containers**
  - *dockercompose.restart*
  - *dockercompose.stop*
  - *dockercompose.pause*

- `dockercompose.unpause`
- `dockercompose.start`
- `dockercompose.kill`
- `dockercompose.rm`
- `dockercompose.up`

- **Manage containers image:**

- `dockercompose.pull`
- `dockercompose.build`

- **Gather information about containers:**

- `dockercompose.ps`

### Detailed Function Documentation

`salt.modules.dockercompose.build`(*path*, *service\_names=None*)

Build image for containers in the docker-compose file, *service\_names* is a python list, if omitted build images for all containers. Please note that at the moment the module does not allow you to upload your Dockerfile, nor any other file you could need with your docker-compose.yml, you will have to make sure the files you need are actually in the directory specified in the *build* keyword

**path** Path where the docker-compose file is stored on the server

**service\_names** If specified will pull only the image for the specified services

CLI Example:

```
salt myminion dockercompose.build /path/where/docker-compose/stored
salt myminion dockercompose.build /path/where/docker-compose/stored '[janus]'
```

`salt.modules.dockercompose.create`(*path*, *docker\_compose*)

Create and validate a docker-compose file into a directory

**path** Path where the docker-compose file will be stored on the server

**docker\_compose** docker\_compose file

CLI Example:

```
salt myminion dockercompose.create /path/where/docker-compose/stored content
```

`salt.modules.dockercompose.get`(*path*)

Get the content of the docker-compose file into a directory

**path** Path where the docker-compose file is stored on the server

CLI Example:

```
salt myminion dockercompose.get /path/where/docker-compose/stored
```

`salt.modules.dockercompose.kill`(*path*, *service\_names=None*)

Kill containers in the docker-compose file, *service\_names* is a python list, if omitted kill all containers

**path** Path where the docker-compose file is stored on the server

**service\_names** If specified will kill only the specified services

CLI Example:

```
salt myminion dockercompose.kill /path/where/docker-compose/stored
salt myminion dockercompose.kill /path/where/docker-compose/stored '[janus]'
```

`salt.modules.dockercompose.pause`(*path*, *service\_names=None*)

Pause running containers in the docker-compose file, *service\_names* is a python list, if omitted pause all containers

**path** Path where the docker-compose file is stored on the server

**service\_names** If specified will pause only the specified services

CLI Example:

```
salt myminion dockercompose.pause /path/where/docker-compose/stored
salt myminion dockercompose.pause /path/where/docker-compose/stored '[janus]'
```

`salt.modules.dockercompose.ps`(*path*)

List all running containers and report some information about them

**path** Path where the docker-compose file is stored on the server

CLI Example:

```
salt myminion dockercompose.ps /path/where/docker-compose/stored
```

`salt.modules.dockercompose.pull`(*path*, *service\_names=None*)

Pull image for containers in the docker-compose file, *service\_names* is a python list, if omitted pull all images

**path** Path where the docker-compose file is stored on the server

**service\_names** If specified will pull only the image for the specified services

CLI Example:

```
salt myminion dockercompose.pull /path/where/docker-compose/stored
salt myminion dockercompose.pull /path/where/docker-compose/stored '[janus]'
```

`salt.modules.dockercompose.restart`(*path*, *service\_names=None*)

Restart container(s) in the docker-compose file, *service\_names* is a python list, if omitted restart all containers

**path** Path where the docker-compose file is stored on the server

**service\_names** If specified will restart only the specified services

CLI Example:

```
salt myminion dockercompose.restart /path/where/docker-compose/stored
salt myminion dockercompose.restart /path/where/docker-compose/stored '[janus]'
```

`salt.modules.dockercompose.rm`(*path*, *service\_names=None*)

Remove stopped containers in the docker-compose file, *service\_names* is a python list, if omitted remove all stopped containers

**path** Path where the docker-compose file is stored on the server

**service\_names** If specified will remove only the specified stopped services

CLI Example:

```
salt myminion dockercompose.rm /path/where/docker-compose/stored
salt myminion dockercompose.rm /path/where/docker-compose/stored '[janus]'
```

`salt.modules.dockercompose.start`(*path*, *service\_names=None*)

Start containers in the docker-compose file, *service\_names* is a python list, if omitted start all containers

**path** Path where the docker-compose file is stored on the server

**service\_names** If specified will start only the specified services

CLI Example:

```
salt myminion dockercompose.start /path/where/docker-compose/stored
salt myminion dockercompose.start /path/where/docker-compose/stored '[janus]'
```

`salt.modules.dockercompose.stop`(*path*, *service\_names=None*)

Stop running containers in the docker-compose file, `service_names` is a python list, if omitted stop all containers

**path** Path where the docker-compose file is stored on the server

**service\_names** If specified will stop only the specified services

CLI Example:

```
salt myminion dockercompose.stop /path/where/docker-compose/stored
salt myminion dockercompose.stop /path/where/docker-compose/stored '[janus]'
```

`salt.modules.dockercompose.unpause`(*path, service\_names=None*)

Un-Pause containers in the docker-compose file, `service_names` is a python list, if omitted unpause all containers

**path** Path where the docker-compose file is stored on the server

**service\_names** If specified will un-pause only the specified services

CLI Example:

```
salt myminion dockercompose.pause /path/where/docker-compose/stored
salt myminion dockercompose.pause /path/where/docker-compose/stored '[janus]'
```

`salt.modules.dockercompose.up`(*path, service\_names=None*)

Create and start containers defined in the the docker-compose.yml file located in `path`, `service_names` is a python list, if omitted create and start all containers

**path** Path where the docker-compose file is stored on the server

**service\_names** If specified will create and start only the specified services

CLI Example:

```
salt myminion dockercompose.up /path/where/docker-compose/stored
salt myminion dockercompose.up /path/where/docker-compose/stored '[janus]'
```

## 14.7.97 salt.modules.dockermod

Management of Docker Containers

New in version 2015.8.0.

Changed in version 2017.7.0: This module has replaced the legacy docker execution module.

**depends** `docker` Python module

---

**Note:** Older releases of the Python bindings for Docker were called `docker-py` in PyPI. All releases of `docker`, and releases of `docker-py`  $\geq$  1.6.0 are supported. These python bindings can easily be installed using `pip.install`:

```
salt myminion pip.install docker
```

To upgrade from `docker-py` to `docker`, you must first uninstall `docker-py`, and then install `docker`:

```
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```

---

### Authentication

If you have previously performed a `docker login` from the minion, then the credentials saved in `~/.docker/config.json` will be used for any actions which require authentication. If not, then credentials can be configured in Pillar data. The configuration schema is as follows:

```
docker-registries:
  <registry_url>:
    username: <username>
    password: <password>
```

For example:

```
docker-registries:
  hub:
    username: foo
    password: s3cr3t
```

**Note:** As of the 2016.3.7, 2016.11.4, and 2017.7.0 releases of Salt, credentials for the Docker Hub can be configured simply by specifying `hub` in place of the registry URL. In earlier releases, it is necessary to specify the actual registry URL for the Docker Hub (i.e. `https://index.docker.io/v1/`).

More than one registry can be configured. Salt will look for Docker credentials in the `docker-registries` Pillar key, as well as any key ending in `-docker-registries`. For example:

```
docker-registries:
  'https://mydomain.tld/registry:5000':
    username: foo
    password: s3cr3t

foo-docker-registries:
  https://index.foo.io/v1/:
    username: foo
    password: s3cr3t

bar-docker-registries:
  https://index.bar.io/v1/:
    username: foo
    password: s3cr3t
```

To login to the configured registries, use the `docker.login` function. This only needs to be done once for a given registry, and it will store/update the credentials in `~/.docker/config.json`.

**Note:** For Salt releases before 2016.3.7 and 2016.11.4, `docker.login` is not available. Instead, Salt will try to authenticate using each of your configured registries for each push/pull, behavior which is not correct and has been resolved in newer releases.

## Configuration Options

The following configuration options can be set to fine-tune how Salt uses Docker:

- `docker.url`: URL to the docker service (default: local socket).
- `docker.version`: API version to use (should not need to be set manually in the vast majority of cases)
- `docker.exec_driver`: Execution driver to use, one of `nsenter`, `lxc-attach`, or `docker-exec`. See the *Executing Commands Within a Running Container* section for more details on how this config parameter is used.

These configuration options are retrieved using `config.get` (click the link for further information).

## Executing Commands Within a Running Container

---

**Note:** With the release of Docker 1.13.1, the Execution Driver has been removed. Starting in versions 2016.3.6, 2016.11.4, and 2017.7.0, Salt defaults to using `docker exec` to run commands in containers, however for older Salt releases it will be necessary to set the `docker.exec_driver` config option to either `docker-exec` or `nsenter` for Docker versions 1.13.1 and newer.

---

Multiple methods exist for executing commands within Docker containers:

- `lxc-attach`: Default for older versions of docker
- `nsenter`: Enters container namespace to run command
- `docker-exec`: Native support for executing commands in Docker containers (added in Docker 1.3)

Adding a configuration option (see `config.get`) called `docker.exec_driver` will tell Salt which execution driver to use:

```
docker.exec_driver: docker-exec
```

If this configuration option is not found, Salt will use the appropriate interface (either `nsenter` or `lxc-attach`) based on the Execution Driver value returned from `docker info`. `docker-exec` will not be used by default, as it is presently (as of version 1.6.2) only able to execute commands as the effective user of the container. Thus, if a USER directive was used to run as a non-privileged user, `docker-exec` would be unable to perform the action as root. Salt can still use `docker-exec` as an execution driver, but must be explicitly configured (as in the example above) to do so at this time.

If possible, try to manually specify the execution driver, as it will save Salt a little work.

This execution module provides functions that shadow those from the `cmd` module. They are as follows:

- `docker.retcode`
- `docker.run`
- `docker.run_all`
- `docker.run_stderr`
- `docker.run_stdout`
- `docker.script`
- `docker.script_retcode`

### Detailed Function Documentation

`salt.modules.dockermod.build`(*path=None, image=None, cache=True, rm=True, api\_response=False, fileobj=None, dockerfile=None, buildargs=None*)

Builds a docker image from a Dockerfile or a URL

**path** Path to directory on the Minion containing a Dockerfile

**image** Image to be built, in `repo:tag` notation. If just the repository name is passed, a tag name of `latest` will be assumed. If building from a URL, this parameter can be omitted.

**cache** [True] Set to `False` to force the build process not to use the Docker image cache, and pull all required intermediate image layers

**rm** [True] Remove intermediate containers created during build

**api\_response** [False] If `True`: an `API_Response` key will be present in the return data, containing the raw output from the Docker API.

**fileobj** Allows for a file-like object containing the contents of the Dockerfile to be passed in place of a file path argument. This argument should not be used from the CLI, only from other Salt code.

**dockerfile** Allows for an alternative Dockerfile to be specified. Path to alternative Dockerfile is relative to the build path for the Docker container.

New in version develop.

**buildargs** A dictionary of build arguments provided to the docker build process.

#### RETURN DATA

A dictionary containing one or more of the following keys:

- **Id** - ID of the newly-built image
- **Time\_Elapsed** - Time in seconds taken to perform the build
- **Intermediate\_Containers** - IDs of containers created during the course of the build process

*(Only present if rm=False)*

• **Images** - A dictionary containing one or more of the following keys:

- **Already\_Pulled** - Layers that that were already present on the Minion
- **Pulled** - Layers that that were pulled

*(Only present if the image specified by the ``image`` argument was not present on the Minion, or if cache=False)*

• **Status** - A string containing a summary of the pull action (usually a message saying that an image was downloaded, or that it was up to date).

*(Only present if the image specified by the ``image`` argument was not present on the Minion, or if cache=False)*

CLI Example:

```
salt myminion docker.build /path/to/docker/build/dir image=myimage:dev
salt myminion docker.build https://github.com/myuser/myrepo.git image=myimage:
↳latest

.. versionadded:: develop

salt myminion docker.build /path/to/docker/build/dir dockerfile=Dockefile.
↳different image=myimage:dev
```

**salt.modules.dockermod.call**(name, function, \*args, \*\*kwargs)

Executes a Salt function inside a running container

New in version 2016.11.0.

The container does not need to have Salt installed, but Python is required.

**name** Container name or ID

**function** Salt execution module function

CLI Example:

```
salt myminion docker.call test.ping
salt myminion test.arg arg1 arg2 key1=val1
salt myminion dockerng.call compassionate_mirzakhani test.arg arg1 arg2 key1=val1
```

**salt.modules.dockermod.commit**(name, image, message=None, author=None)

Commits a container, thereby promoting it to an image. Equivalent to running the `docker commit` Docker CLI command.

**name** Container name or ID to commit

**image** Image to be committed, in `repo:tag` notation. If just the repository name is passed, a tag name of `latest` will be assumed.

**message** Commit message (Optional)

**author** Author name (Optional)

#### RETURN DATA

A dictionary containing the following keys:

- **Id** - ID of the newly-created image
- **Image** - Name of the newly-created image
- **Time\_Elapsed** - Time in seconds taken to perform the commit

CLI Example:

```
salt myminion docker.commit mycontainer myuser/myimage
salt myminion docker.commit mycontainer myuser/myimage:mytag
```

**salt.modules.dockermod.compare\_container** (*first, second, ignore=None*)

New in version 2017.7.0.

Compare two containers' Config and HostConfig and return any differences between the two.

**first** Name or ID of first container

**second** Name or ID of second container

**ignore** A comma-separated list (or Python list) of keys to ignore when comparing. This is useful when comparing two otherwise identical containers which have different hostnames.

**salt.modules.dockermod.connect\_container\_to\_network** (*container, network\_id, ipv4\_address=None*)

Connect container to network.

**container** Container name or ID

**network\_id** ID of network

**ipv4\_address** The IPv4 address to connect to the container

New in version 2017.7.0.

CLI Example:

```
salt myminion docker.connect_container_from_network web-1
↪ 1f9d2454d0872b68dd9e8744c6e7a4c66b86f10abacc21e14f7f014f729b2bc
```

**salt.modules.dockermod.copy\_from** (*name, \*args, \*\*kwargs*)

Copy a file from inside a container to the Minion

**name** Container name

**source** Path of the file on the container's filesystem

**dest** Destination on the Minion. Must be an absolute path. If the destination is a directory, the file will be copied into that directory.

**overwrite** [False] Unless this option is set to True, then if a file exists at the location specified by the **dest** argument, an error will be raised.

**makedirs** [False] Create the parent directory on the container if it does not already exist.

#### RETURN DATA

A boolean (True if successful, otherwise False)

CLI Example:

```
salt myminion docker.copy_from mycontainer /var/log/nginx/access.log /home/myuser
```

**salt.modules.dockermod.copy\_to** (*name, \*args, \*\*kwargs*)

Copy a file from the host into a container

**name** Container name

**source** File to be copied to the container. Can be a local path on the Minion or a remote file from the Salt fileservers.

**dest** Destination on the container. Must be an absolute path. If the destination is a directory, the file will be copied into that directory.

**exec\_driver** [None] If not passed, the execution driver will be detected as described *above*.  
**overwrite** [False] Unless this option is set to True, then if a file exists at the location specified by the **dest** argument, an error will be raised.  
**makedirs** [False] Create the parent directory on the container if it does not already exist.

**RETURN DATA**

A boolean (True if successful, otherwise False)

CLI Example:

```
salt myminion docker.copy_to mycontainer /tmp/foo /root/foo
```

`salt.modules.dockermod.create(*args, **kwargs)`

Create a new container

**image** Image from which to create the container

**name** Name for the new container. If not provided, Docker will randomly generate one for you (it will be included in the return data).

**skip\_translate** This function translates Salt CLI or SLS input into the format which `docker-py` expects. However, in the event that Salt's translation logic fails (due to potential changes in the Docker Remote API, or to bugs in the translation code), this argument can be used to exert granular control over which arguments are translated and which are not.

Pass this argument as a comma-separated list (or Python list) of arguments, and translation for each passed argument name will be skipped. Alternatively, pass True and *all* translation will be skipped.

Skipping translation allows for arguments to be formatted directly in the format which `docker-py` expects. This allows for API changes and other issues to be more easily worked around. An example of using this option to skip translation would be:

```
salt myminion docker.create image=centos:7.3.1611 skip_translate=environment ↵
↪environment="{ 'FOO': 'bar' }"
```

See the following links for more information:

- [docker-py Low-level API](#)
- [Docker Engine API](#)

**ignore\_collisions** [False] Since many of `docker-py`'s arguments differ in name from their CLI counterparts (with which most Docker users are more familiar), Salt detects usage of these and aliases them to the `docker-py` version of that argument. However, if both the alias and the `docker-py` version of the same argument (e.g. `env` and `environment`) are used, an error will be raised. Set this argument to True to suppress these errors and keep the `docker-py` version of the argument.

**validate\_ip\_addrs** [True] For parameters which accept IP addresses as input, IP address validation will be performed. To disable, set this to False

**client\_timeout** [60] Timeout in seconds for the Docker client. This is not a timeout for this function, but for receiving a response from the API.

---

**Note:** This is only used if Salt needs to pull the requested image.

---

**CONTAINER CONFIGURATION ARGUMENTS**

**auto\_remove** (or *rm*) [False] Enable auto-removal of the container on daemon side when the container's process exits (analogous to running a docker container with `--rm` on the CLI).

Examples:

- `auto_remove=True`
- `rm=True`

**binds** Files/directories to bind mount. Each bind mount should be passed in one of the following formats:

- `<host_path>:<container_path>` - `host_path` is mounted within the container as `container_path` with read-write access.
- `<host_path>:<container_path>:<selinux_context>` - `host_path` is mounted within the container as `container_path` with read-write access. Additionally, the specified selinux context will be set within the container.
- `<host_path>:<container_path>:<read_only>` - `host_path` is mounted within the container as `container_path`, with the read-only or read-write setting explicitly defined.
- `<host_path>:<container_path>:<read_only>,<selinux_context>` - `host_path` is mounted within the container as `container_path`, with the read-only or read-write setting explicitly defined. Additionally, the specified selinux context will be set within the container.

`<read_only>` can be either `ro` for read-write access, or `rw` for read-only access. When omitted, it is assumed to be read-write.

`<selinux_context>` can be `z` if the volume is shared between multiple containers, or `Z` if the volume should be private.

---

**Note:** When both `<read_only>` and `<selinux_context>` are specified, there must be a comma before `<selinux_context>`.

---

Binds can be expressed as a comma-separated list or a Python list, however in cases where both `ro/rw` and an selinux context are specified, the binds *must* be specified as a Python list.

Examples:

- `binds=/srv/www:/var/www:ro`
- `binds=/srv/www:/var/www:rw`
- `binds=/srv/www:/var/www`
- `binds=["/srv/www:/var/www:ro,Z"]`
- `binds=["/srv/www:/var/www:rw,Z"]`
- `binds=/srv/www:/var/www:Z`

---

**Note:** The second and third examples above are equivalent to each other, as are the last two examples.

---

**blkio\_weight** Block IO weight (relative weight), accepts a weight value between 10 and 1000.

Example: `blkio_weight=100`

**blkio\_weight\_device** Block IO weight (relative device weight), specified as a list of expressions in the format `PATH:WEIGHT`

Example: `blkio_weight_device=/dev/sda:100`

**cap\_add** List of capabilities to add within the container. Can be passed as a comma-separated list or a Python list. Requires Docker 1.2.0 or newer.

Examples:

- `cap_add=SYS_ADMIN,MKNOD`
- `cap_add=["SYS_ADMIN,MKNOD"]`

**cap\_drop** List of capabilities to drop within the container. Can be passed as a comma-separated string or a Python list. Requires Docker 1.2.0 or newer.

Examples:

- `cap_drop=SYS_ADMIN,MKNOD`,
- `cap_drop=["SYS_ADMIN,MKNOD"]`

**command (or *cmd*)** Command to run in the container

Example: `command=bash` or `cmd=bash`

Changed in version 2015.8.1: `cmd` is now also accepted

**cpuset\_cpus (or *cpuset*)** CPUs on which which to allow execution, specified as a string containing a range (e.g. 0-3) or a comma-separated list of CPUs (e.g. 0,1).

Examples:

- `cpuset_cpus="0-3"`
- `cpuset="0,1"`

**cpuset\_mems** Memory nodes on which which to allow execution, specified as a string containing a range (e.g. 0-3) or a comma-separated list of MEMs (e.g. 0,1). Only effective on NUMA systems.

Examples:

- `cpuset_mems="0-3"`
- `cpuset_mems="0,1"`

**cpu\_group** The length of a CPU period in microseconds

Example: `cpu_group=100000`

**cpu\_period** Microseconds of CPU time that the container can get in a CPU period

Example: `cpu_period=50000`

**cpu\_shares** CPU shares (relative weight), specified as an integer between 2 and 1024.

Example: `cpu_shares=512`

**detach** [False] If True, run the container's command in the background (daemon mode)

Example: `detach=True`

**devices** List of host devices to expose within the container

Examples:

- `devices="/dev/net/tun,/dev/xvda1:/dev/xvda1,/dev/xvdb1:/dev/xvdb1:r"`
- `devices=["'/dev/net/tun','/dev/xvda1:/dev/xvda1','/dev/xvdb1:/dev/xvdb1:r']"`

**device\_read\_bps** Limit read rate (bytes per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where `RATE` is either an integer number of bytes, or a string ending in `kb`, `mb`, or `gb`.

Examples:

- `device_read_bps="/dev/sda:1mb,/dev/sdb:5mb"`
- `device_read_bps=["'/dev/sda:100mb','/dev/sdb:5mb']"`

**device\_read\_iops** Limit read rate (I/O per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where `RATE` is a number of I/O operations.

Examples:

- `device_read_iops="/dev/sda:1000,/dev/sdb:500"`
- `device_read_iops=["'/dev/sda:1000','/dev/sdb:500']"`

**device\_write\_bps** Limit write rate (bytes per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where `RATE` is either an integer number of bytes, or a string ending in `kb`, `mb` or `gb`.

Examples:

- `device_write_bps="/dev/sda:100mb,/dev/sdb:50mb"`
- `device_write_bps="['/dev/sda:100mb', '/dev/sdb:50mb']"`

**device\_read\_iops** Limit write rate (I/O per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where `RATE` is a number of I/O operations.

Examples:

- `device_read_iops="/dev/sda:1000,/dev/sdb:500"`
- `device_read_iops="['/dev/sda:1000', '/dev/sdb:500']"`

**dns** List of DNS nameservers. Can be passed as a comma-separated list or a Python list.

Examples:

- `dns=8.8.8.8,8.8.4.4`
- `dns=["8.8.8.8', '8.8.4.4']"`

---

**Note:** To skip IP address validation, use `validate_ip_addrs=False`

---

**dns\_opt** Additional options to be added to the container's `resolv.conf` file

Example: `dns_opt=ndots:9`

**dns\_search** List of DNS search domains. Can be passed as a comma-separated list or a Python list.

Examples:

- `dns_search=foo1.domain.tld,foo2.domain.tld`
- `dns_search=["foo1.domain.tld,foo2.domain.tld"]"`

**domainname** The domain name to use for the container

Example: `domainname=domain.tld`

**entrypoint** Entrypoint for the container. Either a string (e.g. `"mycmd --arg1 --arg2"`) or a Python list (e.g. `"['mycmd', '--arg1', '--arg2']"`)

Examples:

- `entrypoint="cat access.log"`
- `entrypoint=["cat', 'access.log']"`

**environment (or *env*)** Either a dictionary of environment variable names and their values, or a Python list of strings in the format `VARNAME=value`.

Examples:

- `environment='VAR1=value,VAR2=value'`
- `environment=["VAR1=value', 'VAR2=value']"`
- `environment={"VAR1": 'value', 'VAR2': 'value'}"`

**extra\_hosts** Additional hosts to add to the container's `/etc/hosts` file. Can be passed as a comma-separated list or a Python list. Requires Docker 1.3.0 or newer.

Examples:

- `extra_hosts=web1:10.9.8.7,web2:10.9.8.8`

- `extra_hosts="['web1:10.9.8.7', 'web2:10.9.8.8']"`
- `extra_hosts="{ 'web1': '10.9.8.7', 'web2': '10.9.8.8' }"`

---

**Note:** To skip IP address validation, use `validate_ip_addrs=False`

---

**group\_add** List of additional group names and/or IDs that the container process will run as

Examples:

- `group_add=web,network`
- `group_add="['web', 'network']"`

**hostname** Hostname of the container. If not provided, and if a name has been provided, the hostname will default to the name that was passed.

Example: `hostname=web1`

**Warning:** If the container is started with `network_mode=host`, the hostname will be overridden by the hostname of the Minion.

**interactive (or *stdin\_open*):** `False` Leave stdin open, even if not attached

Examples:

- `interactive=True`
- `stdin_open=True`

**ipc\_mode (or *ipc*)** Set the IPC mode for the container. The default behavior is to create a private IPC namespace for the container, but this option can be used to change that behavior:

- `container:<container_name_or_id>` reuses another container shared memory, semaphores and message queues
- `host`: use the host's shared memory, semaphores and message queues

Examples:

- `ipc_mode=container:foo`
- `ipc=host`

**Warning:** Using `host` gives the container full access to local shared memory and is therefore considered insecure.

**isolation** Specifies the type of isolation technology used by containers

Example: `isolation=hyperv`

---

**Note:** The default value on Windows server is `process`, while the default value on Windows client is `hyperv`. On Linux, only `default` is supported.

---

**labels (or *label*)** Add metadata to the container. Labels can be set both with and without values:

Examples (*with* values):

- `labels="label1=value1,label2=value2"`
- `labels=["label1=value1', 'label2=value2']"`

- `labels="{ 'label1': 'value1', 'label2': 'value2' }"`

Examples (*without* values):

- `labels=label1,label2`
- `labels=["label1','label2']"`

**links** Link this container to another. Links should be specified in the format `<container_name_or_id>:<link_alias>`. Multiple links can be passed, either as a comma separated list or a Python list.

Examples:

- `links=web1:link1,web2:link2,`
- `links=["web1:link1','web2:link2']"`
- `links="{ 'web1': 'link1', 'web2': 'link2' }"`

**log\_driver** Set container's logging driver. Requires Docker 1.6 or newer.

Example:

- `log_driver=syslog`

---

**Note:** The logging driver feature was improved in Docker 1.13 introducing option name changes. Please see Docker's [Configure logging drivers](#) documentation for more information.

---

**log\_opt** Config options for the `log_driver` config option. Requires Docker 1.6 or newer.

Example:

- `log_opt="syslog-address=tcp://192.168.0.42,syslog-facility=daemon"`
- `log_opt=["syslog-address=tcp://192.168.0.42', `syslog-facility=daemon']"`
- `log_opt="{ `syslog-address': `tcp://192.168.0.42', `syslog-facility: daemon"`

**lxc\_conf** Additional LXC configuration parameters to set before starting the container.

Examples:

- `lxc_conf="lxc.utsname=docker,lxc.arch=x86_64"`
- `lxc_conf=["lxc.utsname=docker','lxc.arch=x86_64']"`
- `lxc_conf="{ 'lxc.utsname': 'docker', 'lxc.arch': 'x86_64' }"`

---

**Note:** These LXC configuration parameters will only have the desired effect if the container is using the LXC execution driver, which has been deprecated for some time.

---

**mac\_address** MAC address to use for the container. If not specified, a random MAC address will be used.

Example: `mac_address=01:23:45:67:89:0a`

**mem\_limit (or *memory*)** [0] Memory limit. Can be specified in bytes or using single-letter units (i.e. 512M, 2G, etc.). A value of 0 (the default) means no memory limit.

Examples:

- `mem_limit=512M`
- `memory=1073741824`

**mem\_swappiness** Tune a container's memory swappiness behavior. Accepts an integer between 0 and 100.

Example: `mem_swappiness=60`

**memswap\_limit (or *memory\_swap*)** [-1] Total memory limit (memory plus swap). Set to -1 to disable swap. A value of 0 means no swap limit.

Examples:

- `memswap_limit=1G`
- `memory_swap=2147483648`

**network\_disabled** [False] If True, networking will be disabled within the container

Example: `network_disabled=True`

**network\_mode** [bridge] One of the following:

- `bridge` - Creates a new network stack for the container on the docker bridge
- `none` - No networking (equivalent of the Docker CLI argument `--net=none`). Not to be confused with Python's None.
- `container:<name_or_id>` - Reuses another container's network stack
- `host` - Use the host's network stack inside the container

**Warning:** Using host mode gives the container full access to the hosts system's services (such as D-Bus), and is therefore considered insecure.

Examples:

- `network_mode=null`
- `network_mode=container:web1`

**oom\_kill\_disable** Whether to disable OOM killer

Example: `oom_kill_disable=False`

**oom\_score\_adj** An integer value containing the score given to the container in order to tune OOM killer preferences

Example: `oom_score_adj=500`

**pid\_mode** Set to `host` to use the host container's PID namespace within the container. Requires Docker 1.5.0 or newer.

Example: `pid_mode=host`

**pids\_limit** Set the container's PID limit. Set to -1 for unlimited.

Example: `pids_limit=2000`

**port\_bindings (or *publish*)** Bind exposed ports which were exposed using the `ports` argument to `docker.create`. These should be passed in the same way as the `--publish` argument to the `docker run` CLI command:

- `ip:hostPort:containerPort` - Bind a specific IP and port on the host to a specific port within the container.
- `ip::containerPort` - Bind a specific IP and an ephemeral port to a specific port within the container.
- `hostPort:containerPort` - Bind a specific port on all of the host's interfaces to a specific port within the container.
- `containerPort` - Bind an ephemeral port on all of the host's interfaces to a specific port within the container.

Multiple bindings can be separated by commas, or passed as a Python list. The below two examples are equivalent:

- `port_bindings="5000:5000,2123:2123/udp,8080"`
- `port_bindings=["5000:5000', '2123:2123/udp', 8080]"`

Port bindings can also include ranges:

- `port_bindings="14505-14506:4505-4506"`

---

**Note:** When specifying a protocol, it must be passed in the `containerPort` value, as seen in the examples above.

---

**ports** A list of ports to expose on the container. Can be passed as comma-separated list or a Python list. If the protocol is omitted, the port will be assumed to be a TCP port.

Examples:

- `ports=1111,2222/udp`
- `ports=["1111, '2222/udp']"`

**privileged** [False] If True, runs the exec process with extended privileges

Example: `privileged=True`

**publish\_all\_ports** (or **publish\_all**): False Publish all ports to the host

Example: `publish_all_ports=True`

**read\_only** [False] If True, mount the container's root filesystem as read only

Example: `read_only=True`

**restart\_policy** (or **restart**) Set a restart policy for the container. Must be passed as a string in the format `policy[:retry_count]` where `policy` is one of `always`, `unless-stopped`, or `on-failure`, and `retry_count` is an optional limit to the number of retries. The retry count is ignored when using the `always` or `unless-stopped` restart policy.

Examples:

- `restart_policy=on-failure:5`
- `restart_policy=always`

**security\_opt** Security configuration for MLS systems such as SELinux and AppArmor. Can be passed as a comma-separated list or a Python list.

Examples:

- `security_opt=apparmor:unconfined,param2:value2`
- `security_opt='["apparmor:unconfined", "param2:value2"]'`

---

**Important:** Some security options can contain commas. In these cases, this argument *must* be passed as a Python list, as splitting by comma will result in an invalid configuration.

---

---

**Note:** See the documentation for `security_opt` at <https://docs.docker.com/engine/reference/run/#security-configuration>

---

**shm\_size** Size of /dev/shm

Example: `shm_size=128M`

**stop\_signal** The signal used to stop the container. The default is SIGTERM.

Example: `stop_signal=SIGRTMIN+3`

**stop\_timeout** Timeout to stop the container, in seconds

Example: `stop_timeout=5`

**storage\_opt** Storage driver options for the container

Examples:

- `storage_opt='dm.basesize=40G'`
- `storage_opt=['dm.basesize=40G']`
- `storage_opt={'dm.basesize': '40G'}`

**sysctls (or *sysctl*)** Set sysctl options for the container

Examples:

- `sysctl='fs.nr_open=1048576,kernel.pid_max=32768'`
- `sysctls=['fs.nr_open=1048576','kernel.pid_max=32768']`
- `sysctls={'fs.nr_open': '1048576','kernel.pid_max': '32768'}`

**tmpfs** A map of container directories which should be replaced by tmpfs mounts, and their corresponding mount options. Can be passed as Python list of PATH:VALUE mappings, or a Python dictionary. However, since commas usually appear in the values, this option *cannot* be passed as a comma-separated list.

Examples:

- `tmpfs=['/run:rw,noexec,nosuid,size=65536k','/var/lib/mysql:rw,noexec,nosuid,s`
- `tmpfs={'/run': 'rw,noexec,nosuid,size=65536k','/var/lib/mysql': 'rw,noexec,nosuid,size=600m'}`

**tty** [False] Attach TTYs

Example: `tty=True`

**ulimits (or *ulimit*)** List of ulimits. These limits should be passed in the format `<ulimit_name>:<soft_limit>:<hard_limit>`, with the hard limit being optional. Can be passed as a comma-separated list or a Python list.

Examples:

- `ulimits='nofile=1024:1024,nproc=60'`
- `ulimits=['nofile=1024:1024','nproc=60']`

**user** User under which to run exec process

Example: `user=foo`

**usersns\_mode (or *user\_ns\_mode*)** Sets the user namespace mode, when the user namespace remapping option is enabled.

Example: `usersns_mode=host`

**volumes (or *volume*)** List of directories to expose as volumes. Can be passed as a comma-separated list or a Python list.

Examples:

- `volumes=/mnt/vol1,/mnt/vol2`
- `volume=['/mnt/vol1','/mnt/vol2']`

**volumes\_from** Container names or IDs from which the container will get volumes. Can be passed as a comma-separated list or a Python list.

Example: `volumes_from=foo,volumes_from=foo,bar,volumes_from=['foo,bar']`

**volume\_driver** Sets the container's volume driver

Example: `volume_driver=foobar`

**working\_dir** (or *workdir*) Working directory inside the container

Examples:

- `working_dir=/var/log/nginx`
- `workdir=/var/www/myapp`

#### RETURN DATA

A dictionary containing the following keys:

- **Id** - ID of the newly-created container
- **Name** - Name of the newly-created container

CLI Example:

```
# Create a data-only container
salt myminion docker.create myuser/mycontainer volumes="/mnt/vol1,/mnt/vol2"
# Create a CentOS 7 container that will stay running once started
salt myminion docker.create centos:7 name=mycent7 interactive=True tty=True
↳ command=bash
```

`salt.modules.dockermod.create_network` (*name*, *driver=None*)

Create a new network

**network\_id** ID of network

**driver** Driver of the network

CLI Example:

```
salt myminion docker.create_network web_network driver=bridge
```

`salt.modules.dockermod.create_volume` (*name*, *driver=None*, *driver\_opts=None*)

Create a new volume

New in version 2015.8.4.

**name** name of volume

**driver** Driver of the volume

**driver\_opts** Options for the driver volume

CLI Example:

```
salt myminion docker.create_volume my_volume driver=local
```

`salt.modules.dockermod.dangling` (*prune=False*, *force=False*)

Return top-level images (those on which no other images depend) which do not have a tag assigned to them.

These include:

- Images which were once tagged but were later untagged, such as those which were superseded by committing a new copy of an existing tagged image.
- Images which were loaded using `docker.load` (or the `docker load` Docker CLI command), but not tagged.

**prune** [False] Remove these images

**force** [False] If True, and if `prune=True`, then forcibly remove these images.

#### RETURN DATA

If `prune=False`, the return data will be a list of dangling image IDs.

If `prune=True`, the return data will be a dictionary with each key being the ID of the dangling image, and the following information for each image:

- Comment - Any error encountered when trying to prune a dangling image  
(Only present if prune failed)
- Removed - A boolean (True if prune was successful, False if not)

CLI Example:

```
salt myminion docker.dangling
salt myminion docker.dangling prune=True
```

`salt.modules.dockermod.depends`(*name*)

Returns the containers and images, if any, which depend on the given image

**name** Name or ID of image

**RETURN DATA**

A dictionary containing the following keys:

- Containers - A list of containers which depend on the specified image
- Images - A list of IDs of images which depend on the specified image

CLI Example:

```
salt myminion docker.depends myimage
salt myminion docker.depends 0123456789ab
```

`salt.modules.dockermod.diff`(*name*, \**args*, \*\**kwargs*)

Get information on changes made to container's filesystem since it was created. Equivalent to running the `docker diff` Docker CLI command.

**name** Container name or ID

**RETURN DATA**

A dictionary containing any of the following keys:

- Added - A list of paths that were added.
- Changed - A list of paths that were changed.
- Deleted - A list of paths that were deleted.

These keys will only be present if there were changes, so if the container has no differences the return dict will be empty.

CLI Example:

```
salt myminion docker.diff mycontainer
```

`salt.modules.dockermod.disconnect_container_from_network`(*container*, *network\_id*)

Disconnect container from network.

**container** Container name or ID

**network\_id** ID of network

CLI Example:

```
salt myminion docker.disconnect_container_from_network web-1
→1f9d2454d0872b68dd9e8744c6e7a4c66b86f10abacc21e14f7f014f729b2bc
```

`salt.modules.dockermod.exists`(*name*)

Check if a given container exists

**name** Container name or ID

**RETURN DATA**

A boolean (True if the container exists, otherwise False)

CLI Example:

```
salt myminion docker.exists mycontainer
```

`salt.modules.dockermod.export`(*name*, \**args*, \*\**kwargs*)

Exports a container to a tar archive. It can also optionally compress that tar archive, and push it up to the Master.

**name** Container name or ID

**path** Absolute path on the Minion where the container will be exported

**overwrite** [False] Unless this option is set to True, then if a file exists at the location specified by the path argument, an error will be raised.

**makedirs** [False] If True, then if the parent directory of the file specified by the path argument does not exist, Salt will attempt to create it.

**compression** [None] Can be set to any of the following:

- `gzip` or `gz` for gzip compression
- `bzip2` or `bz2` for bzip2 compression
- `xz` or `lzma` for XZ compression (requires `xz-utils`, as well as the `lzma` module from Python 3.3, available in Python 2 and Python 3.0-3.2 as `backports.lzma`)

This parameter can be omitted and Salt will attempt to determine the compression type by examining the filename passed in the path parameter.

**push** [False] If True, the container will be pushed to the master using `cp.push`.

---

**Note:** This requires `file_recv` to be set to True on the Master.

---

## RETURN DATA

A dictionary will containing the following keys:

- `Path` - Path of the file that was exported
- `Push` - Reports whether or not the file was successfully pushed to the Master

*(Only present if push=True)*

- `Size` - Size of the file, in bytes
- `Size_Human` - Size of the file, in human-readable units
- `Time_Elapsed` - Time in seconds taken to perform the export

CLI Examples:

```
salt myminion docker.export mycontainer /tmp/mycontainer.tar
salt myminion docker.export mycontainer /tmp/mycontainer.tar.xz push=True
```

`salt.modules.dockermod.get_client_args`()

New in version 2016.3.6,2016.11.4,2017.7.0.

Changed in version 2017.7.0: Replaced the container config args with the ones from the API's `create_container` function.

Returns the args for docker-py's [low-level API](#), organized by args for container creation, host config, and networking config.

CLI Example:

```
salt myminion docker.get_client_args
```

`salt.modules.dockermod.history`(*name*, *quiet=False*)

Return the history for an image. Equivalent to running the `docker history` Docker CLI command.

**name** Container name or ID

**quiet** [False] If True, the return data will simply be a list of the commands run to build the container.

```

$ salt myminion docker.history nginx:latest quiet=True
myminion:
  - FROM scratch
  - ADD file:
    ↪ef063ed0ae9579362871b9f23d2bc0781ef7cd4de6ac822052cf6c9c5a12b1e2 in /
  - CMD ["/bin/bash"]
  - MAINTAINER NGINX Docker Maintainers "docker-maint@nginx.com"
  - apt-key adv --keyserver pgp.mit.edu --recv-keys
    ↪573BFD6B3D8FBC641079A6ABABF5BD827BD9BF62
  - echo "deb http://nginx.org/packages/mainline/debian/ wheezy nginx" >> /
    ↪etc/apt/sources.list
  - ENV NGINX_VERSION=1.7.10-1~wheezy
  - apt-get update && apt-get install -y ca-certificates nginx=${NGINX_
    ↪VERSION} && rm -rf /var/lib/apt/lists/*
  - ln -sf /dev/stdout /var/log/nginx/access.log
  - ln -sf /dev/stderr /var/log/nginx/error.log
  - VOLUME ["/var/cache/nginx"]
  - EXPOSE map[80/tcp:{}] 443/tcp:[]
  - CMD [nginx -g daemon off;]
      https://github.com/saltstack/salt/pull/22421

```

### RETURN DATA

If `quiet=False`, the return value will be a list of dictionaries containing information about each step taken to build the image. The keys in each step include the following:

- Command - The command executed in this build step
- Id - Layer ID
- Size - Cumulative image size, in bytes
- Size\_Human - Cumulative image size, in human-readable units
- Tags - Tag(s) assigned to this layer
- Time\_Created\_Epoch - Time this build step was completed (Epoch time)
- Time\_Created\_Local - Time this build step was completed (Minion's local timezone)

CLI Example:

```
salt myminion docker.exists mycontainer
```

`salt.modules.dockermod.images` (*verbose=False, \*\*kwargs*)

Returns information about the Docker images on the Minion. Equivalent to running the `docker images` Docker CLI command.

**all** [False] If True, untagged images will also be returned

**verbose** [False] If True, a `docker inspect` will be run on each image returned.

### RETURN DATA

A dictionary with each key being an image ID, and each value some general info about that image (time created, size, tags associated with the image, etc.)

CLI Example:

```
salt myminion docker.images
salt myminion docker.images all=True
```

`salt.modules.dockermod.import` (*source, image, api\_response=False*)

Imports content from a local tarball or a URL as a new docker image

**source** Content to import (URL or absolute path to a tarball). URL can be a file on the Salt fileservers (i.e. `salt://path/to/rootfs/tarball.tar.xz`). To import a file from a saltenv other than base (e.g. `dev`), pass it at the end of the URL (ex. `salt://path/to/rootfs/tarball.tar.xz?saltenv=dev`).

**image** Image to be created by the import, in `repo:tag` notation. If just the repository name is passed, a tag name of `latest` will be assumed.

**api\_response** [False] If True an `api_response` key will be present in the return data, containing the raw output from the Docker API.

#### RETURN DATA

A dictionary containing the following keys:

- Id** - ID of the newly-created image
- Image** - Name of the newly-created image
- Time\_Elapsed** - Time in seconds taken to perform the commit

CLI Example:

```
salt myminion docker.import /tmp/cent7-minimal.tar.xz myuser/centos
salt myminion docker.import /tmp/cent7-minimal.tar.xz myuser/centos:7
salt myminion docker.import salt://dockerimages/cent7-minimal.tar.xz myuser/
↪centos:7
```

**salt.modules.dockermod.info()**

Returns a dictionary of system-wide information. Equivalent to running the `docker info` Docker CLI command.

CLI Example:

```
salt myminion docker.info
```

**salt.modules.dockermod.inspect(name)**

Changed in version 2017.7.0: Volumes and networks are now checked, in addition to containers and images.

This is a generic container/image/volume/network inspecton function. It will run the following functions in order:

- `docker.inspect_container`
- `docker.inspect_image`
- `docker.inspect_volume`
- `docker.inspect_network`

The first of these to find a match will be returned.

**name** Container/image/volume/network name or ID

#### RETURN DATA

A dictionary of container/image/volume/network information

CLI Example:

```
salt myminion docker.inspect mycontainer
salt myminion docker.inspect busybox
```

**salt.modules.dockermod.inspect\_container(name, \*args, \*\*kwargs)**

Retrieves container information. Equivalent to running the `docker inspect` Docker CLI command, but will only look for container information.

**name** Container name or ID

#### RETURN DATA

A dictionary of container information

CLI Example:

```
salt myminion docker.inspect_container mycontainer
salt myminion docker.inspect_container 0123456789ab
```

`salt.modules.dockermod.inspect_image(name)`

Retrieves image information. Equivalent to running the `docker inspect` Docker CLI command, but will only look for image information.

**Note:** To inspect an image, it must have been pulled from a registry or built locally. Images on a Docker registry which have not been pulled cannot be inspected.

**name** Image name or ID

#### RETURN DATA

A dictionary of image information

CLI Examples:

```
salt myminion docker.inspect_image busybox
salt myminion docker.inspect_image centos:6
salt myminion docker.inspect_image 0123456789ab
```

`salt.modules.dockermod.inspect_network(network_id)`

Inspect Network

**network\_id** ID of network

CLI Example:

```
salt myminion docker.inspect_network
↪ 1f9d2454d0872b68dd9e8744c6e7a4c66b86f10abacc21e14f7f014f729b2bc
```

`salt.modules.dockermod.inspect_volume(name)`

Inspect Volume

New in version 2015.8.4.

**name** Name of volume

CLI Example:

```
salt myminion docker.inspect_volume my_volume
```

`salt.modules.dockermod.kill(*args, **kwargs)`

Kill all processes in a running container instead of performing a graceful shutdown

**name** Container name or ID

#### RETURN DATA

A dictionary will be returned, containing the following keys:

- **status** - A dictionary showing the prior state of the container as well as the new state
- **result** - A boolean noting whether or not the action was successful
- **comment** - Only present if the container cannot be killed

CLI Example:

```
salt myminion docker.kill mycontainer
```

`salt.modules.dockermod.layers(name)`

Returns a list of the IDs of layers belonging to the specified image, with the top-most layer (the one corresponding to the passed name) appearing last.

**name** Image name or ID

CLI Example:

```
salt myminion docker.layers centos:7
```

`salt.modules.dockermod.list_containers(**kwargs)`

Returns a list of containers by name. This is different from `docker.ps` in that `docker.ps` returns its results organized by container ID.

**all** [False] If True, stopped containers will be included in return data

CLI Example:

```
salt myminion docker.inspect_image <image>
```

`salt.modules.dockermod.list_tags()`

Returns a list of tagged images

CLI Example:

```
salt myminion docker.list_tags
```

`salt.modules.dockermod.load(path, image=None)`

Load a tar archive that was created using `docker.save` (or via the Docker CLI using `docker save`).

**path** Path to docker tar archive. Path can be a file on the Minion, or the URL of a file on the Salt fileserver (i.e. `salt://path/to/docker/saved/image.tar`). To load a file from a saltenv other than base (e.g. `dev`), pass it at the end of the URL (ex. `salt://path/to/rootfs/tarball.tar.xz?saltenv=dev`).

**image** [None] If specified, the topmost layer of the newly-loaded image will be tagged with the specified repo and tag using `docker.tag`. The image name should be specified in `repo:tag` notation. If just the repository name is passed, a tag name of `latest` will be assumed.

#### RETURN DATA

A dictionary will be returned, containing the following keys:

- Path** - Path of the file that was saved
- Layers** - A list containing the IDs of the layers which were loaded. Any layers in the file that was loaded, which were already present on the Minion, will not be included.
- Image** - Name of tag applied to topmost layer

*(Only present if tag was specified and tagging was successful)*

- Time\_Elapsed** - Time in seconds taken to load the file
- Warning** - Message describing any problems encountered in attempt to tag the topmost layer

*(Only present if tag was specified and tagging failed)*

CLI Example:

```
salt myminion docker.load /path/to/image.tar
salt myminion docker.load salt://path/to/docker/saved/image.tar image=myuser/
↳myimage:mytag
```

`salt.modules.dockermod.login(*registries)`

New in version 2016.3.7,2016.11.4,2017.7.0.

Performs a `docker login` to authenticate to one or more configured repositories. See the documentation at the top of this page to configure authentication credentials.

Multiple registry URLs (matching those configured in Pillar) can be passed, and Salt will attempt to login to *just* those registries. If no registry URLs are provided, Salt will attempt to login to *all* configured registries.

#### RETURN DATA

A dictionary containing the following keys:

- Results** - A dictionary mapping registry URLs to the authentication result. True means a successful login, False means a failed login.
- Errors** - A list of errors encountered during the course of this function.

CLI Example:

```
salt myminion docker.login
salt myminion docker.login hub
salt myminion docker.login hub https://mydomain.tld/registry/
```

**salt.modules.dockermod.logs**(*name*)

Returns the logs for the container. Equivalent to running the `docker logs` Docker CLI command.

**name** Container name or ID

CLI Example:

```
salt myminion docker.logs mycontainer
```

**salt.modules.dockermod.networks**(*names=None, ids=None*)

Changed in version 2017.7.0: The `names` and `ids` can be passed as a comma-separated list now, as well as a Python list.

List existing networks

**names** Filter by name

**ids** Filter by id

CLI Example:

```
salt myminion docker.networks names=network-web
salt myminion docker.networks
↳ ids=1f9d2454d0872b68dd9e8744c6e7a4c66b86f10abacc21e14f7f014f729b2bc
```

**salt.modules.dockermod.pause**(*\*args, \*\*kwargs*)

Pauses a container

**name** Container name or ID

**RETURN DATA**

A dictionary will be returned, containing the following keys:

- **status** - A dictionary showing the prior state of the container as well as the new state
- **result** - A boolean noting whether or not the action was successful
- **comment** - Only present if the container cannot be paused

CLI Example:

```
salt myminion docker.pause mycontainer
```

**salt.modules.dockermod.pid**(*name, \*args, \*\*kwargs*)

Returns the PID of a container

**name** Container name or ID

CLI Example:

```
salt myminion docker.pid mycontainer
salt myminion docker.pid 0123456789ab
```

**salt.modules.dockermod.port**(*name, \*args, \*\*kwargs*)

Returns port mapping information for a given container. Equivalent to running the `docker port` Docker CLI command.

**name** Container name or ID

**private\_port** [None] If specified, get information for that specific port. Can be specified either as a port number (i.e. 5000), or as a port number plus the protocol (i.e. 5000/udp).

If this argument is omitted, all port mappings will be returned.

**RETURN DATA**

A dictionary of port mappings, with the keys being the port and the values being the mapping(s) for that port.

CLI Examples:

```
salt myminion docker.port mycontainer
salt myminion docker.port mycontainer 5000
salt myminion docker.port mycontainer 5000/udp
```

`salt.modules.dockermod.ps` (*filters=None, \*\*kwargs*)

Returns information about the Docker containers on the Minion. Equivalent to running the `docker ps` Docker CLI command.

**all** [False] If True, stopped containers will also be returned

**host**: False If True, local host's network topology will be included

**verbose** [False] If True, a `docker inspect` will be run on each container returned.

**filters**: None A dictionary of filters to be processed on the container list. Available filters:

- **exited** (int): Only containers with specified exit code
- **status** (str): One of restarting, running, paused, exited
- **label** (str): format either `key` or `key=value`

#### RETURN DATA

A dictionary with each key being an container ID, and each value some general info about that container (time created, name, command, etc.)

CLI Example:

```
salt myminion docker.ps
salt myminion docker.ps all=True
salt myminion docker.ps filters="{label: 'role=web'}"
```

`salt.modules.dockermod.pull` (*image, insecure\_registry=False, api\_response=False, client\_timeout=60*)

Pulls an image from a Docker registry

**image** Image to be pulled, in `repo:tag` notation. If just the repository name is passed, a tag name of `latest` will be assumed.

**insecure\_registry** [False] If True, the Docker client will permit the use of insecure (non-HTTPS) registries.

**api\_response** [False] If True, an `API_Response` key will be present in the return data, containing the raw output from the Docker API.

---

**Note:** This may result in a **lot** of additional return data, especially for larger images.

---

**client\_timeout** Timeout in seconds for the Docker client. This is not a timeout for this function, but for receiving a response from the API.

#### RETURN DATA

A dictionary will be returned, containing the following keys:

• **Layers** - A dictionary containing one or more of the following keys:

- `Already_Pulled` - Layers that that were already present on the Minion
- `Pulled` - Layers that that were pulled

• **Status** - A string containing a summary of the pull action (usually a message saying that an image was downloaded, or that it was up to date).

• **Time\_Elapsed** - Time in seconds taken to perform the pull

CLI Example:

```
salt myminion docker.pull centos
salt myminion docker.pull centos:6
```

`salt.modules.dockermod.push`(*image*, *insecure\_registry=False*, *api\_response=False*, *client\_timeout=60*)

Changed in version 2015.8.4: The `Id` and `Image` keys are no longer present in the return data. This is due to changes in the Docker Remote API.

Pushes an image to a Docker registry. See the documentation at top of this page to configure authentication credentials.

**image** Image to be pushed, in `repo:tag` notation.

Changed in version 2015.8.4: If just the repository name is passed, then all tagged images for the specified repo will be pushed. In prior releases, a tag of `latest` was assumed if the tag was omitted.

**insecure\_registry** [False] If True, the Docker client will permit the use of insecure (non-HTTPS) registries.

**api\_response** [False] If True, an `API_Response` key will be present in the return data, containing the raw output from the Docker API.

**client\_timeout** Timeout in seconds for the Docker client. This is not a timeout for this function, but for receiving a response from the API.

#### RETURN DATA

A dictionary will be returned, containing the following keys:

- **Layers** - A dictionary containing one or more of the following keys:

- `Already_Pushed` - Layers that that were already present on the Minion

- `Pushed` - Layers that that were pushed

- **Time\_Elapsed** - Time in seconds taken to perform the push

CLI Example:

```
salt myminion docker.push myuser/mycontainer
salt myminion docker.push myuser/mycontainer:mytag
```

`salt.modules.dockermod.remove_network`(*network\_id*)

Remove a network

**network\_id** ID of network

CLI Example:

```
salt myminion docker.remove_network 1f9d2454d0872b68dd9e8744c6e7a4c66b86f10abacc21e14f7f014f729b2bc
```

`salt.modules.dockermod.remove_volume`(*name*)

Remove a volume

New in version 2015.8.4.

**name** Name of volume

CLI Example:

```
salt myminion docker.remove_volume my_volume
```

`salt.modules.dockermod.rename`(*name*, *new\_name*)

New in version 2017.7.0.

Renames a container. Returns `True` if successful, and raises an error if the API returns one. If unsuccessful and the API returns no error (should not happen), then `False` will be returned.

**name** Name or ID of existing container

**new\_name** New name to assign to container

CLI Example:

```
salt myminion docker.rename foo bar
```

`salt.modules.dockermod.resolve_tag(name, tags=None)`

New in version 2017.7.2, Oxygen.

Given an image tag, check the locally-pulled tags (using `docker.list_tags`) and return the matching tag. This helps disambiguate differences on some platforms where images from the Docker Hub are prefixed with `docker.io/`. If an image name with no tag is passed, a tag of `latest` is assumed.

If the specified image is not pulled locally, this function will return `False`.

**tags** An optional Python list of tags to check against. If passed, then `docker.list_tags` will not be run to get a list of tags. This is useful when resolving a number of tags at the same time.

CLI Examples:

```
salt myminion docker.resolve_tag busybox
salt myminion docker.resolve_tag busybox:latest
```

`salt.modules.dockermod.restart(name, *args, **kwargs)`

Restarts a container

**name** Container name or ID

**timeout** [10] Timeout in seconds after which the container will be killed (if it has not yet gracefully shut down)

#### RETURN DATA

A dictionary will be returned, containing the following keys:

- **status** - A dictionary showing the prior state of the container as well as the new state
- **result** - A boolean noting whether or not the action was successful
- **restarted** - If restart was successful, this key will be present and will be set to `True`.

CLI Examples:

```
salt myminion docker.restart mycontainer
salt myminion docker.restart mycontainer timeout=20
```

`salt.modules.dockermod.retcode(name, cmd, exec_driver=None, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)`

Run `cmd.retcode` within a container

**name** Container name or ID in which to run the command

**cmd** Command to run

**exec\_driver** [None] If not passed, the execution driver will be detected as described [above](#).

**stdin** [None] Standard input to be used for the command

**output\_loglevel** [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

**use\_vt** [False] Use SaltStack's `utils.vt` to stream output to console.

**keep\_env** [None] If not passed, only a sane default `PATH` environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.retcode mycontainer 'ls -l /etc'
```

`salt.modules.dockermod.rm(*args, **kwargs)`

Removes a container

**name** Container name or ID

**force** [False] If `True`, the container will be killed first before removal, as the Docker API will not permit a running container to be removed. This option is set to `False` by default to prevent accidental removal of a running container.

**stop** [False] If `True`, the container will be stopped first before removal, as the Docker API will not permit a running container to be removed. This option is set to `False` by default to prevent accidental removal

of a running container.

New in version 2017.7.0.

**volumes** [False] Also remove volumes associated with container

#### RETURN DATA

A list of the IDs of containers which were removed

CLI Example:

```
salt myminion docker.rm mycontainer
salt myminion docker.rm mycontainer force=True
```

`salt.modules.dockermod.rmi(*names, **kwargs)`

Removes an image

**name** Name (in `repo:tag` notation) or ID of image.

**force** [False] If True, the image will be removed even if the Minion has containers created from that image

**prune** [True] If True, untagged parent image layers will be removed as well, set this to False to keep them.

#### RETURN DATA

A dictionary will be returned, containing the following two keys:

- Layers - A list of the IDs of image layers that were removed
- Tags - A list of the tags that were removed
- Errors - A list of any errors that were encountered

CLI Examples:

```
salt myminion docker.rmi busybox
salt myminion docker.rmi busybox force=True
salt myminion docker.rmi foo bar baz
```

`salt.modules.dockermod.run(name, cmd, exec_driver=None, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)`

Run `cmd.run` within a container

**name** Container name or ID in which to run the command

**cmd** Command to run

**exec\_driver** [None] If not passed, the execution driver will be detected as described [above](#).

**stdin** [None] Standard input to be used for the command

**output\_loglevel** [debug] Level at which to log the output from the command. Set to quiet to suppress logging.

**use\_vt** [False] Use SaltStack's `utils.vt` to stream output to console.

**keep\_env** [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.run mycontainer 'ls -l /etc'
```

`salt.modules.dockermod.run_all(name, cmd, exec_driver=None, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)`

Run `cmd.run_all` within a container

---

**Note:** While the command is run within the container, it is initiated from the host. Therefore, the PID in the return dict is from the host, not from the container.

---

**name** Container name or ID in which to run the command  
**cmd** Command to run  
**exec\_driver** [None] If not passed, the execution driver will be detected as described *above*.  
**stdin** [None] Standard input to be used for the command  
**output\_loglevel** [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.  
**use\_vt** [False] Use SaltStack's `utils.vt` to stream output to console.  
**keep\_env** [None] If not passed, only a sane default `PATH` environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.run_all mycontainer 'ls -l /etc'
```

```
salt.modules.dockermod.run_stderr(name, cmd, exec_driver=None, stdin=None,
                                  python_shell=True, output_loglevel='debug', use_vt=False,
                                  ignore_retcode=False, keep_env=None)
```

Run `cmd.run_stderr` within a container

**name** Container name or ID in which to run the command  
**cmd** Command to run  
**exec\_driver** [None] If not passed, the execution driver will be detected as described *above*.  
**stdin** [None] Standard input to be used for the command  
**output\_loglevel** [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.  
**use\_vt** [False] Use SaltStack's `utils.vt` to stream output to console.  
**keep\_env** [None] If not passed, only a sane default `PATH` environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.run_stderr mycontainer 'ls -l /etc'
```

```
salt.modules.dockermod.run_stdout(name, cmd, exec_driver=None, stdin=None,
                                  python_shell=True, output_loglevel='debug', use_vt=False,
                                  ignore_retcode=False, keep_env=None)
```

Run `cmd.run_stdout` within a container

**name** Container name or ID in which to run the command  
**cmd** Command to run  
**exec\_driver** [None] If not passed, the execution driver will be detected as described *above*.  
**stdin** [None] Standard input to be used for the command  
**output\_loglevel** [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.  
**use\_vt** [False] Use SaltStack's `utils.vt` to stream output to console.  
**keep\_env** [None] If not passed, only a sane default `PATH` environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.run_stdout mycontainer 'ls -l /etc'
```

```
salt.modules.dockermod.save(name, path, overwrite=False, makedirs=False, compression=None,
                             **kwargs)
```

Saves an image and to a file on the minion. Equivalent to running the `docker save` Docker CLI command, but unlike `docker save` this will also work on named images instead of just images IDs.

**name** Name or ID of image. Specify a specific tag by using the `repo:tag` notation.

**path** Absolute path on the Minion where the image will be exported  
**overwrite** [False] Unless this option is set to True, then if the destination file exists an error will be raised.  
**makedirs** [False] If True, then if the parent directory of the file specified by the path argument does not exist, Salt will attempt to create it.

**compression** [None] Can be set to any of the following:

- `gzip` or `gz` for gzip compression
- `bzip2` or `bz2` for bzip2 compression
- `xz` or `lzma` for XZ compression (requires `xz-utils`, as well as the `lzma` module from Python 3.3, available in Python 2 and Python 3.0-3.2 as `backports.lzma`)

This parameter can be omitted and Salt will attempt to determine the compression type by examining the filename passed in the path parameter.

---

**Note:** Since the Docker API does not support `docker save`, compression will be a bit slower with this function than with `docker.export` since the image(s) will first be saved and then the compression done afterwards.

---

**push** [False] If True, the container will be pushed to the master using `cp.push`.

---

**Note:** This requires `file_recv` to be set to True on the Master.

---

## RETURN DATA

A dictionary will be returned, containing the following keys:

- `Path` - Path of the file that was saved
- `Push` - Reports whether or not the file was successfully pushed to the Master

(Only present if `push=True`)

- `Size` - Size of the file, in bytes
- `Size_Human` - Size of the file, in human-readable units
- `Time_Elapsed` - Time in seconds taken to perform the save

CLI Examples:

```
salt myminion docker.save centos:7 /tmp/cent7.tar
salt myminion docker.save 0123456789ab cdef01234567 /tmp/saved.tar
```

`salt.modules.dockermod.script`(*name*, *source*, *saltenv*='base', *args*=None, *template*=None, *exec\_driver*=None, *stdin*=None, *python\_shell*=True, *output\_loglevel*='debug', *ignore\_retcode*=False, *use\_vt*=False, *keep\_env*=None)

Run `cmd.script` within a container

---

**Note:** While the command is run within the container, it is initiated from the host. Therefore, the PID in the return dict is from the host, not from the container.

---

**name** Container name or ID

**source** Path to the script. Can be a local path on the Minion or a remote file from the Salt fileserver.

**args** A string containing additional command-line options to pass to the script.

**template** [None] Templating engine to use on the script before running.

**exec\_driver** [None] If not passed, the execution driver will be detected as described *above*.

**stdin** [None] Standard input to be used for the script

**output\_loglevel** [debug] Level at which to log the output from the script. Set to `quiet` to suppress logging.

**use\_vt** [False] Use SaltStack's `utils.vt` to stream output to console.

**keep\_env** [None] If not passed, only a sane default `PATH` environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.script mycontainer salt://docker_script.py
salt myminion docker.script mycontainer salt://scripts/runme.sh 'arg1 arg2 "arg 3"'
salt myminion docker.script mycontainer salt://scripts/runme.sh stdin=
↳ 'one\two\three\tfour\tfive\t' output_loglevel=quiet
```

`salt.modules.dockermod.script_retcodes`(*name*, *source*, *saltenv*='base', *args*=None, *template*=None, *exec\_driver*=None, *stdin*=None, *python\_shell*=True, *output\_loglevel*='debug', *ignore\_retcodes*=False, *use\_vt*=False, *keep\_env*=None)

Run `cmd.script_retcodes` within a container

**name** Container name or ID

**source** Path to the script. Can be a local path on the Minion or a remote file from the Salt fileserver.

**args** A string containing additional command-line options to pass to the script.

**template** [None] Templating engine to use on the script before running.

**exec\_driver** [None] If not passed, the execution driver will be detected as described [above](#).

**stdin** [None] Standard input to be used for the script

**output\_loglevel** [debug] Level at which to log the output from the script. Set to `quiet` to suppress logging.

**use\_vt** [False] Use SaltStack's `utils.vt` to stream output to console.

**keep\_env** [None] If not passed, only a sane default `PATH` environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.script_retcodes mycontainer salt://docker_script.py
salt myminion docker.script_retcodes mycontainer salt://scripts/runme.sh 'arg1
↳ arg2 "arg 3"'
salt myminion docker.script_retcodes mycontainer salt://scripts/runme.sh stdin=
↳ 'one\two\three\tfour\tfive\t' output_loglevel=quiet
```

`salt.modules.dockermod.search`(*name*, *official*=False, *trusted*=False)

Searches the registry for an image

**name** Search keyword

**official** [False] Limit results to official builds

**trusted** [False] Limit results to trusted builds

#### RETURN DATA

A dictionary with each key being the name of an image, and the following information for each image:

- **Description** - Image description
- **Official** - A boolean (True if an official build, False if not)
- **Stars** - Number of stars the image has on the registry
- **Trusted** - A boolean (True if a trusted build, False if not)

CLI Example:

```
salt myminion docker.search centos
salt myminion docker.search centos official=True
```

`salt.modules.dockermod.signal`(*\*args*, *\*\*kwargs*)

Send a signal to a container. Signals can be either strings or numbers, and are defined in the **Standard Signals** section of the `signal(7)` manpage. Run `man 7 signal` on a Linux host to browse this manpage.

**name** Container name or ID

**signal** Signal to send to container

#### RETURN DATA

If the signal was successfully sent, True will be returned. Otherwise, an error will be raised.

CLI Example:

```
salt myminion docker.signal mycontainer SIGHUP
```

`salt.modules.dockermod.sls`(*name*, *mods=None*, *saltenv='base'*, *\*\*kwargs*)

Apply the states defined by the specified SLS modules to the running container

New in version 2016.11.0.

The container does not need to have Salt installed, but Python is required.

**name** Container name or ID

**mods** [None] A string containing comma-separated list of SLS with defined states to apply to the container.

**saltenv** [base] Specify the environment from which to retrieve the SLS indicated by the *mods* parameter.

CLI Example:

```
salt myminion docker.sls compassionate_mirzakhani mods=rails,web
```

`salt.modules.dockermod.sls_build`(*name*, *base='opensuse/python'*, *mods=None*, *saltenv='base'*, *dryrun=False*, *\*\*kwargs*)

Build a Docker image using the specified SLS modules on top of base image

New in version 2016.11.0.

The base image does not need to have Salt installed, but Python is required.

**name** Image name to be built and committed

**base** [opensuse/python] Name or ID of the base image

**mods** [None] A string containing comma-separated list of SLS with defined states to apply to the base image.

**saltenv** [base] Specify the environment from which to retrieve the SLS indicated by the *mods* parameter.

**base** the base image

**mods** the state modules to execute during build

**saltenv** the salt environment to use

**dryrun: False** when set to True the container will not be committed at the end of the build. The dryrun succeed also when the state contains errors.

#### RETURN DATA

A dictionary with the ID of the new container. In case of a dryrun, the state result is returned and the container gets removed.

CLI Example:

```
salt myminion docker.sls_build imgname base=mybase mods=rails,web
```

`salt.modules.dockermod.start`(*\*args*, *\*\*kwargs*)

Start a container

**name** Container name or ID

#### RETURN DATA

A dictionary will be returned, containing the following keys:

- **status** - A dictionary showing the prior state of the container as well as the new state
- **result** - A boolean noting whether or not the action was successful
- **comment** - Only present if the container cannot be started

CLI Example:

```
salt myminion docker.start mycontainer
```

`salt.modules.dockermod.state`(*name*, \**args*, \*\**kwargs*)

Returns the state of the container

**name** Container name or ID

**RETURN DATA**

A string representing the current state of the container (either running, paused, or stopped)

CLI Example:

```
salt myminion docker.state mycontainer
```

`salt.modules.dockermod.stop`(\**args*, \*\**kwargs*)

Stops a running container

**name** Container name or ID

**unpause** [False] If True and the container is paused, it will be unpaused before attempting to stop the container.

**timeout** Timeout in seconds after which the container will be killed (if it has not yet gracefully shut down)

Changed in version 2017.7.0: If this argument is not passed, then the container's configuration will be checked. If the container was created using the `stop_timeout` argument, then the configured timeout will be used, otherwise the timeout will be 10 seconds.

**RETURN DATA**

A dictionary will be returned, containing the following keys:

- **status** - A dictionary showing the prior state of the container as well as the new state
- **result** - A boolean noting whether or not the action was successful
- **comment** - Only present if the container can not be stopped

CLI Examples:

```
salt myminion docker.stop mycontainer
salt myminion docker.stop mycontainer unpause=True
salt myminion docker.stop mycontainer timeout=20
```

`salt.modules.dockermod.tag`(*name*, *image*, *force=False*)

Tag an image into a repository and return True. If the tag was unsuccessful, an error will be raised.

**name** ID of image

**image** Tag to apply to the image, in `repo:tag` notation. If just the repository name is passed, a tag name of `latest` will be assumed.

**force** [False] Force apply tag

CLI Example:

```
salt myminion docker.tag 0123456789ab myrepo/mycontainer
salt myminion docker.tag 0123456789ab myrepo/mycontainer:mytag
```

`salt.modules.dockermod.top`(*name*, \**args*, \*\**kwargs*)

Runs the `docker top` command on a specific container

**name** Container name or ID

CLI Example:

**RETURN DATA**

A list of dictionaries containing information about each process

```
salt myminion docker.top mycontainer
salt myminion docker.top 0123456789ab
```

`salt.modules.dockermod.unpause`(\**args*, \*\**kwargs*)

Unpauses a container

**name** Container name or ID

#### RETURN DATA

A dictionary will be returned, containing the following keys:

- **status** - A dictionary showing the prior state of the container as well as the new state
- **result** - A boolean noting whether or not the action was successful
- **comment** - Only present if the container can not be unpaused

CLI Example:

```
salt myminion docker.pause mycontainer
```

#### `salt.modules.dockermod.version()`

Returns a dictionary of Docker version information. Equivalent to running the `docker version` Docker CLI command.

CLI Example:

```
salt myminion docker.version
```

#### `salt.modules.dockermod.volumes(filters=None)`

List existing volumes

New in version 2015.8.4.

**filters** There is one available filter: `dangling=true`

CLI Example:

```
salt myminion docker.volumes filters="{dangling: True}"
```

#### `salt.modules.dockermod.wait(name, ignore_already_stopped=False, fail_on_exit_status=False)`

Wait for the container to exit gracefully, and return its exit code

---

**Note:** This function will block until the container is stopped.

---

**name** Container name or ID

**ignore\_already\_stopped** Boolean flag that prevent execution to fail, if a container is already stopped.

**fail\_on\_exit\_status** Boolean flag to report execution as failure if `exit_status` is different than 0.

#### RETURN DATA

A dictionary will be returned, containing the following keys:

- **status** - A dictionary showing the prior state of the container as well as the new state
- **result** - A boolean noting whether or not the action was successful
- **exit\_status** - Exit status for the container
- **comment** - Only present if the container is already stopped

CLI Example:

```
salt myminion docker.wait mycontainer
```

## 14.7.98 salt.modules.dpkg

Support for DEB packages

#### `salt.modules.dpkg.bin_pkg_info(path, saltenv='base')`

New in version 2015.8.0.

Parses RPM metadata and returns a dictionary of information about the package (name, version, etc.).

**path** Path to the file. Can either be an absolute path to a file on the minion, or a salt fileserver URL (e.g. `salt://path/to/file.rpm`). If a salt fileserver URL is passed, the file will be cached to the minion so that it can be examined.

**saltenv** [base] Salt fileserver environment from which to retrieve the package. Ignored if `path` is a local file path on the minion.

CLI Example:

```
salt '*' lowpkg.bin_pkg_info /root/foo-1.2.3-1ubuntu1_all.deb
salt '*' lowpkg.bin_pkg_info salt://foo-1.2.3-1ubuntu1_all.deb
```

`salt.modules.dpkg.file_dict(*packages)`

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of `_every_file` on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' lowpkg.file_list httpd
salt '*' lowpkg.file_list httpd postfix
salt '*' lowpkg.file_list
```

`salt.modules.dpkg.file_list(*packages)`

List the files that belong to a package. Not specifying any packages will return a list of `_every_file` on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' lowpkg.file_list httpd
salt '*' lowpkg.file_list httpd postfix
salt '*' lowpkg.file_list
```

`salt.modules.dpkg.info(*packages, **kwargs)`

Returns a detailed summary of package information for provided package names. If no packages are specified, all packages will be returned.

New in version 2015.8.1.

**packages** The names of the packages for which to return information.

**failhard** Whether to throw an exception if none of the packages are installed. Defaults to True.

New in version 2016.11.3.

CLI example:

```
salt '*' lowpkg.info
salt '*' lowpkg.info apache2 bash
salt '*' lowpkg.info 'php5*' failhard=false
```

`salt.modules.dpkg.list_pkgs(*packages)`

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

External dependencies:

```
Virtual package resolution requires aptitude. Because this function
uses dpkg, virtual packages will be reported as not installed.
```

CLI Example:

```
salt '*' lowpkg.list_pkgs
salt '*' lowpkg.list_pkgs httpd
```

`salt.modules.dpkg.unpurge(*packages)`  
Change package selection for each package specified to `install`

CLI Example:

```
salt '*' lowpkg.unpurge curl
```

## 14.7.99 salt.modules.drac

Manage Dell DRAC

`salt.modules.drac.change_password(username, password, uid=None)`  
Change users password

CLI Example:

```
salt dell drac.change_password [USERNAME] [PASSWORD] [UID - optional]
salt dell drac.change_password diana secret
```

`salt.modules.drac.create_user(username, password, permissions, users=None)`  
Create user accounts

CLI Example:

```
salt dell drac.create_user [USERNAME] [PASSWORD] [PRIVILEGES]
salt dell drac.create_user diana secret login,test_alerts,clear_logs
```

### DRAC Privileges

- login : Login to iDRAC
- drac : Configure iDRAC
- user\_management : Configure Users
- clear\_logs : Clear Logs
- server\_control\_commands : Execute Server Control Commands
- console\_redirection : Access Console Redirection
- virtual\_media : Access Virtual Media
- test\_alerts : Test Alerts
- debug\_commands : Execute Debug Commands

`salt.modules.drac.delete_user(username, uid=None)`  
Delete a user

CLI Example:

```
salt dell drac.delete_user [USERNAME] [UID - optional]
salt dell drac.delete_user diana 4
```

`salt.modules.drac.email_alerts(action)`  
Enable/Disable email alerts

CLI Example:

```
salt dell drac.email_alerts True
salt dell drac.email_alerts False
```

`salt.modules.drac.list_users()`

List all DRAC users

CLI Example:

```
salt dell drac.list_users
```

`salt.modules.drac.nameservers(*ns)`

Configure the nameservers on the DRAC

CLI Example:

```
salt dell drac.nameservers [NAMESERVERS]
salt dell drac.nameservers ns1.example.com ns2.example.com
```

`salt.modules.drac.network_info()`

Return Network Configuration

CLI Example:

```
salt dell drac.network_info
```

`salt.modules.drac.server_hardreset()`

Performs a reset (reboot) operation on the managed server.

CLI Example:

```
salt dell drac.server_hardreset
```

`salt.modules.drac.server_poweroff()`

Powers down the managed server.

CLI Example:

```
salt dell drac.server_poweroff
```

`salt.modules.drac.server_poweron()`

Powers up the managed server.

CLI Example:

```
salt dell drac.server_poweron
```

`salt.modules.drac.server_pxe()`

Configure server to PXE perform a one off PXE boot

CLI Example:

```
salt dell drac.server_pxe
```

`salt.modules.drac.server_reboot()`

Issues a power-cycle operation on the managed server. This action is similar to pressing the power button on the system's front panel to power down and then power up the system.

CLI Example:

```
salt dell drac.server_reboot
```

`salt.modules.drac.set_network(ip, netmask, gateway)`

Configure Network

CLI Example:

```
salt dell drac.set_network [DRAC IP] [NETMASK] [GATEWAY]
salt dell drac.set_network 192.168.0.2 255.255.255.0 192.168.0.1
```

`salt.modules.drac.set_permissions(username, permissions, uid=None)`

Configure users permissions

CLI Example:

```
salt dell drac.set_permissions [USERNAME] [PRIVILEGES] [USER INDEX - optional]
salt dell drac.set_permissions diana login,test_alerts,clear_logs 4
```

#### DRAC Privileges

- login : Login to iDRAC
- drac : Configure iDRAC
- user\_management : Configure Users
- clear\_logs : Clear Logs
- server\_control\_commands : Execute Server Control Commands
- console\_redirection : Access Console Redirection
- virtual\_media : Access Virtual Media
- test\_alerts : Test Alerts
- debug\_commands : Execute Debug Commands

`salt.modules.drac.set_snmp(community)`

Configure SNMP community string

CLI Example:

```
salt dell drac.set_snmp [COMMUNITY]
salt dell drac.set_snmp public
```

`salt.modules.drac.syslog(server, enable=True)`

Configure syslog remote logging, by default syslog will automatically be enabled if a server is specified. However, if you want to disable syslog you will need to specify a server followed by False

CLI Example:

```
salt dell drac.syslog [SYSLOG IP] [ENABLE/DISABLE]
salt dell drac.syslog 0.0.0.0 False
```

`salt.modules.drac.system_info()`

Return System information

CLI Example:

```
salt dell drac.system_info
```

### 14.7.100 salt.modules.dracr

Manage Dell DRAC.

New in version 2015.8.2.

`salt.modules.dracr.change_password`(*username*, *password*, *uid=None*, *host=None*, *admin\_username=None*, *admin\_password=None*, *module=None*)

Change user's password

CLI Example:

```
salt dell dracr.change_password [USERNAME] [PASSWORD] uid=[OPTIONAL]
    host=<remote DRAC> admin_username=<DRAC user>
    admin_password=<DRAC PW>
salt dell dracr.change_password diana secret
```

Note that if only a username is specified then this module will look up details for all 16 possible DRAC users. This is time consuming, but might be necessary if one is not sure which user slot contains the one you want. Many late-model Dell chassis have `root` as UID 1, so if you can depend on that then setting the password is much quicker. Raises an error if the supplied password is greater than 20 chars.

`salt.modules.dracr.create_user`(*username*, *password*, *permissions*, *users=None*, *host=None*, *admin\_username=None*, *admin\_password=None*)

Create user accounts

CLI Example:

```
salt dell dracr.create_user [USERNAME] [PASSWORD] [PRIVILEGES]
salt dell dracr.create_user diana secret login,test_alerts,clear_logs
```

#### DRAC Privileges

- login : Login to iDRAC
- drac : Configure iDRAC
- user\_management : Configure Users
- clear\_logs : Clear Logs
- server\_control\_commands : Execute Server Control Commands
- console\_redirection : Access Console Redirection
- virtual\_media : Access Virtual Media
- test\_alerts : Test Alerts
- debug\_commands : Execute Debug Commands

`salt.modules.dracr.delete_user`(*username*, *uid=None*, *host=None*, *admin\_username=None*, *admin\_password=None*)

Delete a user

CLI Example:

```
salt dell dracr.delete_user [USERNAME] [UID - optional]
salt dell dracr.delete_user diana 4
```

`salt.modules.dracr.deploy_password`(*username*, *password*, *host=None*, *admin\_username=None*, *admin\_password=None*, *module=None*)

Change the QuickDeploy password, used for switches as well

CLI Example:

```
salt dell dracr.deploy_password [USERNAME] [PASSWORD]
  host=<remote DRAC> admin_username=<DRAC user>
  admin_password=<DRAC PW>
salt dell dracr.change_password diana secret
```

Note that if only a username is specified then this module will look up details for all 16 possible DRAC users. This is time consuming, but might be necessary if one is not sure which user slot contains the one you want. Many late-model Dell chassis have `root` as UID 1, so if you can depend on that then setting the password is much quicker.

`salt.modules.dracr.deploy_snmp`(*snmp*, *host=None*, *admin\_username=None*, *admin\_password=None*, *module=None*)

Change the QuickDeploy SNMP community string, used for switches as well

CLI Example:

```
salt dell dracr.deploy_snmp SNMP_STRING
  host=<remote DRAC or CMC> admin_username=<DRAC user>
  admin_password=<DRAC PW>
salt dell dracr.deploy_password diana secret
```

`salt.modules.dracr.email_alerts`(*action*, *host=None*, *admin\_username=None*, *admin\_password=None*)

Enable/Disable email alerts

CLI Example:

```
salt dell dracr.email_alerts True
salt dell dracr.email_alerts False
```

`salt.modules.dracr.get_chassis_datacenter`(*host=None*, *admin\_username=None*, *admin\_password=None*)

Get the datacenter of the chassis.

**host** The chassis host.

**admin\_username** The username used to access the chassis.

**admin\_password** The password used to access the chassis.

CLI Example:

```
salt '*' dracr.set_chassis_location host=111.222.333.444
  admin_username=root admin_password=secret
```

`salt.modules.dracr.get_chassis_location`(*host=None*, *admin\_username=None*, *admin\_password=None*)

Get the location of the chassis.

**host** The chassis host.

**admin\_username** The username used to access the chassis.

**admin\_password** The password used to access the chassis.

CLI Example:

```
salt '*' dracr.set_chassis_location host=111.222.333.444
  admin_username=root admin_password=secret
```

`salt.modules.dracr.get_chassis_name`(*host=None*, *admin\_username=None*, *admin\_password=None*)

Get the name of a chassis.

**host** The chassis host.

**admin\_username** The username used to access the chassis.

**admin\_password** The password used to access the chassis.

CLI Example:

```
salt '*' dracr.get_chassis_name host=111.222.333.444
      admin_username=root admin_password=secret
```

**salt.modules.dracr.get\_slotname**(*slot*, *host=None*, *admin\_username=None*, *admin\_password=None*)

Get the name of a slot number in the chassis.

**slot** The number of the slot for which to obtain the name.

**host** The chassis host.

**admin\_username** The username used to access the chassis.

**admin\_password** The password used to access the chassis.

CLI Example:

```
salt-call --local dracr.get_slotname 0 host=111.222.333.444
      admin_username=root admin_password=secret
```

**salt.modules.dracr.idrac\_general**(*blade\_name*, *command*, *idrac\_password=None*, *host=None*, *admin\_username=None*, *admin\_password=None*)

Run a generic racadm command against a particular blade in a chassis. Blades are usually named things like 'server-1', 'server-2', etc. If the iDRAC has a different password than the CMC, then you can pass it with the `idrac_password` kwarg.

**Parameters**

- **blade\_name** -- Name of the blade to run the command on
- **command** -- Command like to pass to racadm
- **idrac\_password** -- Password for the iDRAC if different from the CMC
- **host** -- Chassis hostname
- **admin\_username** -- CMC username
- **admin\_password** -- CMC password

**Returns** stdout if the retcode is 0, otherwise a standard `cmd.run_all` dictionary

CLI Example:

```
salt fx2 chassis.cmd idrac_general server-1 'get BIOS.SysProfileSettings'
```

**salt.modules.dracr.list\_slotnames**(*host=None*, *admin\_username=None*, *admin\_password=None*)

List the names of all slots in the chassis.

**host** The chassis host.

**admin\_username** The username used to access the chassis.

**admin\_password** The password used to access the chassis.

CLI Example:

```
salt-call --local dracr.list_slotnames host=111.222.333.444
      admin_username=root admin_password=secret
```

**salt.modules.dracr.list\_users**(*host=None*, *admin\_username=None*, *admin\_password=None*, *module=None*)

List all DRAC users

CLI Example:

```
salt dell dracr.list_users
```

`salt.modules.dracr.nameservers`(*ns*, *host=None*, *admin\_username=None*, *admin\_password=None*,  
*module=None*)

Configure the nameservers on the DRAC

CLI Example:

```
salt dell dracr.nameservers [NAMESERVERS]
salt dell dracr.nameservers ns1.example.com ns2.example.com
    admin_username=root admin_password=calvin module=server-1
    host=192.168.1.1
```

`salt.modules.dracr.network_info`(*host=None*, *admin\_username=None*, *admin\_password=None*,  
*module=None*)

Return Network Configuration

CLI Example:

```
salt dell dracr.network_info
```

`salt.modules.dracr.server_hardreset`(*host=None*, *admin\_username=None*, *ad-*  
*min\_password=None*, *module=None*)

Performs a reset (reboot) operation on the managed server.

**host** The chassis host.

**admin\_username** The username used to access the chassis.

**admin\_password** The password used to access the chassis.

**module** The element to hard reset on the chassis such as a blade. If not provided, the chassis will be reset.

CLI Example:

```
salt dell dracr.server_hardreset
salt dell dracr.server_hardreset module=server-1
```

`salt.modules.dracr.server_power`(*status*, *host=None*, *admin\_username=None*, *ad-*  
*min\_password=None*, *module=None*)

**status** One of 'powerup', 'powerdown', 'powercycle', 'hardreset', 'graceshutdown'

**host** The chassis host.

**admin\_username** The username used to access the chassis.

**admin\_password** The password used to access the chassis.

**module** The element to reboot on the chassis such as a blade. If not provided, the chassis will be rebooted.

CLI Example:

```
salt dell dracr.server_reboot
salt dell dracr.server_reboot module=server-1
```

`salt.modules.dracr.server_poweroff`(*host=None*, *admin\_username=None*, *ad-*  
*min\_password=None*, *module=None*)

Powers down the managed server.

**host** The chassis host.

**admin\_username** The username used to access the chassis.

**admin\_password** The password used to access the chassis.

**module** The element to power off on the chassis such as a blade. If not provided, the chassis will be powered off.

CLI Example:

```
salt dell dracr.server_poweroff
salt dell dracr.server_poweroff module=server-1
```

`salt.modules.dracr.server_poweron` (*host=None, admin\_username=None, admin\_password=None, module=None*)

Powers up the managed server.

**host** The chassis host.

**admin\_username** The username used to access the chassis.

**admin\_password** The password used to access the chassis.

**module** The element to power on located on the chassis such as a blade. If not provided, the chassis will be powered on.

CLI Example:

```
salt dell dracr.server_poweron
salt dell dracr.server_poweron module=server-1
```

`salt.modules.dracr.server_powerstatus` (*host=None, admin\_username=None, admin\_password=None, module=None*)

return the power status for the passed module

CLI Example:

```
salt dell drac.server_powerstatus
```

`salt.modules.dracr.server_pxe` (*host=None, admin\_username=None, admin\_password=None*)

Configure server to PXE perform a one off PXE boot

CLI Example:

```
salt dell dracr.server_pxe
```

`salt.modules.dracr.server_reboot` (*host=None, admin\_username=None, admin\_password=None, module=None*)

Issues a power-cycle operation on the managed server. This action is similar to pressing the power button on the system's front panel to power down and then power up the system.

**host** The chassis host.

**admin\_username** The username used to access the chassis.

**admin\_password** The password used to access the chassis.

**module** The element to reboot on the chassis such as a blade. If not provided, the chassis will be rebooted.

CLI Example:

```
salt dell dracr.server_reboot
salt dell dracr.server_reboot module=server-1
```

`salt.modules.dracr.set_chassis_datacenter` (*location, host=None, admin\_username=None, admin\_password=None*)

Set the location of the chassis.

**location** The name of the datacenter to be set on the chassis.

**host** The chassis host.

**admin\_username** The username used to access the chassis.

**admin\_password** The password used to access the chassis.

CLI Example:

```
salt '*' dracr.set_chassis_datacenter datacenter-name host=111.222.333.444
admin_username=root admin_password=secret
```

`salt.modules.dracr.set_chassis_location` (*location, host=None, admin\_username=None, admin\_password=None*)

Set the location of the chassis.

**location** The name of the location to be set on the chassis.

**host** The chassis host.  
**admin\_username** The username used to access the chassis.  
**admin\_password** The password used to access the chassis.  
 CLI Example:

```
salt '*' dracr.set_chassis_location location-name host=111.222.333.444
      admin_username=root admin_password=secret
```

**salt.modules.dracr.set\_chassis\_name**(*name*, *host=None*, *admin\_username=None*, *admin\_password=None*)

Set the name of the chassis.  
**name** The name to be set on the chassis.  
**host** The chassis host.  
**admin\_username** The username used to access the chassis.  
**admin\_password** The password used to access the chassis.  
 CLI Example:

```
salt '*' dracr.set_chassis_name my-chassis host=111.222.333.444
      admin_username=root admin_password=secret
```

**salt.modules.dracr.set\_network**(*ip*, *netmask*, *gateway*, *host=None*, *admin\_username=None*, *admin\_password=None*)

Configure Network on the CMC or individual iDRAC. Use `set_niccfg` for blade and switch addresses.  
 CLI Example:

```
salt dell dracr.set_network [DRAC IP] [NETMASK] [GATEWAY]
salt dell dracr.set_network 192.168.0.2 255.255.255.0 192.168.0.1
      admin_username=root admin_password=calvin host=192.168.1.1
```

**salt.modules.dracr.set\_permissions**(*username*, *permissions*, *uid=None*, *host=None*, *admin\_username=None*, *admin\_password=None*)

Configure users permissions  
 CLI Example:

```
salt dell dracr.set_permissions [USERNAME] [PRIVILEGES]
      [USER INDEX - optional]
salt dell dracr.set_permissions diana login,test_alerts,clear_logs 4
```

#### DRAC Privileges

- `login` : Login to iDRAC
- `drac` : Configure iDRAC
- `user_management` : Configure Users
- `clear_logs` : Clear Logs
- `server_control_commands` : Execute Server Control Commands
- `console_redirection` : Access Console Redirection
- `virtual_media` : Access Virtual Media
- `test_alerts` : Test Alerts
- `debug_commands` : Execute Debug Commands

`salt.modules.dracr.set_slotname`(*slot*, *name*, *host=None*, *admin\_username=None*, *admin\_password=None*)

Set the name of a slot in a chassis.

**slot** The slot number to change.

**name** The name to set. Can only be 15 characters long.

**host** The chassis host.

**admin\_username** The username used to access the chassis.

**admin\_password** The password used to access the chassis.

CLI Example:

```
salt '*' dracr.set_slotname 2 my-slotname host=111.222.333.444
admin_username=root admin_password=secret
```

`salt.modules.dracr.set_snmp`(*community*, *host=None*, *admin\_username=None*, *admin\_password=None*)

Configure CMC or individual iDRAC SNMP community string. Use `deploy_snmp` for configuring chassis switch SNMP.

CLI Example:

```
salt dell dracr.set_snmp [COMMUNITY]
salt dell dracr.set_snmp public
```

`salt.modules.dracr.syslog`(*server*, *enable=True*, *host=None*, *admin\_username=None*, *admin\_password=None*, *module=None*)

Configure syslog remote logging, by default syslog will automatically be enabled if a server is specified. However, if you want to disable syslog you will need to specify a server followed by `False`

CLI Example:

```
salt dell dracr.syslog [SYSLOG IP] [ENABLE/DISABLE]
salt dell dracr.syslog 0.0.0.0 False
```

`salt.modules.dracr.system_info`(*host=None*, *admin\_username=None*, *admin\_password=None*, *module=None*)

Return System information

CLI Example:

```
salt dell dracr.system_info
```

`salt.modules.dracr.update_firmware`(*filename*, *host=None*, *admin\_username=None*, *admin\_password=None*)

Updates firmware using local firmware file

```
salt dell dracr.update_firmware firmware.exe
```

This executes the following command on your FX2 (using username and password stored in the pillar data)

```
racadm update -f firmware.exe -u user -p pass
```

`salt.modules.dracr.update_firmware_nfs_or_cifs`(*filename*, *share*, *host=None*, *admin\_username=None*, *admin\_password=None*)

Executes the following for CIFS (using username and password stored in the pillar data)

```
racadm update -f <updatefile> -u user -p pass -l //IP-Address/share
```

Or for NFS (using username and password stored in the pillar data)

```
racadm update -f <updatefile> -u user -p pass -l IP-address:/share
```

Salt command for CIFS:

```
salt dell dracr.update_firmware_nfs_or_cifs      firmware.exe //IP-Address/
↳share
```

Salt command for NFS:

```
salt dell dracr.update_firmware_nfs_or_cifs      firmware.exe IP-address:/share
```

### 14.7.101 salt.modules.drbd

DRBD administration module

`salt.modules.drbd.overview()`

Show status of the DRBD devices

CLI Example:

```
salt '*' drbd.overview
```

### 14.7.102 salt.modules.dummyproxy\_package module

Package support for the dummy proxy used by the test suite

`salt.modules.dummyproxy_package.install`(*name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, \*\*kwargs*)

`salt.modules.dummyproxy_package.installed`(*name, version=None, refresh=False, fromrepo=None, skip\_verify=False, pkgs=None, sources=None, \*\*kwargs*)

`salt.modules.dummyproxy_package.list_pkgs`(*versions\_as\_list=False, \*\*kwargs*)

`salt.modules.dummyproxy_package.remove`(*name=None, pkgs=None, \*\*kwargs*)

`salt.modules.dummyproxy_package.upgrade`(*name=None, pkgs=None, refresh=True, skip\_verify=True, normalize=True, \*\*kwargs*)

`salt.modules.dummyproxy_package.version`(*\*names, \*\*kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

### 14.7.103 salt.modules.dummyproxy\_service module

Provide the service module for the dummy proxy used in integration tests

`salt.modules.dummyproxy_service.enabled(name, sig=None)`

Only the `redbull` service is `enabled` in the test

New in version 2016.11.3.

`salt.modules.dummyproxy_service.get_all()`

Return a list of all available services

New in version 2016.11.3.

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.dummyproxy_service.list()`

Return a list of all available services.

New in version 2016.11.3.

CLI Example:

```
salt '*' service.list
```

`salt.modules.dummyproxy_service.restart(name, sig=None)`

Restart the specified service with dummy.

New in version 2016.11.3.

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.dummyproxy_service.running(name, sig=None)`

Return whether this service is running.

New in version 2016.11.3.

`salt.modules.dummyproxy_service.start(name, sig=None)`

Start the specified service on the dummy

New in version 2016.11.3.

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.dummyproxy_service.status(name, sig=None)`

Return the status for a service via dummy, returns a bool whether the service is running.

New in version 2016.11.3.

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.dummyproxy_service.stop(name, sig=None)`

Stop the specified service on the dummy

New in version 2016.11.3.

CLI Example:

```
salt '*' service.stop <service name>
```

### 14.7.104 salt.modules.ebuild

Support for Portage

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to ``pkg.install' is not available`), see [here](#).

#### optdepends

- portage Python adapter

For now all package names *MUST* include the package category, i.e. 'vim' will not work, 'app-editors/vim' will.

`salt.modules.ebuild.check_db(*names, **kwargs)`

New in version 0.17.0.

Returns a dict containing the following information for each specified package:

1. A key found, which will be a boolean value denoting if a match was found in the package database.
2. If found is False, then a second key called suggestions will be present, which will contain a list of possible matches. This list will be empty if the package name was specified in category/pkgname format, since the suggestions are only intended to disambiguate ambiguous package names (ones submitted without a category).

CLI Examples:

```
salt '*' pkg.check_db <package1> <package2> <package3>
```

`salt.modules.ebuild.check_extra_requirements(pkgname, pkgver)`

Check if the installed package already has the given requirements.

CLI Example:

```
salt '*' pkg.check_extra_requirements 'sys-devel/gcc' '~>4.1.2:4.1::
↳gentoo[nls,fortran]'
```

`salt.modules.ebuild.depclean(name=None, slot=None, fromrepo=None, pkgs=None)`

Portage has a function to remove unused dependencies. If a package is provided, it will only removed the package if no other package depends on it.

**name** The name of the package to be cleaned.

**slot** Restrict the remove to a specific slot. Ignored if name is None.

**fromrepo** Restrict the remove to a specific slot. Ignored if name is None.

**pkgs** Clean multiple packages. slot and fromrepo arguments are ignored if this argument is present. Must be passed as a python list.

Return a list containing the removed packages:

CLI Example:

```
salt '*' pkg.depclean <package name>
```

`salt.modules.ebuild.ex_mod_init(low)`

If the config option `ebuild.enforce_nice_config` is set to True, this module will enforce a nice tree structure for `/etc/portage/package.*` configuration files.

New in version 0.17.0: Initial automatic enforcement added when pkg is used on a Gentoo system.

Changed in version 2014.1.0-Hydrogen: Configure option added to make this behaviour optional, defaulting to off.

**See also:**

`ebuild.ex_mod_init` is called automatically when a state invokes a `pkg` state on a Gentoo system.  
`salt.states.pkg.mod_init()`

`ebuild.ex_mod_init` uses `portage_config.enforce_nice_config` to do the lifting.  
`salt.modules.portage_config.enforce_nice_config()`

CLI Example:

```
salt '*' pkg.ex_mod_init
```

`salt.modules.ebuild.install`(*name=None, refresh=False, pkgs=None, sources=None, slot=None, fromrepo=None, uses=None, binhost=None, \*\*kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd >= 205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any emerge commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Install the passed package(s), add `refresh=True` to sync the portage tree before package is installed.

**name** The name of the package to be installed. Note that this parameter is ignored if either `pkgs` or `sources` is passed. Additionally, please note that this option can only be used to emerge a package from the portage tree. To install a `tbz2` package manually, use the `sources` option described below.

CLI Example:

```
salt '*' pkg.install <package name>
```

**refresh** Whether or not to sync the portage tree before installing.

**version** Install a specific version of the package, e.g. `1.0.9-r1`. Ignored if `pkgs` or `sources` is passed.

**slot** Similar to `version`, but specifies a valid slot to be installed. It will install the latest available version in the specified slot. Ignored if `pkgs` or `sources` or `version` is passed.

CLI Example:

```
salt '*' pkg.install sys-devel/gcc slot='4.4'
```

**fromrepo** Similar to `slot`, but specifies the repository from the package will be installed. It will install the latest available version in the specified repository. Ignored if `pkgs` or `sources` or `version` is passed.

CLI Example:

```
salt '*' pkg.install salt fromrepo='gentoo'
```

**uses** Similar to `slot`, but specifies a list of use flag. Ignored if `pkgs` or `sources` or `version` is passed.

CLI Example:

```
salt '*' pkg.install sys-devel/gcc uses='["nptl","-nossp"]'
```

Multiple Package Installation Options:

**pkgs** A list of packages to install from the portage tree. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs=['foo','bar',"~category/package:slot::  
↳repository[use]"]'
```

**sources** A list of tbz2 packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.tbz2"}, {"bar": "salt://bar.tbz2"}]'
```

**binhost** has two options `try` and `force`. `try` - tells emerge to try and install the package from a configured binhost. `force` - forces emerge to install the package from a binhost otherwise it fails out.

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

`salt.modules.ebuild.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.ebuild.list_pkgs(versions_as_list=False, **kwargs)`

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.ebuild.list_upgrades(refresh=True, backtrack=3, **kwargs)`

List all available package upgrades.

**refresh** Whether or not to sync the portage tree before checking for upgrades.

**backtrack** Specifies an integer number of times to backtrack if dependency calculation fails due to a conflict or an unsatisfied dependency (default: `3`).

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.ebuild.porttree_matches(name)`

Returns a list containing the matches for a given package name from the portage tree. Note that the specific version of the package will not be provided for packages that have several versions in the portage tree, but rather the name of the package (i.e. ``dev-python/paramiko``).

`salt.modules.ebuild.purge(name=None, slot=None, fromrepo=None, pkgs=None, **kwargs)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd`  $\geq$  205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any emerge commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Portage does not have a `purge`, this function calls `remove` followed by `depclean` to emulate a `purge` process

**name** The name of the package to be deleted.

**slot** Restrict the `remove` to a specific slot. Ignored if `name` is `None`.

**fromrepo** Restrict the remove to a specific slot. Ignored if name is None.

Multiple Package Options:

**pkgs** Uninstall multiple packages. `slot` and `fromrepo` arguments are ignored if this argument is present. Must be passed as a python list.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package name> slot=4.4
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs=['foo', 'bar']
```

`salt.modules.ebuild.refresh_db()`

Updates the portage tree (emerge --sync). Uses eix-sync if available.

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.ebuild.remove(name=None, slot=None, fromrepo=None, pkgs=None, **kwargs)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd<=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any emerge commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Remove packages via `emerge --unmerge`.

**name** The name of the package to be deleted.

**slot** Restrict the remove to a specific slot. Ignored if name is None.

**fromrepo** Restrict the remove to a specific slot. Ignored if name is None.

Multiple Package Options:

**pkgs** Uninstall multiple packages. `slot` and `fromrepo` arguments are ignored if this argument is present. Must be passed as a python list.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package name> slot=4.4 fromrepo=gentoo
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs=['foo', 'bar']
```

`salt.modules.ebuild.update(pkg, slot=None, fromrepo=None, refresh=False, binhost=None)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd<=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any emerge commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Updates the passed package (`emerge --update package`)

**slot** Restrict the update to a particular slot. It will update to the latest version within the slot.

**fromrepo** Restrict the update to a particular repository. It will update to the latest version within the repository.

**binhost** has two options `try` and `force`. `try` - tells emerge to try and install the package from a configured binhost. `force` - forces emerge to install the package from a binhost otherwise it fails out.

Return a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.update <package name>
```

`salt.modules.ebuild.upgrade` (*refresh=True, binhost=None, backtrack=3*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any emerge commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Run a full system upgrade (`emerge -uDN @world`)

**binhost** has two options `try` and `force`. `try` - tells emerge to try and install the package from a configured binhost. `force` - forces emerge to install the package from a binhost otherwise it fails out.

**backtrack** Specifies an integer number of times to backtrack if dependency calculation fails due to a conflict or an unsatisfied dependency (default: `'3'`).

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.ebuild.upgrade_available` (*name*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.ebuild.version` (*\*names, \*\*kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

`salt.modules.ebuild.version_clean` (*version*)

Clean the version string removing extra data.

CLI Example:

```
salt '*' pkg.version_clean <version_string>
```

`salt.modules.ebuild.version_cmp(pkg1, pkg2, **kwargs)`

Do a cmp-style comparison on two packages. Return -1 if `pkg1 < pkg2`, 0 if `pkg1 == pkg2`, and 1 if `pkg1 > pkg2`. Return None if there was a problem making the comparison.

CLI Example:

```
salt '*' pkg.version_cmp '0.2.4-0' '0.2.4.1-0'
```

### 14.7.105 salt.modules.eix

Support for Eix

`salt.modules.eix.sync()`

Sync portage/overlay trees and update the eix database

CLI Example:

```
salt '*' eix.sync
```

`salt.modules.eix.update()`

Update the eix database

CLI Example:

```
salt '*' eix.update
```

### 14.7.106 salt.modules.elasticsearch

Elasticsearch - A distributed RESTful search and analytics server

Module to provide Elasticsearch compatibility to Salt (compatible with Elasticsearch version 1.5.2+)

New in version 2015.8.0.

**depends** `elasticsearch-py`

**configuration** This module accepts connection configuration details either as parameters or as configuration settings in `/etc/salt/minion` on the relevant minions:

```
elasticsearch:
  host: '10.10.10.100:9200'

elasticsearch-cluster:
  hosts:
    - '10.10.10.100:9200'
    - '10.10.10.101:9200'
    - '10.10.10.102:9200'

elasticsearch-extra:
  hosts:
    - '10.10.10.100:9200'
  use_ssl: True
  verify_certs: True
  ca_certs: /path/to/custom_ca_bundle.pem
  number_of_shards: 1
  number_of_replicas: 0
  functions_blacklist:
    - 'saltutil.find_job'
```

```

- 'pillar.items'
- 'grains.items'
proxies:
- http: http://proxy:3128
- https: http://proxy:1080

```

When specifying proxies the requests backend will be used and the `proxies` data structure is passed as-is to that module.

This data can also be passed into pillar. Options passed into `opts` will overwrite options passed into pillar.

Some functionality might be limited by `elasticsearch-py` and Elasticsearch server versions.

`salt.modules.elasticsearch.alias_create` (*indices*, *alias*, *hosts=None*, *body=None*, *profile=None*)

Create an alias for a specific index/indices

**indices** Single or multiple indices separated by comma, use `_all` to perform the operation on all indices.

**alias** Alias name

**body** Optional definition such as routing or filter as defined in <https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-aliases.html>

CLI example:

```
salt myminion elasticsearch.alias_create testindex_v1 testindex
```

`salt.modules.elasticsearch.alias_delete` (*indices*, *aliases*, *hosts=None*, *body=None*, *profile=None*)

Delete an alias of an index

**indices** Single or multiple indices separated by comma, use `_all` to perform the operation on all indices.

**aliases** Alias names separated by comma

CLI example:

```
salt myminion elasticsearch.alias_delete testindex_v1 testindex
```

`salt.modules.elasticsearch.alias_exists` (*aliases*, *indices=None*, *hosts=None*, *profile=None*)

Return a boolean indicating whether given alias exists

**indices** Single or multiple indices separated by comma, use `_all` to perform the operation on all indices.

**aliases** Alias names separated by comma

CLI example:

```
salt myminion elasticsearch.alias_exists None testindex
```

`salt.modules.elasticsearch.alias_get` (*indices=None*, *aliases=None*, *hosts=None*, *profile=None*)

Check for the existence of an alias and if it exists, return it

**indices** Single or multiple indices separated by comma, use `_all` to perform the operation on all indices.

**aliases** Alias names separated by comma

CLI example:

```
salt myminion elasticsearch.alias_get testindex
```

`salt.modules.elasticsearch.cluster_health` (*index=None*, *level='cluster'*, *local=False*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Return Elasticsearch cluster health.

**index** Limit the information returned to a specific index

**level** Specify the level of detail for returned information, default `cluster`, valid choices are: `cluster`, `indices`, `shards`

**local** Return local information, do not retrieve the state from master node

CLI example:

```
salt myminion elasticsearch.health
```

**salt.modules.elasticsearch.cluster\_stats** (*nodes=None, hosts=None, profile=None*)

New in version 2017.7.0.

Return Elasticsearch cluster stats.

**nodes** List of cluster nodes (id or name) to display stats for. Use `_local` for connected node, empty for all

CLI example:

```
salt myminion elasticsearch.stats
```

**salt.modules.elasticsearch.document\_create** (*index, doc\_type, body=None, id=None, hosts=None, profile=None*)

Create a document in a specified index

**index** Index name where the document should reside

**doc\_type** Type of the document

**body** Document to store

**id** Optional unique document identifier for specified `doc_type` (empty for random)

CLI example:

```
salt myminion elasticsearch.document_create testindex doctype1 '{}'
```

**salt.modules.elasticsearch.document\_delete** (*index, doc\_type, id, hosts=None, profile=None*)

Delete a document from an index

**index** Index name where the document resides

**doc\_type** Type of the document

**id** Document identifier

CLI example:

```
salt myminion elasticsearch.document_delete testindex doctype1 AUx-384m0Bug_8U80wQZ
```

**salt.modules.elasticsearch.document\_exists** (*index, id, doc\_type='\_all', hosts=None, profile=None*)

Return a boolean indicating whether given document exists

**index** Index name where the document resides

**id** Document identifier

**doc\_type** Type of the document, use `_all` to fetch the first document matching the ID across all types

CLI example:

```
salt myminion elasticsearch.document_exists testindex AUx-384m0Bug_8U80wQZ
```

**salt.modules.elasticsearch.document\_get** (*index, id, doc\_type='\_all', hosts=None, profile=None*)

Check for the existence of a document and if it exists, return it

**index** Index name where the document resides

**id** Document identifier

**doc\_type** Type of the document, use `_all` to fetch the first document matching the ID across all types

CLI example:

```
salt myminion elasticsearch.document_get testindex AUx-384m0Bug_8U80wQZ
```

```
salt.modules.elasticsearch.index_close(index, allow_no_indices=True, expand_wildcards='open', ignore_unavailable=True, hosts=None, profile=None)
```

New in version 2017.7.0.

Close specified index.

**index** Index to be closed

**allow\_no\_indices** Whether to ignore if a wildcard indices expression resolves into no concrete indices. (This includes `_all` string or when no indices have been specified)

**expand\_wildcards** Whether to expand wildcard expression to concrete indices that are open, closed or both., default 'open', valid choices are: 'open', 'closed', 'none', 'all'

**ignore\_unavailable** Whether specified concrete indices should be ignored when unavailable (missing or closed)

CLI example:

```
salt myminion elasticsearch.index_close testindex
```

```
salt.modules.elasticsearch.index_create(index, body=None, hosts=None, profile=None)
```

Create an index

**index** Index name

**body** Index definition, such as settings and mappings as defined in <https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-create-index.html>

CLI example:

```
salt myminion elasticsearch.index_create testindex
salt myminion elasticsearch.index_create testindex2 '{"settings" : {"index" : {
  ↳ "number_of_shards" : 3, "number_of_replicas" : 2}}}'
```

```
salt.modules.elasticsearch.index_delete(index, hosts=None, profile=None)
```

Delete an index

**index** Index name

CLI example:

```
salt myminion elasticsearch.index_delete testindex
```

```
salt.modules.elasticsearch.index_exists(index, hosts=None, profile=None)
```

Return a boolean indicating whether given index exists

**index** Index name

CLI example:

```
salt myminion elasticsearch.index_exists testindex
```

```
salt.modules.elasticsearch.index_get(index, hosts=None, profile=None)
```

Check for the existence of an index and if it exists, return it

**index** Index name

CLI example:

```
salt myminion elasticsearch.index_get testindex
```

```
salt.modules.elasticsearch.index_open(index, allow_no_indices=True, expand_wildcards='closed', ignore_unavailable=True, hosts=None, profile=None)
```

New in version 2017.7.0.

Open specified index.

**index** Index to be opened

**allow\_no\_indices** Whether to ignore if a wildcard indices expression resolves into no concrete indices. (This includes `_all` string or when no indices have been specified)

**expand\_wildcards** Whether to expand wildcard expression to concrete indices that are open, closed or both., default 'closed', valid choices are: 'open', 'closed', 'none', 'all'

**ignore\_unavailable** Whether specified concrete indices should be ignored when unavailable (missing or closed)

CLI example:

```
salt myminion elasticsearch.index_open testindex
```

**salt.modules.elasticsearch.index\_template\_create**(*name*, *body*, *hosts=None*, *profile=None*)

Create an index template

**name** Index template name

**body** Template definition as specified in <http://www.elastic.co/guide/en/elasticsearch/reference/current/indices-templates.html>

CLI example:

```
salt myminion elasticsearch.index_template_create testindex_tmpl '{ "template":
↳ "logstash-*", "order": 1, "settings": { "number_of_shards": 1 } }'
```

**salt.modules.elasticsearch.index\_template\_delete**(*name*, *hosts=None*, *profile=None*)

Delete an index template (type) along with its data

**name** Index template name

CLI example:

```
salt myminion elasticsearch.index_template_delete testindex_tmpl user
```

**salt.modules.elasticsearch.index\_template\_exists**(*name*, *hosts=None*, *profile=None*)

Return a boolean indicating whether given index template exists

**name** Index template name

CLI example:

```
salt myminion elasticsearch.index_template_exists testindex_tmpl
```

**salt.modules.elasticsearch.index\_template\_get**(*name*, *hosts=None*, *profile=None*)

Retrieve template definition of index or index/type

**name** Index template name

CLI example:

```
salt myminion elasticsearch.index_template_get testindex_tmpl
```

**salt.modules.elasticsearch.info**(*hosts=None*, *profile=None*)

New in version 2017.7.0.

Return Elasticsearch information.

CLI example:

```
salt myminion elasticsearch.info
salt myminion elasticsearch.info profile=elasticsearch-extra
```

**salt.modules.elasticsearch.mapping\_create**(*index*, *doc\_type*, *body*, *hosts=None*, *profile=None*)

Create a mapping in a given index

**index** Index for the mapping

**doc\_type** Name of the document type

**body** Mapping definition as specified in <https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-put-mapping.html>

CLI example:

```
salt myminion elasticsearch.mapping_create testindex user '{ "user" : {
↳ "properties" : { "message" : { "type" : "string", "store" : true } } } }'
```

**salt.modules.elasticsearch.mapping\_delete**(*index, doc\_type, hosts=None, profile=None*)

Delete a mapping (type) along with its data. As of Elasticsearch 5.0 this is no longer available.

**index** Index for the mapping

**doc\_type** Name of the document type

CLI example:

```
salt myminion elasticsearch.mapping_delete testindex user
```

**salt.modules.elasticsearch.mapping\_get**(*index, doc\_type, hosts=None, profile=None*)

Retrieve mapping definition of index or index/type

**index** Index for the mapping

**doc\_type** Name of the document type

CLI example:

```
salt myminion elasticsearch.mapping_get testindex user
```

**salt.modules.elasticsearch.node\_info**(*nodes=None, flat\_settings=False, hosts=None, profile=None*)

New in version 2017.7.0.

Return Elasticsearch node information.

**nodes** List of cluster nodes (id or name) to display stats for. Use `_local` for connected node, empty for all

**flat\_settings** Flatten settings keys

CLI example:

```
salt myminion elasticsearch.node_info flat_settings=True
```

**salt.modules.elasticsearch.ping**(*allow\_failure=False, hosts=None, profile=None*)

New in version 2017.7.0.

Test connection to Elasticsearch instance. This method does not fail if not explicitly specified.

**allow\_failure** Throw exception if ping fails

CLI example:

```
salt myminion elasticsearch.ping allow_failure=True
salt myminion elasticsearch.ping profile=elasticsearch-extra
```

**salt.modules.elasticsearch.pipeline\_create**(*id, body, hosts=None, profile=None*)

New in version 2017.7.0.

Create Ingest pipeline by supplied definition. Available since Elasticsearch 5.0.

**id** Pipeline id

**body** Pipeline definition as specified in <https://www.elastic.co/guide/en/elasticsearch/reference/master/pipeline.html>

CLI example:

```
salt myminion elasticsearch.pipeline_create mypipeline '{"description": "my
↳ custom pipeline", "processors": [{"set" : {"field": "collector_timestamp_millis
↳", "value": "{[_ingest.timestamp]}"}]}'
```

`salt.modules.elasticsearch.pipeline_delete` (*id*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Delete Ingest pipeline. Available since Elasticsearch 5.0.

**id** Pipeline id

CLI example:

```
salt myminion elasticsearch.pipeline_delete mypipeline
```

`salt.modules.elasticsearch.pipeline_get` (*id*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Retrieve Ingest pipeline definition. Available since Elasticsearch 5.0.

**id** Pipeline id

CLI example:

```
salt myminion elasticsearch.pipeline_get mypipeline
```

`salt.modules.elasticsearch.pipeline_simulate` (*id*, *body*, *verbose=False*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Simulate existing Ingest pipeline on provided data. Available since Elasticsearch 5.0.

**id** Pipeline id

**body** Pipeline definition as specified in <https://www.elastic.co/guide/en/elasticsearch/reference/master/pipeline.html>

**verbose** Specify if the output should be more verbose

CLI example:

```
salt myminion elasticsearch.pipeline_simulate mypipeline '{"docs":[{"_index":
  ↳"index", "_type":"type", "_id":"id", "_source":{"foo":"bar"}}, {"_index":"index", "_
  ↳type":"type", "_id":"id", "_source":{"foo":"rab"}}]}' verbose=True
```

`salt.modules.elasticsearch.repository_create` (*name*, *body*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Create repository for storing snapshots. Note that shared repository paths have to be specified in `path.repo` Elasticsearch configuration option.

**name** Repository name

**body** Repository definition as in <https://www.elastic.co/guide/en/elasticsearch/reference/current/modules-snapshots.html>

CLI example:

```
salt myminion elasticsearch.repository_create testrepo '{"type":"fs","settings":{"
  ↳"location":"/tmp/test","compress":true}}'
```

`salt.modules.elasticsearch.repository_delete` (*name*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Delete existing repository.

**name** Repository name

CLI example:

```
salt myminion elasticsearch.repository_delete testrepo
```

`salt.modules.elasticsearch.repository_get` (*name*, *local=False*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Get existing repository details.

**name** Repository name  
**local** Retrieve only local information, default is false  
 CLI example:

```
salt myminion elasticsearch.repository_get testrepo
```

`salt.modules.elasticsearch.repository_verify`(*name, hosts=None, profile=None*)

New in version 2017.7.0.

Obtain list of cluster nodes which successfully verified this repository.

**name** Repository name  
 CLI example:

```
salt myminion elasticsearch.repository_verify testrepo
```

`salt.modules.elasticsearch.search_template_create`(*id, body, hosts=None, profile=None*)

New in version 2017.7.0.

Create search template by supplied definition

**id** Template ID  
**body** Search template definition  
 CLI example:

```
salt myminion elasticsearch.search_template_create mytemplate '{"template":{"query":
  ↳":{"match":{"title":"{{query_string}}"}}}}'
```

`salt.modules.elasticsearch.search_template_delete`(*id, hosts=None, profile=None*)

New in version 2017.7.0.

Delete existing search template definition.

**id** Template ID  
 CLI example:

```
salt myminion elasticsearch.search_template_delete mytemplate
```

`salt.modules.elasticsearch.search_template_get`(*id, hosts=None, profile=None*)

New in version 2017.7.0.

Obtain existing search template definition.

**id** Template ID  
 CLI example:

```
salt myminion elasticsearch.search_template_get mytemplate
```

`salt.modules.elasticsearch.snapshot_create`(*repository, snapshot, body=None, hosts=None, profile=None*)

New in version 2017.7.0.

Create snapshot in specified repository by supplied definition.

**repository** Repository name  
**snapshot** Snapshot name  
**body** Snapshot definition as in <https://www.elastic.co/guide/en/elasticsearch/reference/current/modules-snapshots.html>  
 CLI example:

```
salt myminion elasticsearch.snapshot_create testrepo testsnapshot '{"indices":
  ↳:"index_1,index_2","ignore_unavailable":true,"include_global_state":false}'
```

`salt.modules.elasticsearch.snapshot_delete`(*repository*, *snapshot*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Delete snapshot from specified repository.

**repository** Repository name

**snapshot** Snapshot name

CLI example:

```
salt myminion elasticsearch.snapshot_delete testrepo testsnapshot
```

`salt.modules.elasticsearch.snapshot_get`(*repository*, *snapshot*, *ignore\_unavailable=False*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Obtain snapshot residing in specified repository.

**repository** Repository name

**snapshot** Snapshot name, use `_all` to obtain all snapshots in specified repository

**ignore\_unavailable** Ignore unavailable snapshots

CLI example:

```
salt myminion elasticsearch.snapshot_get testrepo testsnapshot
```

`salt.modules.elasticsearch.snapshot_restore`(*repository*, *snapshot*, *body=None*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Restore existing snapshot in specified repository by supplied definition.

**repository** Repository name

**snapshot** Snapshot name

**body** Restore definition as in <https://www.elastic.co/guide/en/elasticsearch/reference/current/modules-snapshots.html>

CLI example:

```
salt myminion elasticsearch.snapshot_restore testrepo testsnapshot '{"indices":  
  ↪ "index_1,index_2","ignore_unavailable":true,"include_global_state":true}'
```

`salt.modules.elasticsearch.snapshot_status`(*repository=None*, *snapshot=None*, *ignore\_unavailable=False*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Obtain status of all currently running snapshots.

**repository** Particular repository to look for snapshots

**snapshot** Snapshot name

**ignore\_unavailable** Ignore unavailable snapshots

CLI example:

```
salt myminion elasticsearch.snapshot_status ignore_unavailable=True
```

### 14.7.107 salt.modules.envron

Support for getting and setting the environment variables of the current salt process.

`salt.modules.envron.get`(*key*, *default=""*)

Get a single salt process environment variable.

**key** String used as the key for environment lookup.

**default** If the key is not found in the environment, return this value. Default: ``

CLI Example:

```
salt '*' environ.get foo
salt '*' environ.get baz default=False
```

**salt.modules.environ.has\_value**(*key, value=None*)

Determine whether the key exists in the current salt process environment dictionary. Optionally compare the current value of the environment against the supplied value string.

**key** Must be a string. Used as key for environment lookup.

**value:** Optional. If key exists in the environment, compare the current value with this value. Return True if they are equal.

CLI Example:

```
salt '*' environ.has_value foo
```

**salt.modules.environ.item**(*keys, default=''*)

Get one or more salt process environment variables. Returns a dict.

**keys** Either a string or a list of strings that will be used as the keys for environment lookup.

**default** If the key is not found in the environment, return this value. Default: ``

CLI Example:

```
salt '*' environ.item foo
salt '*' environ.item '[foo, baz]' default=None
```

**salt.modules.environ.items**()

Return a dict of the entire environment set for the salt process

CLI Example:

```
salt '*' environ.items
```

**salt.modules.environ.setenv**(*environ, false\_unsets=False, clear\_all=False, update\_minion=False, permanent=False*)

Set multiple salt process environment variables from a dict. Returns a dict.

**environ** Must be a dict. The top-level keys of the dict are the names of the environment variables to set. Each key's value must be a string or False. Refer to the `false\_unsets` parameter for behavior when a value set to False.

**false\_unsets** If a key's value is False and false\_unsets is True, then the key will be removed from the salt processes environment dict entirely. If a key's value is False and false\_unsets is not True, then the key's value will be set to an empty string. Default: False

**clear\_all** USE WITH CAUTION! This option can unset environment variables needed for salt to function properly. If clear\_all is True, then any environment variables not defined in the environ dict will be deleted. Default: False

**update\_minion** If True, apply these environ changes to the main salt-minion process. If False, the environ changes will only affect the current salt subprocess. Default: False

**permanent** On Windows minions this will set the environment variable in the registry so that it is always added as a environment variable when applications open. If you want to set the variable to HKLM instead of HKCU just pass in ``HKLM`` for this parameter. On all other minion types this will be ignored. Note: This will only take affect on applications opened after this has been set.

CLI Example:

```
salt '*' environ.setenv '{"foo": "bar", "baz": "quux"}'
salt '*' environ.setenv '{"a": "b", "c": False}' false_unsets=True
```

**salt.modules.environ.setval**(*key, val, false\_unsets=False, permanent=False*)

Set a single salt process environment variable. Returns True on success.

**key** The environment key to set. Must be a string.

**val** The value to set. Must be a string or False. Refer to the `false_unsets` parameter for behavior when set to False.

**false\_unsets** If val is False and false\_unsets is True, then the key will be removed from the salt processes environment dict entirely. If val is False and false\_unsets is not True, then the key's value will be set to an empty string. Default: False.

**permanent** On Windows minions this will set the environment variable in the registry so that it is always added as a environment variable when applications open. If you want to set the variable to HKLM instead of HKCU just pass in ```HKLM``` for this parameter. On all other minion types this will be ignored. Note: This will only take affect on applications opened after this has been set.

CLI Example:

```
salt '*' environ.setval foo bar
salt '*' environ.setval baz val=False false_unsets=True
salt '*' environ.setval baz bar permanent=True
salt '*' environ.setval baz bar permanent=HKLM
```

### 14.7.108 salt.modules.eselect

Support for eselect, Gentoo's configuration and management tool.

`salt.modules.eselect.exec_action(module, action, module_parameter=None, action_parameter=None, state_only=False)`

Execute an arbitrary action on a module.

**module** name of the module to be executed

**action** name of the module's action to be run

**module\_parameter** additional params passed to the defined module

**action\_parameter** additional params passed to the defined action

**state\_only** don't return any output but only the success/failure of the operation

CLI Example (updating the php implementation used for apache2):

```
salt '*' eselect.exec_action php update action_parameter='apache2'
```

`salt.modules.eselect.get_current_target(module, module_parameter=None, action_parameter=None)`

Get the currently selected target for the given module.

**module** name of the module to be queried for its current target

**module\_parameter** additional params passed to the defined module

**action\_parameter** additional params passed to the `'show'` action

CLI Example (current target of system-wide java-vm):

```
salt '*' eselect.get_current_target java-vm action_parameter='system'
```

CLI Example (current target of kernel symlink):

```
salt '*' eselect.get_current_target kernel
```

`salt.modules.eselect.get_modules()`

List available eselect modules.

CLI Example:

```
salt '*' eselect.get_modules
```

`salt.modules.eselect.get_target_list(module, action_parameter=None)`

List available targets for the given module.

**module** name of the module to be queried for its targets  
**action\_parameter** additional params passed to the defined action

New in version 2016.11.0.

CLI Example:

```
salt '*' eselect.get_target_list kernel
```

```
salt.modules.eselect.set_target(module, target, module_parameter=None, ac-
tion_parameter=None)
```

Set the target for the given module. Target can be specified by index or name.

**module** name of the module for which a target should be set  
**target** name of the target to be set for this module  
**module\_parameter** additional params passed to the defined module  
**action\_parameter** additional params passed to the defined action

CLI Example (setting target of system-wide java-vm):

```
salt '*' eselect.set_target java-vm icedtea-bin-7 action_parameter='system'
```

CLI Example (setting target of kernel symlink):

```
salt '*' eselect.set_target kernel linux-3.17.5-gentoo
```

### 14.7.109 salt.modules.esxi

Glues the VMware vSphere Execution Module to the VMware ESXi Proxy Minions to the *esxi proxymodule*.

New in version 2015.8.4.

Depends: *vSphere Remote Execution Module (salt.modules.vsphere)*

For documentation on commands that you can direct to an ESXi host via proxy, look in the documentation for *salt.modules.vsphere*.

This execution module calls through to a function in the ESXi proxy module called `ch_config`, which looks up the function passed in the command parameter in *salt.modules.vsphere* and calls it.

To execute commands with an ESXi Proxy Minion using the vSphere Execution Module, use the `esxi.cmd` <vsphere-function-name> syntax. Both args and kwargs needed for various vsphere execution module functions must be passed through in a kwarg- type manor.

```
salt 'esxi-proxy' esxi.cmd system_info
salt 'esxi-proxy' esxi.cmd get_service_policy service_name='ssh'
```

### 14.7.110 salt.modules.etcd\_mod

Execution module to work with etcd

**depends**

- python-etcd

#### Configuration

To work with an etcd server you must configure an etcd profile. The etcd config can be set in either the Salt Minion configuration file or in pillar:

```
my_etcd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

It is technically possible to configure etcd without using a profile, but this is not considered to be a best practice, especially when multiple etcd servers or clusters are available.

```
etcd.host: 127.0.0.1
etcd.port: 4001
```

---

**Note:** The etcd configuration can also be set in the Salt Master config file, but in order to use any etcd configurations defined in the Salt Master config, the *pillar\_opts* must be set to True.

Be aware that setting *pillar\_opts* to True has security implications as this makes all master configuration settings available in all minion's pillars.

---

`salt.modules.etcd_mod.get`(*key*, *recurse=False*, *profile=None*)

New in version 2014.7.0.

Get a value from etcd, by direct path. Returns None on failure.

CLI Examples:

```
salt myminion etcd.get /path/to/key
salt myminion etcd.get /path/to/key profile=my_etcd_config
salt myminion etcd.get /path/to/key recurse=True profile=my_etcd_config
```

`salt.modules.etcd_mod.ls`(*path='/'*, *profile=None*)

New in version 2014.7.0.

Return all keys and dirs inside a specific path. Returns an empty dict on failure.

CLI Example:

```
salt myminion etcd.ls /path/to/dir/
salt myminion etcd.ls /path/to/dir/ profile=my_etcd_config
```

`salt.modules.etcd_mod.rm`(*key*, *recurse=False*, *profile=None*)

New in version 2014.7.0.

Delete a key from etcd. Returns True if the key was deleted, False if it wasn't and None if there was a failure.

CLI Example:

```
salt myminion etcd.rm /path/to/key
salt myminion etcd.rm /path/to/key profile=my_etcd_config
salt myminion etcd.rm /path/to/dir recurse=True profile=my_etcd_config
```

`salt.modules.etcd_mod.set`(*key*, *value*, *profile=None*, *ttl=None*, *directory=False*)

New in version 2014.7.0.

Set a key in etcd by direct path. Optionally, create a directory or set a TTL on the key. Returns None on failure.

CLI Example:

```

salt myminion etcd.set /path/to/key value
salt myminion etcd.set /path/to/key value profile=my_etcd_config
salt myminion etcd.set /path/to/dir ' ' directory=True
salt myminion etcd.set /path/to/key value ttl=5

```

`salt.modules.etcd_mod.tree`(*path='/', profile=None*)

New in version 2014.7.0.

Recurse through etcd and return all values. Returns None on failure.

CLI Example:

```

salt myminion etcd.tree
salt myminion etcd.tree profile=my_etcd_config
salt myminion etcd.tree /path/to/keys profile=my_etcd_config

```

`salt.modules.etcd_mod.update`(*fields, path='', profile=None*)

New in version 2016.3.0.

Sets a dictionary of values in one call. Useful for large updates in syndic environments. The dictionary can contain a mix of formats such as:

```

{
  '/some/example/key': 'bar',
  '/another/example/key': 'baz'
}

```

Or it may be a straight dictionary, which will be flattened to look like the above format:

```

{
  'some': {
    'example': {
      'key': 'bar'
    }
  },
  'another': {
    'example': {
      'key': 'baz'
    }
  }
}

```

You can even mix the two formats and it will be flattened to the first format. Leading and trailing `/' will be removed.

Empty directories can be created by setting the value of the key to an empty dictionary.

The `path' parameter will optionally set the root of the path to use.

CLI Example:

```

salt myminion etcd.update '{"/path/to/key': 'baz', '/another/key': 'bar'}"
salt myminion etcd.update '{"/path/to/key': 'baz', '/another/key': 'bar'}"
↳ profile=my_etcd_config
salt myminion etcd.update '{"/path/to/key': 'baz', '/another/key': 'bar'}" path=/'
↳ some/root'

```

`salt.modules.etcd_mod.watch`(*key, recurse=False, profile=None, timeout=0, index=None*)

New in version 2016.3.0.

Makes a best effort to watch for a key or tree change in etcd. Returns a dict containing the new key value ( or None if the key was deleted ), the modifiedIndex of the key, whether the key changed or not, the path to the key that changed and whether it is a directory or not.

If something catastrophic happens, returns {}

CLI Example:

```
salt myminion etcd.watch /path/to/key
salt myminion etcd.watch /path/to/key timeout=10
salt myminion etcd.watch /patch/to/key profile=my_etcd_config index=10
```

### 14.7.111 salt.modules.ethtool module

Module for running ethtool command

New in version 2016.3.0.

**codeauthor** Krzysztof Pawlowski <msciciel@msciciel.eu>

**maturity** new

**depends** python-ethtool

**platform** linux

**salt.modules.ethtool.set\_coalesce**(*devname*, \*\*kwargs)

Changes the coalescing settings of the specified network device

CLI Example:

```
salt '*' ethtool.set_coalesce <devname> [adaptive_rx=on|off] [adaptive_tx=on|off] [
↳rx_usecs=N] [rx_frames=N]
  [rx_usecs_irq=N] [rx_frames_irq=N] [tx_usecs=N] [tx_frames=N] [tx_usecs_
↳irq=N] [tx_frames_irq=N]
  [stats_block_usecs=N] [pkt_rate_low=N] [rx_usecs_low=N] [rx_frames_low=N] [tx_
↳usecs_low=N] [tx_frames_low=N]
  [pkt_rate_high=N] [rx_usecs_high=N] [rx_frames_high=N] [tx_usecs_high=N] [tx_
↳frames_high=N]
  [sample_interval=N]
```

**salt.modules.ethtool.set\_offload**(*devname*, \*\*kwargs)

Changes the offload parameters and other features of the specified network device

CLI Example:

```
salt '*' ethtool.set_offload <devname> tcp_segmentation_offload=on
```

**salt.modules.ethtool.set\_ring**(*devname*, \*\*kwargs)

Changes the rx/tx ring parameters of the specified network device

CLI Example:

```
salt '*' ethtool.set_ring <devname> [rx=N] [rx_mini=N] [rx_jumbo=N] [tx=N]
```

**salt.modules.ethtool.show\_coalesce**(*devname*)

Queries the specified network device for coalescing information

CLI Example:

```
salt '*' ethtool.show_coalesce <devname>
```

`salt.modules.ethtool.show_driver(devname)`

Queries the specified network device for associated driver information

CLI Example:

```
salt '*' ethtool.show_driver <devname>
```

`salt.modules.ethtool.show_offload(devname)`

Queries the specified network device for the state of protocol offload and other features

CLI Example:

```
salt '*' ethtool.show_offload <devname>
```

`salt.modules.ethtool.show_ring(devname)`

Queries the specified network device for rx/tx ring parameter information

CLI Example:

```
salt '*' ethtool.show_ring <devname>
```

### 14.7.112 salt.modules.event

Use the [Salt Event System](#) to fire events from the master to the minion and vice-versa.

`salt.modules.event.fire(data, tag)`

Fire an event on the local minion event bus. Data must be formed as a dict.

CLI Example:

```
salt '*' event.fire '{"data": "my event data"}' 'tag'
```

`salt.modules.event.fire_master(data, tag, preload=None)`

Fire an event off up to the master server

CLI Example:

```
salt '*' event.fire_master '{"data": "my event data"}' 'tag'
```

`salt.modules.event.send(tag, data=None, preload=None, with_env=False, with_grains=False, with_pillar=False, with_env_opts=False, **kwargs)`

Send an event to the Salt Master

New in version 2014.7.0.

#### Parameters

- **tag** -- A tag to give the event. Use slashes to create a namespace for related events. E.g., myco/build/buildserver1/start, myco/build/buildserver1/success, myco/build/buildserver1/failure.
- **data** -- A dictionary of data to send in the event. This is free-form. Send any data points that are needed for whoever is consuming the event. Arguments on the CLI are interpreted as YAML so complex data structures are possible.

- **with\_env** (Specify True to include all environment variables, or specify a list of strings of variable names to include.) -- Include environment variables from the current shell environment in the event data as `environ`. This is a short-hand for working with systems that seed the environment with relevant data such as Jenkins.
- **with\_grains** (Specify True to include all grains, or specify a list of strings of grain names to include.) -- Include grains from the current minion in the event data as `grains`.
- **with\_pillar** (Specify True to include all Pillar values, or specify a list of strings of Pillar keys to include. It is a best-practice to only specify a relevant subset of Pillar data.) -- Include Pillar values from the current minion in the event data as `pillar`. Remember Pillar data is often sensitive data so be careful. This is useful for passing ephemeral Pillar values through an event. Such as passing the `pillar={}` kwarg in `state.sls` from the Master, through an event on the Minion, then back to the Master.
- **with\_env\_opts** (Specify True to include `saltenv` and `pillarenv` values or False to omit them.) -- Include `saltenv` and `pillarenv` set on minion at the moment when event is send into event data.
- **kwargs** -- Any additional keyword arguments passed to this function will be interpreted as key-value pairs and included in the event data. This provides a convenient alternative to YAML for simple values.

CLI Example:

```
salt-call event.send myco/mytag foo=Foo bar=Bar
salt-call event.send 'myco/mytag' '{foo: Foo, bar: Bar}'
```

A convenient way to allow Jenkins to execute `salt-call` is via `sudo`. The following rule in `sudoers` will allow the `jenkins` user to run only the following command.

`/etc/sudoers` (allow preserving the environment):

```
jenkins ALL=(ALL) NOPASSWD:SETENV: /usr/bin/salt-call event.send*
```

Call Jenkins via `sudo` (preserve the environment):

```
sudo -E salt-call event.send myco/jenkins/build/success with_env=[BUILD_ID, BUILD_
↳URL, GIT_BRANCH, GIT_COMMIT]
```

### 14.7.113 salt.modules.extfs

Module for managing ext2/3/4 file systems

`salt.modules.extfs.attributes` (*device*, *args=None*)

Return attributes from `dumpe2fs` for a specified device

CLI Example:

```
salt '*' extfs.attributes /dev/sda1
```

`salt.modules.extfs.blocks` (*device*, *args=None*)

Return block and inode info from `dumpe2fs` for a specified device

CLI Example:

```
salt '*' extfs.blocks /dev/sda1
```

`salt.modules.extfs.dump`(*device*, *args=None*)  
Return all contents of dumpe2fs for a specified device

CLI Example:

```
salt '*' extfs.dump /dev/sda1
```

`salt.modules.extfs.mkfs`(*device*, *fs\_type*, *\*\*kwargs*)  
Create a file system on the specified device

CLI Example:

```
salt '*' extfs.mkfs /dev/sda1 fs_type=ext4 opts='acl,noexec'
```

Valid options are:

- block\_size**: 1024, 2048 or 4096
- check**: check for bad blocks
- direct**: use direct IO
- ext\_opts**: extended file system options (comma-separated)
- fragment\_size**: size of fragments
- force**: setting force to True will cause mke2fs to specify the -F option twice (it is already set once); this is truly dangerous
- blocks\_per\_group**: number of blocks in a block group
- number\_of\_groups**: ext4 option for a virtual block group
- bytes\_per\_inode**: set the bytes/inode ratio
- inode\_size**: size of the inode
- journal**: set to True to create a journal (default on ext3/4)
- journal\_opts**: options for the fs journal (comma separated)
- blocks\_file**: read bad blocks from file
- label**: label to apply to the file system
- reserved**: percentage of blocks reserved for super-user
- last\_dir**: last mounted directory
- test**: set to True to not actually create the file system (mke2fs -n)
- number\_of\_inodes**: override default number of inodes
- creator\_os**: override ``creator operating system" field
- opts**: mount options (comma separated)
- revision**: set the filesystem revision (default 1)
- super**: write superblock and group descriptors only
- fs\_type**: set the filesystem type (REQUIRED)
- usage\_type**: how the filesystem is going to be used
- uuid**: set the UUID for the file system

See the `mke2fs(8)` manpage for a more complete description of these options.

`salt.modules.extfs.tune`(*device*, *\*\*kwargs*)  
Set attributes for the specified device (using tune2fs)

CLI Example:

```
salt '*' extfs.tune /dev/sda1 force=True label=wildstallyns opts='acl,noexec'
```

Valid options are:

- max**: max mount count
- count**: mount count
- error**: error behavior

- extended\_opts**: extended options (comma separated)
- force**: force, even if there are errors (set to True)
- group**: group name or gid that can use the reserved blocks
- interval**: interval between checks
- journal**: set to True to create a journal (default on ext3/4)
- journal\_opts**: options for the fs journal (comma separated)
- label**: label to apply to the file system
- reserved**: percentage of blocks reserved for super-user
- last\_dir**: last mounted directory
- opts**: mount options (comma separated)
- feature**: set or clear a feature (comma separated)
- mmp\_check**: mmp check interval
- reserved**: reserved blocks count
- quota\_opts**: quota options (comma separated)
- time**: time last checked
- user**: user or uid who can use the reserved blocks
- uuid**: set the UUID for the file system

See the `mke2fs(8)` manpage for a more complete description of these options.

#### 14.7.114 salt.modules.file

Manage information about regular files, directories, and special files on the minion, set/read user, group, mode, and data

`salt.modules.file.access(path, mode)`

New in version 2014.1.0.

Test whether the Salt process has the specified access to the file. One of the following modes must be specified:

CLI Example:

```
salt '*' file.access /path/to/file f
salt '*' file.access /path/to/file x
```

`salt.modules.file.append(path, *args, **kwargs)`

New in version 0.9.5.

Append text to the end of a file

**path** path to file

**\*args** strings to append to file

CLI Example:

```
salt '*' file.append /etc/motd \
    "With all thine offerings thou shalt offer salt." \
    "Salt is what makes things taste bad when it isn't in them."
```

---

#### Attention

If you need to pass a string to append and that string contains an equal sign, you **must** include the argument name, `args`. For example:

```
salt '*' file.append /etc/motd args='cheese=spam'
salt '*' file.append /etc/motd args="['cheese=spam', 'spam=cheese']"
```

---

`salt.modules.file.apply_template_on_contents`(*contents*, *template*, *context*, *defaults*, *saltenv*)

Return the contents after applying the templating engine

**contents** template string

**template** template format

**context** Overrides default context variables passed to the template.

**defaults** Default context passed to the template.

CLI Example:

```
salt '*' file.apply_template_on_contents \
  contents='This is a {{ template }} string.' \
  template=jinja \
  "context={}" "defaults={'template': 'cool'}" \
  saltenv=base
```

`salt.modules.file.basename`(*path*)

Returns the final component of a pathname

New in version 2015.5.0.

This can be useful at the CLI but is frequently useful when scripting.

```
{%- set filename = salt['file.basename'](source_file) %}
```

CLI Example:

```
salt '*' file.basename 'test/test.config'
```

`salt.modules.file.blockreplace`(*path*, *marker\_start*='#-- start managed zone --', *marker\_end*='#-- end managed zone --', *content*='', *append\_if\_not\_found*=False, *prepend\_if\_not\_found*=False, *backup*='.bak', *dry\_run*=False, *show\_changes*=True, *append\_newline*=False)

New in version 2014.1.0.

Replace content of a text block in a file, delimited by line markers

A block of content delimited by comments can help you manage several lines entries without worrying about old entries removal.

---

**Note:** This function will store two copies of the file in-memory (the original version and the edited version) in order to detect changes and only edit the targeted file if necessary.

---

**path** Filesystem path to the file to be edited

**marker\_start** The line content identifying a line as the start of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output

**marker\_end** The line content identifying a line as the end of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output

**content** The content to be used between the two lines identified by `marker_start` and `marker_stop`.

**append\_if\_not\_found** [False] If markers are not found and set to True then, the markers and content will be appended to the file.

**prepend\_if\_not\_found** [False] If markers are not found and set to True then, the markers and content will be prepended to the file.

**backup** The file extension to use for a backup of the file if any edit is made. Set to False to skip making a backup.

**dry\_run** Don't make any edits to the file.

**show\_changes** Output a unified diff of the old file and the new file. If `False`, return a boolean if any changes were made.

**append\_newline**: Append a newline to the content block. For more information see: <https://github.com/saltstack/salt/issues/33686>

New in version 2016.3.4.

CLI Example:

```
salt '*' file.blockreplace /etc/hosts '#-- start managed zone foobar : DO NOT
↳EDIT --' \
'#-- end managed zone foobar --' '$'10.0.1.1 foo.foobar\n10.0.1.2 bar.foobar' True
```

`salt.modules.file.check_file_meta`(*name, sfn, source, source\_sum, user, group, mode, saltenv, contents=None*)

Check for the changes in the file metadata.

CLI Example:

```
salt '*' file.check_file_meta /etc/httpd/conf.d/httpd.conf salt://http/httpd.conf
↳'{hash_type: 'md5', 'hsum': <md5sum>}' root, root, '755' base
```

---

**Note:** Supported hash types include sha512, sha384, sha256, sha224, sha1, and md5.

---

**name** Path to file destination

**sfn** Template-processed source file contents

**source** URL to file source

**source\_sum** File checksum information as a dictionary

```
{hash_type: md5, hsum: <md5sum>}
```

**user** Destination file user owner

**group** Destination file group owner

**mode** Destination file permissions mode

**saltenv** Salt environment used to resolve source files

**contents** File contents

`salt.modules.file.check_hash`(*path, file\_hash*)

Check if a file matches the given hash string

Returns `True` if the hash matches, otherwise `False`.

**path** Path to a file local to the minion.

**hash** The hash to check against the file specified in the `path` argument.

Changed in version 2016.11.4.

For this and newer versions the hash can be specified without an accompanying hash type (e.g. `e138491e9d5b97023cea823fe17bac22`), but for earlier releases it is necessary to also specify the hash type in the format `<hash_type>=<hash_value>` (e.g. `md5=e138491e9d5b97023cea823fe17bac22`).

CLI Example:

```
salt '*' file.check_hash /etc/fstab e138491e9d5b97023cea823fe17bac22
salt '*' file.check_hash /etc/fstab md5=e138491e9d5b97023cea823fe17bac22
```

`salt.modules.file.check_managed`(*name, source, source\_hash, source\_hash\_name, user, group, mode, template, context, defaults, saltenv, contents=None, skip\_verify=False, \*\*kwargs*)

Check to see what changes need to be made for a file

CLI Example:

```
salt '*' file.check_managed /etc/httpd/conf.d/httpd.conf salt://http/httpd.conf '
↳{hash_type: 'md5', 'hsum': <md5sum>}' root, root, '755' jinja True None None base
```

`salt.modules.file.check_managed_changes`(*name, source, source\_hash, source\_hash\_name, user, group, mode, template, context, defaults, saltenv, contents=None, skip\_verify=False, keep\_mode=False, \*\*kwargs*)

Return a dictionary of what changes need to be made for a file

CLI Example:

```
salt '*' file.check_managed_changes /etc/httpd/conf.d/httpd.conf salt://http/
↳httpd.conf '{hash_type: 'md5', 'hsum': <md5sum>}' root, root, '755' jinja True
↳None None base
```

`salt.modules.file.check_perms`(*name, ret, user, group, mode, follow\_symlinks=False*)

Check the permissions on files and chown if needed

CLI Example:

```
salt '*' file.check_perms /etc/sudoers '{}' root root 400
```

Changed in version 2014.1.3: `follow_symlinks` option added

`salt.modules.file.chgrp`(*path, group*)

Change the group of a file

**path** path to the file or directory

**group** group owner

CLI Example:

```
salt '*' file.chgrp /etc/passwd root
```

`salt.modules.file.chown`(*path, user, group*)

Chown a file, pass the file the desired user and group

**path** path to the file or directory

**user** user owner

**group** group owner

CLI Example:

```
salt '*' file.chown /etc/passwd root root
```

`salt.modules.file.comment`(*path, regex, char='#, backup='.bak')*)

Deprecated since version 0.17.0: Use `replace()` instead.

Comment out specified lines in a file

**path** The full path to the file to be edited

**regex** A regular expression used to find the lines that are to be commented; this pattern will be wrapped in parenthesis and will move any preceding/trailing `^` or `$` characters outside the parenthesis (e.g., the pattern `^foo$` will be rewritten as `^(foo)$`)

**char** [#] The character to be inserted at the beginning of a line in order to comment it out

**backup** [.bak] The file will be backed up before edit with this file extension

**Warning:** This backup will be overwritten each time `sed` / `comment` / `uncomment` is called. Meaning the backup will only be useful after the first invocation.

CLI Example:

```
salt '*' file.comment /etc/modules pcspr
```

`salt.modules.file.comment_line`(*path*, *regex*, *char*='#', *cmnt*=True, *backup*='.bak')

Comment or Uncomment a line in a text file.

#### Parameters

- **path** -- string The full path to the text file.
- **regex** -- string A regex expression that begins with `^` that will find the line you wish to comment. Can be as simple as `^color =`
- **char** -- string The character used to comment a line in the type of file you're referencing. Default is `#`
- **cmnt** -- boolean True to comment the line. False to uncomment the line. Default is True.
- **backup** -- string The file extension to give the backup file. Default is `.bak` Set to False/None to not keep a backup.

**Returns** boolean Returns True if successful, False if not

CLI Example:

The following example will comment out the `pcspr` line in the `/etc/modules` file using the default `#` character and create a backup file named `modules.bak`

```
salt '*' file.comment_line '/etc/modules' '^pcspr'
```

CLI Example:

The following example will uncomment the `log_level` setting in `minion` config file if it is set to either `warning`, `info`, or `debug` using the `#` character and create a backup file named `minion.bk`

```
salt '*' file.comment_line 'C:\salt\conf\minion' '^log_level: (warning|info|debug)
↪' '#' False '.bk'
```

`salt.modules.file.contains`(*path*, *text*)

Deprecated since version 0.17.0: Use `search()` instead.

Return True if the file at `path` contains `text`

CLI Example:

```
salt '*' file.contains /etc/crontab 'mymaintenance.sh'
```

`salt.modules.file.contains_glob`(*path*, *glob\_expr*)

Deprecated since version 0.17.0: Use `search()` instead.

Return True if the given `glob` matches a string in the named file

CLI Example:

```
salt '*' file.contains_glob /etc/foobar '*cheese*'
```

`salt.modules.file.contains_regex`(*path, regex, lchar=''*)

Deprecated since version 0.17.0: Use `search()` instead.

Return True if the given regular expression matches on any line in the text of a given file.

If the `lchar` argument (leading char) is specified, it will strip `lchar` from the left side of each line before trying to match

CLI Example:

```
salt '*' file.contains_regex /etc/crontab
```

`salt.modules.file.copy`(*src, dst, recurse=False, remove\_existing=False*)

Copy a file or directory from source to dst

In order to copy a directory, the `recurse` flag is required, and will by default overwrite files in the destination with the same path, and retain all other existing files. (similar to `cp -r` on unix)

`remove_existing` will remove all files in the target directory, and then copy files from the source.

---

**Note:** The copy function accepts paths that are local to the Salt minion. This function does not support `salt://`, `http://`, or the other additional file paths that are supported by `states.file.managed` and `states.file.recurse`.

---

CLI Example:

```
salt '*' file.copy /path/to/src /path/to/dst
salt '*' file.copy /path/to/src_dir /path/to/dst_dir recurse=True
salt '*' file.copy /path/to/src_dir /path/to/dst_dir recurse=True remove_
↳existing=True
```

`salt.modules.file.delete_backup`(*path, backup\_id*)

New in version 0.17.0.

Delete a previous version of a file that was backed up using Salt's *file state backup* system.

**path** The path on the minion to check for backups

**backup\_id** The numeric id for the backup you wish to delete, as found using `file.list_backups`

CLI Example:

```
salt '*' file.delete_backup /var/cache/salt/minion/file_backup/home/foo/bar/baz.
↳txt 0
```

`salt.modules.file.directory_exists`(*path*)

Tests to see if path is a valid directory. Returns True/False.

CLI Example:

```
salt '*' file.directory_exists /etc
```

`salt.modules.file.dirname`(*path*)

Returns the directory component of a pathname

New in version 2015.5.0.

This can be useful at the CLI but is frequently useful when scripting.

```
{%- from salt['file.dirname'](tpldir) + '/vars.jinja' import parent_vars %}
```

CLI Example:

```
salt '*' file.dirname 'test/path/filename.config'
```

`salt.modules.file.diskusage`(*path*)

Recursively calculate disk usage of path and return it in bytes

CLI Example:

```
salt '*' file.diskusage /path/to/check
```

`salt.modules.file.extract_hash`(*hash\_fn*, *hash\_type*='sha256', *file\_name*='', *source*='', *source\_hash\_name*=None)

Changed in version 2016.3.5: Prior to this version, only the *file\_name* argument was considered for filename matches in the hash file. This would be problematic for cases in which the user was relying on a remote checksum file that they do not control, and they wished to use a different name for that file on the minion from the filename on the remote server (and in the checksum file). For example, managing `/tmp/myfile.tar.gz` when the remote file was at `https://mydomain.tld/different_name.tar.gz`. The *file.managed* state now also passes this function the source URI as well as the *source\_hash\_name* (if specified). In cases where *source\_hash\_name* is specified, it takes precedence over both the *file\_name* and *source*. When it is not specified, *file\_name* takes precedence over *source*. This allows for better capability for matching hashes.

Changed in version 2016.11.0: File name and source URI matches are no longer disregarded when *source\_hash\_name* is specified. They will be used as fallback matches if there is no match to the *source\_hash\_name* value.

This routine is called from the *file.managed* state to pull a hash from a remote file. Regular expressions are used line by line on the *source\_hash* file, to find a potential candidate of the indicated hash type. This avoids many problems of arbitrary file layout rules. It specifically permits pulling hash codes from debian `*.dsc` files.

If no exact match of a hash and filename are found, then the first hash found (if any) will be returned. If no hashes at all are found, then None will be returned.

For example:

```
openerp_7.0-latest-1.tar.gz:
  file.managed:
    - name: /tmp/openerp_7.0-20121227-075624-1_all.deb
    - source: http://nightly.openerp.com/7.0/nightly/deb/openerp_7.0-20121227-
      ↪075624-1.tar.gz
    - source_hash: http://nightly.openerp.com/7.0/nightly/deb/openerp_7.0-
      ↪20121227-075624-1.dsc
```

CLI Example:

```
salt '*' file.extract_hash /path/to/hash/file sha512 /etc/foo
```

`salt.modules.file.file_exists`(*path*)

Tests to see if path is a valid file. Returns True/False.

CLI Example:

```
salt '*' file.file_exists /etc/passwd
```

`salt.modules.file.find`(*path*, *\*args*, *\*\*kwargs*)

Approximate the Unix `find(1)` command and return a list of paths that meet the specified criteria.

The options include match criteria:

```

name      = path-glob          # case sensitive
iname     = path-glob          # case insensitive
regex     = path-regex         # case sensitive
iregex    = path-regex         # case insensitive
type      = file-types         # match any listed type
user      = users              # match any listed user
group     = groups             # match any listed group
size      = [+~]number[size-unit] # default unit = byte
mtime     = interval           # modified since date
grep      = regex              # search file contents

```

and/or actions:

```

delete [= file-types]          # default type = 'f'
exec   = command [arg ...]     # where {} is replaced by pathname
print  [= print-opts]

```

and/or depth criteria:

```

maxdepth = maximum depth to transverse in path
mindepth = minimum depth to transverse before checking files or directories

```

The default action is `print=path`

`path-glob`:

```

*           = match zero or more chars
?           = match any char
[abc]       = match a, b, or c
[!abc] or [^abc] = match anything except a, b, and c
[x-y]       = match chars x through y
[!x-y] or [^x-y] = match anything except chars x through y
{a,b,c}     = match a or b or c

```

`path-regex`: a Python Regex (regular expression) pattern to match pathnames

`file-types`: a string of one or more of the following:

```

a: all file types
b: block device
c: character device
d: directory
p: FIFO (named pipe)
f: plain file
l: symlink
s: socket

```

`users`: a space and/or comma separated list of user names and/or uids

`groups`: a space and/or comma separated list of group names and/or gids

`size-unit`:

```

b: bytes
k: kilobytes
m: megabytes
g: gigabytes
t: terabytes

```

interval:

```
[<num>w] [<num>d] [<num>h] [<num>m] [<num>s]
```

where:

```
w: week
d: day
h: hour
m: minute
s: second
```

print-opts: a comma and/or space separated list of one or more of the following:

```
group: group name
md5: MD5 digest of file contents
mode: file permissions (as integer)
mtime: last modification time (as time_t)
name: file basename
path: file absolute path
size: file size in bytes
type: file type
user: user name
```

CLI Examples:

```
salt '*' file.find / type=f name=\*.bak size=+10m
salt '*' file.find /var mtime=+30d size=+10m print=path,size,mtime
salt '*' file.find /var/log name=\*.[0-9] mtime=+30d size=+10m delete
```

`salt.modules.file.get_devmm(name)`

Get major/minor info from a device

CLI Example:

```
salt '*' file.get_devmm /dev/chr
```

`salt.modules.file.get_diff(minionfile, masterfile, saltenv='base')`

Return unified diff of file compared to file on master

CLI Example:

```
salt '*' file.get_diff /home/fred/.vimrc salt://users/fred/.vimrc
```

`salt.modules.file.get_gid(path, follow_symlinks=True)`

Return the id of the group that owns a given file

**path** file or directory of which to get the gid

**follow\_symlinks** indicated if symlinks should be followed

CLI Example:

```
salt '*' file.get_gid /etc/passwd
```

Changed in version 0.16.4: `follow_symlinks` option added

`salt.modules.file.get_group(path, follow_symlinks=True)`

Return the group that owns a given file

**path** file or directory of which to get the group

**follow\_symlinks** indicated if symlinks should be followed

CLI Example:

```
salt '*' file.get_group /etc/passwd
```

Changed in version 0.16.4: `follow_symlinks` option added

`salt.modules.file.get_hash(path, form='sha256', chunk_size=65536)`

Get the hash sum of a file

This is better than `get_sum` for the following reasons:

- It does not read the entire file into memory.
- **It does not return a string on error.** The returned value of `get_sum` cannot really be trusted since it is vulnerable to collisions: `get_sum(..., 'xyz') == 'Hash xyz not supported'`

**path** path to the file or directory

**form** desired sum format

**chunk\_size** amount to sum at once

CLI Example:

```
salt '*' file.get_hash /etc/shadow
```

`salt.modules.file.get_managed(name, template, source, source_hash, source_hash_name, user, group, mode, saltenv, context, defaults, skip_verify=False, **kwargs)`

Return the managed file data for `file.managed`

**name** location where the file lives on the server

**template** template format

**source** managed source file

**source\_hash** hash of the source file

**source\_hash\_name** When `source_hash` refers to a remote file, this specifies the filename to look for in that file.

New in version 2016.3.5.

**user** Owner of file

**group** Group owner of file

**mode** Permissions of file

**context** Variables to add to the template context

**defaults** Default values of for `context_dict`

**skip\_verify** If True, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.3.0.

CLI Example:

```
salt '*' file.get_managed /etc/httpd/conf.d/httpd.conf jinja salt://http/httpd.conf
↳conf '{hash_type: 'md5', 'hsum': <md5sum>}' None root root '755' base None None
```

`salt.modules.file.get_mode(path, follow_symlinks=True)`

Return the mode of a file

**path** file or directory of which to get the mode

**follow\_symlinks** indicated if symlinks should be followed

CLI Example:

```
salt '*' file.get_mode /etc/passwd
```

Changed in version 2014.1.0: `follow_symlinks` option added

`salt.modules.file.get_selinux_context(path)`

Get an SELinux context from a given path

CLI Example:

```
salt '*' file.get_selinux_context /etc/hosts
```

`salt.modules.file.get_source_sum`(*file\_name*='', *source*='', *source\_hash*=None, *source\_hash\_name*=None, *saltenv*='base')

New in version 2016.11.0.

Used by `file.get_managed` to obtain the hash and hash type from the parameters specified below.

**file\_name** Optional file name being managed, for matching with `file.extract_hash`.

**source** Source file, as used in `file` and other states. If `source_hash` refers to a file containing hashes, then this filename will be used to match a filename in that file. If the `source_hash` is a hash expression, then this argument will be ignored.

**source\_hash** Hash file/expression, as used in `file` and other states. If this value refers to a remote URL or absolute path to a local file, it will be cached and `file.extract_hash` will be used to obtain a hash from it.

**source\_hash\_name** Specific file name to look for when `source_hash` refers to a remote file, used to disambiguate ambiguous matches.

**saltenv** [base] Salt fileserver environment from which to retrieve the `source_hash`. This value will only be used when `source_hash` refers to a file on the Salt fileserver (i.e. one beginning with `salt://`).

CLI Example:

```
salt '*' file.get_source_sum /tmp/foo.tar.gz source=http://mydomain.tld/foo.tar.
↳gz source_hash=499ae16dcae71eeb7c3a30c75ea7a1a6
salt '*' file.get_source_sum /tmp/foo.tar.gz source=http://mydomain.tld/foo.tar.
↳gz source_hash=https://mydomain.tld/hashes.md5
salt '*' file.get_source_sum /tmp/foo.tar.gz source=http://mydomain.tld/foo.tar.
↳gz source_hash=https://mydomain.tld/hashes.md5 source_hash_name=./dir2/foo.tar.
↳gz
```

`salt.modules.file.get_sum`(*path*, *form*='sha256')

Return the checksum for the given file. The following checksum algorithms are supported:

- md5
- sha1
- sha224
- sha256 (default)
- sha384
- sha512

**path** path to the file or directory

**form** desired sum format

CLI Example:

```
salt '*' file.get_sum /etc/passwd sha512
```

`salt.modules.file.get_uid`(*path*, *follow\_symlinks*=True)

Return the id of the user that owns a given file

**path** file or directory of which to get the uid

**follow\_symlinks** indicated if symlinks should be followed

CLI Example:

```
salt '*' file.get_uid /etc/passwd
```

Changed in version 0.16.4: `follow_symlinks` option added

`salt.modules.file.get_user`(*path*, *follow\_symlinks*=True)

Return the user that owns a given file

**path** file or directory of which to get the user  
**follow\_symlinks** indicated if symlinks should be followed  
 CLI Example:

```
salt '*' file.get_user /etc/passwd
```

Changed in version 0.16.4: `follow_symlinks` option added

**salt.modules.file.gid\_to\_group**(*gid*)  
 Convert the group id to the group name on this system  
**gid** gid to convert to a group name  
 CLI Example:

```
salt '*' file.gid_to_group 0
```

**salt.modules.file.grep**(*path, pattern, \*opts*)  
 Grep for a string in the specified file

---

**Note:** This function's return value is slated for refinement in future versions of Salt

---

**path** Path to the file to be searched

---

**Note:** Globbing is supported (i.e. `/var/log/foo/*.log`, but if globbing is being used then the path should be quoted to keep the shell from attempting to expand the glob expression.

---

**pattern** Pattern to match. For example: `test`, or `a[0-5]`  
**opts** Additional command-line flags to pass to the `grep` command. For example: `-v`, or `-i -B2`

---

**Note:** The options should come after a double-dash (as shown in the examples below) to keep Salt's own argument parser from interpreting them.

---

CLI Example:

```
salt '*' file.grep /etc/passwd nobody
salt '*' file.grep /etc/sysconfig/network-scripts/ifcfg-eth0 ipaddr -- -i
salt '*' file.grep /etc/sysconfig/network-scripts/ifcfg-eth0 ipaddr -- -i -B2
salt '*' file.grep "/etc/sysconfig/network-scripts/*" ipaddr -- -i -l
```

**salt.modules.file.group\_to\_gid**(*group*)  
 Convert the group to the gid on this system  
**group** group to convert to its gid  
 CLI Example:

```
salt '*' file.group_to_gid root
```

**salt.modules.file.is\_blkdev**(*name*)  
 Check if a file exists and is a block device.  
 CLI Example:

```
salt '*' file.is_blkdev /dev/blk
```

**salt.modules.file.is\_chrdev**(*name*)  
 Check if a file exists and is a character device.

CLI Example:

```
salt '*' file.is_chrdev /dev/chr
```

`salt.modules.file.is_fifo`(*name*)

Check if a file exists and is a FIFO.

CLI Example:

```
salt '*' file.is_fifo /dev/fifo
```

`salt.modules.file.is_link`(*path*)

Check if the path is a symbolic link

CLI Example:

```
salt '*' file.is_link /path/to/link
```

`salt.modules.file.join`(\**args*)

Return a normalized file system path for the underlying OS

New in version 2014.7.0.

This can be useful at the CLI but is frequently useful when scripting combining path variables:

```
{% set www_root = '/var' %}  
{% set app_dir = 'myapp' %}  
  
myapp_config:  
  file:  
    - managed  
    - name: {{ salt['file.join'](www_root, app_dir, 'config.yaml') }}
```

CLI Example:

```
salt '*' file.join '/' 'usr' 'local' 'bin'
```

`salt.modules.file.lchown`(*path*, *user*, *group*)

Chown a file, pass the file the desired user and group without following symlinks.

**path** path to the file or directory

**user** user owner

**group** group owner

CLI Example:

```
salt '*' file.chown /etc/passwd root root
```

`salt.modules.file.line`(*path*, *content=None*, *match=None*, *mode=None*, *location=None*, *before=None*, *after=None*, *show\_changes=True*, *backup=False*, *quiet=False*, *indent=True*)

New in version 2015.8.0.

Edit a line in the configuration file. The **path** and **content** arguments are required, as well as passing in one of the mode options.

**path** Filesystem path to the file to be edited.

**content** Content of the line. Allowed to be empty if **mode=delete**.

**match** Match the target line for an action by a fragment of a string or regular expression.

If neither **before** nor **after** are provided, and **match** is also **None**, **match** becomes the **content** value.

**mode** Defines how to edit a line. One of the following options is required:

- **ensure** If line does not exist, it will be added. This is based on the `content` argument.
- **replace** If line already exists, it will be replaced.
- **delete** Delete the line, once found.
- **insert** Insert a line.

---

**Note:** If `mode=insert` is used, at least one of the following options must also be defined: `location`, `before`, or `after`. If `location` is used, it takes precedence over the other two options.

---

**location** Defines where to place content in the line. Note this option is only used when `mode=insert` is specified. If a location is passed in, it takes precedence over both the `before` and `after` kwargs. Valid locations are:

- **start** Place the content at the beginning of the file.
- **end** Place the content at the end of the file.

**before** Regular expression or an exact case-sensitive fragment of the string. This option is only used when either the `ensure` or `insert` mode is defined.

**after** Regular expression or an exact case-sensitive fragment of the string. This option is only used when either the `ensure` or `insert` mode is defined.

**show\_changes** Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made. Default is `True`

---

**Note:** Using this option will store two copies of the file in-memory (the original version and the edited version) in order to generate the diff.

---

**backup** Create a backup of the original file with the extension: ``Year-Month-Day-Hour-Minutes-Seconds``.

**quiet** Do not raise any exceptions. E.g. ignore the fact that the file that is tried to be edited does not exist and nothing really happened.

**indent** Keep indentation with the previous line. This option is not considered when the `delete` mode is specified.

CLI Example:

```
salt '*' file.line /etc/nsswitch.conf "networks:          files dns" after="hosts:.*?"
↳ " mode='ensure'
```

---

**Note:** If an equal sign (=) appears in an argument to a Salt command, it is interpreted as a keyword argument in the format of `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt '*' file.line /path/to/file content="CREATEMAIL_SPOOL=no" match="CREATE_MAIL_
↳SPOOL=yes" mode="replace"
```

---

`salt.modules.file.link`(*src, path*)

New in version 2014.1.0.

Create a hard link to a file

CLI Example:

```
salt '*' file.link /path/to/file /path/to/link
```

`salt.modules.file.list_backups`(*path, limit=None*)

New in version 0.17.0.

Lists the previous versions of a file backed up using Salt's *file state backup* system.

**path** The path on the minion to check for backups

**limit** Limit the number of results to the most recent N backups

CLI Example:

```
salt '*' file.list_backups /foo/bar/baz.txt
```

`salt.modules.file.list_backups_dir`(*path*, *limit=None*)

Lists the previous versions of a directory backed up using Salt's *file state backup* system.

**path** The directory on the minion to check for backups

**limit** Limit the number of results to the most recent N backups

CLI Example:

```
salt '*' file.list_backups_dir /foo/bar/baz/
```

`salt.modules.file.lstat`(*path*)

New in version 2014.1.0.

Returns the lstat attributes for the given file or dir. Does not support symbolic links.

CLI Example:

```
salt '*' file.lstat /path/to/file
```

`salt.modules.file.makedirs`(*path*, *user=None*, *group=None*, *mode=None*)

Ensure that the directory containing this path is available.

---

**Note:** The path must end with a trailing slash otherwise the directory/directories will be created up to the parent directory. For example if path is `/opt/code`, then it would be treated as `/opt/` but if the path ends with a trailing slash like `/opt/code/`, then it would be treated as `/opt/code/`.

---

CLI Example:

```
salt '*' file.makedirs /opt/code/
```

`salt.modules.file.makedirs_perms`(*name*, *user=None*, *group=None*, *mode='0755'*)

Taken and modified from `os.makedirs` to set user, group and mode for each directory created.

CLI Example:

```
salt '*' file.makedirs_perms /opt/code
```

`salt.modules.file.manage_file`(*name*, *sfn*, *ret*, *source*, *source\_sum*, *user*, *group*, *mode*, *saltenv*, *backup*, *makedirs=False*, *template=None*, *show\_changes=True*, *contents=None*, *dir\_mode=None*, *follow\_symlinks=True*, *skip\_verify=False*, *keep\_mode=False*, *encoding=None*, *encoding\_errors='strict'*, *\*\*kwargs*)

Checks the destination against what was retrieved with `get_managed` and makes the appropriate modifications (if necessary).

**name** location to place the file

**sfn** location of cached file on the minion

This is the path to the file stored on the minion. This file is placed on the minion using `cp.cache_file`. If the hash sum of that file matches the `source_sum`, we do not transfer the file to the minion again.

This file is then grabbed and if it has `template` set, it renders the file to be placed into the correct place on the system using `salt.files.utils.copyfile()`

**ret** The initial state return data structure. Pass in `None` to use the default structure.

**source** file reference on the master

**source\_hash** sum hash for source

**user** user owner

**group** group owner

**backup** backup\_mode

**makedirs** make directories if they do not exist

**template** format of templating

**show\_changes** Include diff in state return

**contents:** contents to be placed in the file

**dir\_mode** mode for directories created with makedirs

**skip\_verify** [False] If True, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.3.0.

**keep\_mode** [False] If True, and the `source` is a file from the Salt fileserver (or a local file on the minion), the mode of the destination file will be set to the mode of the source file.

---

**Note:** `keep_mode` does not work with salt-ssh.

As a consequence of how the files are transferred to the minion, and the inability to connect back to the master with salt-ssh, salt is unable to stat the file as it exists on the fileserver and thus cannot mirror the mode on the salt-ssh minion

---

**encoding** [None] If None, `str()` will be applied to contents. If not None, specified encoding will be used. See <https://docs.python.org/3/library/codecs.html#standard-encodings> for the list of available encodings.

New in version 2017.7.0.

**encoding\_errors** ['strict'] Default is `'strict'`. See <https://docs.python.org/2/library/codecs.html#codec-base-classes> for the error handling schemes.

New in version 2017.7.0.

CLI Example:

```
salt '*' file.manage_file /etc/httpd/conf.d/httpd.conf '{}' salt://http/httpd.conf '{hash_type: 'md5', 'hsum': <md5sum>}' root root '755' base ''
```

Changed in version 2014.7.0: `follow_symlinks` option added

`salt.modules.file.mkdir`(*dir\_path*, *user=None*, *group=None*, *mode=None*)  
Ensure that a directory is available.

CLI Example:

```
salt '*' file.mkdir /opt/jetty/context
```

`salt.modules.file.mknod`(*name*, *ntype*, *major=0*, *minor=0*, *user=None*, *group=None*, *mode='0600'*)  
New in version 0.17.0.

Create a block device, character device, or fifo pipe. Identical to the gnu `mknod`.

CLI Examples:

```
salt '*' file.mknod /dev/chr c 180 31
salt '*' file.mknod /dev/blk b 8 999
salt '*' file.nknod /dev/fifo p
```

`salt.modules.file.mknod_blkdev`(*name*, *major*, *minor*, *user=None*, *group=None*, *mode='0660'*)  
New in version 0.17.0.

Create a block device.

CLI Example:

```
salt '*' file.mknod_blkdev /dev/blk 8 999
```

`salt.modules.file.mknod_chrdev` (*name*, *major*, *minor*, *user=None*, *group=None*, *mode='0660'*)

New in version 0.17.0.

Create a character device.

CLI Example:

```
salt '*' file.mknod_chrdev /dev/chr 180 31
```

`salt.modules.file.mknod_fifo` (*name*, *user=None*, *group=None*, *mode='0660'*)

New in version 0.17.0.

Create a FIFO pipe.

CLI Example:

```
salt '*' file.mknod_fifo /dev/fifo
```

`salt.modules.file.move` (*src*, *dst*)

Move a file or directory

CLI Example:

```
salt '*' file.move /path/to/src /path/to/dst
```

`salt.modules.file.normpath` (*path*)

Returns Normalize path, eliminating double slashes, etc.

New in version 2015.5.0.

This can be useful at the CLI but is frequently useful when scripting.

```
{%- from salt['file.normpath'](tpldir + '/../vars.jinja') import parent_vars %}
```

CLI Example:

```
salt '*' file.normpath 'a/b/c/..'
```

`salt.modules.file.open_files` (*by\_pid=False*)

Return a list of all physical open files on the system.

CLI Examples:

```
salt '*' file.open_files
salt '*' file.open_files by_pid=True
```

`salt.modules.file.pardir` ()

Return the relative parent directory path symbol for underlying OS

New in version 2014.7.0.

This can be useful when constructing Salt Formulas.

```
{% set pardir = salt['file.pardir']() %}
{% set final_path = salt['file.join']('subdir', pardir, 'confdir') %}
```

CLI Example:

```
salt '*' file.pardir
```

`salt.modules.file.patch`(*originalfile*, *patchfile*, *options*=', dry\_run=False)

New in version 0.10.4.

Apply a patch to a file or directory.

Equivalent to:

```
patch <options> -i <patchfile> <originalfile>
```

Or, when a directory is patched:

```
patch <options> -i <patchfile> -d <originalfile> -p0
```

**originalfile** The full path to the file or directory to be patched

**patchfile** A patch file to apply to *originalfile*

**options** Options to pass to patch.

CLI Example:

```
salt '*' file.patch /opt/file.txt /tmp/file.txt.patch
```

`salt.modules.file.path_exists_glob`(*path*)

Tests to see if path after expansion is a valid path (file or directory). Expansion allows usage of ? \* and character ranges []. Tilde expansion is not supported. Returns True/False.

New in version Hellium.

CLI Example:

```
salt '*' file.path_exists_glob /etc/pam*/pass*
```

`salt.modules.file.prepend`(*path*, *\*args*, *\*\*kwargs*)

New in version 2014.7.0.

Prepend text to the beginning of a file

**path** path to file

**\*args** strings to prepend to the file

CLI Example:

```
salt '*' file.prepend /etc/motd \
    "With all thine offerings thou shalt offer salt." \
    "Salt is what makes things taste bad when it isn't in them."
```

### Attention

If you need to pass a string to append and that string contains an equal sign, you **must** include the argument name, *args*. For example:

```
salt '*' file.prepend /etc/motd args='cheese=spam'
```

```
salt '*' file.prepend /etc/motd args="['cheese=spam', 'spam=cheese']"
```

`salt.modules.file.psed`(*path*, *before*, *after*, *limit*='', *backup*='.bak', *flags*='gMS', *escape\_all*=False, *multi*=False)

Deprecated since version 0.17.0: Use `replace()` instead.

Make a simple edit to a file (pure Python version)

Equivalent to:

```
sed <backup> <options> "/<limit>/ s/<before>/<after>/<flags> <file>"
```

**path** The full path to the file to be edited

**before** A pattern to find in order to replace with **after**

**after** Text that will replace **before**

**limit** [' '] An initial pattern to search for before searching for **before**

**backup** [.bak] The file will be backed up before edit with this file extension; **WARNING**: each time `sed/comment/uncomment` is called will overwrite this backup

**flags** [gMS]

Flags to modify the search. Valid values are:

- g: Replace all occurrences of the pattern, not just the first.
- I: Ignore case.
- L: Make `\w`, `\W`, `\b`, `\B`, `\s` and `\S` dependent on the locale.
- M: Treat multiple lines as a single line.
- S: Make `.` match all characters, including newlines.
- U: Make `\w`, `\W`, `\b`, `\B`, `\d`, `\D`, `\s` and `\S` dependent on Unicode.
- X: Verbose (whitespace is ignored).

**multi**: **False** If True, treat the entire file as a single line

Forward slashes and single quotes will be escaped automatically in the **before** and **after** patterns.

CLI Example:

```
salt '*' file.sed /etc/httpd/httpd.conf 'LogLevel warn' 'LogLevel info'
```

`salt.modules.file.read`(*path*, *binary*=False)

New in version 2017.7.0.

Return the content of the file.

CLI Example:

```
salt '*' file.read /path/to/file
```

`salt.modules.file.readdir`(*path*)

New in version 2014.1.0.

Return a list containing the contents of a directory

CLI Example:

```
salt '*' file.readdir /path/to/dir/
```

`salt.modules.file.readlink`(*path*, *canonicalize*=False)

New in version 2014.1.0.

Return the path that a symlink points to If *canonicalize* is set to True, then it return the final target

CLI Example:

```
salt '*' file.readlink /path/to/link
```

`salt.modules.file.remove`(*path*)

Remove the named file. If a directory is supplied, it will be recursively deleted.

CLI Example:

```
salt '*' file.remove /tmp/foo
```

`salt.modules.file.rename`(*src*, *dst*)

Rename a file or directory

CLI Example:

```
salt '*' file.rename /path/to/src /path/to/dst
```

`salt.modules.file.replace`(*path*, *pattern*, *repl*, *count*=0, *flags*=8, *bufsize*=1, *append\_if\_not\_found*=False, *prepend\_if\_not\_found*=False, *not\_found\_content*=None, *backup*='bak', *dry\_run*=False, *search\_only*=False, *show\_changes*=True, *ignore\_if\_missing*=False, *preserve\_inode*=True, *backslash\_literal*=False)

New in version 0.17.0.

Replace occurrences of a pattern in a file. If `show_changes` is True, then a diff of what changed will be returned, otherwise a True will be returned when changes are made, and False when no changes are made.

This is a pure Python implementation that wraps Python's `sub()`.

**path** Filesystem path to the file to be edited. If a symlink is specified, it will be resolved to its target.

**pattern** A regular expression, to be matched using Python's `search()`.

**repl** The replacement text

**count** [0] Maximum number of pattern occurrences to be replaced. If count is a positive integer n, only n occurrences will be replaced, otherwise all occurrences will be replaced.

**flags** (list or int) A list of flags defined in the [re module documentation](#). Each list item should be a string that will correlate to the human-friendly flag name. E.g., [ ' IGNORECASE ', ' MULTILINE ' ]. Optionally, flags may be an int, with a value corresponding to the XOR (|) of all the desired flags. Defaults to 8 (which supports 'MULTILINE').

**bufsize** (int or str) How much of the file to buffer into memory at once. The default value 1 processes one line at a time. The special value `file` may be specified which will read the entire file into memory before processing.

**append\_if\_not\_found** [False] New in version 2014.7.0.

If set to True, and pattern is not found, then the content will be appended to the file.

**prepend\_if\_not\_found** [False] New in version 2014.7.0.

If set to True and pattern is not found, then the content will be prepended to the file.

**not\_found\_content** New in version 2014.7.0.

Content to use for append/prepend if not found. If None (default), uses `repl`. Useful when `repl` uses references to group in pattern.

**backup** [.bak] The file extension to use for a backup of the file before editing. Set to False to skip making a backup.

**dry\_run** [False] If set to True, no changes will be made to the file, the function will just return the changes that would have been made (or a True/False value if `show_changes` is set to False).

**search\_only** [False] If set to true, this no changes will be performed on the file, and this function will simply return True if the pattern was matched, and False if not.

**show\_changes** [True] If True, return a diff of changes made. Otherwise, return True if changes were made, and False if not.

---

**Note:** Using this option will store two copies of the file in memory (the original version and the edited version) in order to generate the diff. This may not normally be a concern, but could impact performance if used with large files.

---

**ignore\_if\_missing** [False] New in version 2015.8.0.

If set to `True`, this function will simply return `False` if the file doesn't exist. Otherwise, an error will be thrown.

**preserve\_inode** [True] New in version 2015.8.0.

Preserve the inode of the file, so that any hard links continue to share the inode with the original filename. This works by *copying* the file, reading from the copy, and writing to the file at the original inode. If `False`, the file will be *moved* rather than copied, and a new file will be written to a new inode, but using the original filename. Hard links will then share an inode with the backup, instead (if using backup to create a backup copy).

**backslash\_literal** [False] New in version 2016.11.7.

Interpret backslashes as literal backslashes for the `repl` and not escape characters. This will help when using `append/prepend` so that the backslashes are not interpreted for the `repl` on the second run of the state.

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt '*' file.replace /path/to/file pattern='=' repl=':'
salt '*' file.replace /path/to/file pattern="bind-address\s*=" repl='bind-address:
↪'
```

CLI Examples:

```
salt '*' file.replace /etc/httpd/httpd.conf pattern='LogLevel warn' repl=
↪'LogLevel info'
salt '*' file.replace /some/file pattern='before' repl='after' flags=[MULTILINE,
↪IGNORECASE]'
```

`salt.modules.file.restore_backup`(*path*, *backup\_id*)

New in version 0.17.0.

Restore a previous version of a file that was backed up using Salt's *file state backup* system.

**path** The path on the minion to check for backups

**backup\_id** The numeric id for the backup you wish to restore, as found using *file.list\_backups*

CLI Example:

```
salt '*' file.restore_backup /foo/bar/baz.txt 0
```

`salt.modules.file.restorecon`(*path*, *recursive=False*)

Reset the SELinux context on a given path

CLI Example:

```
salt '*' file.restorecon /home/user/.ssh/authorized_keys
```

`salt.modules.file.rmdir`(*path*)

New in version 2014.1.0.

Remove the specified directory. Fails if a directory is not empty.

CLI Example:

```
salt '*' file.rmdir /tmp/foo/
```

`salt.modules.file.search`(*path*, *pattern*, *flags=8*, *bufsize=1*, *ignore\_if\_missing=False*, *multiline=False*)

New in version 0.17.0.

Search for occurrences of a pattern in a file

Except for multiline, params are identical to `replace()`.

**multiline** If true, inserts `'MULTILINE'` into `flags` and sets `bufsize` to `'file'`.

New in version 2015.8.0.

CLI Example:

```
salt '*' file.search /etc/crontab 'mymaintenance.sh'
```

`salt.modules.file.sed`(*path*, *before*, *after*, *limit=''*, *backup='.bak'*, *options='-r -e'*, *flags='g'*, *escape\_all=False*, *negate\_match=False*)

Deprecated since version 0.17.0: Use `replace()` instead.

Make a simple edit to a file

Equivalent to:

```
sed <backup> <options> "/<limit>/ s/<before>/<after>/<flags> <file>"
```

**path** The full path to the file to be edited

**before** A pattern to find in order to replace with `after`

**after** Text that will replace `before`

**limit** [' '] An initial pattern to search for before searching for `before`

**backup** [.bak] The file will be backed up before edit with this file extension; **WARNING:** each time `sed/comment/uncomment` is called will overwrite this backup

**options** [-r -e] Options to pass to `sed`

**flags** [g] Flags to modify the `sed` search; e.g., `i` for case-insensitive pattern matching

**negate\_match** [False] Negate the search command (!)

New in version 0.17.0.

Forward slashes and single quotes will be escaped automatically in the `before` and `after` patterns.

CLI Example:

```
salt '*' file.sed /etc/httpd/httpd.conf 'LogLevel warn' 'LogLevel info'
```

`salt.modules.file.sed_contains`(*path*, *text*, *limit=''*, *flags='g'*)

Deprecated since version 0.17.0: Use `search()` instead.

Return True if the file at `path` contains `text`. Utilizes `sed` to perform the search (line-wise search).

Note: the `p` flag will be added to any `flags` you pass in.

CLI Example:

```
salt '*' file.contains /etc/crontab 'mymaintenance.sh'
```

`salt.modules.file.seek_read`(*path*, *size*, *offset*)

New in version 2014.1.0.

Seek to a position on a file and read it

**path** path to file

**seek** amount to read at once

**offset** offset to start into the file

CLI Example:

```
salt '*' file.seek_read /path/to/file 4096 0
```

`salt.modules.file.seek_write`(*path, data, offset*)

New in version 2014.1.0.

Seek to a position on a file and write to it

**path** path to file

**data** data to write to file

**offset** position in file to start writing

CLI Example:

```
salt '*' file.seek_write /path/to/file 'some data' 4096
```

`salt.modules.file.set_mode`(*path, mode*)

Set the mode of a file

**path** file or directory of which to set the mode

**mode** mode to set the path to

CLI Example:

```
salt '*' file.set_mode /etc/passwd 0644
```

`salt.modules.file.set_selinux_context`(*path, user=None, role=None, type=None, range=None*)

Set a specific SELinux label on a given path

CLI Example:

```
salt '*' file.set_selinux_context path <role> <type> <range>
```

`salt.modules.file.source_list`(*source, source\_hash, saltenv*)

Check the source list and return the source to use

CLI Example:

```
salt '*' file.source_list salt://http/httpd.conf '{hash_type: 'md5', 'hsum':  
→<md5sum>}' base
```

`salt.modules.file.stats`(*path, hash\_type=None, follow\_symlinks=True*)

Return a dict containing the stats for a given file

CLI Example:

```
salt '*' file.stats /etc/passwd
```

`salt.modules.file.statvfs`(*path*)

New in version 2014.1.0.

Perform a statvfs call against the filesystem that the file resides on

CLI Example:

```
salt '*' file.statvfs /path/to/file
```

`salt.modules.file.symlink`(*src, path*)

Create a symbolic link (symlink, soft link) to a file

CLI Example:

```
salt '*' file.symlink /path/to/file /path/to/link
```

`salt.modules.file.touch`(*name*, *atime=None*, *mtime=None*)

New in version 0.9.5.

Just like the `touch` command, create a file if it doesn't exist or simply update the `atime` and `mtime` if it already does.

**atime**: Access time in Unix epoch time

**mtime**: Last modification in Unix epoch time

CLI Example:

```
salt '*' file.touch /var/log/emptyfile
```

`salt.modules.file.truncate`(*path*, *length*)

New in version 2014.1.0.

Seek to a position on a file and delete everything after that point

**path** path to file

**length** offset into file to truncate

CLI Example:

```
salt '*' file.truncate /path/to/file 512
```

`salt.modules.file.uid_to_user`(*uid*)

Convert a uid to a user name

**uid** uid to convert to a username

CLI Example:

```
salt '*' file.uid_to_user 0
```

`salt.modules.file.uncomment`(*path*, *regex*, *char='#*, *backup='.bak'*)

Deprecated since version 0.17.0: Use `replace()` instead.

Uncomment specified commented lines in a file

**path** The full path to the file to be edited

**regex** A regular expression used to find the lines that are to be uncommented. This regex should not include the comment character. A leading `^` character will be stripped for convenience (for easily switching between `comment()` and `uncomment()`).

**char** [#] The character to remove in order to uncomment a line

**backup** [.bak] The file will be backed up before edit with this file extension; **WARNING**: each time `sed/comment/uncomment` is called will overwrite this backup

CLI Example:

```
salt '*' file.uncomment /etc/hosts.deny 'ALL: PARANOID'
```

`salt.modules.file.user_to_uid`(*user*)

Convert user name to a uid

**user** user name to convert to its uid

CLI Example:

```
salt '*' file.user_to_uid root
```

`salt.modules.file.write`(*path*, *\*args*, *\*\*kwargs*)

New in version 2014.7.0.

Write text to a file, overwriting any existing contents.

**path** path to file

*\*args* strings to write to the file

CLI Example:

```
salt '*' file.write /etc/motd \  
    "With all thine offerings thou shalt offer salt."
```

---

### Attention

If you need to pass a string to append and that string contains an equal sign, you **must** include the argument name, *args*. For example:

```
salt '*' file.write /etc/motd args='cheese=spam'  
  
salt '*' file.write /etc/motd args="['cheese=spam','spam=cheese']"
```

---

## 14.7.115 salt.modules.firewalld

Support for firewalld.

New in version 2015.2.0.

**salt.modules.firewalld.add\_interface**(*zone, interface, permanent=True*)

Bind an interface to a zone

New in version 2016.3.0.

CLI Example:

```
salt '*' firewalld.add_interface zone eth0
```

**salt.modules.firewalld.add\_masquerade**(*zone=None, permanent=True*)

Enable masquerade on a zone. If zone is omitted, default zone will be used.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.add_masquerade
```

To enable masquerade on a specific zone

```
salt '*' firewalld.add_masquerade dmz
```

**salt.modules.firewalld.add\_port**(*zone, port, permanent=True*)

Allow specific ports in a zone.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.add_port internal 443/tcp
```

**salt.modules.firewalld.add\_port\_fwd**(*zone, src, dest, proto='tcp', dstaddr='', permanent=True*)

Add port forwarding.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewallld.add_port_fwd public 80 443 tcp
```

`salt.modules.firewalld.add_rich_rule`(*zone, rule, permanent=True*)

Add a rich rule to a zone

New in version 2016.11.0.

CLI Example:

```
salt '*' firewallld.add_rich_rule zone 'rule'
```

`salt.modules.firewalld.add_service`(*service, zone=None, permanent=True*)

Add a service for zone. If zone is omitted, default zone will be used.

CLI Example:

```
salt '*' firewallld.add_service ssh
```

To assign a service to a specific zone:

```
salt '*' firewallld.add_service ssh my_zone
```

`salt.modules.firewalld.add_service_port`(*service, port*)

Add a new port to the specified service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewallld.add_service_port zone 80
```

`salt.modules.firewalld.add_service_protocol`(*service, protocol*)

Add a new protocol to the specified service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewallld.add_service_protocol zone ssh
```

`salt.modules.firewalld.add_source`(*zone, source, permanent=True*)

Bind a source to a zone

New in version 2016.3.0.

CLI Example:

```
salt '*' firewallld.add_source zone 192.168.1.0/24
```

`salt.modules.firewalld.allow_icmp`(*zone, icmp, permanent=True*)

Allow a specific ICMP type on a zone

New in version 2015.8.0.

CLI Example:

```
salt '*' firewallld.allow_icmp zone echo-reply
```

`salt.modules.firewalld.block_icmp`(*zone, icmp, permanent=True*)

Block a specific ICMP type on a zone

New in version 2015.8.0.

CLI Example:

```
salt '*' firewallld.block_icmp zone echo-reply
```

`salt.modules.firewalld.default_zone()`  
Print default zone for connections and interfaces

CLI Example:

```
salt '*' firewallld.default_zone
```

`salt.modules.firewalld.delete_service(name, restart=True)`  
Delete an existing service

CLI Example:

```
salt '*' firewallld.delete_service my_service
```

By default firewalld will be reloaded. However, to avoid reloading you need to specify the restart as False

```
salt '*' firewallld.delete_service my_service False
```

`salt.modules.firewalld.delete_zone(zone, restart=True)`  
Delete an existing zone

CLI Example:

```
salt '*' firewallld.delete_zone my_zone
```

By default firewalld will be reloaded. However, to avoid reloading you need to specify the restart as False

```
salt '*' firewallld.delete_zone my_zone False
```

`salt.modules.firewalld.get_icmp_types(permanent=True)`  
Print predefined icmp types

CLI Example:

```
salt '*' firewallld.get_icmp_types
```

`salt.modules.firewalld.get_interfaces(zone, permanent=True)`  
List interfaces bound to a zone

New in version 2016.3.0.

CLI Example:

```
salt '*' firewallld.get_interfaces zone
```

`salt.modules.firewalld.get_masquerade(zone=None, permanent=True)`  
Show if masquerading is enabled on a zone. If zone is omitted, default zone will be used.

CLI Example:

```
salt '*' firewallld.get_masquerade zone
```

`salt.modules.firewalld.get_rich_rules(zone, permanent=True)`  
List rich rules bound to a zone

New in version 2016.11.0.

CLI Example:

```
salt '*' firewallld.get_rich_rules zone
```

`salt.modules.firewalld.get_service_ports`(*service*)

List ports of a service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewallld.get_service_ports zone
```

`salt.modules.firewalld.get_service_protocols`(*service*)

List protocols of a service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewallld.get_service_protocols zone
```

`salt.modules.firewalld.get_services`(*permanent=True*)

Print predefined services

CLI Example:

```
salt '*' firewallld.get_services
```

`salt.modules.firewalld.get_sources`(*zone, permanent=True*)

List sources bound to a zone

New in version 2016.3.0.

CLI Example:

```
salt '*' firewallld.get_sources zone
```

`salt.modules.firewalld.get_zones`(*permanent=True*)

Print predefined zones

CLI Example:

```
salt '*' firewallld.get_zones
```

`salt.modules.firewalld.list_all`(*zone=None, permanent=True*)

List everything added for or enabled in a zone

CLI Example:

```
salt '*' firewallld.list_all
```

List a specific zone

```
salt '*' firewallld.list_all my_zone
```

`salt.modules.firewalld.list_icmp_block`(*zone, permanent=True*)

List ICMP blocks on a zone

New in version 2015.8.0.

CLI Example:

```
salt '*' firewallld.list_icmp_block zone
```

**salt.modules.firewalld.list\_port\_fwd**(*zone, permanent=True*)

List port forwarding

New in version 2015.8.0.

CLI Example:

```
salt '*' firewallld.list_port_fwd public
```

**salt.modules.firewalld.list\_ports**(*zone, permanent=True*)

List all ports in a zone.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewallld.list_ports
```

**salt.modules.firewalld.list\_services**(*zone=None, permanent=True*)

List services added for zone as a space separated list. If zone is omitted, default zone will be used.

CLI Example:

```
salt '*' firewallld.list_services
```

List a specific zone

```
salt '*' firewallld.list_services my_zone
```

**salt.modules.firewalld.list\_zones**(*permanent=True*)

List everything added for or enabled in all zones

CLI Example:

```
salt '*' firewallld.list_zones
```

**salt.modules.firewalld.make\_permanent**()

Make current runtime configuration permanent.

New in version 2016.3.0.

CLI Example:

```
salt '*' firewallld.make_permanent
```

**salt.modules.firewalld.new\_service**(*name, restart=True*)

Add a new service

CLI Example:

```
salt '*' firewallld.new_service my_service
```

By default firewalld will be reloaded. However, to avoid reloading you need to specify the restart as False

```
salt '*' firewallld.new_service my_service False
```

`salt.modules.firewalld.new_zone(zone, restart=True)`

Add a new zone

CLI Example:

```
salt '*' firewalld.new_zone my_zone
```

By default firewalld will be reloaded. However, to avoid reloading you need to specify the restart as False

```
salt '*' firewalld.new_zone my_zone False
```

`salt.modules.firewalld.reload_rules()`

Reload the firewall rules, which makes the permanent configuration the new runtime configuration without losing state information.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.reload
```

`salt.modules.firewalld.remove_interface(zone, interface, permanent=True)`

Remove an interface bound to a zone

New in version 2016.3.0.

CLI Example:

```
salt '*' firewalld.remove_interface zone eth0
```

`salt.modules.firewalld.remove_masquerade(zone=None, permanent=True)`

Remove masquerade on a zone. If zone is omitted, default zone will be used.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.remove_masquerade
```

To remove masquerade on a specific zone

```
salt '*' firewalld.remove_masquerade dmz
```

`salt.modules.firewalld.remove_port(zone, port, permanent=True)`

Remove a specific port from a zone.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.remove_port internal 443/tcp
```

`salt.modules.firewalld.remove_port_fwd(zone, src, dest, proto='tcp', dstaddr='', permanent=True)`

Remove Port Forwarding.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.remove_port_fwd public 80 443 tcp
```

`salt.modules.firewalld.remove_rich_rule(zone, rule, permanent=True)`

Add a rich rule to a zone

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.remove_rich_rule zone 'rule'
```

`salt.modules.firewalld.remove_service(service, zone=None, permanent=True)`

Remove a service from zone. This option can be specified multiple times. If zone is omitted, default zone will be used.

CLI Example:

```
salt '*' firewalld.remove_service ssh
```

To remove a service from a specific zone

```
salt '*' firewalld.remove_service ssh dmz
```

`salt.modules.firewalld.remove_service_port(service, port)`

Remove a port from the specified service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.remove_service_port zone 80
```

`salt.modules.firewalld.remove_service_protocol(service, protocol)`

Remove a protocol from the specified service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.remove_service_protocol zone ssh
```

`salt.modules.firewalld.remove_source(zone, source, permanent=True)`

Remove a source bound to a zone

New in version 2016.3.0.

CLI Example:

```
salt '*' firewalld.remove_source zone 192.168.1.0/24
```

`salt.modules.firewalld.set_default_zone(zone)`

Set default zone

CLI Example:

```
salt '*' firewalld.set_default_zone damian
```

`salt.modules.firewalld.version()`

Return version from firewall-cmd

CLI Example:

```
salt '*' firewallld.version
```

### 14.7.116 salt.modules.freebsd\_sysctl

Module for viewing and modifying sysctl parameters

`salt.modules.freebsd_sysctl.assign(name, value)`  
Assign a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.assign net.inet.icmp.icmplim 50
```

`salt.modules.freebsd_sysctl.get(name)`  
Return a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.get hw.physmem
```

`salt.modules.freebsd_sysctl.persist(name, value, config='/etc/sysctl.conf')`  
Assign and persist a simple sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.persist net.inet.icmp.icmplim 50
salt '*' sysctl.persist coretemp_load NO config=/boot/loader.conf
```

`salt.modules.freebsd_sysctl.show(config_file=False)`  
Return a list of sysctl parameters for this minion

CLI Example:

```
salt '*' sysctl.show
```

### 14.7.117 salt.modules.freebsd\_update module

Support for freebsd-update utility on FreeBSD.

New in version 2017.7.0.

**maintainer** George Mamalakis <mamalos@gmail.com>

**maturity** new

**platform** FreeBSD

`salt.modules.freebsd_update.fetch(**kwargs)`  
New in version 2016.3.4.

freebsd-update fetch wrapper. Based on the currently installed world and the configuration options set, fetch all available binary updates.

**kwargs:** Parameters of freebsd-update command.

`salt.modules.freebsd_update.ids(**kwargs)`  
New in version 2016.3.4.

freebsd-update IDS wrapper function. Compares the system against a ``known good'' index of the installed release.

**kwargs:** Parameters of freebsd-update command.

`salt.modules.freebsd_update.install(**kwargs)`  
New in version 2016.3.4.

freebsd-update install wrapper. Install the most recently fetched updates or upgrade.  
**kwargs:** Parameters of freebsd-update command.

`salt.modules.freebsd_update.rollback(**kwargs)`  
New in version 2016.3.4.

freebsd-update rollback wrapper. Uninstalls the most recently installed updates.  
**kwargs:** Parameters of freebsd-update command.

`salt.modules.freebsd_update.update(**kwargs)`  
New in version 2016.3.4.

Command that simplifies freebsd-update by running freebsd-update fetch first and then freebsd-update install.  
**kwargs:** Parameters of freebsd-update command.

`salt.modules.freebsd_update.upgrade(**kwargs)`  
New in version 2016.3.4.

Dummy function used only to print a message that upgrade is not available. The reason is that upgrade needs manual intervention and reboot, so even if used with:  
`yes | freebsd-update -r VERSION`  
the additional freebsd-update install that needs to run after the reboot cannot be implemented easily.  
**kwargs:** Parameters of freebsd-update command.

### 14.7.118 `salt.modules.freebsdjail`

The jail module for FreeBSD

`salt.modules.freebsdjail.fstab(jail)`  
Display contents of a fstab(5) file defined in specified jail's configuration. If no file is defined, return False.

CLI Example:

```
salt '*' jail.fstab <jail name>
```

`salt.modules.freebsdjail.get_enabled()`  
Return which jails are set to be run

CLI Example:

```
salt '*' jail.get_enabled
```

`salt.modules.freebsdjail.is_enabled()`  
See if jail service is actually enabled on boot

CLI Example:

```
salt '*' jail.is_enabled <jail name>
```

`salt.modules.freebsdjail.restart(jail='')`  
Restart the specified jail or all, if none specified

CLI Example:

```
salt '*' jail.restart [<jail name>]
```

`salt.modules.freebsdjail.show_config(jail)`

Display specified jail's configuration

CLI Example:

```
salt '*' jail.show_config <jail name>
```

`salt.modules.freebsdjail.start(jail='')`

Start the specified jail or all, if none specified

CLI Example:

```
salt '*' jail.start [<jail name>]
```

`salt.modules.freebsdjail.status(jail)`

See if specified jail is currently running

CLI Example:

```
salt '*' jail.status <jail name>
```

`salt.modules.freebsdjail.stop(jail='')`

Stop the specified jail or all, if none specified

CLI Example:

```
salt '*' jail.stop [<jail name>]
```

`salt.modules.freebsdjail.sysctl()`

Dump all jail related kernel states (sysctl)

CLI Example:

```
salt '*' jail.sysctl
```

### 14.7.119 salt.modules.freebsdkernel

Module to manage FreeBSD kernel modules

`salt.modules.freebsdkernel.available()`

Return a list of all available kernel modules

CLI Example:

```
salt '*' kmod.available
```

`salt.modules.freebsdkernel.check_available(mod)`

Check to see if the specified kernel module is available

CLI Example:

```
salt '*' kmod.check_available vmm
```

`salt.modules.freebsdkernel.is_loaded(mod)`

Check to see if the specified kernel module is loaded

CLI Example:

```
salt '*' kmod.is_loaded vmm
```

`salt.modules.freebsd_kmod.load(mod, persist=False)`

Load the specified kernel module

**mod** Name of the module to add

**persist** Write the module to `sysrc kld_modules` to make it load on system reboot

CLI Example:

```
salt '*' kmod.load bhyve
```

`salt.modules.freebsd_kmod.lsmod()`

Return a dict containing information about currently loaded modules

CLI Example:

```
salt '*' kmod.lsmod
```

`salt.modules.freebsd_kmod.mod_list(only_persist=False)`

Return a list of the loaded module names

CLI Example:

```
salt '*' kmod.mod_list
```

`salt.modules.freebsd_kmod.remove(mod, persist=False)`

Remove the specified kernel module

CLI Example:

```
salt '*' kmod.remove vmm
```

### 14.7.120 salt.modules.freebsd\_pkg

Remote package support using `pkg_add(1)`

---

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `'pkg.install' is not available`), see [here](#).

---

**Warning:** This module has been completely rewritten. Up to and including version 0.17.0, it supported `pkg_add(1)`, but checked for the existence of a `pkgng` local database and, if found, would provide some of `pkgng`'s functionality. The rewrite of this module has removed all `pkgng` support, and moved it to the `pkgng` execution module. For versions `<= 0.17.0`, the documentation here should not be considered accurate. If your Minion is running one of these versions, then the documentation for this module can be viewed using the `sys.doc` function:

```
salt bsdminion sys.doc pkg
```

This module acts as the default package provider for FreeBSD 9 and older. If you need to use `pkgng` on a FreeBSD 9 system, you will need to override the `pkg` provider by setting the `providers` parameter in your Minion config file, in order to use `pkgng`.

```
providers:
  pkg: pkgng
```

More information on pkgng support can be found in the documentation for the [pkgng](#) module.

This module will respect the PACKAGEROOT and PACKAGESITE environment variables, if set, but these values can also be overridden in several ways:

1. **Salt configuration parameters.** The configuration parameters `freebsdpkg.PACKAGEROOT` and `freebsdpkg.PACKAGESITE` are recognized. These config parameters are looked up using `config.get` and can thus be specified in the Master config file, Grains, Pillar, or in the Minion config file. Example:

```
freebsdpkg.PACKAGEROOT: ftp://ftp.freebsd.org/
freebsdpkg.PACKAGESITE: ftp://ftp.freebsd.org/pub/FreeBSD/ports/ia64/packages-9-
↳stable/Latest/
```

2. **CLI arguments.** Both the `packageroot` (used interchangeably with `fromrepo` for API compatibility) and `packagesite` CLI arguments are recognized, and override their config counterparts from section 1 above.

```
salt -G 'os:FreeBSD' pkg.install zsh fromrepo=ftp://ftp2.freebsd.org/
salt -G 'os:FreeBSD' pkg.install zsh packageroot=ftp://ftp2.freebsd.org/
salt -G 'os:FreeBSD' pkg.install zsh packagesite=ftp://ftp2.freebsd.org/pub/
↳FreeBSD/ports/ia64/packages-9-stable/Latest/
```

.. note::

These arguments can also be passed through in states:

.. code-block:: yaml

```
zsh:
  pkg.installed:
    - fromrepo: ftp://ftp2.freebsd.org/
```

`salt.modules.freebsdpkg.file_dict(*packages)`

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of `_every_file` on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.freebsdpkg.file_list(*packages)`

List the files that belong to a package. Not specifying any packages will return a list of `_every_file` on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.freebsdpkg.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)`

Install package(s) using `pkg_add(1)`

**name** The name of the package to be installed.

**refresh** Whether or not to refresh the package database before installing.

**fromrepo or packageroot** Specify a package repository from which to install. Overrides the system default, as well as the PACKAGEROOT environment variable.

**packagesite** Specify the exact directory from which to install the remote package. Overrides the PACKAGE-SITE environment variable, if present.

Multiple Package Installation Options:

**pkgs** A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs=['foo', 'bar']
```

**sources** A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources=[{"foo": "salt://foo.deb"}, {"bar": "salt://bar.
deb"}]
```

Return a dict containing the new package names and versions:

```
{'package': {'old': 'old-version',
              'new': 'new-version'}}
```

CLI Example:

```
salt '*' pkg.install <package name>
```

`salt.modules.freebsdpkg.latest_version(*names, **kwargs)`

`pkg_add(1)` is not capable of querying for remote packages, so this function will always return results as if there is no package available for install or upgrade.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.freebsdpkg.list_pkgs(versions_as_list=False, with_origin=False, **kwargs)`

List the packages currently installed as a dict:

```
{'package_name': 'version'}
```

**with\_origin** [False] Return a nested dictionary containing both the origin name and version for each installed package.

New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.freebsdpkg.refresh_db()`

`pkg_add(1)` does not use a local database of available packages, so this function simply returns True. it exists merely for API compatibility.

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.freebsdpkg.remove`(*name=None, pkgs=None, \*\*kwargs*)

Remove packages using `pkg_delete(1)`

**name** The name of the package to be deleted.

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.freebsdpkg.version`(*\*names, \*\*kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

**with\_origin** [False] Return a nested dictionary containing both the origin name and version for each specified package.

New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

### 14.7.121 salt.modules.freebsdports

Install software from the FreeBSD ports (7) system

New in version 2014.1.0.

This module allows you to install ports using `BATCH=yes` to bypass configuration prompts. It is recommended to use the `ports` state to install ports, but it is also possible to use this module exclusively from the command line.

```
salt minion-id ports.config security/nmap IPV6=off
salt minion-id ports.install security/nmap
```

`salt.modules.freebsdports.config`(*name, reset=False, \*\*kwargs*)

Modify configuration options for a given port. Multiple options can be specified. To see the available options for a port, use `ports.showconfig`.

**name** The port name, in category/name format

**reset** [False] If True, runs a `make rmconfig` for the port, clearing its configuration before setting the desired options

CLI Examples:

```
salt '*' ports.config security/nmap IPV6=off
```

`salt.modules.freebsdports.deinstall`(*name*)

De-install a port.

CLI Example:

```
salt '*' ports.deinstall security/nmap
```

`salt.modules.freebsdports.install`(*name*, *clean=True*)

Install a port from the ports tree. Installs using BATCH=yes for non-interactive building. To set config options for a given port, use [ports.config](#).

**clean** [True] If True, cleans after installation. Equivalent to running `make install clean BATCH=yes`.

---

**Note:** It may be helpful to run this function using the `-t` option to set a higher timeout, since compiling a port may cause the Salt command to exceed the default timeout.

---

CLI Example:

```
salt -t 1200 '*' ports.install security/nmap
```

`salt.modules.freebsdports.list_all`()

Lists all ports available.

CLI Example:

```
salt '*' ports.list_all
```

**Warning:** Takes a while to run, and returns a **LOT** of output

`salt.modules.freebsdports.rmconfig`(*name*)

Clear the cached options for the specified port; run a `make rmconfig`

**name** The name of the port to clear

CLI Example:

```
salt '*' ports.rmconfig security/nmap
```

`salt.modules.freebsdports.search`(*name*)

Search for matches in the ports tree. Globs are supported, and the category is optional

CLI Examples:

```
salt '*' ports.search 'security/*'  
salt '*' ports.search 'security/n*'  
salt '*' ports.search nmap
```

**Warning:** Takes a while to run

`salt.modules.freebsdports.showconfig`(*name*, *default=False*, *dict\_return=False*)

Show the configuration options for a given port.

**default** [False] Show the default options for a port (not necessarily the same as the current configuration)

**dict\_return** [False] Instead of returning the output of `make showconfig`, return the data in a dictionary

CLI Example:

```
salt '*' ports.showconfig security/nmap  
salt '*' ports.showconfig security/nmap default=True
```

`salt.modules.freebsdports.update`(*extract=False*)

Update the ports tree

**extract** [False] If True, runs a `portsnap extract` after fetching, should be used for first-time installation of the ports tree.

CLI Example:

```
salt '*' ports.update
```

### 14.7.122 salt.modules.freebsdservice

The service module for FreeBSD

---

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `'service.start' is not available`), see [here](#).

---

**salt.modules.freebsdservice.available**(*name*, *jail=None*)

Check that the given service is available.

Changed in version 2016.3.4.

**jail:** optional jid or jail name

CLI Example:

```
salt '*' service.available sshd
```

**salt.modules.freebsdservice.disable**(*name*, *\*\*kwargs*)

Disable the named service to start at boot

Arguments the same as for enable()

Changed in version 2016.3.4.

**jail** (optional keyword argument) the jail's id or name

**chroot** (optional keyword argument) the jail's chroot, if the jail's /etc is not mounted read-write

CLI Example:

```
salt '*' service.disable <service name>
```

**salt.modules.freebsdservice.disabled**(*name*, *\*\*kwargs*)

Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.disabled <service name>
```

**salt.modules.freebsdservice.enable**(*name*, *\*\*kwargs*)

Enable the named service to start at boot

**name** service name

**config** [/etc/rc.conf] Config file for managing service. If config value is empty string, then /etc/rc.conf.d/<service> used. See man rc.conf(5) for details.

Also service.config variable can be used to change default.

Changed in version 2016.3.4.

**jail** (optional keyword argument) the jail's id or name

**chroot** (optional keyword argument) the jail's chroot, if the jail's /etc is not mounted read-write

CLI Example:

```
salt '*' service.enable <service name>
```

**salt.modules.freebsdservice.enabled**(*name*, *\*\*kwargs*)

Return True if the named service is enabled, false otherwise

**name** Service name

Changed in version 2016.3.4.

Support for jail (representing jid or jail name) keyword argument in kwargs

CLI Example:

```
salt '*' service.enabled <service name>
```

**salt.modules.freebsdservice.get\_all**(*jail=None*)

Return a list of all available services

Changed in version 2016.3.4.

jail: optional jid or jail name

CLI Example:

```
salt '*' service.get_all
```

**salt.modules.freebsdservice.get\_disabled**(*jail=None*)

Return what services are available but not enabled to start at boot

Changed in version 2016.3.4.

Support for jail (representing jid or jail name) keyword argument in kwargs

CLI Example:

```
salt '*' service.get_disabled
```

**salt.modules.freebsdservice.get\_enabled**(*jail=None*)

Return what services are set to run on boot

Changed in version 2016.3.4.

Support for jail (representing jid or jail name) keyword argument in kwargs

CLI Example:

```
salt '*' service.get_enabled
```

**salt.modules.freebsdservice.missing**(*name, jail=None*)

The inverse of `service.available`. Returns True if the specified service is not available, otherwise returns False.

Changed in version 2016.3.4.

jail: optional jid or jail name

CLI Example:

```
salt '*' service.missing sshd
```

**salt.modules.freebsdservice.reload**(*name, jail=None*)

Restart the named service

Changed in version 2016.3.4.

jail: optional jid or jail name

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.freebsdservice.restart`(*name*, *jail=None*)

Restart the named service

Changed in version 2016.3.4.

*jail*: optional jid or jail name

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.freebsdservice.start`(*name*, *jail=None*)

Start the specified service

Changed in version 2016.3.4.

*jail*: optional jid or jail name

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.freebsdservice.status`(*name*, *sig=None*, *jail=None*)

Return the status for a service (True or False).

**name** Name of service

Changed in version 2016.3.4.

*jail*: optional jid or jail name

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.freebsdservice.stop`(*name*, *jail=None*)

Stop the specified service

Changed in version 2016.3.4.

*jail*: optional jid or jail name

CLI Example:

```
salt '*' service.stop <service name>
```

### 14.7.123 salt.modules.gem

Manage ruby gems.

`salt.modules.gem.install`(*gems*, *ruby=None*, *gem\_bin=None*, *runas=None*, *version=None*, *rdoc=False*, *ri=False*, *pre\_releases=False*, *proxy=None*, *source=None*)

Installs one or several gems.

#### Parameters

- **gems** -- string The gems to install
- **gem\_bin** -- string : None Full path to gem binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.

- **runas** -- string : None The user to run gem as.
- **version** -- string : None Specify the version to install for the gem. Doesn't play nice with multiple gems at once
- **rdoc** -- boolean : False Generate RDoc documentation for the gem(s).
- **ri** -- boolean : False Generate RI documentation for the gem(s).
- **pre\_releases** -- boolean : False Include pre-releases in the available versions
- **proxy** -- string : None Use the specified HTTP proxy server for all outgoing traffic. Format: `http://hostname[{}:port]`

**source** [None] Use the specified HTTP gem source server to download gem. Format: `http://hostname[{}:port]`

CLI Example:

```
salt '*' gem.install vagrant
salt '*' gem.install redphone gem_bin=/opt/sensu/embedded/bin/gem
```

`salt.modules.gem.list` (*prefix=''*, *ruby=None*, *runas=None*, *gem\_bin=None*)

List locally installed gems.

Parameters

- **prefix** -- string : Only list gems when the name matches this prefix.
- **gem\_bin** -- string : None Full path to gem binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **runas** -- string : None The user to run gem as.

CLI Example:

```
salt '*' gem.list
```

`salt.modules.gem.list_upgrades` (*ruby=None*, *runas=None*, *gem\_bin=None*)

New in version 2015.8.0.

Check if an upgrade is available for installed gems

**gem\_bin** [None] Full path to gem binary to use.

**ruby** [None] If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.

**runas** [None] The user to run gem as.

CLI Example:

```
salt '*' gem.list_upgrades
```

`salt.modules.gem.sources_add` (*source\_uri*, *ruby=None*, *runas=None*, *gem\_bin=None*)

Add a gem source.

Parameters

- **source\_uri** -- string The source URI to add.
- **gem\_bin** -- string : None Full path to gem binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **runas** -- string : None The user to run gem as.

CLI Example:

```
salt '*' gem.sources_add http://rubygems.org/
```

`salt.modules.gem.sources_list`(*ruby=None, runas=None, gem\_bin=None*)

List the configured gem sources.

#### Parameters

- **gem\_bin** -- string : None Full path to gem binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **runas** -- string : None The user to run gem as.

CLI Example:

```
salt '*' gem.sources_list
```

`salt.modules.gem.sources_remove`(*source\_uri, ruby=None, runas=None, gem\_bin=None*)

Remove a gem source.

#### Parameters

- **source\_uri** -- string The source URI to remove.
- **gem\_bin** -- string : None Full path to gem binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **runas** -- string : None The user to run gem as.

CLI Example:

```
salt '*' gem.sources_remove http://rubygems.org/
```

`salt.modules.gem.uninstall`(*gems, ruby=None, runas=None, gem\_bin=None*)

Uninstall one or several gems.

#### Parameters

- **gems** -- string The gems to uninstall.
- **gem\_bin** -- string : None Full path to gem binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **runas** -- string : None The user to run gem as.

CLI Example:

```
salt '*' gem.uninstall vagrant
```

`salt.modules.gem.update`(*gems, ruby=None, runas=None, gem\_bin=None*)

Update one or several gems.

#### Parameters

- **gems** -- string The gems to update.
- **gem\_bin** -- string : None Full path to gem binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **runas** -- string : None The user to run gem as.

CLI Example:

```
salt '*' gem.update vagrant
```

`salt.modules.gem.update_system`(*version=''*, *ruby=None*, *runas=None*, *gem\_bin=None*)

Update rubygems.

#### Parameters

- **version** -- string : (newest) The version of rubygems to install.
- **gem\_bin** -- string : None Full path to gem binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **runas** -- string : None The user to run gem as.

CLI Example:

```
salt '*' gem.update_system
```

### 14.7.124 salt.modules.genesis

Module for managing container and VM images

New in version 2014.7.0.

`salt.modules.genesis.avail_platforms`()

Return which platforms are available

CLI Example:

```
salt myminion genesis.avail_platforms
```

`salt.modules.genesis.bootstrap`(*platform*, *root*, *img\_format='dir'*, *fs\_format='ext2'*, *fs\_opts=None*, *arch=None*, *flavor=None*, *repo\_url=None*, *static\_qemu=None*, *img\_size=None*, *mount\_dir=None*, *pkg\_cache=None*, *pkgs=None*, *exclude\_pkgs=None*, *epel\_url='http://download.fedoraproject.org/pub/epel/6/i386/epel-release-6-8.noarch.rpm'*)

Create an image for a specific platform.

Please note that this function *MUST* be run as root, as images that are created make files belonging to root.  
**platform** Which platform to use to create the image. Currently supported platforms are rpm, deb and pacman.

**root** Local path to create the root of the image filesystem.

**img\_format** Which format to create the image in. By default, just copies files into a directory on the local filesystem (`dir`). Future support will exist for `sparse`.

**fs\_format** When using a non-`dir` `img_format`, which filesystem to format the image to. By default, `ext2`.

**fs\_opts** When using a non-`dir` `img_format`, a dict of opts may be specified.

**arch** Architecture to install packages for, if supported by the underlying bootstrap tool. Currently only used for deb.

**flavor** Which flavor of operating system to install. This correlates to a specific directory on the distribution repositories. For instance, `wheezy` on Debian.

**repo\_url** Mainly important for Debian-based repos. Base URL for the mirror to install from. (e.x.: <http://ftp.debian.org/debian/>)

**static\_qemu** Local path to the static qemu binary required for this arch. (e.x.: `/usr/bin/qemu-amd64-static`)

**pkg\_confs** The location of the conf files to copy into the image, to point the installer to the right repos and configuration.

**img\_size** If `img_format` is not `dir`, then the size of the image must be specified.

**mount\_dir** If `img_format` is not `dir`, then the image must be mounted somewhere. If the `mount_dir` is not specified, then it will be created at `/opt/salt-genesis.<random_uuid>`. This directory will be unmounted and removed when the process is finished.

**pkg\_cache** This points to a directory containing a cache of package files to be copied to the image. It does not need to be specified.

**pkgs** A list of packages to be installed on this image. For RedHat, this will include `yum`, `centos-release` and `iputils` by default.

**exclude\_pkgs** A list of packages to be excluded. If you do not want to install the defaults, you need to include them in this list.

**epel\_url** The URL to download the EPEL release package from.

CLI Examples:

```
salt myminion genesis.bootstrap pacman /root/arch
salt myminion genesis.bootstrap rpm /root/redhat
salt myminion genesis.bootstrap deb /root/wheezy arch=amd64
↳ flavor=wheezy static_qemu=/usr/bin/qemu-x86_64-static
```

`salt.modules.genesis.ldd_deps` (*filename, ret=None*)

Recurse through a set of dependencies reported by `ldd`, to find associated dependencies.

Please note that this does not necessarily resolve all (non-package) dependencies for a file; but it does help.

CLI Example:

```
salt myminion genesis.ldd_deps bash salt myminion genesis.ldd_deps /bin/bash
```

`salt.modules.genesis.mksls` (*fmt, src, dst=None*)

Convert an installation file/script to an SLS file. Currently supports `kickstart`, `preseed`, and `autoyast`.

CLI Examples:

```
salt <minion> genesis.mksls kickstart /path/to/kickstart.cfg salt <minion> genesis.mksls kickstart
/path/to/kickstart.cfg /path/to/dest.sls
```

New in version Beryllium.

`salt.modules.genesis.pack` (*name, root, path=None, pack\_format='tar', compress='bzip2'*)

Pack up a directory structure, into a specific format

CLI Examples:

```
salt myminion genesis.pack centos /root/centos
salt myminion genesis.pack centos /root/centos pack_format='tar'
```

`salt.modules.genesis.unpack` (*name, dest=None, path=None, pack\_format='tar', compress='bzip2'*)

Unpack an image into a directory structure

CLI Example:

```
salt myminion genesis.unpack centos /root/centos
```

### 14.7.125 salt.modules.gentoo\_service

Top level package command wrapper, used to translate the os detected by grains to the correct service manager

---

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `'service.start' is not available`), see [here](#).

---

`salt.modules.gentoo_service.available(name)`

Returns True if the specified service is available, otherwise returns False.

CLI Example:

```
salt '*' service.available sshd
```

`salt.modules.gentoo_service.disable(name, **kwargs)`

Disable the named service to start at boot

CLI Example:

```
salt '*' service.disable <service name> <runlevels=single-runlevel>
salt '*' service.disable <service name> <runlevels=[runlevel1,runlevel2]>
```

`salt.modules.gentoo_service.disabled(name)`

Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.disabled <service name> <runlevels=[runlevel]>
```

`salt.modules.gentoo_service.enable(name, **kwargs)`

Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name> <runlevels=single-runlevel>
salt '*' service.enable <service name> <runlevels=[runlevel1,runlevel2]>
```

`salt.modules.gentoo_service.enabled(name, **kwargs)`

Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.enabled <service name> <runlevels=single-runlevel>
salt '*' service.enabled <service name> <runlevels=[runlevel1,runlevel2]>
```

`salt.modules.gentoo_service.get_all()`

Return all available boot services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.gentoo_service.get_disabled()`

Return a set of services that are installed but disabled

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.gentoo_service.get_enabled()`

Return a list of service that are enabled on boot

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.gentoo_service.missing(name)`

The inverse of `service.available`. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.gentoo_service.reload_(name)`

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.gentoo_service.restart(name)`

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.gentoo_service.start(name)`

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.gentoo_service.status(name, sig=None)`

Return the status for a service, returns the PID or an empty string if the service is running or not, pass a signature to use to find the service via ps

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

`salt.modules.gentoo_service.stop(name)`

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

`salt.modules.gentoo_service.zap(name)`

Resets service state

CLI Example:

```
salt '*' service.zap <service name>
```

### 14.7.126 salt.modules.gentoolkitmod

Support for Gentoolkit

`salt.modules.gentoolkitmod.eclean_dist(destructive=False, package_names=False, size_limit=0, time_limit=0, fetch_restricted=False, exclude_file='/etc/eclean/distfiles.exclude')`

Clean obsolete portage sources

**destructive** Only keep minimum for reinstallation

**package\_names** Protect all versions of installed packages. Only meaningful if used with `destructive=True`

**size\_limit** <size> Don't delete distfiles bigger than <size>. <size> is a size specification: ``10M" is ``ten megabytes", ``200K" is ``two hundreds kilobytes", etc. Units are: G, M, K and B.

**time\_limit** <time> Don't delete distfiles files modified since <time> <time> is an amount of time: ``1y" is ``one year", ``2w" is ``two weeks", etc. Units are: y (years), m (months), w (weeks), d (days) and h (hours).

**fetch\_restricted** Protect fetch-restricted files. Only meaningful if used with `destructive=True`

**exclude\_file** Path to exclusion file. Default is `/etc/eclean/distfiles.exclude` This is the same default `eclean-dist` uses. Use `None` if this file exists and you want to ignore.

Returns a dict containing the cleaned, saved, and deprecated dists:

```
{'cleaned': {<dist file>: <size>},
 'deprecated': {<package>: <dist file>},
 'saved': {<package>: <dist file>},
 'total_cleaned': <size>}
```

CLI Example:

```
salt '*' gentoolkit.eclean_dist destructive=True
```

`salt.modules.gentoolkitmod.eclean_pkg`(*destructive=False, package\_names=False, time\_limit=0, exclude\_file='/etc/eclean/packages.exclude'*)

Clean obsolete binary packages

**destructive** Only keep minimum for reinstallation

**package\_names** Protect all versions of installed packages. Only meaningful if used with `destructive=True`

**time\_limit** <time> Don't delete distfiles files modified since <time> <time> is an amount of time: ``1y" is ``one year", ``2w" is ``two weeks", etc. Units are: y (years), m (months), w (weeks), d (days) and h (hours).

**exclude\_file** Path to exclusion file. Default is `/etc/eclean/packages.exclude` This is the same default `eclean-pkg` uses. Use `None` if this file exists and you want to ignore.

Returns a dict containing the cleaned binary packages:

```
{'cleaned': {<dist file>: <size>},
 'total_cleaned': <size>}
```

CLI Example:

```
salt '*' gentoolkit.eclean_pkg destructive=True
```

`salt.modules.gentoolkitmod.glsa_check_list`(*glsa\_list*)

List the status of Gentoo Linux Security Advisories

**glsa\_list** can contain an arbitrary number of GLSA ids, filenames containing GLSAs or the special identifiers `'all'` and `'affected'`

Returns a dict containing glsa ids with a description, status, and CVEs:

```
{<glsa_id>: {'description': <glsa_description>,
 'status': <glsa status>,
 'CVEs': [<list of CVEs>]}}
```

CLI Example:

```
salt '*' gentoolkit.glsa_check_list 'affected'
```

`salt.modules.gentoolkitmod.revdep_rebuild`(*lib=None*)

Fix up broken reverse dependencies

**lib** Search for reverse dependencies for a particular library rather than every library on the system. It can be a full path to a library or basic regular expression.

CLI Example:

```
salt '*' gentoolkit.revdep_rebuild
```

### 14.7.127 salt.modules.git

Support for the Git SCM

**salt.modules.git.add**(*cwd*, *filename*, *opts*='', *git\_opts*='', *user*=None, *password*=None, *ignore\_retcode*=False)

Changed in version 2015.8.0: The `--verbose` command line argument is now implied

Interface to `git-add(1)`

**cwd** The path to the git checkout

**filename** The location of the file/directory to add, relative to `cwd`

**opts** Any additional options to add to the command line, in a single string

---

**Note:** On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

**git\_opts** Any additional options to add to git command itself (not the `add` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.add /path/to/repo foo/bar.py
salt myminion git.add /path/to/repo foo/bar.py opts='--dry-run'
```

**salt.modules.git.archive**(*cwd*, *output*, *rev*='HEAD', *prefix*=None, *git\_opts*='', *user*=None, *password*=None, *ignore\_retcode*=False, *\*\*kwargs*)

Changed in version 2015.8.0: Returns True if successful, raises an error if not.

Interface to `git-archive(1)`, exports a tarball/zip file of the repository

**cwd** The path to be archived

---

**Note:** `git archive` permits a partial archive to be created. Thus, this path does not need to be the root of the git repository. Only the files within the directory specified by `cwd` (and its subdirectories) will be in the resulting archive. For example, if there is a git checkout at `/tmp/foo`, then passing

/tmp/foo/bar as the cwd will result in just the files underneath /tmp/foo/bar to be exported as an archive.

---

**output** The path of the archive to be created

**overwrite** [False] Unless set to True, Salt will not overwrite an existing archive at the path specified by the output argument.

New in version 2015.8.0.

**rev** [HEAD] The revision from which to create the archive

**format** Manually specify the file format of the resulting archive. This argument can be omitted, and `git archive` will attempt to guess the archive type (and compression) from the filename. `zip`, `tar`, `tar.gz`, and `tgz` are extensions that are recognized automatically, and `git` can be configured to support other archive types with the addition of `git` configuration keys.

See the `git-archive(1)` manpage explanation of the `--format` argument (as well as the CONFIGURATION section of the manpage) for further information.

New in version 2015.8.0.

**prefix** Prepend `<prefix>` to every filename in the archive. If unspecified, the name of the directory at the top level of the repository will be used as the prefix (e.g. if `cwd` is set to `/foo/bar/baz`, the prefix will be `baz`, and the resulting archive will contain a top-level directory by that name).

---

**Note:** The default behavior if the `--prefix` option for `git archive` is not specified is to not prepend a prefix, so Salt's behavior differs slightly from `git archive` in this respect. Use `prefix=''` to create an archive with no prefix.

---

Changed in version 2015.8.0: The behavior of this argument has been changed slightly. As of this version, it is necessary to include the trailing slash when specifying a prefix, if the prefix is intended to create a top-level directory.

**git\_opts** Any additional options to add to `git` command itself (not the `archive` subcommand), in a single string. This is useful for passing `-c` to run `git` with temporary changes to the `git` configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in `git` 1.7.2 and newer.

---

**user** User under which to run the `git` command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode** [False] If True, do not log an error to the minion log if the `git` command returns a nonzero exit status.

New in version 2015.8.0.

CLI Example:

```
salt myminion git.archive /path/to/repo /path/to/archive.tar
```

`salt.modules.git.branch(cwd, name=None, opts='', git_opts='', user=None, password=None, ignore_retcode=False)`

Interface to `git-branch(1)`

**cwd** The path to the `git` checkout

**name** Name of the branch on which to operate. If not specified, the current branch will be assumed.

**opts** Any additional options to add to the command line, in a single string

---

**Note:** To create a branch based on something other than HEAD, pass the name of the revision as `opts`. If the revision is in the format `remotename/branch`, then this will also set the remote tracking branch.

Additionally, on the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

**git\_opts** Any additional options to add to git command itself (not the `branch` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
# Set remote tracking branch
salt myminion git.branch /path/to/repo mybranch opts='--set-upstream-to origin/
↳mybranch'
# Create new branch
salt myminion git.branch /path/to/repo mybranch upstream/somebranch
# Delete branch
salt myminion git.branch /path/to/repo mybranch opts='-d'
# Rename branch (2015.8.0 and later)
salt myminion git.branch /path/to/repo newbranch opts='-m oldbranch'
```

`salt.modules.git.checkout`(*cwd*, *rev=None*, *force=False*, *opts=''*, *git\_opts=''*, *user=None*, *password=None*, *ignore\_retcode=False*)

Interface to `git-checkout(1)`

**cwd** The path to the git checkout

**opts** Any additional options to add to the command line, in a single string

---

**Note:** On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

**git\_opts** Any additional options to add to git command itself (not the `checkout` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

**rev** The remote branch or revision to checkout.

Changed in version 2015.8.0: Optional when using `-b` or `-B` in `opts`.

**force** [False] Force a checkout even if there might be overwritten changes

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
# Checking out local local revisions
salt myminion git.checkout /path/to/repo somebranch user=jeff
salt myminion git.checkout /path/to/repo opts='testbranch -- conf/file1 file2'
salt myminion git.checkout /path/to/repo rev=origin/mybranch opts='--track'
# Checking out remote revision into new branch
salt myminion git.checkout /path/to/repo upstream/master opts='-b newbranch'
# Checking out current revision into new branch (2015.8.0 and later)
salt myminion git.checkout /path/to/repo opts='-b newbranch'
```

`salt.modules.git.clone`(`cwd`, `url=None`, `name=None`, `opts=''`, `git_opts=''`, `user=None`, `password=None`, `identity=None`, `https_user=None`, `https_pass=None`, `ignore_retcode=False`, `saltenv='base'`)

Interface to `git-clone`(1)

**cwd** Location of git clone

Changed in version 2015.8.0: If `name` is passed, then the clone will be made *within* this directory.

**url** The URL of the repository to be cloned

Changed in version 2015.8.0: Argument renamed from `repository` to `url`

**name** Optional alternate name for the top-level directory to be created by the clone

New in version 2015.8.0.

**opts** Any additional options to add to the command line, in a single string

**git\_opts** Any additional options to add to git command itself (not the `clone` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**identity** Path to a private key to use for ssh URLs

**Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`

Changed in version 2016.3.0.

**https\_user** Set HTTP Basic Auth username. Only accepted for HTTPS URLs.

New in version 2015.5.0.

**https\_pass** Set HTTP Basic Auth password. Only accepted for HTTPS URLs.

New in version 2015.5.0.

**ignore\_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**saltenv** The default salt environment to pull sls files from

New in version 2016.3.1.

CLI Example:

```
salt myminion git.clone /path/to/repo_parent_dir git://github.com/saltstack/salt.
→git
```

`salt.modules.git.commit(cwd, message, opts='', git_opts='', user=None, password=None, filename=None, ignore_retcode=False)`

Interface to `git-commit(1)`

**cwd** The path to the git checkout

**message** Commit message

**opts** Any additional options to add to the command line, in a single string. These opts will be added to the end of the git command being run.

---

**Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

The `-m` option should not be passed here, as the commit message will be defined by the `message` argument.

---

**git\_opts** Any additional options to add to git command itself (not the `commit` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**filename** The location of the file/directory to commit, relative to `cwd`. This argument is optional, and can be used to commit a file without first staging it.

---

**Note:** This argument only works on files which are already tracked by the git repository.

---

New in version 2015.8.0.

**ignore\_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.commit /path/to/repo 'The commit message'
salt myminion git.commit /path/to/repo 'The commit message' filename=foo/bar.py
```

`salt.modules.git.config_get`(*key*, *cwd=None*, *user=None*, *password=None*, *ignore\_retcode=False*, *\*\*kwargs*)

Get the value of a key in the git configuration file

**key** The name of the configuration key to get

Changed in version 2015.8.0: Argument renamed from `setting_name` to `key`

**cwd** The path to the git checkout

Changed in version 2015.8.0: Now optional if `global` is set to True

**global** [False] If True, query the global git configuration. Otherwise, only the local git configuration will be queried.

New in version 2015.8.0.

**all** [False] If True, return a list of all values set for `key`. If the key does not exist, None will be returned.

New in version 2015.8.0.

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.config_get user.name cwd=/path/to/repo
salt myminion git.config_get user.email global=True
salt myminion git.config_get core.gitproxy cwd=/path/to/repo all=True
```

`salt.modules.git.config_get_regexp`(*key*, *value\_regex=None*, *cwd=None*, *user=None*, *password=None*, *ignore\_retcode=False*, *\*\*kwargs*)

New in version 2015.8.0.

Get the value of a key or keys in the git configuration file using regexes for more flexible matching. The return data is a dictionary mapping keys to lists of values matching the `value_regex`. If no values match, an empty dictionary will be returned.

**key** Regex on which key names will be matched

**value\_regex** If specified, return all values matching this regex. The return data will be a dictionary mapping keys to lists of values matching the regex.

---

**Important:** Only values matching the `value_regex` will be part of the return data. So, if key matches a multivar, then it is possible that not all of the values will be returned. To get all values set for a multivar, simply omit the `value_regex` argument.

---

**cwd** The path to the git checkout

**global** [False] If True, query the global git configuration. Otherwise, only the local git configuration will be queried.

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

CLI Examples:

```
# Matches any values for key 'foo.bar'
salt myminion git.config_get_regexp /path/to/repo foo.bar
# Matches any value starting with 'baz' set for key 'foo.bar'
salt myminion git.config_get_regexp /path/to/repo foo.bar 'baz.*'
# Matches any key starting with 'user.'
salt myminion git.config_get_regexp '^user\.' global=True
```

`salt.modules.git.config_set`(*key*, *value=None*, *multivar=None*, *cwd=None*, *user=None*, *password=None*, *ignore\_retcode=False*, *\*\*kwargs*)

Changed in version 2015.8.0: Return the value(s) of the key being set

Set a key in the git configuration file

**cwd** The path to the git checkout. Must be an absolute path, or the word `global` to indicate that a global key should be set.

Changed in version 2014.7.0: Made `cwd` argument optional if `is_global=True`

**key** The name of the configuration key to set

Changed in version 2015.8.0: Argument renamed from `setting_name` to `key`

**value** The value to set for the specified key. Incompatible with the `multivar` argument.

Changed in version 2015.8.0: Argument renamed from `setting_value` to `value`

**add** [False] Add a value to a key, creating/updating a multivar

New in version 2015.8.0.

**multivar** Set a multivar all at once. Values can be comma-separated or passed as a Python list. Incompatible with the `value` argument.

New in version 2015.8.0.

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**global** [False] If True, set a global variable

CLI Example:

```
salt myminion git.config_set user.email me@example.com cwd=/path/to/repo
salt myminion git.config_set user.email foo@bar.com global=True
```

**salt.modules.git.config\_unset**(*key*, *value\_regex=None*, *cwd=None*, *user=None*, *password=None*, *ignore\_retcode=False*, *\*\*kwargs*)

New in version 2015.8.0.

Unset a key in the git configuration file

**cwd** The path to the git checkout. Must be an absolute path, or the word `global` to indicate that a global key should be unset.

**key** The name of the configuration key to unset

**value\_regex** Regular expression that matches exactly one key, used to delete a single value from a multivar. Ignored if `all` is set to True.

**all** [False] If True unset all values for a multivar. If False, and key is a multivar, an error will be raised.

**global** [False] If True, unset set a global variable. Otherwise, a local variable will be unset.

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

CLI Example:

```
salt myminion git.config_unset /path/to/repo foo.bar
salt myminion git.config_unset /path/to/repo foo.bar all=True
```

**salt.modules.git.current\_branch**(*cwd*, *user=None*, *password=None*, *ignore\_retcode=False*)

Returns the current branch name of a local checkout. If HEAD is detached, return the SHA1 of the revision which is currently checked out.

**cwd** The path to the git checkout

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Example:

```
salt myminion git.current_branch /path/to/repo
```

**salt.modules.git.describe**(*cwd*, *rev='HEAD'*, *user=None*, *password=None*, *ignore\_retcode=False*)

Returns the `git-describe(1)` string (or the SHA1 hash if there are no tags) for the given revision.

**cwd** The path to the git checkout  
**rev** [HEAD] The revision to describe  
**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.describe /path/to/repo
salt myminion git.describe /path/to/repo develop
```

`salt.modules.git.diff(cwd, item1=None, item2=None, opts='', git_opts='', user=None, password=None, no_index=False, cached=False, paths=None)`

New in version 2015.8.12,2016.3.3,2016.11.0.

Interface to `git-diff(1)`

**cwd** The path to the git checkout

**item1** and **item2** Revision(s) to pass to the `git diff` command. One or both of these arguments may be ignored if some of the options below are set to True. When `cached` is False, and no revisions are passed to this function, then the current working tree will be compared against the index (i.e. unstaged changes). When two revisions are passed, they will be compared to each other.

**opts** Any additional options to add to the command line, in a single string

---

**Note:** On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

**git\_opts** Any additional options to add to git command itself (not the `diff` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**no\_index** [False] When it is necessary to diff two files in the same repo against each other, and not diff two different revisions, set this option to True. If this is left False in these instances, then a normal `git diff` will be performed against the index (i.e. unstaged changes), and files in the `paths` option will be used to narrow down the diff output.

---

**Note:** Requires Git 1.5.1 or newer. Additionally, when set to True, `item1` and `item2` will be ignored.

---

**cached** [False] If True, compare staged changes to `item1` (if specified), otherwise compare them to the most recent commit.

---

**Note:** `item2` is ignored if this option is set to True.

---

**paths** File paths to pass to the `git diff` command. Can be passed as a comma-separated list or a Python list.

CLI Example:

```
# Perform diff against the index (staging area for next commit)
salt myminion git.diff /path/to/repo
# Compare staged changes to the most recent commit
salt myminion git.diff /path/to/repo cached=True
# Compare staged changes to a specific revision
salt myminion git.diff /path/to/repo mybranch cached=True
# Perform diff against the most recent commit (includes staged changes)
salt myminion git.diff /path/to/repo HEAD
# Diff two commits
salt myminion git.diff /path/to/repo abcdef1 aabbccd
# Diff two commits, only showing differences in the specified paths
salt myminion git.diff /path/to/repo abcdef1 aabbccd paths=path/to/file1,path/to/
↪file2
# Diff two files with one being outside the working tree
salt myminion git.diff /path/to/repo no_index=True paths=path/to/file1,/absolute/
↪path/to/file2
```

`salt.modules.git.fetch`(*cwd*, *remote=None*, *force=False*, *refspecs=None*, *opts=''*, *git\_opts=''*, *user=None*, *password=None*, *identity=None*, *ignore\_retcode=False*, *saltenv='base'*)

Changed in version 2015.8.2: Return data is now a dictionary containing information on branches and tags that were added/updated

Interface to `git-fetch(1)`

**cwd** The path to the git checkout

**remote** Optional remote name to fetch. If not passed, then git will use its default behavior (as detailed in `git-fetch(1)`).

New in version 2015.8.0.

**force** Force the fetch even when it is not a fast-forward.

New in version 2015.8.0.

**refspecs** Override the refspec(s) configured for the remote with this argument. Multiple refspecs can be passed, comma-separated.

New in version 2015.8.0.

**opts** Any additional options to add to the command line, in a single string

---

**Note:** On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

**git\_opts** Any additional options to add to git command itself (not the `fetch` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**identity** Path to a private key to use for ssh URLs

**Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`

Changed in version 2016.3.0.

**ignore\_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**saltenv** The default salt environment to pull sls files from

New in version 2016.3.1.

CLI Example:

```
salt myminion git.fetch /path/to/repo upstream
salt myminion git.fetch /path/to/repo identity=/root/.ssh/id_rsa
```

`salt.modules.git.init` (*cwd*, *bare=False*, *template=None*, *separate\_git\_dir=None*, *shared=None*, *opts=''*, *git\_opts=''*, *user=None*, *password=None*, *ignore\_retcode=False*)

Interface to `git-init(1)`

**cwd** The path to the directory to be initialized

**bare** [False] If True, init a bare repository

New in version 2015.8.0.

**template** Set this argument to specify an alternate `template directory`

New in version 2015.8.0.

**separate\_git\_dir** Set this argument to specify an alternate `$GIT_DIR`

New in version 2015.8.0.

**shared** Set sharing permissions on git repo. See `git-init(1)` for more details.

New in version 2015.8.0.

**opts** Any additional options to add to the command line, in a single string

---

**Note:** On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

**git\_opts** Any additional options to add to git command itself (not the `init` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

**Note:** This is only supported in git 1.7.2 and newer.

---

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.init /path/to/repo
# Init a bare repo (before 2015.8.0)
salt myminion git.init /path/to/bare/repo.git opts='--bare'
# Init a bare repo (2015.8.0 and later)
salt myminion git.init /path/to/bare/repo.git bare=True
```

`salt.modules.git.is_worktree(cwd, user=None, password=None)`

New in version 2015.8.0.

This function will attempt to determine if `cwd` is part of a worktree by checking its `.git` to see if it is a file containing a reference to another gitdir.

**cwd** path to the worktree to be removed

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

CLI Example:

```
salt myminion git.is_worktree /path/to/repo
```

`salt.modules.git.list_branches(cwd, remote=False, user=None, password=None, ignore_retcode=False)`

New in version 2015.8.0.

Return a list of branches

**cwd** The path to the git checkout

**remote** [False] If True, list remote branches. Otherwise, local branches will be listed.

**Warning:** This option will only return remote branches of which the local checkout is aware, use `git.fetch` to update remotes.

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.list_branches /path/to/repo
salt myminion git.list_branches /path/to/repo remote=True
```

`salt.modules.git.list_tags` (*cwd*, *user=None*, *password=None*, *ignore\_retcode=False*)

New in version 2015.8.0.

Return a list of tags

**cwd** The path to the git checkout

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.list_tags /path/to/repo
```

`salt.modules.git.list_worktrees` (*cwd*, *stale=False*, *user=None*, *password=None*, *\*\*kwargs*)

New in version 2015.8.0.

Returns information on worktrees

Changed in version 2015.8.4: Version 2.7.0 added the `list` subcommand to `git-worktree(1)` which provides a lot of additional information. The return data has been changed to include this information, even for pre-2.7.0 versions of git. In addition, if a worktree has a detached head, then any tags which point to the worktree's HEAD will be included in the return data.

---

**Note:** By default, only worktrees for which the worktree directory is still present are returned, but this can be changed using the `all` and `stale` arguments (described below).

---

**cwd** The path to the git checkout

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**all** [False] If True, then return all worktrees tracked under `$GIT_DIR/worktrees`, including ones for which the gitdir is no longer present.

**stale** [False] If True, return *only* worktrees whose gitdir is no longer present.

---

**Note:** Only one of `all` and `stale` can be set to `True`.

---

CLI Examples:

```
salt myminion git.list_worktrees /path/to/repo
salt myminion git.list_worktrees /path/to/repo all=True
salt myminion git.list_worktrees /path/to/repo stale=True
```

`salt.modules.git.ls_remote` (*cwd=None, remote='origin', ref=None, opts='', git\_opts='', user=None, password=None, identity=None, https\_user=None, https\_pass=None, ignore\_retcode=False, saltenv='base'*)

Interface to `git-ls-remote(1)`. Returns the upstream hash for a remote reference.

**cwd** The path to the git checkout. Optional (and ignored if present) when `remote` is set to a URL instead of a remote name.

**remote** [origin] The name of the remote to query. Can be the name of a git remote (which exists in the git checkout defined by the `cwd` parameter), or the URL of a remote repository.

Changed in version 2015.8.0: Argument renamed from `repository` to `remote`

**ref** The name of the ref to query. Optional, if not specified, all refs are returned. Can be a branch or tag name, or the full name of the reference (for example, to get the hash for a Github pull request number 1234, `ref` can be set to `refs/pull/1234/head`)

Changed in version 2015.8.0: Argument renamed from `branch` to `ref`

Changed in version 2015.8.4: Defaults to returning all refs instead of master.

**opts** Any additional options to add to the command line, in a single string

New in version 2015.8.0.

**git\_opts** Any additional options to add to git command itself (not the `ls-remote` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**identity** Path to a private key to use for ssh URLs

**Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`

Changed in version 2016.3.0.

**https\_user** Set HTTP Basic Auth username. Only accepted for HTTPS URLs.

New in version 2015.5.0.

**https\_pass** Set HTTP Basic Auth password. Only accepted for HTTPS URLs.

New in version 2015.5.0.

**ignore\_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**saltenv** The default salt environment to pull sls files from

New in version 2016.3.1.

CLI Example:

```
salt myminion git.ls_remote /path/to/repo origin master
salt myminion git.ls_remote remote=https://mydomain.tld/repo.git ref=mytag opts='-
↳-tags'
```

`salt.modules.git.merge(cwd, rev=None, opts='', git_opts='', user=None, password=None, ignore_retcode=False, **kwargs)`

Interface to `git-merge(1)`

**cwd** The path to the git checkout

**rev** Revision to merge into the current branch. If not specified, the remote tracking branch will be merged.

New in version 2015.8.0.

**opts** Any additional options to add to the command line, in a single string

---

**Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

**git\_opts** Any additional options to add to git command itself (not the merge subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Example:

```
# Fetch first...
salt myminion git.fetch /path/to/repo
# ... then merge the remote tracking branch
salt myminion git.merge /path/to/repo
# .. or merge another rev
salt myminion git.merge /path/to/repo rev=upstream/foo
```

`salt.modules.git.merge_base` (*cwd*, *refs=None*, *octopus=False*, *is\_ancestor=False*, *independent=False*, *fork\_point=None*, *opts=''*, *git\_opts=''*, *user=None*, *password=None*, *ignore\_retcode=False*, *\*\*kwargs*)

New in version 2015.8.0.

Interface to `git-merge-base(1)`.

**cwd** The path to the git checkout

**refs** Any refs/commits to check for a merge base. Can be passed as a comma-separated list or a Python list.

**all** [False] Return a list of all matching merge bases. Not compatible with any of the below options except for octopus.

**octopus** [False] If True, then this function will determine the best common ancestors of all specified commits, in preparation for an n-way merge. See [here](#) for a description of how these bases are determined.

Set `all` to True with this option to return all computed merge bases, otherwise only the "best" will be returned.

**is\_ancestor** [False] If True, then instead of returning the merge base, return a boolean telling whether or not the first commit is an ancestor of the second commit.

---

**Note:** This option requires two commits to be passed.

---

Changed in version 2015.8.2: Works properly in git versions older than 1.8.0, where the `--is-ancestor` CLI option is not present.

**independent** [False] If True, this function will return the IDs of the refs/commits passed which cannot be reached by another commit.

**fork\_point** If passed, then this function will return the commit where the commit diverged from the ref specified by `fork_point`. If no fork point is found, None is returned.

---

**Note:** At most one commit is permitted to be passed if a `fork_point` is specified. If no commits are passed, then HEAD is assumed.

---

**opts** Any additional options to add to the command line, in a single string

---

**Note:** On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

This option should not be necessary unless new CLI arguments are added to `git-merge-base(1)` and are not yet supported in Salt.

---

**git\_opts** Any additional options to add to git command itself (not the `merge-base` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode** [False] if True, do not log an error to the minion log if the git command returns a nonzero exit status.

CLI Examples:

```
salt myminion git.merge_base /path/to/repo HEAD upstream/mybranch
salt myminion git.merge_base /path/to/repo 8f2e542,4ad8cab,cdc9886 octopus=True
salt myminion git.merge_base /path/to/repo refs=8f2e542,4ad8cab,cdc9886
  ↳ independent=True
salt myminion git.merge_base /path/to/repo refs=8f2e542,4ad8cab is_ancestor=True
salt myminion git.merge_base /path/to/repo fork_point=upstream/master
salt myminion git.merge_base /path/to/repo refs=mybranch fork_point=upstream/
  ↳ master
```

`salt.modules.git.merge_tree(cwd, ref1, ref2, base=None, user=None, password=None, ignore_retcode=False)`

New in version 2015.8.0.

Interface to `git-merge-tree(1)`, shows the merge results and conflicts from a 3-way merge without touching the index.

**cwd** The path to the git checkout

**ref1** First ref/commit to compare

**ref2** Second ref/commit to compare

**base** The base tree to use for the 3-way-merge. If not provided, then `git.merge_base` will be invoked on `ref1` and `ref2` to determine the merge base to use.

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode** [False] if True, do not log an error to the minion log if the git command returns a nonzero exit status.

CLI Examples:

```
salt myminion git.merge_tree /path/to/repo HEAD upstream/dev
salt myminion git.merge_tree /path/to/repo HEAD upstream/dev base=aaf3c3d
```

`salt.modules.git.pull(cwd, opts='', git_opts='', user=None, password=None, identity=None, ignore_retcode=False, saltenv='base')`

Interface to `git-pull(1)`

**cwd** The path to the git checkout

**opts** Any additional options to add to the command line, in a single string

---

**Note:** On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

**git\_opts** Any additional options to add to git command itself (not the `pull` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**identity** Path to a private key to use for ssh URLs

**Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`

Changed in version 2016.3.0.

**ignore\_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**saltenv** The default salt environment to pull sls files from

New in version 2016.3.1.

CLI Example:

```
salt myminion git.pull /path/to/repo opts='--rebase origin master'
```

`salt.modules.git.push`(*cwd*, *remote=None*, *ref=None*, *opts=''*, *git\_opts=''*, *user=None*, *password=None*, *identity=None*, *ignore\_retcode=False*, *saltenv='base'*, *\*\*kwargs*)

Interface to `git-push(1)`

**cwd** The path to the git checkout

**remote** Name of the remote to which the ref should be pushed

New in version 2015.8.0.

**ref** [master] Name of the ref to push

---

**Note:** Being a `refspec`, this argument can include a colon to define local and remote ref names.

---

**opts** Any additional options to add to the command line, in a single string

---

**Note:** On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

**git\_opts** Any additional options to add to git command itself (not the push subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**identity** Path to a private key to use for ssh URLs

**Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`

Changed in version 2016.3.0.

**ignore\_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**saltenv** The default salt environment to pull sls files from

New in version 2016.3.1.

CLI Example:

```
# Push master as origin/master
salt myminion git.push /path/to/repo origin master
# Push issue21 as upstream/develop
salt myminion git.push /path/to/repo upstream issue21:develop
# Delete remote branch 'upstream/temp'
salt myminion git.push /path/to/repo upstream :temp
```

`salt.modules.git.rebase(cwd, rev='master', opts='', git_opts='', user=None, password=None, ignore_retcode=False)`

Interface to `git-rebase(1)`

**cwd** The path to the git checkout

**rev** [master] The revision to rebase onto the current branch

**opts** Any additional options to add to the command line, in a single string

---

**Note:** On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

**git\_opts** Any additional options to add to git command itself (not the `rebase` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Example:

```
salt myminion git.rebase /path/to/repo master
salt myminion git.rebase /path/to/repo 'origin master'
salt myminion git.rebase /path/to/repo origin/master opts='--onto newbranch'
```

`salt.modules.git.remote_get(cwd, remote='origin', user=None, password=None, redact_auth=True, ignore_retcode=False)`

Get the fetch and push URL for a specific remote

**cwd** The path to the git checkout

**remote** [origin] Name of the remote to query

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**redact\_auth** [True] Set to False to include the username/password if the remote uses HTTPS Basic Auth. Otherwise, this information will be redacted.

**Warning:** Setting this to False will not only reveal any HTTPS Basic Auth that is configured, but the return data will also be written to the job cache. When possible, it is recommended to use SSH for authentication.

New in version 2015.5.6.

**ignore\_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.remote_get /path/to/repo
salt myminion git.remote_get /path/to/repo upstream
```

`salt.modules.git.remote_refs(url, heads=False, tags=False, user=None, password=None, identity=None, https_user=None, https_pass=None, ignore_retcode=False, saltenv='base')`

New in version 2015.8.0.

Return the remote refs for the specified URL

**url** URL of the remote repository

**heads** [False] Restrict output to heads. Can be combined with tags.

**tags** [False] Restrict output to tags. Can be combined with heads.

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**identity** Path to a private key to use for ssh URLs

**Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`

Changed in version 2016.3.0.

**https\_user** Set HTTP Basic Auth username. Only accepted for HTTPS URLs.

**https\_pass** Set HTTP Basic Auth password. Only accepted for HTTPS URLs.

**ignore\_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

**saltenv** The default salt environment to pull sls files from

New in version 2016.3.1.

CLI Example:

```
salt myminion git.remote_refs https://github.com/saltstack/salt.git
```

```
salt.modules.git.remote_set(cwd, url, remote='origin', user=None, password=None,
                            https_user=None, https_pass=None, push_url=None,
                            push_https_user=None, push_https_pass=None, ignore_retcode=False)
```

**cwd** The path to the git checkout

**url** Remote URL to set

**remote** [origin] Name of the remote to set

**push\_url** If unset, the push URL will be identical to the fetch URL.

New in version 2015.8.0.

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**https\_user** Set HTTP Basic Auth username. Only accepted for HTTPS URLs.

New in version 2015.5.0.

**https\_pass** Set HTTP Basic Auth password. Only accepted for HTTPS URLs.

New in version 2015.5.0.

**push\_https\_user** Set HTTP Basic Auth user for `push_url`. Ignored if `push_url` is unset. Only accepted for HTTPS URLs.

New in version 2015.8.0.

**push\_https\_pass** Set HTTP Basic Auth password for `push_url`. Ignored if `push_url` is unset. Only accepted for HTTPS URLs.

New in version 2015.8.0.

**ignore\_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.remote_set /path/to/repo git@github.com:user/repo.git
salt myminion git.remote_set /path/to/repo git@github.com:user/repo.git
  ↳ remote=upstream
salt myminion git.remote_set /path/to/repo https://github.com:user/repo.git
  ↳ remote=upstream push_url=git@github.com:user/repo.git
```

`salt.modules.git.remotes`(*cwd*, *user=None*, *password=None*, *redact\_auth=True*, *ignore\_retcode=False*)

Get fetch and push URLs for each remote in a git checkout

**cwd** The path to the git checkout

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**redact\_auth** [True] Set to `False` to include the username/password for authenticated remotes in the return data. Otherwise, this information will be redacted.

**Warning:** Setting this to `False` will not only reveal any HTTPS Basic Auth that is configured, but the return data will also be written to the job cache. When possible, it is recommended to use SSH for authentication.

New in version 2015.5.6.

**ignore\_retcode** [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Example:

```
salt myminion git.remotes /path/to/repo
```

`salt.modules.git.reset`(*cwd*, *opts=''*, *git\_opts=''*, *user=None*, *password=None*, *ignore\_retcode=False*)

Interface to `git-reset(1)`, returns the stdout from the git command

**cwd** The path to the git checkout

**opts** Any additional options to add to the command line, in a single string

**Note:** On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

**git\_opts** Any additional options to add to git command itself (not the `reset` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

**Note:** This is only supported in git 1.7.2 and newer.

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
# Soft reset to a specific commit ID
salt myminion git.reset /path/to/repo ac3ee5c
# Hard reset
salt myminion git.reset /path/to/repo opts='--hard origin/master'
```

`salt.modules.git.rev_parse(cwd, rev=None, opts='', git_opts='', user=None, password=None, ignore_retcode=False)`

New in version 2015.8.0.

Interface to `git-rev-parse(1)`

**cwd** The path to the git checkout

**rev** Revision to parse. See the [SPECIFYING REVISIONS](#) section of the `git-rev-parse(1)` manpage for details on how to format this argument.

This argument is optional when using the options in the *Options for Files* section of the `git-rev-parse(1)` manpage.

**opts** Any additional options to add to the command line, in a single string

**git\_opts** Any additional options to add to git command itself (not the `rev-parse` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

CLI Examples:

```
# Get the full SHA1 for HEAD
salt myminion git.rev_parse /path/to/repo HEAD
# Get the short SHA1 for HEAD
salt myminion git.rev_parse /path/to/repo HEAD opts='--short'
# Get the develop branch's upstream tracking branch
salt myminion git.rev_parse /path/to/repo 'develop@{upstream}' opts='--abbrev-ref'
# Get the SHA1 for the commit corresponding to tag v1.2.3
salt myminion git.rev_parse /path/to/repo 'v1.2.3^{commit}'
# Find out whether or not the repo at /path/to/repo is a bare repository
salt myminion git.rev_parse /path/to/repo opts='--is-bare-repository'
```

`salt.modules.git.revision(cwd, rev='HEAD', short=False, user=None, password=None, ignore_retcode=False)`

Returns the SHA1 hash of a given identifier (hash, branch, tag, HEAD, etc.)

**cwd** The path to the git checkout

**rev** [HEAD] The revision

**short** [False] If True, return an abbreviated SHA1 git hash

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Example:

```
salt myminion git.revision /path/to/repo mybranch
```

`salt.modules.git.rm(cwd, filename, opts='', git_opts='', user=None, password=None, ignore_retcode=False)`

Interface to `git-rm(1)`

**cwd** The path to the git checkout

**filename** The location of the file/directory to remove, relative to cwd

---

**Note:** To remove a directory, `-r` must be part of the `opts` parameter.

---

**opts** Any additional options to add to the command line, in a single string

---

**Note:** On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

**git\_opts** Any additional options to add to git command itself (not the `rm` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.rm /path/to/repo foo/bar.py
salt myminion git.rm /path/to/repo foo/bar.py opts='--dry-run'
salt myminion git.rm /path/to/repo foo/baz opts='-r'
```

---

```
salt.modules.git.stash(cwd, action='save', opts='', git_opts='', user=None, password=None, ignore_retcode=False)
```

Interface to `git-stash(1)`, returns the stdout from the git command

**cwd** The path to the git checkout

**opts** Any additional options to add to the command line, in a single string. Use this to complete the `git stash` command by adding the remaining arguments (i.e. 'save <stash comment>', 'apply stash@{2}', 'show', etc.). Omitting this argument will simply run `git stash`.

**git\_opts** Any additional options to add to git command itself (not the `stash` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.stash /path/to/repo save opts='work in progress'
salt myminion git.stash /path/to/repo apply opts='stash@{1}'
salt myminion git.stash /path/to/repo drop opts='stash@{1}'
salt myminion git.stash /path/to/repo list
```

```
salt.modules.git.status(cwd, user=None, password=None, ignore_retcode=False)
```

Changed in version 2015.8.0: Return data has changed from a list of lists to a dictionary

Returns the changes to the repository

**cwd** The path to the git checkout

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Example:

```
salt myminion git.status /path/to/repo
```

```
salt.modules.git.submodule(cwd, command, opts='', git_opts='', user=None, password=None, identity=None, ignore_retcode=False, saltenv='base', **kwargs)
```

Changed in version 2015.8.0: Added the `command` argument to allow for operations other than update to

be run on submodules, and deprecated the `init` argument. To do a submodule update with `init=True` moving forward, use `command=update opts='--init'`

Interface to [git-submodule\(1\)](#)

**cwd** The path to the submodule

**command** Submodule command to run, see [git-submodule\(1\)](#) *<git submodule>* for more information. Any additional arguments after the command (such as the URL when adding a submodule) must be passed in the `opts` parameter.

New in version 2015.8.0.

**opts** Any additional options to add to the command line, in a single string

---

**Note:** On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

**git\_opts** Any additional options to add to git command itself (not the `submodule` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

**init** [False] If True, ensures that new submodules are initialized

Deprecated since version 2015.8.0: Pass `init` as the `command` parameter, or include `--init` in the `opts` param with `command` set to `update`.

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**identity** Path to a private key to use for ssh URLs

**Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the [sshd\(8\)](#) manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`

Changed in version 2016.3.0.

**ignore\_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**saltenv** The default salt environment to pull sls files from

New in version 2016.3.1.

CLI Example:

```
# Update submodule and ensure it is initialized (before 2015.8.0)
salt myminion git.submodule /path/to/repo/sub/repo init=True
```

```
# Update submodule and ensure it is initialized (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/sub/repo update opts='--init'

# Rebase submodule (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/sub/repo update opts='--rebase'

# Add submodule (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/sub/repo add opts='https://mydomain.tld/
↳repo.git'

# Unregister submodule (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/sub/repo deinit
```

`salt.modules.git.symbolic_ref(cwd, ref, value=None, opts='', git_opts='', user=None, password=None, ignore_retcode=False)`

New in version 2015.8.0.

Interface to `git-symbolic-ref(1)`

**cwd** The path to the git checkout

**ref** Symbolic ref to read/modify

**value** If passed, then the symbolic ref will be set to this value and an empty string will be returned.

If not passed, then the ref to which `ref` points will be returned, unless `--delete` is included in `opts` (in which case the symbolic ref will be deleted).

**opts** Any additional options to add to the command line, in a single string

**git\_opts** Any additional options to add to git command itself (not the `symbolic-refs` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
# Get ref to which HEAD is pointing
salt myminion git.symbolic_ref /path/to/repo HEAD
# Set/overwrite symbolic ref 'FOO' to local branch 'foo'
salt myminion git.symbolic_ref /path/to/repo FOO refs/heads/foo
# Delete symbolic ref 'FOO'
salt myminion git.symbolic_ref /path/to/repo FOO opts='--delete'
```

`salt.modules.git.version(versioninfo=False)`

New in version 2015.8.0.

Returns the version of Git installed on the minion

**versioninfo** [False] If True, return the version in a versioninfo list (e.g. [2, 5, 0])

CLI Example:

```
salt myminion git.version
```

```
salt.modules.git.worktree_add(cwd, worktree_path, ref=None, reset_branch=None, force=None, detach=False, opts='', git_opts='', user=None, password=None, ignore_retcode=False, **kwargs)
```

New in version 2015.8.0.

Interface to `git-worktree(1)`, adds a worktree

**cwd** The path to the git checkout

**worktree\_path** Path to the new worktree. Can be either absolute, or relative to `cwd`.

**branch** Name of new branch to create. If omitted, will be set to the basename of the `worktree_path`. For example, if the `worktree_path` is `/foo/bar/baz`, then `branch` will be `baz`.

**ref** Name of the ref on which to base the new worktree. If omitted, then `HEAD` is used, and a new branch will be created, named for the basename of the `worktree_path`. For example, if the `worktree_path` is `/foo/bar/baz` then a new branch `baz` will be created, and pointed at `HEAD`.

**reset\_branch** [False] If `False`, then `git-worktree(1)` will fail to create the worktree if the targeted branch already exists. Set this argument to `True` to reset the targeted branch to point at `ref`, and checkout the newly-reset branch into the new worktree.

**force** [False] By default, `git-worktree(1)` will not permit the same branch to be checked out in more than one worktree. Set this argument to `True` to override this.

**opts** Any additional options to add to the command line, in a single string

---

**Note:** On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` to avoid causing errors with Salt's own argument parsing.

All CLI options for adding worktrees as of Git 2.5.0 are already supported by this function as of Salt 2015.8.0, so using this argument is unnecessary unless new CLI arguments are added to `git-worktree(1)` and are not yet supported in Salt.

---

**git\_opts** Any additional options to add to git command itself (not the `worktree` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode** [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.worktree_add /path/to/repo/main ../hotfix ref=origin/master
salt myminion git.worktree_add /path/to/repo/main ../hotfix branch=hotfix21
↳ ref=v2.1.9.3
```

`salt.modules.git.worktree_prune(cwd, dry_run=False, verbose=True, expire=None, opts='', git_opts='', user=None, password=None, ignore_retcode=False)`

New in version 2015.8.0.

Interface to `git-worktree(1)`, prunes stale worktree administrative data from the gitdir

**cwd** The path to the main git checkout or a linked worktree

**dry\_run** [False] If True, then this function will report what would have been pruned, but no changes will be made.

**verbose** [True] Report all changes made. Set to False to suppress this output.

**expire** Only prune unused worktree data older than a specific period of time. The date format for this parameter is described in the documentation for the `gc.pruneWorktreesExpire` config param in the `git-config(1)` manpage.

**opts** Any additional options to add to the command line, in a single string

---

**Note:** On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` to avoid causing errors with Salt's own argument parsing.

All CLI options for pruning worktrees as of Git 2.5.0 are already supported by this function as of Salt 2015.8.0, so using this argument is unnecessary unless new CLI arguments are added to `git-worktree(1)` and are not yet supported in Salt.

---

**git\_opts** Any additional options to add to git command itself (not the `worktree` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.worktree_prune /path/to/repo
salt myminion git.worktree_prune /path/to/repo dry_run=True
salt myminion git.worktree_prune /path/to/repo expire=1.day.ago
```

`salt.modules.git.worktree_rm(cwd, user=None)`

New in version 2015.8.0.

Recursively removes the worktree located at `cwd`, returning True if successful. This function will attempt to determine if `cwd` is actually a worktree by invoking `git.is_worktree`. If the path does not correspond to a worktree, then an error will be raised and no action will be taken.

**Warning:** There is no undoing this action. Be **VERY** careful before running this function.

**cwd** Path to the worktree to be removed

**user** Used for path expansion when `cwd` is not an absolute path. By default, when `cwd` is not absolute, the path will be assumed to be relative to the home directory of the user under which the minion is running. Setting this option will change the home directory from which path expansion is performed.

CLI Examples:

```
salt myminion git.worktree_rm /path/to/worktree
```

### 14.7.128 salt.modules.github module

Module for interacting with the GitHub v3 API.

New in version 2016.3.0.

**depends** PyGithub python module

#### Configuration

Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the `'github'` key by default, if defined.

For example:

```
github:
  token: abc1234
  org_name: my_organization

  # optional: some functions require a repo_name, which
  # can be set in the config file, or passed in at the CLI.
  repo_name: my_repo

  # optional: it can be dangerous to change the privacy of a repository
  # in an automated way. set this to True to allow privacy modifications
  allow_repo_privacy_changes: False
```

```
salt.modules.github.add_repo(name, description=None, homepage=None, private=None,
                             has_issues=None, has_wiki=None, has_downloads=None,
                             auto_init=None, gitignore_template=None, license_template=None,
                             profile='github')
```

Create a new github repository.

**name** The name of the team to be created.

**description** The description of the repository.

**homepage** The URL with more information about the repository.

**private** The visibility of the repository. Note that private repositories require a paid GitHub account.

**has\_issues** Whether to enable issues for this repository.

**has\_wiki** Whether to enable the wiki for this repository.

**has\_downloads** Whether to enable downloads for this repository.

**auto\_init** Whether to create an initial commit with an empty README.

**gitignore\_template** The desired language or platform for a .gitignore, e.g. ```Haskell```.

**license\_template** The desired LICENSE template to apply, e.g. ```mit``` or ```mozilla```.

**profile** The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.add_repo 'repo_name'
```

New in version 2016.11.0.

`salt.modules.github.add_team`(*name*, *description=None*, *repo\_names=None*, *privacy=None*, *permission=None*, *profile='github'*)

Create a new Github team within an organization.

**name** The name of the team to be created.

**description** The description of the team.

**repo\_names** The names of repositories to add the team to.

**privacy** The level of privacy for the team, can be `secret` or `closed`.

**permission** The default permission for new repositories added to the team, can be `pull`, `push` or `admin`.

**profile** The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.add_team 'team_name'
```

New in version 2016.11.0.

`salt.modules.github.add_team_member`(*name*, *team\_name*, *profile='github'*)

Adds a team member to a team with `team_name`.

**name** The name of the team member to add.

**team\_name** The name of the team of which to add the user.

**profile** The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.add_team_member 'user_name' 'team_name'
```

New in version 2016.11.0.

`salt.modules.github.add_team_repo`(*repo\_name*, *team\_name*, *profile='github'*, *permission=None*)

Adds a repository to a team with `team_name`.

**repo\_name** The name of the repository to add.

**team\_name** The name of the team of which to add the repository.

**profile** The name of the profile configuration to use. Defaults to `github`.

**permission** The permission for team members within the repository, can be `pull`, `push` or `admin`. If not specified, the default permission specified on the team will be used.

New in version 2017.7.0.

CLI Example:

```
salt myminion github.add_team_repo 'my_repo' 'team_name'
```

New in version 2016.11.0.

`salt.modules.github.add_user`(*name*, *profile='github'*)

Add a GitHub user.

**name** The user for which to obtain information.

**profile** The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.add_user github-handle
```

`salt.modules.github.edit_repo`(*name*, *description=None*, *homepage=None*, *private=None*, *has\_issues=None*, *has\_wiki=None*, *has\_downloads=None*, *profile='github'*)

Updates an existing Github repository.

**name** The name of the team to be created.

**description** The description of the repository.

**homepage** The URL with more information about the repository.

**private** The visibility of the repository. Note that private repositories require a paid GitHub account.

**has\_issues** Whether to enable issues for this repository.  
**has\_wiki** Whether to enable the wiki for this repository.  
**has\_downloads** Whether to enable downloads for this repository.  
**profile** The name of the profile configuration to use. Defaults to `github`.  
CLI Example:

```
salt myminion github.add_repo 'repo_name'
```

New in version 2016.11.0.

`salt.modules.github.edit_team`(*name*, *description=None*, *privacy=None*, *permission=None*, *profile='github'*)

Updates an existing Github team.

**name** The name of the team to be edited.

**description** The description of the team.

**privacy** The level of privacy for the team, can be `'secret'` or `'closed'`.

**permission** The default permission for new repositories added to the team, can be `'pull'`, `'push'` or `'admin'`.

**profile** The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.edit_team 'team_name' description='Team description'
```

New in version 2016.11.0.

`salt.modules.github.get_issue`(*issue\_number*, *repo\_name=None*, *profile='github'*, *output='min'*)

Return information about a single issue in a named repository.

New in version 2016.11.0.

**issue\_number** The number of the issue to retrieve.

**repo\_name** The name of the repository from which to get the issue. This argument is required, either passed via the CLI, or defined in the configured profile. A `repo_name` passed as a CLI argument will override the `repo_name` defined in the configured profile, if provided.

**profile** The name of the profile configuration to use. Defaults to `github`.

**output** The amount of data returned by each issue. Defaults to `min`. Change to `full` to see all issue output.

CLI Example:

```
salt myminion github.get_issue 514
salt myminion github.get_issue 514 repo_name=salt
```

`salt.modules.github.get_issue_comments`(*issue\_number*, *repo\_name=None*, *profile='github'*, *since=None*, *output='min'*)

Return information about the comments for a given issue in a named repository.

New in version 2016.11.0.

**issue\_number** The number of the issue for which to retrieve comments.

**repo\_name** The name of the repository to which the issue belongs. This argument is required, either passed via the CLI, or defined in the configured profile. A `repo_name` passed as a CLI argument will override the `repo_name` defined in the configured profile, if provided.

**profile** The name of the profile configuration to use. Defaults to `github`.

**since** Only comments updated at or after this time are returned. This is a timestamp in ISO 8601 format: `YYYY-MM-DDTHH:MM:SSZ`.

**output** The amount of data returned by each issue. Defaults to `min`. Change to `full` to see all issue output.

CLI Example:

```
salt myminion github.get_issue_comments 514
salt myminion github.get_issue 514 repo_name=salt
```

```
salt.modules.github.get_issues(repo_name=None, profile='github', milestone=None, state='open',
                               assignee=None, creator=None, mentioned=None, labels=None,
                               sort='created', direction='desc', since=None, output='min',
                               per_page=None)
```

Returns information for all issues in a given repository, based on the search options.

New in version 2016.11.0.

**repo\_name** The name of the repository for which to list issues. This argument is required, either passed via the CLI, or defined in the configured profile. A `repo_name` passed as a CLI argument will override the `repo_name` defined in the configured profile, if provided.

**profile** The name of the profile configuration to use. Defaults to `github`.

**milestone** The number of a GitHub milestone, or a string of either `*` or `none`.

If a number is passed, it should refer to a milestone by its number field. Use the `github.get_milestone` function to obtain a milestone's number.

If the string `*` is passed, issues with any milestone are accepted. If the string `none` is passed, issues without milestones are returned.

**state** Indicates the state of the issues to return. Can be either `open`, `closed`, or `all`. Default is `open`.

**assignee** Can be the name of a user. Pass in `none` (as a string) for issues with no assigned user or `*` for issues assigned to any user.

**creator** The user that created the issue.

**mentioned** A user that's mentioned in the issue.

**labels** A string of comma separated label names. For example, `bug,ui,@high`.

**sort** What to sort results by. Can be either `created`, `updated`, or `comments`. Default is `created`.

**direction** The direction of the sort. Can be either `asc` or `desc`. Default is `desc`.

**since** Only issues updated at or after this time are returned. This is a timestamp in ISO 8601 format: `YYYY-MM-DDTHH:MM:SSZ`.

**output** The amount of data returned by each issue. Defaults to `min`. Change to `full` to see all issue output.

**per\_page** GitHub paginates data in their API calls. Use this value to increase or decrease the number of issues gathered from GitHub, per page. If not set, GitHub defaults are used. Maximum is 100.

CLI Example:

```
salt myminion github.get_issues my-github-repo
```

```
salt.modules.github.get_milestone(number=None, name=None, repo_name=None, profile='github', output='min')
```

Return information about a single milestone in a named repository.

New in version 2016.11.0.

**number** The number of the milestone to retrieve. If provided, this option will be favored over `name`.

**name** The name of the milestone to retrieve.

**repo\_name** The name of the repository for which to list issues. This argument is required, either passed via the CLI, or defined in the configured profile. A `repo_name` passed as a CLI argument will override the `repo_name` defined in the configured profile, if provided.

**profile** The name of the profile configuration to use. Defaults to `github`.

**output** The amount of data returned by each issue. Defaults to `min`. Change to `full` to see all issue output.

CLI Example:

```
salt myminion github.get_milestone 72
salt myminion github.get_milestone name=my_milestone
```

```
salt.modules.github.get_milestones(repo_name=None, profile='github', state='open',
                                    sort='due_on', direction='asc', output='min',
                                    per_page=None)
```

Return information about milestones for a given repository.

New in version 2016.11.0.

**repo\_name** The name of the repository for which to list issues. This argument is required, either passed via the CLI, or defined in the configured profile. A `repo_name` passed as a CLI argument will override the `repo_name` defined in the configured profile, if provided.

**profile** The name of the profile configuration to use. Defaults to `github`.

**state** The state of the milestone. Either `open`, `closed`, or `all`. Default is `open`.

**sort** What to sort results by. Either `due_on` or `completeness`. Default is `due_on`.

**direction** The direction of the sort. Either `asc` or `desc`. Default is `asc`.

**output** The amount of data returned by each issue. Defaults to `min`. Change to `full` to see all issue output.

**per\_page** GitHub paginates data in their API calls. Use this value to increase or decrease the number of issues gathered from GitHub, per page. If not set, GitHub defaults are used.

CLI Example:

```
salt myminion github.get_milestones
```

```
salt.modules.github.get_prs(repo_name=None, profile='github', state='open', head=None,
                             base=None, sort='created', direction='desc', output='min',
                             per_page=None)
```

Returns information for all pull requests in a given repository, based on the search options provided.

New in version 2017.7.0.

**repo\_name** The name of the repository for which to list pull requests. This argument is required, either passed via the CLI, or defined in the configured profile. A `repo_name` passed as a CLI argument will override the `repo_name` defined in the configured profile, if provided.

**profile** The name of the profile configuration to use. Defaults to `github`.

**state** Indicates the state of the pull requests to return. Can be either `open`, `closed`, or `all`. Default is `open`.

**head** Filter pull requests by head user and branch name in the format of `user:ref-name`. Example: `'github:new-script-format'`. Default is `None`.

**base** Filter pulls by base branch name. Example: `gh-pages`. Default is `None`.

**sort** What to sort results by. Can be either `created`, `updated`, `popularity` (comment count), or `long-running` (age, filtering by pull requests updated within the last month). Default is `created`.

**direction** The direction of the sort. Can be either `asc` or `desc`. Default is `desc`.

**output** The amount of data returned by each pull request. Defaults to `min`. Change to `full` to see all pull request output.

**per\_page** GitHub paginates data in their API calls. Use this value to increase or decrease the number of pull requests gathered from GitHub, per page. If not set, GitHub defaults are used. Maximum is 100.

CLI Example:

```
salt myminion github.get_prs
salt myminion github.get_prs base=2016.11
```

```
salt.modules.github.get_repo_info(repo_name, profile='github', ignore_cache=False)
```

Return information for a given repo.

New in version 2016.11.0.

**repo\_name** The name of the repository.

**profile** The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.get_repo_info salt
salt myminion github.get_repo_info salt profile='my-github-profile'
```

```
salt.modules.github.get_repo_teams(repo_name, profile='github')
```

Return teams belonging to a repository.

New in version 2017.7.0.

**repo\_name** The name of the repository from which to retrieve teams.

**profile** The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.get_repo_teams salt
salt myminion github.get_repo_teams salt profile='my-github-profile'
```

`salt.modules.github.get_team(name, profile='github')`

Returns the team details if a team with the given name exists, or `None` otherwise.

**name** The team name for which to obtain information.

**profile** The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.get_team 'team_name'
```

`salt.modules.github.get_user(name, profile='github', user_details=False)`

Get a GitHub user by name.

**name** The user for which to obtain information.

**profile** The name of the profile configuration to use. Defaults to `github`.

**user\_details** Prints user information details. Defaults to `False`. If the user is already in the organization and `user_details` is set to `False`, the `get_user` function returns `True`. If the user is not already present in the organization, user details will be printed by default.

CLI Example:

```
salt myminion github.get_user github-handle
salt myminion github.get_user github-handle user_details=true
```

`salt.modules.github.is_team_member(name, team_name, profile='github')`

Returns `True` if the github user is in the team with `team_name`, or `False` otherwise.

**name** The name of the user whose membership to check.

**team\_name** The name of the team to check membership in.

**profile** The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.is_team_member 'user_name' 'team_name'
```

New in version 2016.11.0.

`salt.modules.github.list_members_without_mfa(profile='github', ignore_cache=False)`

List all members (in lower case) without MFA turned on.

**profile** The name of the profile configuration to use. Defaults to `github`.

**ignore\_cache** Bypasses the use of cached team repos.

CLI Example:

```
salt myminion github.list_members_without_mfa
```

New in version 2016.11.0.

`salt.modules.github.list_private_repos(profile='github')`

List private repositories within the organization. Dependent upon the access rights of the profile token.

New in version 2016.11.0.

**profile** The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.list_private_repos
salt myminion github.list_private_repos profile='my-github-profile'
```

`salt.modules.github.list_public_repos(profile='github')`

List public repositories within the organization.

New in version 2016.11.0.

**profile** The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.list_public_repos
salt myminion github.list_public_repos profile='my-github-profile'
```

`salt.modules.github.list_repos(profile='github')`

List all repositories within the organization. Includes public and private repositories within the organization. Dependent upon the access rights of the profile token.

New in version 2016.11.0.

**profile** The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.list_repos
salt myminion github.list_repos profile='my-github-profile'
```

`salt.modules.github.list_team_members(team_name, profile='github', ignore_cache=False)`

Gets the names of team members in lower case.

**team\_name** The name of the team from which to list members.

**profile** The name of the profile configuration to use. Defaults to `github`.

**ignore\_cache** Bypasses the use of cached team members.

CLI Example:

```
salt myminion github.list_team_members 'team_name'
```

New in version 2016.11.0.

`salt.modules.github.list_team_repos(team_name, profile='github', ignore_cache=False)`

Gets the repo details for a given team as a dict from `repo_name` to repo details. Note that repo names are always in lower case.

**team\_name** The name of the team from which to list repos.

**profile** The name of the profile configuration to use. Defaults to `github`.

**ignore\_cache** Bypasses the use of cached team repos.

CLI Example:

```
salt myminion github.list_team_repos 'team_name'
```

New in version 2016.11.0.

`salt.modules.github.list_teams(profile='github', ignore_cache=False)`

Lists all teams with the organization.

**profile** The name of the profile configuration to use. Defaults to `github`.

**ignore\_cache** Bypasses the use of cached teams.

CLI Example:

```
salt myminion github.list_teams
```

New in version 2016.11.0.

`salt.modules.github.list_users(profile='github', ignore_cache=False)`

List all users within the organization.

**profile** The name of the profile configuration to use. Defaults to `github`.

**ignore\_cache** Bypasses the use of cached users.

New in version 2016.11.0.

CLI Example:

```
salt myminion github.list_users
salt myminion github.list_users profile='my-github-profile'
```

**salt.modules.github.remove\_repo**(*name*, *profile*='github')

Remove a Github repository.

**name** The name of the repository to be removed.

**profile** The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.remove_repo 'my-repo'
```

New in version 2016.11.0.

**salt.modules.github.remove\_team**(*name*, *profile*='github')

Remove a github team.

**name** The name of the team to be removed.

**profile** The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.remove_team 'team_name'
```

New in version 2016.11.0.

**salt.modules.github.remove\_team\_member**(*name*, *team\_name*, *profile*='github')

Removes a team member from a team with `team_name`.

**name** The name of the team member to remove.

**team\_name** The name of the team from which to remove the user.

**profile** The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.remove_team_member 'user_name' 'team_name'
```

New in version 2016.11.0.

**salt.modules.github.remove\_team\_repo**(*repo\_name*, *team\_name*, *profile*='github')

Removes a repository from a team with `team_name`.

**repo\_name** The name of the repository to remove.

**team\_name** The name of the team of which to remove the repository.

**profile** The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.remove_team_repo 'my_repo' 'team_name'
```

New in version 2016.11.0.

**salt.modules.github.remove\_user**(*name*, *profile*='github')

Remove a Github user by name.

**name** The user for which to obtain information.

**profile** The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.remove_user github-handle
```

## 14.7.129 salt.modules.glance

Module for handling openstack glance calls.

### optdepends

- glanceclient Python adapter

**configuration** This module is not usable until the following are specified either in a pillar or in the minion's config file:

```
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.insecure: False  #(optional)
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
```

If configuration for multiple openstack accounts is required, they can be set up as different configuration profiles: For example:

```
openstack1:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'

openstack2:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/'
```

With this configuration in place, any of the glance functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' glance.image_list profile=openstack1
```

**salt.modules.glance.image\_create**(*name*, *location=None*, *profile=None*, *visibility=None*, *container\_format='bare'*, *disk\_format='raw'*, *protected=None*)

Create an image (glance image-create)

CLI Example, old format:

```
salt '*' glance.image_create name=f16-jeos \
  disk_format=qcow2 container_format=ovf
```

CLI Example, new format resembling Glance API v2:

```
salt '*' glance.image_create name=f16-jeos visibility=public \
  disk_format=qcow2 container_format=ovf
```

The parameter `visibility` defaults to `public` if not specified.

**salt.modules.glance.image\_delete**(*id=None*, *name=None*, *profile=None*)

Delete an image (glance image-delete)

CLI Examples:

```
salt '*' glance.image_delete c2eb2eb0-53e1-4a80-b990-8ec887eae7df
salt '*' glance.image_delete id=c2eb2eb0-53e1-4a80-b990-8ec887eae7df
salt '*' glance.image_delete name=f16-jeos
```

`salt.modules.glance.image_list` (*id=None, profile=None, name=None*)  
Return a list of available images (glance image-list)

CLI Example:

```
salt '*' glance.image_list
```

`salt.modules.glance.image_schema` (*profile=None*)  
Returns names and descriptions of the schema ``image``'s properties for this profile's instance of glance

CLI Example:

```
salt '*' glance.image_schema
```

`salt.modules.glance.image_show` (*id=None, name=None, profile=None*)  
Return details about a specific image (glance image-show)

CLI Example:

```
salt '*' glance.image_show
```

`salt.modules.glance.image_update` (*id=None, name=None, profile=None, \*\*kwargs*)  
Update properties of given image. Known to work for: - min\_ram (in MB) - protected (bool) - visibility ('public' or 'private')

CLI Example:

```
salt '*' glance.image_update id=c2eb2eb0-53e1-4a80-b990-8ec887eae7df
salt '*' glance.image_update name=f16-jeos
```

`salt.modules.glance.schema_get` (*name, profile=None*)  
Known valid names of schemas are:

- image
- images
- member
- members

CLI Example:

```
salt '*' glance.schema_get name=f16-jeos
```

### 14.7.130 salt.modules.glusterfs

Manage a glusterfs pool

`salt.modules.glusterfs.add_volume_bricks` (*name, bricks*)

Add brick(s) to an existing volume

**name** Volume name

**bricks** List of bricks to add to the volume

`salt.modules.glusterfs.create_volume`(*name*, *bricks*, *stripe=False*, *replica=False*, *device\_vg=False*, *transport='tcp'*, *start=False*, *force=False*)

Create a glusterfs volume.

**name** Name of the gluster volume

**bricks** Bricks to create volume from, in <peer>:<brick path> format. For multiple bricks use list format: `["<peer1>:<brick1>", "<peer2>:<brick2>"]`

**stripe** Stripe count, the number of bricks should be a multiple of the stripe count for a distributed striped volume

**replica** Replica count, the number of bricks should be a multiple of the replica count for a distributed replicated volume

**device\_vg** If true, specifies volume should use block backend instead of regular posix backend. Block device backend volume does not support multiple bricks

**transport** Transport protocol to use, can be `'tcp'`, `'rdma'` or `'tcp,rdma'`

**start** Start the volume after creation

**force** Force volume creation, this works even if creating in root FS

CLI Example:

```
salt host1 glusterfs.create newvolume host1:/brick

salt gluster1 glusterfs.create vol2 ["gluster1:/export/vol2/brick",
↪ "gluster2:/export/vol2/brick"] replica=2 start=True
```

`salt.modules.glusterfs.delete_volume`(*target*, *stop=True*)

Deletes a gluster volume

**target** Volume to delete

**stop** Stop volume before delete if it is started, True by default

`salt.modules.glusterfs.disable_quota_volume`(*name*)

Disable quota on a glusterfs volume.

**name** Name of the gluster volume

`salt.modules.glusterfs.enable_quota_volume`(*name*)

Enable quota on a glusterfs volume.

**name** Name of the gluster volume

`salt.modules.glusterfs.info`(*name=None*)

New in version 2015.8.4.

Return gluster volume info.

**name** Optional name to retrieve only information of one volume

CLI Example:

```
salt '*' glusterfs.info
```

`salt.modules.glusterfs.list_quota_volume`(*name*)

List quotas of glusterfs volume. *name*

Name of the gluster volume

`salt.modules.glusterfs.list_volumes`()

List configured volumes

CLI Example:

```
salt '*' glusterfs.list_volumes
```

`salt.modules.glusterfs.peer`(*name*)

Add another node into the peer list.

**name** The remote host to probe.

CLI Example:

```
salt 'one.gluster.*' glusterfs.peer two
```

GLUSTER direct CLI example (to show what salt is sending to gluster):

```
$ gluster peer probe ftp2
```

GLUSTER CLI 3.4.4 return example (so we know what we are parsing): #if the ``peer" is the local host:  
peer probe: success: on localhost not needed

```
#if the peer was just added: peer probe: success
```

```
#if the peer was already part of the cluster: peer probe: success: host ftp2 port 24007 already in peer list
```

**salt.modules.glusterfs.peer\_status()**

Return peer status information

The return value is a dictionary with peer UUIDs as keys and dicts of peer information as values. Hostnames are listed in one list. GlusterFS separates one of the hostnames but the only reason for this seems to be which hostname happens to be used first in peering.

CLI Example:

```
salt '*' glusterfs.peer_status
```

GLUSTER direct CLI example (to show what salt is sending to gluster):

```
$ gluster peer status
```

GLUSTER CLI 3.4.4 return example (so we know what we are parsing):

```
Number of Peers: 2
```

```
Hostname: ftp2 Port: 24007 Uuid: cbc256b-e66e-4ec7-a718-21082d396c24 State: Peer in Cluster (Connected)
```

```
Hostname: ftp3 Uuid: 5ea10457-6cb2-427b-a770-7897509625e9 State: Peer in Cluster (Connected)
```

**salt.modules.glusterfs.set\_quota\_volume**(*name, path, size, enable\_quota=False*)

Set quota to glusterfs volume.

**name** Name of the gluster volume

**path** Folder path for restriction in volume (``/'')

**size** Hard-limit size of the volume (MB/GB)

**enable\_quota** Enable quota before set up restriction

CLI Example:

```
salt '*' glusterfs.set_quota_volume <volume> <path> <size> enable_quota=True
```

**salt.modules.glusterfs.start\_volume**(*name, force=False*)

Start a gluster volume.

**name** Volume name

**force** Force the volume start even if the volume is started .. versionadded:: 2015.8.4

CLI Example:

```
salt '*' glusterfs.start mycluster
```

**salt.modules.glusterfs.status**(*name*)

Check the status of a gluster volume.

**name** Volume name

CLI Example:

```
salt '*' glusterfs.status myvolume
```

**salt.modules.glusterfs.stop\_volume**(*name*, *force=False*)

Stop a gluster volume.

**name** Volume name

**force** Force stop the volume .. versionadded:: 2015.8.4

CLI Example:

```
salt '*' glusterfs.stop_volume mycluster
```

**salt.modules.glusterfs.unset\_quota\_volume**(*name*, *path*)

Unset quota to glusterfs volume. *name*

Name of the gluster volume

**path** Folder path for restriction in volume

CLI Example: .. code-block:: bash

```
salt '*' glusterfs.unset_quota_volume <volume> <path>
```

### 14.7.131 salt.modules.gnomedesktop

GNOME implementations

**salt.modules.gnomedesktop.get**(*schema=None*, *key=None*, *user=None*, *\*\*kwargs*)

Get key in a particular GNOME schema

CLI Example:

```
salt '*' gnome.get user=<username> schema=org.gnome.desktop.screensaver key=idle-activation-enabled
```

**salt.modules.gnomedesktop.getClockFormat**(*\*\*kwargs*)

Return the current clock format, either 12h or 24h format.

CLI Example:

```
salt '*' gnome.getClockFormat user=<username>
```

**salt.modules.gnomedesktop.getClockShowDate**(*\*\*kwargs*)

Return the current setting, if the date is shown in the clock

CLI Example:

```
salt '*' gnome.getClockShowDate user=<username>
```

**salt.modules.gnomedesktop.getIdleActivation**(*\*\*kwargs*)

Get whether the idle activation is enabled

CLI Example:

```
salt '*' gnome.getIdleActivation user=<username>
```

**salt.modules.gnomedesktop.getIdleDelay**(*\*\*kwargs*)

Return the current idle delay setting in seconds

CLI Example:

```
salt '*' gnome.getIdleDelay user=<username>
```

`salt.modules.gnomedesktop.ping(**kwargs)`

A test to ensure the GNOME module is loaded

CLI Example:

```
salt '*' gnome.ping user=<username>
```

`salt.modules.gnomedesktop.setClockFormat(clockFormat, **kwargs)`

Set the clock format, either 12h or 24h format.

CLI Example:

```
salt '*' gnome.setClockFormat <12h|24h> user=<username>
```

`salt.modules.gnomedesktop.setClockShowDate(kvalue, **kwargs)`

Set whether the date is visible in the clock

CLI Example:

```
salt '*' gnome.setClockShowDate <True|False> user=<username>
```

`salt.modules.gnomedesktop.setIdleActivation(kvalue, **kwargs)`

Set whether the idle activation is enabled

CLI Example:

```
salt '*' gnome.setIdleActivation <True|False> user=<username>
```

`salt.modules.gnomedesktop.setIdleDelay(delaySeconds, **kwargs)`

Set the current idle delay setting in seconds

CLI Example:

```
salt '*' gnome.setIdleDelay <seconds> user=<username>
```

`salt.modules.gnomedesktop.set(schema=None, key=None, user=None, value=None, **kwargs)`

Set key in a particular GNOME schema

CLI Example:

```
salt '*' gnome.set user=<username> schema=org.gnome.desktop.screensaver key=idle-
activation-enabled value=False
```

### 14.7.132 salt.modules.gpg

Manage a GPG keychains, add keys, create keys, retrieve keys from key servers. Sign, encrypt and sign plus encrypt text and files.

New in version 2015.5.0.

---

**Note:** The python-gnupg library and gpg binary are required to be installed.

---

`salt.modules.gpg.create_key(*args, **kwargs)`

Create a key in the GPG keychain

---

**Note:** GPG key generation requires *a lot* of entropy and randomness. Difficult to do over a remote connection, consider having another process available which is generating randomness for the machine. Also especially difficult on virtual machines, consider the [rng-tools](#) package.

The `create_key` process takes awhile so increasing the timeout may be necessary, e.g. `-t 15`.

---

**key\_type** The type of the primary key to generate. It must be capable of signing. `'RSA'` or `'DSA'`.  
**key\_length** The length of the primary key in bits.  
**name\_real** The real name of the user identity which is represented by the key.  
**name\_comment** A comment to attach to the user id.  
**name\_email** An email address for the user.  
**subkey\_type** The type of the secondary key to generate.  
**subkey\_length** The length of the secondary key in bits.  
**expire\_date** The expiration date for the primary and any secondary key. You can specify an ISO date, A number of days/weeks/months/years, an epoch value, or 0 for a non-expiring key.  
**use\_passphrase** Whether to use a passphrase with the signing key. Passphrase is received from Pillar.  
**user** Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.  
**gnupghome** Specify the location where GPG keyring and related files are stored.

CLI Example:

```
salt -t 15 '*' gpg.create_key
```

`salt.modules.gpg.decrypt` (*user=None, text=None, filename=None, output=None, use\_passphrase=False, gnupghome=None, bare=False*)

Decrypt a message or file

**user** Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

**text** The encrypted text to decrypt.

**filename** The encrypted filename to decrypt.

**output** The filename where the decrypted data will be written, default is standard out.

**use\_passphrase** Whether to use a passphrase with the signing key. Passphrase is received from Pillar.

**gnupghome** Specify the location where GPG keyring and related files are stored.

**bare** If True, return the (armored) decrypted block as a string without the standard comment/res dict.

CLI Example:

```
salt '*' gpg.decrypt filename='/path/to/important.file.gpg'
```

```
salt '*' gpg.decrypt filename='/path/to/important.file.gpg' use_passphrase=True
```

`salt.modules.gpg.delete_key` (*keyid=None, fingerprint=None, delete\_secret=False, user=None, gnupghome=None*)

Get a key from the GPG keychain

**keyid** The keyid of the key to be deleted.

**fingerprint** The fingerprint of the key to be deleted.

**delete\_secret** Whether to delete a corresponding secret key prior to deleting the public key. Secret keys must be deleted before deleting any corresponding public keys.

**user** Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

**gnupghome** Specify the location where GPG keyring and related files are stored.

CLI Example:

```
salt '*' gpg.delete_key keyid=3FAD9F1E
```

```

salt '*' gpg.delete_key fingerprint=53C96788253E58416D20BCD352952C84C3252192
salt '*' gpg.delete_key keyid=3FAD9F1E user=username
salt '*' gpg.delete_key keyid=3FAD9F1E user=username delete_secret=True

```

`salt.modules.gpg.encrypt`(*user=None, recipients=None, text=None, filename=None, output=None, sign=None, use\_passphrase=False, gnupghome=None, bare=False*)

Encrypt a message or file

**user** Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

**recipients** The fingerprints for those recipient whom the data is being encrypted for.

**text** The text to encrypt.

**filename** The filename to encrypt.

**output** The filename where the signed file will be written, default is standard out.

**sign** Whether to sign, in addition to encrypt, the data. True to use default key or fingerprint to specify a different key to sign with.

**use\_passphrase** Whether to use a passphrase with the signing key. Passphrase is received from Pillar.

**gnupghome** Specify the location where GPG keyring and related files are stored.

**bare** If True, return the (armored) encrypted block as a string without the standard comment/res dict.

CLI Example:

```

salt '*' gpg.encrypt text='Hello there. How are you?'
salt '*' gpg.encrypt filename='/path/to/important.file'
salt '*' gpg.encrypt filename='/path/to/important.file' use_passphrase=True

```

`salt.modules.gpg.export_key`(*keyids=None, secret=False, user=None, gnupghome=None*)

Export a key from the GPG keychain

**keyids** The key ID(s) of the key(s) to be exported. Can be specified as a comma separated string or a list. Anything which GnuPG itself accepts to identify a key - for example, the key ID or the fingerprint could be used.

**secret** Export the secret key identified by the `keyids` information passed.

**user** Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

**gnupghome** Specify the location where GPG keyring and related files are stored.

CLI Example:

```

salt '*' gpg.export_key keyids=3FAD9F1E
salt '*' gpg.export_key keyids=3FAD9F1E secret=True
salt '*' gpg.export_key keyids="['3FAD9F1E','3FBD8F1E']" user=username

```

`salt.modules.gpg.get_key`(*keyid=None, fingerprint=None, user=None, gnupghome=None*)

Get a key from the GPG keychain

**keyid** The key ID (short or long) of the key to be retrieved.

**fingerprint** The fingerprint of the key to be retrieved.

**user** Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

**gnupghome** Specify the location where GPG keyring and related files are stored.

CLI Example:

```

salt '*' gpg.get_key keyid=3FAD9F1E

salt '*' gpg.get_key fingerprint=53C96788253E58416D20BCD352952C84C3252192

salt '*' gpg.get_key keyid=3FAD9F1E user=username

```

`salt.modules.gpg.get_secret_key` (*keyid=None, fingerprint=None, user=None, gnupghome=None*)

Get a key from the GPG keychain

**keyid** The key ID (short or long) of the key to be retrieved.

**fingerprint** The fingerprint of the key to be retrieved.

**user** Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

**gnupghome** Specify the location where GPG keyring and related files are stored.

CLI Example:

```

salt '*' gpg.get_secret_key keyid=3FAD9F1E

salt '*' gpg.get_secret_key fingerprint=53C96788253E58416D20BCD352952C84C3252192

salt '*' gpg.get_secret_key keyid=3FAD9F1E user=username

```

`salt.modules.gpg.import_key` (*\*args, \*\*kwargs*)

Import a key from text or file

**text** The text containing to import.

**filename** The filename containing the key to import.

**user** Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

**gnupghome** Specify the location where GPG keyring and related files are stored.

CLI Example:

```

salt '*' gpg.import_key text='-----BEGIN PGP PUBLIC KEY BLOCK-----\n ... -----END
↳PGP PUBLIC KEY BLOCK-----'

salt '*' gpg.import_key filename='/path/to/public-key-file'

```

`salt.modules.gpg.list_keys` (*user=None, gnupghome=None*)

List keys in GPG keychain

**user** Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

**gnupghome** Specify the location where GPG keyring and related files are stored.

CLI Example:

```

salt '*' gpg.list_keys

```

`salt.modules.gpg.list_secret_keys` (*user=None, gnupghome=None*)

List secret keys in GPG keychain

**user** Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

**gnupghome** Specify the location where GPG keyring and related files are stored.

CLI Example:

```

salt '*' gpg.list_secret_keys

```

`salt.modules.gpg.receive_keys` (*\*args, \*\*kwargs*)

Receive key(s) from keyserver and add them to keychain

**keyserver** Keyserver to use for searching for GPG keys, defaults to `pgp.mit.edu`

**keys** The keyID(s) to retrieve from the keyserver. Can be specified as a comma separated string or a list.

**user** Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

**gnupghome** Specify the location where GPG keyring and related files are stored.

CLI Example:

```
salt '*' gpg.receive_keys keys='3FAD9F1E'

salt '*' gpg.receive_keys keys="['3FAD9F1E', '3FBD9F2E']"

salt '*' gpg.receive_keys keys=3FAD9F1E user=username
```

`salt.modules.gpg.search_keys`(*text*, *keyserver=None*, *user=None*)

Search keys from keyserver

**text** Text to search the keyserver for, e.g. email address, keyID or fingerprint.

**keyserver** Keyserver to use for searching for GPG keys, defaults to `gpg.mit.edu`.

**user** Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

CLI Example:

```
salt '*' gpg.search_keys user@example.com

salt '*' gpg.search_keys user@example.com keyserver=keyserver.ubuntu.com

salt '*' gpg.search_keys user@example.com keyserver=keyserver.ubuntu.com
↪user=username
```

`salt.modules.gpg.sign`(*user=None*, *keyid=None*, *text=None*, *filename=None*, *output=None*, *use\_passphrase=False*, *gnupghome=None*)

Sign message or file

**user** Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

**keyid** The keyid of the key to set the trust level for, defaults to first key in the secret keyring.

**text** The text to sign.

**filename** The filename to sign.

**output** The filename where the signed file will be written, default is standard out.

**use\_passphrase** Whether to use a passphrase with the signing key. Passphrase is received from Pillar.

**gnupghome** Specify the location where GPG keyring and related files are stored.

CLI Example:

```
salt '*' gpg.sign text='Hello there. How are you?'

salt '*' gpg.sign filename='/path/to/important.file'

salt '*' gpg.sign filename='/path/to/important.file' use_passphrase=True
```

`salt.modules.gpg.trust_key`(*keyid=None*, *fingerprint=None*, *trust\_level=None*, *user=None*)

Set the trust level for a key in GPG keychain

**keyid** The keyid of the key to set the trust level for.

**fingerprint** The fingerprint of the key to set the trust level for.

**trust\_level** The trust level to set for the specified key, must be one of the following: `expired`, `unknown`, `not_trusted`, `marginally`, `fully`, `ultimately`

**user** Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

CLI Example:

```

salt '*' gpg.trust_key keyid='3FAD9F1E' trust_level='marginally'
salt '*' gpg.trust_key fingerprint='53C96788253E58416D20BCD352952C84C3252192'
↳trust_level='not_trusted'
salt '*' gpg.trust_key keys=3FAD9F1E trust_level='ultimately' user='username'

```

`salt.modules.gpg.verify`(*text=None, user=None, filename=None, gnupghome=None*)

Verify a message or file

**text** The text to verify.

**filename** The filename to verify.

**user** Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

**gnupghome** Specify the location where GPG keyring and related files are stored.

CLI Example:

```

salt '*' gpg.verify text='Hello there. How are you?'

salt '*' gpg.verify filename='/path/to/important.file'

salt '*' gpg.verify filename='/path/to/important.file' use_passphrase=True

```

### 14.7.133 salt.modules.grafana4 module

Module for working with the Grafana v4 API

New in version 2017.7.0.

**depends** requests

**configuration** This module requires a configuration profile to be configured in the minion config, minion pillar, or master config. The module will use the ``grafana'` key by default, if defined.

For example:

```

grafana:
  grafana_url: http://grafana.localhost
  grafana_user: admin
  grafana_password: admin
  grafana_timeout: 3

```

`salt.modules.grafana4.create_datasource`(*orgname=None, profile='grafana', \*\*kwargs*)

Create a new datasource in an organisation.

**name** Name of the data source.

**type** Type of the datasource (``graphite'`, ``influxdb'` etc.).

**access** Use proxy or direct.

**url** The URL to the data source API.

**user** Optional - user to authenticate with the data source.

**password** Optional - password to authenticate with the data source.

**database** Optional - database to use with the data source.

**basicAuth** Optional - set to True to use HTTP basic auth to authenticate with the data source.

**basicAuthUser** Optional - HTTP basic auth username.

**basicAuthPassword** Optional - HTTP basic auth password.

**jsonData** Optional - additional json data to post (eg. ```timeInterval``).

**isDefault** Optional - set data source as default.

**withCredentials** Optional - Whether credentials such as cookies or auth headers should be sent with cross-site requests.

**typeLogoUrl** Optional - Logo to use for this datasource.

**orgname** Name of the organization in which the data source should be created.  
**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.  
 CLI Example:

```
salt '*' grafana4.create_datasource
```

`salt.modules.grafana4.create_org(profile='grafana', **kwargs)`

Create a new organization.

**name** Name of the organization.

**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.

CLI Example:

```
salt '*' grafana4.create_org <name>
```

`salt.modules.grafana4.create_org_user(orgname=None, profile='grafana', **kwargs)`

Add user to the organization.

**loginOrEmail** Login or email of the user.

**role**

Role of the user for this organization. Should be one of:

- Admin
- Editor
- Read Only Editor
- Viewer

**orgname** Name of the organization in which users are added.

**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.

CLI Example:

```
salt '*' grafana4.create_org_user <orgname> loginOrEmail=<loginOrEmail> role=
↳<role>
```

`salt.modules.grafana4.create_update_dashboard(orgname=None, profile='grafana', **kwargs)`

Create or update a dashboard.

**dashboard** A dict that defines the dashboard to create/update.

**overwrite** Whether the dashboard should be overwritten if already existing.

**orgname** Name of the organization.

**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.

CLI Example:

```
salt '*' grafana4.create_update_dashboard dashboard=<dashboard> overwrite=True
↳<orgname>
```

`salt.modules.grafana4.create_user(profile='grafana', **kwargs)`

Create a new user.

**login** Login of the new user.

**password** Password of the new user.

**email** Email of the new user.

**name** Optional - Full name of the new user.

**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.

CLI Example:

```
salt '*' grafana4.create_user login=<login> password=<password> email=<email>
```

`salt.modules.grafana4.delete_dashboard(slug, orgname=None, profile='grafana')`

Delete a dashboard.

**slug** Slug (name) of the dashboard.

**orgname** Name of the organization.

**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.

CLI Example:

```
salt '*' grafana4.delete_dashboard <slug>
```

`salt.modules.grafana4.delete_datasource(datasourceid, orgname=None, profile='grafana')`

Delete a datasource.

**datasourceid** Id of the datasource.

**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.

CLI Example:

```
salt '*' grafana4.delete_datasource <datasource_id>
```

`salt.modules.grafana4.delete_org(orgid, profile='grafana')`

Delete an organization.

**orgid** Id of the organization.

**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.

CLI Example:

```
salt '*' grafana4.delete_org <org_id>
```

`salt.modules.grafana4.delete_org_user(userid, orgname=None, profile='grafana')`

Remove user from the organization.

**userid** Id of the user.

**orgname** Name of the organization in which users are updated.

**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.

CLI Example:

```
salt '*' grafana4.delete_org_user <user_id> <orgname>
```

`salt.modules.grafana4.delete_user(userid, profile='grafana')`

Delete a user.

**userid** Id of the user.

**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.

CLI Example:

```
salt '*' grafana4.delete_user <user_id>
```

`salt.modules.grafana4.delete_user_org(userid, orgid, profile='grafana')`

Remove a user from an organization.

**userid** Id of the user.

**orgid** Id of the organization.

**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.

CLI Example:

```
salt '*' grafana4.delete_user_org <user_id> <org_id>
```

`salt.modules.grafana4.get_dashboard(slug, orgname=None, profile='grafana')`

Get a dashboard.

**slug** Slug (name) of the dashboard.

**orgname** Name of the organization.

**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.

CLI Example:

```
salt '*' grafana4.get_dashboard <slug>
```

`salt.modules.grafana4.get_datasource` (*name*, *orgname=None*, *profile='grafana'*)

Show a single datasource in an organisation.

**name** Name of the datasource.

**orgname** Name of the organization.

**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.

CLI Example:

```
salt '*' grafana4.get_datasource <name> <orgname>
```

`salt.modules.grafana4.get_datasources` (*orgname=None*, *profile='grafana'*)

List all datasources in an organisation.

**orgname** Name of the organization.

**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.

CLI Example:

```
salt '*' grafana4.get_datasources <orgname>
```

`salt.modules.grafana4.get_org` (*name*, *profile='grafana'*)

Show a single organization.

**name** Name of the organization.

**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.

CLI Example:

```
salt '*' grafana4.get_org <name>
```

`salt.modules.grafana4.get_org_address` (*orgname=None*, *profile='grafana'*)

Get the organization address.

**orgname** Name of the organization in which users are updated.

**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.

CLI Example:

```
salt '*' grafana4.get_org_address <orgname>
```

`salt.modules.grafana4.get_org_prefs` (*orgname=None*, *profile='grafana'*)

Get the organization preferences.

**orgname** Name of the organization in which users are updated.

**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.

CLI Example:

```
salt '*' grafana4.get_org_prefs <orgname>
```

`salt.modules.grafana4.get_org_users` (*orgname=None*, *profile='grafana'*)

Get the list of users that belong to the organization.

**orgname** Name of the organization.

**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.

CLI Example:

```
salt '*' grafana4.get_org_users <orgname>
```

`salt.modules.grafana4.get_orgs` (*profile='grafana'*)

List all organizations.

**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.

CLI Example:

```
salt '*' grafana4.get_orgs
```

`salt.modules.grafana4.get_user` (*login*, *profile='grafana'*)

Show a single user.

**login** Login of the user.

**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.

CLI Example:

```
salt '*' grafana4.get_user <login>
```

`salt.modules.grafana4.get_user_data` (*userid*, *profile='grafana'*)

Get user data.

**userid** Id of the user.

**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.

CLI Example:

```
salt '*' grafana4.get_user_data <user_id>
```

`salt.modules.grafana4.get_user_orgs` (*userid*, *profile='grafana'*)

Get the list of organisations a user belong to.

**userid** Id of the user.

**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.

CLI Example:

```
salt '*' grafana4.get_user_orgs <user_id>
```

`salt.modules.grafana4.get_users` (*profile='grafana'*)

List all users.

**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.

CLI Example:

```
salt '*' grafana4.get_users
```

`salt.modules.grafana4.switch_org` (*orgname*, *profile='grafana'*)

Switch the current organization.

**name** Name of the organization to switch to.

**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.

CLI Example:

```
salt '*' grafana4.switch_org <name>
```

`salt.modules.grafana4.update_datasource` (*datasourceid*, *orgname=None*, *profile='grafana'*,  
*\*\*kwargs*)

Update a datasource.

**datasourceid** Id of the datasource.

**name** Name of the data source.

**type** Type of the datasource (`graphite`, `influxdb` etc.).

**access** Use proxy or direct.

**url** The URL to the data source API.

**user** Optional - user to authenticate with the data source.

**password** Optional - password to authenticate with the data source.

**database** Optional - database to use with the data source.

**basicAuth** Optional - set to True to use HTTP basic auth to authenticate with the data source.

**basicAuthUser** Optional - HTTP basic auth username.

**basicAuthPassword** Optional - HTTP basic auth password.  
**jsonData** Optional - additional json data to post (eg. ``timeInterval``).  
**isDefault** Optional - set data source as default.  
**withCredentials** Optional - Whether credentials such as cookies or auth headers should be sent with cross-site requests.  
**typeLogoUrl** Optional - Logo to use for this datasource.  
**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.  
 CLI Example:

```
salt '*' grafana4.update_datasource <datasourceid>
```

`salt.modules.grafana4.update_org`(*orgid*, *profile='grafana'*, *\*\*kwargs*)

Update an existing organization.  
**orgid** Id of the organization.  
**name** New name of the organization.  
**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.  
 CLI Example:

```
salt '*' grafana4.update_org <org_id> name=<name>
```

`salt.modules.grafana4.update_org_address`(*orgname=None*, *profile='grafana'*, *\*\*kwargs*)

Update the organization address.  
**orgname** Name of the organization in which users are updated.  
**address1** Optional - address1 of the org.  
**address2** Optional - address2 of the org.  
**city** Optional - city of the org.  
**zip\_code** Optional - zip\_code of the org.  
**state** Optional - state of the org.  
**country** Optional - country of the org.  
**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.  
 CLI Example:

```
salt '*' grafana4.update_org_address <orgname> country=<country>
```

`salt.modules.grafana4.update_org_prefs`(*orgname=None*, *profile='grafana'*, *\*\*kwargs*)

Update the organization preferences.  
**orgname** Name of the organization in which users are updated.  
**theme** Selected theme for the org.  
**homeDashboardId** Home dashboard for the org.  
**timezone** Timezone for the org (one of: ``browser``, ``utc``, or ````).  
**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.  
 CLI Example:

```
salt '*' grafana4.update_org_prefs <orgname> theme=<theme> timezone=<timezone>
```

`salt.modules.grafana4.update_org_user`(*userid*, *orgname=None*, *profile='grafana'*, *\*\*kwargs*)

Update user role in the organization.  
**userid** Id of the user.  
**loginOrEmail** Login or email of the user.  
**role**

Role of the user for this organization. Should be one of:

- Admin
- Editor

- Read Only Editor
- Viewer

**orgname** Name of the organization in which users are updated.

**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.

CLI Example:

```
salt '*' grafana4.update_org_user <user_id> <orgname> loginOrEmail=<loginOrEmail>
↪role=<role>
```

`salt.modules.grafana4.update_user` (*userid*, *profile='grafana'*, *\*\*kwargs*)

Update an existing user.

**userid** Id of the user.

**login** Optional - Login of the user.

**email** Optional - Email of the user.

**name** Optional - Full name of the user.

**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.

CLI Example:

```
salt '*' grafana4.update_user <user_id> login=<login> email=<email>
```

`salt.modules.grafana4.update_user_password` (*userid*, *profile='grafana'*, *\*\*kwargs*)

Update a user password.

**userid** Id of the user.

**password** New password of the user.

**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.

CLI Example:

```
salt '*' grafana4.update_user_password <user_id> password=<password>
```

`salt.modules.grafana4.update_user_permissions` (*userid*, *profile='grafana'*, *\*\*kwargs*)

Update a user password.

**userid** Id of the user.

**isGrafanaAdmin** Whether user is a Grafana admin.

**profile** Configuration profile used to connect to the Grafana instance. Default is `grafana`.

CLI Example:

```
salt '*' grafana4.update_user_permissions <user_id> isGrafanaAdmin=<true|false>
```

### 14.7.134 salt.modules.grains

Return/control aspects of the grains data

`salt.modules.grains.append` (*key*, *val*, *convert=False*, *delimiter=':'*)

New in version 0.17.0.

Append a value to a list in the grains config file. If the grain doesn't exist, the grain key is added and the value is appended to the new grain as a list item.

**key** The grain key to be appended to

**val** The value to append to the grain key

**convert** If `convert` is `True`, convert non-list contents into a list. If `convert` is `False` and the grain contains non-list contents, an error is given. Defaults to `False`.

**delimiter** The key can be a nested dict key. Use this parameter to specify the delimiter you use, instead of the default `:`. You can now append values to a list in nested dictionary grains. If the list doesn't exist at this level, it will be created.

New in version 2014.7.6.

CLI Example:

```
salt '*' grains.append key val
```

`salt.modules.grains.delkey(key)`

New in version 2017.7.0.

Remove a grain completely from the grain system, this will remove the grain key and value  
**key** The grain key from which to delete the value.

CLI Example:

`salt.modules.grains.delval(key, destructive=False)`

New in version 0.17.0.

Delete a grain value from the grains config file. This will just set the grain value to *None*. To completely remove the grain run *grains.delkey* or pass *destructive=True* to *grains.delval*.

**key** The grain key from which to delete the value.

**destructive** Delete the key, too. Defaults to False.

CLI Example:

```
salt '*' grains.delval key
```

`salt.modules.grains.equals(key, value)`

Used to make sure the minion's grain key/value matches.

Returns True if matches otherwise False.

New in version 2017.7.0.

CLI Example:

```
salt '*' grains.equals fqdn <expected_fqdn>
salt '*' grains.equals systemd:version 219
```

`salt.modules.grains.fetch(key, default='', delimiter=':', ordered=True)`

Attempt to retrieve the named value from grains, if the named value is not available return the passed default. The default return is an empty string.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in grains looks like this:

```
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the apache key in the pkg dict this key can be passed:

```
pkg:apache
```

#### Parameters

- **delimiter** -- Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

New in version 2014.7.0.

- **ordered** -- Outputs an ordered dict if applicable (default: True)

New in version 2016.11.0.

CLI Example:

```
salt '*' grains.get pkg:apache
salt '*' grains.get abc::def|ghi delimiter='|'
```

`salt.modules.grains.filter_by`(*lookup\_dict*, *grain*='os\_family', *merge*=None, *default*='default', *base*=None)

New in version 0.17.0.

Look up the given grain in a given dictionary for the current OS and return the result

Although this may occasionally be useful at the CLI, the primary intent of this function is for use in Jinja to make short work of creating lookup tables for OS-specific data. For example:

```
{% set apache = salt['grains.filter_by']({
    'Debian': {'pkg': 'apache2', 'srv': 'apache2'},
    'RedHat': {'pkg': 'httpd', 'srv': 'httpd'},
}, default='Debian') %}

myapache:
  pkg.installed:
    - name: {{ apache.pkg }}
  service.running:
    - name: {{ apache.srv }}
```

Values in the lookup table may be overridden by values in Pillar. An example Pillar to override values in the example above could be as follows:

```
apache:
  lookup:
    pkg: apache_13
    srv: apache
```

The call to `filter_by()` would be modified as follows to reference those Pillar values:

```
{% set apache = salt['grains.filter_by']({
    ...
}, merge=salt['pillar.get']('apache:lookup')) %}
```

### Parameters

- **lookup\_dict** -- A dictionary, keyed by a grain, containing a value or values relevant to systems matching that grain. For example, a key could be the grain for an OS and the value could be the name of a package on that particular OS.

Changed in version 2016.11.0: The dictionary key could be a globbing pattern. The function will return the corresponding `lookup_dict` value where grain value matches the pattern. For example:

```
# this will render 'got some salt' if Minion ID begins from 'salt
→ '
salt '*' grains.filter_by '{salt*: got some salt, default: salt
→ is not here}' id
```

- **grain** -- The name of a grain to match with the current system's grains. For example, the value of the `os_family` grain for the current system could be used to pull values from the `lookup_dict` dictionary.

Changed in version 2016.11.0: The grain value could be a list. The function will return the `lookup_dict` value for a first found item in the list matching one of the `lookup_dict` keys.

- **merge** -- A dictionary to merge with the results of the grain selection from `lookup_dict`. This allows Pillar to override the values in the `lookup_dict`. This could be useful, for example, to override the values for non-standard package names such as when using a different Python version from the default Python version provided by the OS (e.g., `python26-mysql` instead of `python-mysql`).
- **default** -- default `lookup_dict`'s key used if the grain does not exist or if the grain value has no match on `lookup_dict`. If unspecified the value is ```default```.

New in version 2014.1.0.

- **base** -- A `lookup_dict` key to use for a base dictionary. The grain-selected `lookup_dict` is merged over this and then finally the `merge` dictionary is merged. This allows common values for each case to be collected in the base and overridden by the grain selection dictionary and the `merge` dictionary. Default is unset.

New in version 2015.5.0.

CLI Example:

```
salt '*' grains.filter_by '{Debian: Debheads rule, RedHat: I love my hat}'
# this one will render {D: {E: I, G: H}, J: K}
salt '*' grains.filter_by '{A: B, C: {D: {E: F, G: H}}}' 'xxx' '{D: {E: I}, J: K}'
→ 'C'
# next one renders {A: {B: G}, D: J}
salt '*' grains.filter_by '{default: {A: {B: C}, D: E}, F: {A: {B: G}}, H: {D: I}}'
→ 'xxx' '{D: J}' 'F' 'default'
# next same as above when default='H' instead of 'F' renders {A: {B: C}, D: J}
```

`salt.modules.grains.get(key, default='', delimiter=':', ordered=True)`

Attempt to retrieve the named value from grains, if the named value is not available return the passed default. The default return is an empty string.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in grains looks like this:

```
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the `apache` key in the `pkg` dict this key can be passed:

```
pkg:apache
```

#### Parameters

- **delimiter** -- Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

New in version 2014.7.0.

- **ordered** -- Outputs an ordered dict if applicable (default: True)

New in version 2016.11.0.

CLI Example:

```
salt '*' grains.get pkg:apache
salt '*' grains.get abc::def|ghi delimiter='|'
```

`salt.modules.grains.get_or_set_hash`(*name*, *length=8*, *chars='abcdefghijklmnopqrstuvwxyz0123456789!@#%&^&\*(-\_+=)'*)

Perform a one-time generation of a hash and write it to the local grains. If that grain has already been set return the value instead.

This is useful for generating passwords or keys that are specific to a single minion that don't need to be stored somewhere centrally.

State Example:

```
some_mysql_user:
  mysql_user:
    - present
    - host: localhost
    - password: {{ salt['grains.get_or_set_hash']('mysql:some_mysql_user') }}
```

CLI Example:

```
salt '*' grains.get_or_set_hash 'django:SECRET_KEY' 50
```

**Warning:** This function could return strings which may contain characters which are reserved as directives by the YAML parser, such as strings beginning with %. To avoid issues when using the output of this function in an SLS file containing YAML+Jinja, surround the call with single quotes.

`salt.modules.grains.has_value`(*key*)

Determine whether a named value exists in the grains dictionary.

Given a grains dictionary that contains the following structure:

```
{'pkg': {'apache': 'httpd'}}
```

One would determine if the apache key in the pkg dict exists by:

```
pkg:apache
```

CLI Example:

```
salt '*' grains.has_value pkg:apache
```

`salt.modules.grains.item`(*\*args*, *\*\*kwargs*)

Return one or more grains

CLI Example:

```
salt '*' grains.item os
salt '*' grains.item os osrelease oscodename
```

Sanitized CLI Example:

```
salt '*' grains.item host sanitize=True
```

`salt.modules.grains.items`(*sanitize=False*)

Return all of the minion's grains

CLI Example:

```
salt '*' grains.items
```

Sanitized CLI Example:

```
salt '*' grains.items sanitize=True
```

`salt.modules.grains.ls()`

Return a list of all available grains

CLI Example:

```
salt '*' grains.ls
```

`salt.modules.grains.remove(key, val, delimiter=':')`

New in version 0.17.0.

Remove a value from a list in the grains config file

**key** The grain key to remove.

**val** The value to remove.

**delimiter** The key can be a nested dict key. Use this parameter to specify the delimiter you use, instead of the default `:`. You can now append values to a list in nested dictionary grains. If the list doesn't exist at this level, it will be created.

New in version 2015.8.2.

CLI Example:

```
salt '*' grains.remove key val
```

`salt.modules.grains.set(key, val='', force=False, destructive=False, delimiter=':')`

Set a key to an arbitrary value. It is used like setval but works with nested keys.

This function is conservative. It will only overwrite an entry if its value and the given one are not a list or a dict. The force parameter is used to allow overwriting in all cases.

New in version 2015.8.0.

**Parameters**

- **force** -- Force writing over existing entry if given or existing values are list or dict. Defaults to False.
- **destructive** -- If an operation results in a key being removed, delete the key, too. Defaults to False.
- **delimiter** -- Specify an alternate delimiter to use when traversing a nested dict, the default being `:`

CLI Example:

```
salt '*' grains.set 'apps:myApp:port' 2209
salt '*' grains.set 'apps:myApp' '{port: 2209}'
```

`salt.modules.grains.setval(key, val, destructive=False)`

Set a grains value in the grains config file

**key** The grain key to be set.

**val** The value to set the grain key to.

**destructive** If an operation results in a key being removed, delete the key, too. Defaults to False.

CLI Example:

```
salt '*' grains.setval key val
salt '*' grains.setval key '{"sub-key': 'val', 'sub-key2': 'val2}'"
```

`salt.modules.grains.setvals` (*grains*, *destructive=False*)

Set new grains values in the grains config file

**destructive** If an operation results in a key being removed, delete the key, too. Defaults to False.

CLI Example:

```
salt '*' grains.setvals '{"key1': 'val1', 'key2': 'val2'}"
```

### 14.7.135 salt.modules.groupadd

Manage groups on Linux, OpenBSD and NetBSD

---

**Important:** If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to `'group.info' is not available`), see [here](#).

---

`salt.modules.groupadd.add` (*name*, *gid=None*, *system=False*, *root=None*)

Add the specified group

CLI Example:

```
salt '*' group.add foo 3456
```

`salt.modules.groupadd.adduser` (*name*, *username*, *root=None*)

Add a user in the group.

CLI Example:

```
salt '*' group.adduser foo bar
```

Verifies if a valid username `'bar'` as a member of an existing group `'foo'`, if not then adds it.

`salt.modules.groupadd.chgid` (*name*, *gid*, *root=None*)

Change the gid for a named group

CLI Example:

```
salt '*' group.chgid foo 4376
```

`salt.modules.groupadd.delete` (*name*, *root=None*)

Remove the named group

CLI Example:

```
salt '*' group.delete foo
```

`salt.modules.groupadd.deluser` (*name*, *username*, *root=None*)

Remove a user from the group.

CLI Example:

```
salt '*' group.deluser foo bar
```

Removes a member user `'bar'` from a group `'foo'`. If group is not present then returns True.

`salt.modules.groupadd.getent` (*refresh=False*)

Return info on all groups

CLI Example:

```
salt '*' group.getent
```

`salt.modules.groupadd.info(name)`

Return information about a group

CLI Example:

```
salt '*' group.info foo
```

`salt.modules.groupadd.members(name, members_list, root=None)`

Replaces members of the group with a provided list.

CLI Example:

```
salt '*' group.members foo `user1,user2,user3,...`
```

Replaces a membership list for a local group `'foo'`. `foo:x:1234:user1,user2,user3,...`

### 14.7.136 salt.modules.grub\_legacy

Support for GRUB Legacy

`salt.modules.grub_legacy.conf()`

Parse GRUB conf file

CLI Example:

```
salt '*' grub.conf
```

`salt.modules.grub_legacy.version()`

Return server version from grub --version

CLI Example:

```
salt '*' grub.version
```

### 14.7.137 salt.modules.guestfs

Interact with virtual machine images via libguestfs

**depends**

- libguestfs

`salt.modules.guestfs.mount(location, access='rw', root=None)`

Mount an image

CLI Example:

```
salt '*' guest.mount /srv/images/fedora.qcow
```

### 14.7.138 salt.modules.hadoop

Support for hadoop

**maintainer** Yann Jouanin <yann.jouanin@intelunix.fr>

**maturity** new

**depends**

**platform** linux

`salt.modules.hadoop.dfs`(*command=None, \*args*)

Execute a command on DFS

CLI Example:

```
salt '*' hadoop.dfs ls /
```

`salt.modules.hadoop.dfs_absent`(*path*)

Check if a file or directory is absent on the distributed FS.

CLI Example:

```
salt '*' hadoop.dfs_absent /some_random_file
```

Returns True if the file is absent

`salt.modules.hadoop.dfs_present`(*path*)

Check if a file or directory is present on the distributed FS.

CLI Example:

```
salt '*' hadoop.dfs_present /some_random_file
```

Returns True if the file is present

`salt.modules.hadoop.namenode_format`(*force=None*)

Format a name node

```
salt '*' hadoop.namenode_format force=True
```

`salt.modules.hadoop.version`()

Return version from hadoop version

CLI Example:

```
salt '*' hadoop.version
```

### 14.7.139 salt.modules.haproxyconn

Support for haproxy

New in version 2014.7.0.

`salt.modules.haproxyconn.disable_server`(*name, backend, socket='/var/run/haproxy.sock'*)

Disable server in haproxy.

**name** Server to disable

**backend** haproxy backend, or all backends if ``\*`` is supplied

**socket** haproxy stats socket

CLI Example:

```
salt '*' haproxy.disable_server db1.example.com mysql
```

`salt.modules.haproxyconn.enable_server`(*name, backend, socket='/var/run/haproxy.sock'*)

Enable Server in haproxy

**name** Server to enable

**backend** haproxy backend, or all backends if ``\*`` is supplied  
**socket** haproxy stats socket  
 CLI Example:

```
salt '*' haproxy.enable_server web1.example.com www
```

`salt.modules.haproxyconn.get_sessions`(*name*, *backend*, *socket*='/var/run/haproxy.sock')

New in version 2016.11.0.

Get number of current sessions on server in backend (scur)

**name** Server name  
**backend** haproxy backend  
**socket** haproxy stats socket  
 CLI Example:

```
salt '*' haproxy.get_sessions web1.example.com www
```

`salt.modules.haproxyconn.get_weight`(*name*, *backend*, *socket*='/var/run/haproxy.sock')

Get server weight

**name** Server name  
**backend** haproxy backend  
**socket** haproxy stats socket  
 CLI Example:

```
salt '*' haproxy.get_weight web1.example.com www
```

`salt.modules.haproxyconn.list_servers`(*backend*, *socket*='/var/run/haproxy.sock', *objectify*=False)

List servers in haproxy backend.

**backend** haproxy backend  
**socket** haproxy stats socket  
 CLI Example:

```
salt '*' haproxy.list_servers mysql
```

`salt.modules.haproxyconn.set_state`(*name*, *backend*, *state*, *socket*='/var/run/haproxy.sock')

Force a server's administrative state to a new state. This can be useful to disable load balancing and/or any traffic to a server. Setting the state to ``ready`` puts the server in normal mode, and the command is the equivalent of the ``enable server`` command. Setting the state to ``maint`` disables any traffic to the server as well as any health checks. This is the equivalent of the ``disable server`` command. Setting the mode to ``drain`` only removes the server from load balancing but still allows it to be checked and to accept new persistent connections. Changes are propagated to tracking servers if any.

**name** Server name  
**backend** haproxy backend  
**state** A string of the state to set. Must be ``ready``, ``drain``, or ``maint``  
 CLI Example:

```
salt '*' haproxy.set_state my_proxy_server my_backend ready
```

`salt.modules.haproxyconn.set_weight`(*name*, *backend*, *weight*=0, *socket*='/var/run/haproxy.sock')

Set server weight  
**name** Server name  
**backend** haproxy backend  
**weight** Server Weight  
**socket** haproxy stats socket

CLI Example:

```
salt '*' haproxy.set_weight web1.example.com www 13
```

`salt.modules.haproxyconn.show_backends` (*socket*='/var/run/haproxy.sock')

Show HaProxy Backends

**socket** haproxy stats socket

CLI Example:

```
salt '*' haproxy.show_backends
```

`salt.modules.haproxyconn.show_frontends` (*socket*='/var/run/haproxy.sock')

Show HaProxy frontends

**socket** haproxy stats socket

CLI Example:

```
salt '*' haproxy.show_frontends
```

### 14.7.140 salt.modules.hashutil

A collection of hashing and encoding functions

`salt.modules.hashutil.base64_b64decode` (*instr*)

Decode a base64-encoded string using the ``modern" Python interface

New in version 2016.3.0.

CLI Example:

```
salt '*' hashutil.base64_b64decode 'Z2V0IHNhbHRlZA=='
```

`salt.modules.hashutil.base64_b64encode` (*instr*)

Encode a string as base64 using the ``modern" Python interface.

Among other possible differences, the ``modern" encoder does not include newline (`n') characters in the encoded output.

New in version 2016.3.0.

CLI Example:

```
salt '*' hashutil.base64_b64encode 'get salted'
```

`salt.modules.hashutil.base64_decodefile` (*instr*, *outfile*)

Decode a base64-encoded string and write the result to a file

New in version 2016.3.0.

CLI Example:

```
salt '*' hashutil.base64_decodefile instr='Z2V0IHNhbHRlZAo=' outfile='/path/to/
↳binary_file'
```

`salt.modules.hashutil.base64_decodestring` (*instr*)

Decode a base64-encoded string using the ``legacy" Python interface

New in version 2014.7.0.

CLI Example:

```
salt '*' hashutil.base64_decodestring instr='Z2V0IHNhbHRlZAo='
```

`salt.modules.hashutil.base64_encodefile` (*fname*)

Read a file from the file system and return as a base64 encoded string

New in version 2016.3.0.

Pillar example:

```
path:
  to:
    data: |
      {{ salt.hashutil.base64_encodefile('/path/to/binary_file') | indent(6) }}
```

The `file.decode` state function can be used to decode this data and write it to disk.

CLI Example:

```
salt '*' hashutil.base64_encodefile /path/to/binary_file
```

`salt.modules.hashutil.base64_encodestring` (*instr*)

Encode a string as base64 using the ``legacy`` Python interface.

Among other possible differences, the ``legacy`` encoder includes a newline (`n`) character after every 76 characters and always at the end of the encoded string.

New in version 2014.7.0.

CLI Example:

```
salt '*' hashutil.base64_encodestring 'get salted'
```

`salt.modules.hashutil.digest` (*instr*, *checksum='md5'*)

Return a checksum digest for a string

**instr** A string

**checksum** [md5] The hashing algorithm to use to generate checksums. Valid options: md5, sha256, sha512.

CLI Example:

```
salt '*' hashutil.digest 'get salted'
```

`salt.modules.hashutil.digest_file` (*infile*, *checksum='md5'*)

Return a checksum digest for a file

**infile** A file path

**checksum** [md5] The hashing algorithm to use to generate checksums. Wraps the `hashutil.digest` execution function.

CLI Example:

```
salt '*' hashutil.digest_file /path/to/file
```

`salt.modules.hashutil.github_signature` (*string*, *shared\_secret*, *challenge\_hmac*)

Verify a challenging hmac signature against a string / shared-secret for github webhooks.

New in version 2017.7.0.

Returns a boolean if the verification succeeded or failed.

CLI Example:

```
salt '*' hashutil.github_signature '{"ref":...}' 'shared secret'
↪ 'sha1=bc6550fc290acf5b42283fa8deaf55cea0f8c206'
```

`salt.modules.hashutil.hmac_signature`(*string, shared\_secret, challenge\_hmac*)

Verify a challenging hmac signature against a string / shared-secret

New in version 2014.7.0.

Returns a boolean if the verification succeeded or failed.

CLI Example:

```
salt '*' hashutil.hmac_signature 'get salted' 'shared secret'  
↪ 'eBwf9bstXg+NiP5A0wppB5HMvZiYMPzEM9W5YmM/AmQ='
```

`salt.modules.hashutil.md5_digest`(*instr*)

Generate an md5 hash of a given string

New in version 2014.7.0.

CLI Example:

```
salt '*' hashutil.md5_digest 'get salted'
```

`salt.modules.hashutil.sha256_digest`(*instr*)

Generate an sha256 hash of a given string

New in version 2014.7.0.

CLI Example:

```
salt '*' hashutil.sha256_digest 'get salted'
```

`salt.modules.hashutil.sha512_digest`(*instr*)

Generate an sha512 hash of a given string

New in version 2014.7.0.

CLI Example:

```
salt '*' hashutil.sha512_digest 'get salted'
```

### 14.7.141 salt.modules.heat module

Module for handling OpenStack Heat calls

New in version 2017.7.0.

#### depends

- heatclient Python module

**configuration** This module is not usable until the user, password, tenant, and auth URL are specified either in a pillar or in the minion's config file. For example:

```
keystone.user: admin  
keystone.password: verybadpass  
keystone.tenant: admin  
keystone.insecure: False  #(optional)  
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'  
 # Optional  
keystone.region_name: 'RegionOne'
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

```
openstack1:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'

openstack2:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/'
```

With this configuration in place, any of the heat functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' heat.flavor_list profile=openstack1
```

**salt.modules.heat.create\_stack**(*name=None, template\_file=None, enviroment=None, parameters=None, poll=0, rollback=False, timeout=60, profile=None*)

Create a stack (heat stack-create)

**name** Name of the new stack

**template\_file** File of template

**enviroment** File of enviroment

**parameters** Parameter dict used to create the stack

**poll** Poll and report events until stack complete

**rollback** Enable rollback on create failure

**timeout** Stack creation timeout in minutes

**profile** Profile to build on

CLI Example:

```
salt '*' heat.create_stack name=mystack \
  template_file=salt://template.yaml \
  enviroment=salt://enviroment.yaml \
  parameters="{\"image\": \"Debian 8\", \"flavor\": \"m1.small\"}" \
  poll=5 rollback=False timeout=60 profile=openstack1
```

**salt.modules.heat.delete\_stack**(*name=None, poll=0, timeout=60, profile=None*)

Delete a stack (heat stack-delete)

**name** Name of the stack

**poll** Poll and report events until stack complete

**timeout** Stack creation timeout in minute

**profile** Profile to use

CLI Examples:

```
salt '*' heat.delete_stack name=mystack poll=5 \
  profile=openstack1
```

**salt.modules.heat.list\_stack**(*profile=None*)

Return a list of available stack (heat stack-list)

**profile** Profile to use

CLI Example:

```
salt '*' heat.list_stack profile=openstack1
```

`salt.modules.heat.show_stack`(*name=None, profile=None*)

Return details about a specific stack (heat stack-show)

**name** Name of the stack

**profile** Profile to use

CLI Example:

```
salt '*' heat.show_stack name=mystack profile=openstack1
```

`salt.modules.heat.template_stack`(*name=None, profile=None*)

Return template a specific stack (heat stack-template)

**name** Name of the stack

**profile** Profile to use

CLI Example:

```
salt '*' heat.template_stack name=mystack profile=openstack1
```

`salt.modules.heat.update_stack`(*name=None, template\_file=None, enviroment=None, parameters=None, poll=0, rollback=False, timeout=60, profile=None*)

Update a stack (heat stack-template)

**name** Name of the stack

**template\_file** File of template

**enviroment** File of enviroment

**parameters** Parameter dict used to update the stack

**poll** Poll and report events until stack complete

**rollback** Enable rollback on update failure

**timeout** Stack creation timeout in minutes

**profile** Profile to build on

CLI Example:

```
salt '*' heat.update_stack name=mystack \  
  template_file=salt://template.yaml \  
  enviroment=salt://enviroment.yaml \  
  parameters="{\"image\": \"Debian 8\", \"flavor\": \"m1.small\"}" \  
  poll=5 rollback=False timeout=60 profile=openstack1
```

#### 14.7.142 salt.modules.hg

Support for the Mercurial SCM

`salt.modules.hg.archive`(*cwd, output, rev='tip', fmt=None, prefix=None, user=None*)

Export a tarball from the repository

**cwd** The path to the Mercurial repository

**output** The path to the archive tarball

**rev: tip** The revision to create an archive from

**fmt: None** Format of the resulting archive. Mercurial supports: tar, tbz2, tgz, zip, uzip, and files formats.

**prefix** [None] Prepend <prefix>/ to every filename in the archive

**user** [None] Run hg as a user other than what the minion runs as

If prefix is not specified it defaults to the basename of the repo directory.

CLI Example:

```
salt '*' hg.archive /path/to/repo output=/tmp/archive.tgz fmt=tgz
```

`salt.modules.hg.clone`(*cwd, repository, opts=None, user=None, identity=None*)

Clone a new repository

**cwd** The path to the Mercurial repository  
**repository** The hg URI of the repository  
**opts** [None] Any additional options to add to the command line  
**user** [None] Run hg as a user other than what the minion runs as  
**identity** [None] Private SSH key on the minion server for authentication (ssh://)

New in version 2015.5.0.

CLI Example:

```
salt '*' hg.clone /path/to/repo https://bitbucket.org/birkenfeld/sphinx
```

**salt.modules.hg.describe** (*cwd, rev='tip', user=None*)

Mimic git describe and return an identifier for the given revision

**cwd** The path to the Mercurial repository  
**rev: tip** The path to the archive tarball  
**user** [None] Run hg as a user other than what the minion runs as  
 CLI Example:

```
salt '*' hg.describe /path/to/repo
```

**salt.modules.hg.pull** (*cwd, opts=None, user=None, identity=None, repository=None*)

Perform a pull on the given repository

**cwd** The path to the Mercurial repository  
**repository** [None] Perform pull from the repository different from .hg/hgrc:[paths]:default  
**opts** [None] Any additional options to add to the command line  
**user** [None] Run hg as a user other than what the minion runs as  
**identity** [None] Private SSH key on the minion server for authentication (ssh://)

New in version 2015.5.0.

CLI Example:

```
salt '*' hg.pull /path/to/repo opts=-u
```

**salt.modules.hg.revision** (*cwd, rev='tip', short=False, user=None*)

Returns the long hash of a given identifier (hash, branch, tag, HEAD, etc)

**cwd** The path to the Mercurial repository  
**rev: tip** The revision  
**short: False** Return an abbreviated commit hash  
**user** [None] Run hg as a user other than what the minion runs as  
 CLI Example:

```
salt '*' hg.revision /path/to/repo mybranch
```

**salt.modules.hg.status** (*cwd, opts=None, user=None*)

Show changed files of the given repository

**cwd** The path to the Mercurial repository  
**opts** [None] Any additional options to add to the command line  
**user** [None] Run hg as a user other than what the minion runs as  
 CLI Example:

```
salt '*' hg.status /path/to/repo
```

**salt.modules.hg.update** (*cwd, rev, force=False, user=None*)

Update to a given revision

**cwd** The path to the Mercurial repository  
**rev** The revision to update to

**force** [False] Force an update  
**user** [None] Run hg as a user other than what the minion runs as  
CLI Example:

```
salt devserver1 hg.update /path/to/repo somebranch
```

### 14.7.143 salt.modules.hipchat

Module for sending messages to hipchat.

New in version 2015.5.0.

**configuration** This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

It is possible to use a different API than <http://api.hipchat.com>, by specifying the API URL in config as `api_url`, or by passing the value directly.

For example:

```
hipchat:  
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15  
  api_version: v1
```

Custom API Example:

```
hipchat:  
  api_url: http://api.hipchat.myteam.com  
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15  
  api_version: v2
```

`salt.modules.hipchat.find_room`(*name*, *api\_url=None*, *api\_key=None*, *api\_version=None*)

Find a room by name and return it.

**Parameters**

- **name** -- The room name.
- **api\_url** -- The HipChat API URL, if not specified in the configuration.
- **api\_key** -- The HipChat admin api key.
- **api\_version** -- The HipChat api version, if not specified in the configuration.

**Returns** The room object.

CLI Example:

```
salt '*' hipchat.find_room name="Development Room"  
  
salt '*' hipchat.find_room name="Development Room" api_  
↪key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15 api_version=v1
```

`salt.modules.hipchat.find_user`(*name*, *api\_url=None*, *api\_key=None*, *api\_version=None*)

Find a user by name and return it.

**Parameters**

- **name** -- The user name.
- **api\_url** -- The HipChat API URL, if not specified in the configuration.
- **api\_key** -- The HipChat admin api key.

- **api\_version** -- The HipChat api version, if not specified in the configuration.

**Returns** The user object.

CLI Example:

```
salt '*' hipchat.find_user name="Thomas Hatch"

salt '*' hipchat.find_user name="Thomas Hatch" api_
↳key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15 api_version=v1
```

`salt.modules.hipchat.list_rooms` (*api\_url=None, api\_key=None, api\_version=None*)

List all HipChat rooms.

**Parameters**

- **api\_url** -- The HipChat API URL, if not specified in the configuration.
- **api\_key** -- The HipChat admin api key.
- **api\_version** -- The HipChat api version, if not specified in the configuration.

**Returns** The room list.

CLI Example:

```
salt '*' hipchat.list_rooms

salt '*' hipchat.list_rooms api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15 api_
↳version=v1
```

`salt.modules.hipchat.list_users` (*api\_url=None, api\_key=None, api\_version=None*)

List all HipChat users.

**Parameters**

- **api\_url** -- The HipChat API URL, if not specified in the configuration.
- **api\_key** -- The HipChat admin api key.
- **api\_version** -- The HipChat api version, if not specified in the configuration.

**Returns** The user list.

CLI Example:

```
salt '*' hipchat.list_users

salt '*' hipchat.list_users api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15 api_
↳version=v1
```

`salt.modules.hipchat.send_message` (*room\_id, message, from\_name, api\_url=None, api\_key=None, api\_version=None, color='yellow', notify=False*)

Send a message to a HipChat room.

**Parameters**

- **room\_id** -- The room id or room name, either will work.
- **message** -- The message to send to the HipChat room.
- **from\_name** -- Specify who the message is from.
- **api\_url** -- The HipChat api URL, if not specified in the configuration.
- **api\_key** -- The HipChat api key, if not specified in the configuration.
- **api\_version** -- The HipChat api version, if not specified in the configuration.

- **color** -- The color for the message, default: yellow.
- **notify** -- Whether to notify the room, default: False.

**Returns** Boolean if message was sent successfully.

CLI Example:

```
salt '*' hipchat.send_message room_id="Development Room" message="Build is done"
↳from_name="Build Server"

salt '*' hipchat.send_message room_id="Development Room" message="Build failed"
↳from_name="Build Server" color="red" notify=True
```

#### 14.7.144 salt.modules.hosts

Manage the information in the hosts file

**salt.modules.hosts.add\_host**(*ip, alias*)

Add a host to an existing entry, if the entry is not in place then create it with the given host

CLI Example:

```
salt '*' hosts.add_host <ip> <alias>
```

**salt.modules.hosts.get\_alias**(*ip*)

Return the list of aliases associated with an ip

Aliases (host names) are returned in the order in which they appear in the hosts file. If there are no aliases associated with the IP, an empty list is returned.

CLI Example:

```
salt '*' hosts.get_alias <ip addr>
```

**salt.modules.hosts.get\_ip**(*host*)

Return the ip associated with the named host

CLI Example:

```
salt '*' hosts.get_ip <hostname>
```

**salt.modules.hosts.has\_pair**(*ip, alias*)

Return true if the alias is set

CLI Example:

```
salt '*' hosts.has_pair <ip> <alias>
```

**salt.modules.hosts.list\_hosts**()

Return the hosts found in the hosts file in this format:

```
{'<ip addr>': ['alias1', 'alias2', ...]}
```

CLI Example:

```
salt '*' hosts.list_hosts
```

`salt.modules.hosts.rm_host` (*ip, alias*)

Remove a host entry from the hosts file

CLI Example:

```
salt '*' hosts.rm_host <ip> <alias>
```

`salt.modules.hosts.set_host` (*ip, alias*)

Set the host entry in the hosts file for the given ip, this will overwrite any previous entry for the given ip

Changed in version 2016.3.0: If `alias` does not include any host names (it is the empty string or contains only whitespace), all entries for the given IP address are removed.

CLI Example:

```
salt '*' hosts.set_host <ip> <alias>
```

### 14.7.145 salt.modules.htpasswd

Support for htpasswd command. Requires the apache2-utils package for Debian-based distros.

New in version 2014.1.0.

The functions here will load inside the webutil module. This allows other functions that don't use htpasswd to use the webutil module name.

`salt.modules.htpasswd.useradd` (*pwfile, user, password, opts='', runas=None*)

Add a user to htpasswd file using the htpasswd command. If the htpasswd file does not exist, it will be created.

**pwfile** Path to htpasswd file

**user** User name

**password** User password

**opts** Valid options that can be passed are:

- *n* Don't update file; display results on stdout.
- *m* Force MD5 encryption of the password (default).
- *d* Force CRYPT encryption of the password.
- *p* Do not encrypt the password (plaintext).
- *s* Force SHA encryption of the password.

**runas** The system user to run htpasswd command with

CLI Examples:

```
salt '*' webutil.useradd /etc/httpd/htpasswd larry badpassword
salt '*' webutil.useradd /etc/httpd/htpasswd larry badpass opts=ns
```

`salt.modules.htpasswd.userdel` (*pwfile, user, runas=None, all\_results=False*)

Delete a user from the specified htpasswd file.

**pwfile** Path to htpasswd file

**user** User name

**runas** The system user to run htpasswd command with

**all\_results** Return stdout, stderr, and retcode, not just stdout

CLI Examples:

```
salt '*' webutil.userdel /etc/httpd/htpasswd larry
```

`salt.modules.htpasswd.verify` (*pwfile, user, password, opts='', runas=None*)  
Return True if the htpasswd file exists, the user has an entry, and their password matches.

**pwfile** Fully qualified path to htpasswd file

**user** User name

**password** User password

**opts** Valid options that can be passed are:

- *m* Force MD5 encryption of the password (default).
- *d* Force CRYPT encryption of the password.
- *p* Do not encrypt the password (plaintext).
- *s* Force SHA encryption of the password.

**runas** The system user to run htpasswd command with

CLI Examples:

```
salt '*' webutil.verify /etc/httpd/htpasswd larry maybepassword
salt '*' webutil.verify /etc/httpd/htpasswd larry maybepassword opts=ns
```

### 14.7.146 salt.modules.http

Module for making various web calls. Primarily designed for webhooks and the like, but also useful for basic http testing.

New in version 2015.5.0.

`salt.modules.http.query` (*url, \*\*kwargs*)

Query a resource, and decode the return data

New in version 2015.5.0.

CLI Example:

```
salt '*' http.query http://somelink.com/
salt '*' http.query http://somelink.com/ method=POST           params='key1=val1&
↳key2=val2'
salt '*' http.query http://somelink.com/ method=POST           data='<xml>
↳somecontent</xml>'
```

`salt.modules.http.update_ca_bundle` (*target=None, source=None, merge\_files=None*)

Update the local CA bundle file from a URL

New in version 2015.5.0.

CLI Example:

```
salt '*' http.update_ca_bundle
salt '*' http.update_ca_bundle target=/path/to/cacerts.pem
salt '*' http.update_ca_bundle source=https://example.com/cacerts.pem
```

If the `target` is not specified, it will be pulled from the `ca_cert` configuration variable available to the minion. If it cannot be found there, it will be placed at `<<FILE_ROOTS>>/cacerts.pem`.

If the `source` is not specified, it will be pulled from the `ca_cert_url` configuration variable available to the minion. If it cannot be found, it will be downloaded from the cURL website, using an http (not https) URL. USING THE DEFAULT URL SHOULD BE AVOIDED!

`merge_files` may also be specified, which includes a string or list of strings representing a file or files to be appended to the end of the CA bundle, once it is downloaded.

CLI Example:

```
salt '*' http.update_ca_bundle merge_files=/path/to/mycert.pem
```

`salt.modules.http.wait_for_successful_query` (*url*, *wait\_for=300*, *\*\*kwargs*)  
Query a resource until a successful response, and decode the return data

CLI Example:

```
salt '*' http.wait_for_successful_query http://somelink.com/ wait_for=160
```

#### 14.7.147 salt.modules.ifttt

Support for IFTTT

New in version 2015.8.0.

Requires an `api_key` in `/etc/salt/minion`:

`salt.modules.ifttt.trigger_event` (*event=None*, *\*\*kwargs*)  
Trigger a configured event in IFTTT.

**Parameters** `event` -- The name of the event to trigger.

**Returns** A dictionary with status, text, and error if result was failure.

#### 14.7.148 salt.modules.ilo

Manage HP ILO

**depends** `hponcfg` (SmartStart Scripting Toolkit Linux Edition)

`salt.modules.ilo.change_password` (*username*, *password*)  
Reset a users password

CLI Example:

```
salt '*' ilo.change_password damianMyerscough
```

`salt.modules.ilo.change_username` (*old\_username*, *new\_username*)  
Change a username

CLI Example:

```
salt '*' ilo.change_username damian diana
```

`salt.modules.ilo.configure_network` (*ip*, *netmask*, *gateway*)  
Configure Network Interface

CLI Example:

```
salt '*' ilo.configure_network [IP ADDRESS] [NETMASK] [GATEWAY]
```

`salt.modules.ilo.configure_snmp` (*community*, *snmp\_port=161*, *snmp\_trapport=161*)  
Configure SNMP

CLI Example:

```
salt '*' ilo.configure_snmp [COMMUNITY STRING] [SNMP PORT] [SNMP TRAP PORT]
```

`salt.modules.ilo.create_user` (*name*, *password*, *\*privileges*)

Create user

CLI Example:

```
salt '*' ilo.create_user damian secretagent VIRTUAL_MEDIA_PRIV
```

If no permissions are specify the user will only have a read-only account.

Supported privileges:

- ADMIN\_PRIV Enables the user to administer user accounts.
- REMOTE\_CONS\_PRIV Enables the user to access the Remote Console functionality.
- RESET\_SERVER\_PRIV Enables the user to remotely manipulate the server power setting.
- VIRTUAL\_MEDIA\_PRIV Enables the user permission to access the virtual media functionality.
- CONFIG\_ILO\_PRIV Enables the user to configure iLO settings.

`salt.modules.ilo.delete_ssh_key` (*username*)

Delete a users SSH key from the ILO

CLI Example:

```
salt '*' ilo.delete_user_sshkey damian
```

`salt.modules.ilo.delete_user` (*username*)

Delete a user

CLI Example:

```
salt '*' ilo.delete_user damian
```

`salt.modules.ilo.disable_dhcp`()

Disable DHCP

CLI Example:

```
salt '*' ilo.disable_dhcp
```

`salt.modules.ilo.disable_ssh`()

Disable the SSH daemon

CLI Example:

```
salt '*' ilo.disable_ssh
```

`salt.modules.ilo.enable_dhcp`()

Enable DHCP

CLI Example:

```
salt '*' ilo.enable_dhcp
```

`salt.modules.ilo.enable_ssh`()

Enable the SSH daemon

CLI Example:

```
salt '*' ilo.enable_ssh
```

`salt.modules.ilo.get_user` (*username*)

Returns local user information, excluding the password

CLI Example:

```
salt '*' ilo.get_user damian
```

`salt.modules.ilo.global_settings()`

Show global settings

CLI Example:

```
salt '*' ilo.global_settings
```

`salt.modules.ilo.list_users()`

List all users

CLI Example:

```
salt '*' ilo.list_users
```

`salt.modules.ilo.list_users_info()`

List all users in detail

CLI Example:

```
salt '*' ilo.list_users_info
```

`salt.modules.ilo.network()`

Grab the current network settings

CLI Example:

```
salt '*' ilo.network
```

`salt.modules.ilo.set_http_port(port=80)`

Configure the port HTTP should listen on

CLI Example:

```
salt '*' ilo.set_http_port 8080
```

`salt.modules.ilo.set_https_port(port=443)`

Configure the port HTTPS should listen on

CLI Example:

```
salt '*' ilo.set_https_port 4334
```

`salt.modules.ilo.set_ssh_key(public_key)`

Configure SSH public keys for specific users

CLI Example:

```
salt '*' ilo.set_ssh_key "ssh-dss AAAAB3NzaC1kc3MAAACBA... damian"
```

The SSH public key needs to be DSA and the last argument in the key needs to be the username (case-sensitive) of the ILO username.

`salt.modules.ilo.set_ssh_port(port=22)`

Enable SSH on a user defined port

CLI Example:

```
salt '*' ilo.set_ssh_port 2222
```

### 14.7.149 salt.modules.icinga2 module

Module to provide icinga2 compatibility to salt.

New in version 2017.7.0.

#### depends

- icinga2 server

**salt.modules.icinga2.generate\_cert**(*domain*)

Generate an icinga2 client certificate and key.

**Returns::** icinga2 pki new-cert --cn domain.tld --key /etc/icinga2/pki/domain.tld.key --cert /etc/icinga2/pki/domain.tld.crt

CLI Example:

```
salt '*' icinga2.generate_cert domain.tld
```

**salt.modules.icinga2.generate\_ticket**(*domain*)

Generate and save an icinga2 ticket.

**Returns::** icinga2 pki ticket --cn domain.tld

CLI Example:

```
salt '*' icinga2.generate_ticket domain.tld
```

**salt.modules.icinga2.node\_setup**(*domain, master, ticket*)

Setup the icinga2 node.

**Returns::** icinga2 node setup --ticket TICKET\_ID --endpoint master.domain.tld --zone domain.tld --master\_host master.domain.tld --trustedcert /etc/icinga2/pki/trusted-master.crt

CLI Example:

```
salt '*' icinga2.node_setup domain.tld master.domain.tld TICKET_ID
```

**salt.modules.icinga2.request\_cert**(*domain, master, ticket, port*)

Request CA cert from master icinga2 node.

**Returns::** icinga2 pki request --host master.domain.tld --port 5665 --ticket TICKET\_ID --key /etc/icinga2/pki/domain.tld.key --cert /etc/icinga2/pki/domain.tld.crt --trustedcert /etc/icinga2/pki/trusted-master.crt --ca /etc/icinga2/pki/ca.crt

CLI Example:

```
salt '*' icinga2.request_cert domain.tld master.domain.tld TICKET_ID
```

**salt.modules.icinga2.save\_cert**(*domain, master*)

Save the certificate for master icinga2 node.

**Returns::** icinga2 pki save-cert --key /etc/icinga2/pki/domain.tld.key --cert /etc/icinga2/pki/domain.tld.crt --trustedcert /etc/icinga2/pki/trusted-master.crt --host master.domain.tld

CLI Example:

```
salt '*' icinga2.save_cert domain.tld master.domain.tld
```

### 14.7.150 salt.modules.incron

Work with incron

`salt.modules.incron.list_tab(user)`  
Return the contents of the specified user's inrontab

CLI Example:

```
salt '*' incron.list_tab root
```

`salt.modules.incron.ls(user)`  
This function is an alias of `list_tab`.  
Return the contents of the specified user's inrontab

CLI Example:

```
salt '*' incron.list_tab root
```

`salt.modules.incron.raw_incron(user)`  
Return the contents of the user's inrontab

CLI Example:

```
salt '*' incron.raw_incron root
```

`salt.modules.incron.raw_system_incron()`  
Return the contents of the system wide inrontab

CLI Example:

```
salt '*' incron.raw_system_incron
```

`salt.modules.incron.rm(user, path, mask, cmd)`  
This function is an alias of `rm_job`.  
Remove a incron job for a specified user. If any of the day/time params are specified, the job will only be removed if the specified params match.

CLI Example:

```
salt '*' incron.rm_job root /path
```

`salt.modules.incron.rm_job(user, path, mask, cmd)`  
Remove a incron job for a specified user. If any of the day/time params are specified, the job will only be removed if the specified params match.

CLI Example:

```
salt '*' incron.rm_job root /path
```

`salt.modules.incron.set_job(user, path, mask, cmd)`  
Sets an incron job up for a specified user.

CLI Example:

```
salt '*' incron.set_job root '/root' 'IN_MODIFY' 'echo "$$ $@ $# $% $&"'
```

`salt.modules.incron.write_incron_file(user, path)`  
Writes the contents of a file to a user's inrontab

CLI Example:

```
salt '*' incron.write_incron_file root /tmp/new_incron
```

`salt.modules.incron.write_incron_file_verbose`(*user, path*)

Writes the contents of a file to a user's incrontab and return error message on error

CLI Example:

```
salt '*' incron.write_incron_file_verbose root /tmp/new_incron
```

### 14.7.151 salt.modules.influx

InfluxDB - A distributed time series database

Module to provide InfluxDB compatibility to Salt (compatible with InfluxDB version 0.9+)

**depends**

- influxdb Python module (>= 3.0.0)

**configuration** This module accepts connection configuration details either as parameters or as configuration settings in `/etc/salt/minion` on the relevant minions:

```
influxdb.host: 'localhost'
influxdb.port: 8086
influxdb.user: 'root'
influxdb.password: 'root'
```

This data can also be passed into pillar. Options passed into `opts` will overwrite options passed into pillar.

Most functions in this module allow you to override or provide some or all of these settings via keyword arguments:

```
salt '*' influxdb.foo_function user='influxadmin' password='s3cr1t'
```

would override user and password while still using the defaults for host and port.

`salt.modules.influx.alter_retention_policy`(*database, name, duration, replication, default=False, \*\*client\_args*)

Modify an existing retention policy.

**name** Name of the retention policy to modify.

**database** Name of the database for which the retention policy was defined.

**duration** New duration of given retention policy.

Durations such as 1h, 90m, 12h, 7d, and 4w, are all supported and mean 1 hour, 90 minutes, 12 hours, 7 day, and 4 weeks, respectively. For infinite retention – meaning the data will never be deleted – use `'INF'` for duration. The minimum retention period is 1 hour.

**replication** New replication of given retention policy.

This determines how many independent copies of each data point are stored in a cluster.

**default** [False] Whether or not to set the modified policy as default.

CLI Example:

```
salt '*' influxdb.alter_retention_policy metrics default 1d 1
```

`salt.modules.influx.continuous_query_exists`(*database, name, \*\*client\_args*)

Check if continuous query with given name exists on the database.

**database** Name of the database for which the continuous query was defined.

**name** Name of the continuous query to check.

CLI Example:

```
salt '*' influxdb.continuous_query_exists metrics default
```

`salt.modules.influx.create_continuous_query`(*database*, *name*, *query*, *resample\_time*=None, *coverage\_period*=None, *\*\*client\_args*)

Create a continuous query.

**database** Name of the database for which the continuous query will be created on.

**name** Name of the continuous query to create.

**query** The continuous query string.

**resample\_time** [None] Duration between continuous query resampling.

**coverage\_period** [None] Duration specifying time period per sample.

CLI Example:

```
salt '*' influxdb.create_continuous_query mydb cq_month 'SELECT mean(*) INTO mydb.
↳ a_month.:MEASUREMENT FROM mydb.a_week./.* / GROUP BY time(5m), *'
```

`salt.modules.influx.create_db`(*name*, *\*\*client\_args*)

Create a database.

**name** Name of the database to create.

CLI Example:

```
salt '*' influxdb.create_db <name>
```

`salt.modules.influx.create_retention_policy`(*database*, *name*, *duration*, *replication*, *default*=False, *\*\*client\_args*)

Create a retention policy.

**database** Name of the database for which the retention policy will be created.

**name** Name of the new retention policy.

**duration** Duration of the new retention policy.

Durations such as 1h, 90m, 12h, 7d, and 4w, are all supported and mean 1 hour, 90 minutes, 12 hours, 7 day, and 4 weeks, respectively. For infinite retention – meaning the data will never be deleted – use 'INF' for duration. The minimum retention period is 1 hour.

**replication** Replication factor of the retention policy.

This determines how many independent copies of each data point are stored in a cluster.

**default** [False] Whether or not the policy as default will be set as default.

CLI Example:

```
salt '*' influxdb.create_retention_policy metrics default 1d 1
```

`salt.modules.influx.create_user`(*name*, *password*, *admin*=False, *\*\*client\_args*)

Create a user.

**name** Name of the user to create.

**password** Password of the new user.

**admin** [False] Whether the user should have cluster administration privileges or not.

CLI Example:

```
salt '*' influxdb.create_user <name> <password>
salt '*' influxdb.create_user <name> <password> admin=True
```

`salt.modules.influx.db_exists`(*name*, *\*\*client\_args*)

Checks if a database exists in InfluxDB.

**name** Name of the database to check.

CLI Example:

```
salt '*' influxdb.db_exists <name>
```

`salt.modules.influx.drop_continuous_query(database, name, **client_args)`

Drop a continuous query.

**database** Name of the database for which the continuous query will be drop from.

**name** Name of the continuous query to drop.

CLI Example:

```
salt '*' influxdb.drop_continuous_query mydb my_cq
```

`salt.modules.influx.drop_db(name, **client_args)`

Drop a database.

**name** Name of the database to drop.

CLI Example:

```
salt '*' influxdb.drop_db <name>
```

`salt.modules.influx.drop_retention_policy(database, name, **client_args)`

Drop a retention policy.

**database** Name of the database for which the retention policy will be dropped.

**name** Name of the retention policy to drop.

CLI Example:

```
salt '*' influxdb.drop_retention_policy mydb mypr
```

`salt.modules.influx.get_continuous_query(database, name, **client_args)`

Get an existing continuous query.

**database** Name of the database for which the continuous query was defined.

**name** Name of the continuous query to get.

CLI Example:

```
salt '*' influxdb.get_continuous_query mydb cq_month
```

`salt.modules.influx.get_retention_policy(database, name, **client_args)`

Get an existing retention policy.

**database** Name of the database for which the retention policy was defined.

**name** Name of the retention policy.

CLI Example:

```
salt '*' influxdb.get_retention_policy metrics default
```

`salt.modules.influx.grant_admin_privileges(name, **client_args)`

Grant cluster administration privileges to a user.

**name** Name of the user to whom admin privileges will be granted.

CLI Example:

```
salt '*' influxdb.grant_admin_privileges <name>
```

`salt.modules.influx.grant_privilege(database, privilege, username, **client_args)`

Grant a privilege on a database to a user.

**database** Name of the database to grant the privilege on.

**privilege** Privilege to grant. Can be one of `read`, `write` or `all`.

**username** Name of the user to grant the privilege to.

`salt.modules.influx.list_dbs(**client_args)`

List all InfluxDB databases.

CLI Example:

```
salt '*' influxdb.list_dbs
```

`salt.modules.influx.list_privileges`(*name*, *\*\*client\_args*)

List privileges from a user.

**name** Name of the user from whom privileges will be listed.

CLI Example:

```
salt '*' influxdb.list_privileges <name>
```

`salt.modules.influx.list_users`(*\*\*client\_args*)

List all users.

CLI Example:

```
salt '*' influxdb.list_users
```

`salt.modules.influx.query`(*database*, *query*, *\*\*client\_args*)

Execute a query.

**database** Name of the database to query on.

**query** InfluxQL query string.

`salt.modules.influx.remove_user`(*name*, *\*\*client\_args*)

Remove a user.

**name** Name of the user to remove

CLI Example:

```
salt '*' influxdb.remove_user <name>
```

`salt.modules.influx.retention_policy_exists`(*database*, *name*, *\*\*client\_args*)

Check if retention policy with given name exists.

**database** Name of the database for which the retention policy was defined.

**name** Name of the retention policy to check.

CLI Example:

```
salt '*' influxdb.retention_policy_exists metrics default
```

`salt.modules.influx.revoke_admin_privileges`(*name*, *\*\*client\_args*)

Revoke cluster administration privileges from a user.

**name** Name of the user from whom admin privileges will be revoked.

CLI Example:

```
salt '*' influxdb.revoke_admin_privileges <name>
```

`salt.modules.influx.revoke_privilege`(*database*, *privilege*, *username*, *\*\*client\_args*)

Revoke a privilege on a database from a user.

**database** Name of the database to grant the privilege on.

**privilege** Privilege to grant. Can be one of `read`, `write` or `all`.

**username** Name of the user to grant the privilege to.

`salt.modules.influx.set_user_password`(*name*, *password*, *\*\*client\_args*)

Change password of a user.

**name** Name of the user for whom to set the password.

**password** New password of the user.

CLI Example:

```
salt '*' influxdb.set_user_password <name> <password>
```

`salt.modules.influxdb.user_exists`(*name*, *\*\*client\_args*)

Check if a user exists.

**name** Name of the user to check.

CLI Example:

```
salt '*' influxdb.user_exists <name>
```

`salt.modules.influxdb.user_info`(*name*, *\*\*client\_args*)

Get information about given user.

**name** Name of the user for which to get information.

CLI Example:

```
salt '*' influxdb.user_info <name>
```

### 14.7.152 salt.modules.influx08 module

InfluxDB - A distributed time series database

Module to provide InfluxDB compatibility to Salt (compatible with InfluxDB version 0.5-0.8)

New in version 2014.7.0.

#### depends

- influxdb Python module (>= 1.0.0)

**configuration** This module accepts connection configuration details either as parameters or as configuration settings in `/etc/salt/minion` on the relevant minions:

```
influxdb08.host: 'localhost'
influxdb08.port: 8086
influxdb08.user: 'root'
influxdb08.password: 'root'
```

This data can also be passed into pillar. Options passed into `opts` will overwrite options passed into pillar.

`salt.modules.influx08.db_create`(*name*, *user=None*, *password=None*, *host=None*, *port=None*)

Create a database

**name** Database name to create

**user** The user to connect as

**password** The password of the user

**host** The host to connect to

**port** The port to connect to

CLI Example:

```
salt '*' influxdb08.db_create <name>
salt '*' influxdb08.db_create <name> <user> <password> <host> <port>
```

`salt.modules.influx08.db_exists`(*name*, *user=None*, *password=None*, *host=None*, *port=None*)

Checks if a database exists in Influxdb

**name** Database name to create

**user** The user to connect as

**password** The password of the user

**host** The host to connect to

**port** The port to connect to

CLI Example:

```
salt '*' influxdb08.db_exists <name>
salt '*' influxdb08.db_exists <name> <user> <password> <host> <port>
```

**salt.modules.influx08.db\_list**(*user=None, password=None, host=None, port=None*)

List all InfluxDB databases

**user** The user to connect as

**password** The password of the user

**host** The host to connect to

**port** The port to connect to

CLI Example:

```
salt '*' influxdb08.db_list
salt '*' influxdb08.db_list <user> <password> <host> <port>
```

**salt.modules.influx08.db\_remove**(*name, user=None, password=None, host=None, port=None*)

Remove a database

**name** Database name to remove

**user** The user to connect as

**password** The password of the user

**host** The host to connect to

**port** The port to connect to

CLI Example:

```
salt '*' influxdb08.db_remove <name>
salt '*' influxdb08.db_remove <name> <user> <password> <host> <port>
```

**salt.modules.influx08.login\_test**(*name, password, database=None, host=None, port=None*)

Checks if a credential pair can log in at all.

If a database is specified: it will check for database user existence. If a database is not specified: it will check for cluster admin existence.

**name** The user to connect as

**password** The password of the user

**database** The database to try to log in to

**host** The host to connect to

**port** The port to connect to

CLI Example:

```
salt '*' influxdb08.login_test <name>
salt '*' influxdb08.login_test <name> <database>
salt '*' influxdb08.login_test <name> <database> <user> <password> <host> <port>
```

**salt.modules.influx08.query**(*database, query, time\_precision='s', chunked=False, user=None, password=None, host=None, port=None*)

Querying data

**database** The database to query

**query** Query to be executed

**time\_precision** Time precision to use (`s`, `m`, or `u`)

**chunked** Whether is chunked or not

**user** The user to connect as

**password** The password of the user

**host** The host to connect to

**port** The port to connect to

CLI Example:

```
salt '*' influxdb08.query <database> <query>
salt '*' influxdb08.query <database> <query> <time_precision> <chunked> <user>
↳<password> <host> <port>
```

`salt.modules.influx08.retention_policy_add`(*database, name, duration, replication, default=False, user=None, password=None, host=None, port=None*)

Add a retention policy.

**database** The database to operate on.

**name** Name of the policy to modify.

**duration** How long InfluxDB keeps the data.

**replication** How many copies of the data are stored in the cluster.

**default** Whether this policy should be the default or not. Default is False.

CLI Example:

```
salt '*' influxdb.retention_policy_add metrics default 1d 1
```

`salt.modules.influx08.retention_policy_alter`(*database, name, duration, replication, default=False, user=None, password=None, host=None, port=None*)

Modify an existing retention policy.

**database** The database to operate on.

**name** Name of the policy to modify.

**duration** How long InfluxDB keeps the data.

**replication** How many copies of the data are stored in the cluster.

**default** Whether this policy should be the default or not. Default is False.

CLI Example:

```
salt '*' influxdb08.retention_policy_modify metrics default 1d 1
```

`salt.modules.influx08.retention_policy_exists`(*database, name, user=None, password=None, host=None, port=None*)

Check if a retention policy exists.

**database** The database to operate on.

**name** Name of the policy to modify.

CLI Example:

```
salt '*' influxdb08.retention_policy_exists metrics default
```

`salt.modules.influx08.retention_policy_get`(*database, name, user=None, password=None, host=None, port=None*)

Get an existing retention policy.

**database** The database to operate on.

**name** Name of the policy to modify.

CLI Example:

```
salt '*' influxdb08.retention_policy_get metrics default
```

`salt.modules.influx08.user_chpass`(*name, passwd, database=None, user=None, password=None, host=None, port=None*)

Change password for a cluster admin or a database user.

If a database is specified: it will update database user password. If a database is not specified: it will update cluster admin password.

**name** User name for whom to change the password

**passwd** New password  
**database** The database on which to operate  
**user** The user to connect as  
**password** The password of the user  
**host** The host to connect to  
**port** The port to connect to  
 CLI Example:

```
salt '*' influxdb08.user_chpass <name> <passwd>
salt '*' influxdb08.user_chpass <name> <passwd> <database>
salt '*' influxdb08.user_chpass <name> <passwd> <database> <user> <password>
↪ <host> <port>
```

**salt.modules.influx08.user\_create**(*name, passwd, database=None, user=None, password=None, host=None, port=None*)

Create a cluster admin or a database user.

If a database is specified: it will create database user. If a database is not specified: it will create a cluster admin.

**name** User name for the new user to create  
**passwd** Password for the new user to create  
**database** The database to create the user in  
**user** The user to connect as  
**password** The password of the user  
**host** The host to connect to  
**port** The port to connect to  
 CLI Example:

```
salt '*' influxdb08.user_create <name> <passwd>
salt '*' influxdb08.user_create <name> <passwd> <database>
salt '*' influxdb08.user_create <name> <passwd> <database> <user> <password>
↪ <host> <port>
```

**salt.modules.influx08.user\_exists**(*name, database=None, user=None, password=None, host=None, port=None*)

Checks if a cluster admin or database user exists.

If a database is specified: it will check for database user existence. If a database is not specified: it will check for cluster admin existence.

**name** User name  
**database** The database to check for the user to exist  
**user** The user to connect as  
**password** The password of the user  
**host** The host to connect to  
**port** The port to connect to  
 CLI Example:

```
salt '*' influxdb08.user_exists <name>
salt '*' influxdb08.user_exists <name> <database>
salt '*' influxdb08.user_exists <name> <database> <user> <password> <host> <port>
```

**salt.modules.influx08.user\_list**(*database=None, user=None, password=None, host=None, port=None*)

List cluster admins or database users.

If a database is specified: it will return database users list. If a database is not specified: it will return cluster admins list.

**database** The database to list the users from

**user** The user to connect as

**password** The password of the user

**host** The host to connect to

**port** The port to connect to

CLI Example:

```
salt '*' influxdb08.user_list
salt '*' influxdb08.user_list <database>
salt '*' influxdb08.user_list <database> <user> <password> <host> <port>
```

`salt.modules.influx08.user_remove`(*name*, *database=None*, *user=None*, *password=None*, *host=None*, *port=None*)

Remove a cluster admin or a database user.

If a database is specified: it will remove the database user. If a database is not specified: it will remove the cluster admin.

**name** User name to remove

**database** The database to remove the user from

**user** User name for the new user to delete

**user** The user to connect as

**password** The password of the user

**host** The host to connect to

**port** The port to connect to

CLI Example:

```
salt '*' influxdb08.user_remove <name>
salt '*' influxdb08.user_remove <name> <database>
salt '*' influxdb08.user_remove <name> <database> <user> <password> <host> <port>
```

### 14.7.153 salt.modules.infoblox

Module for managing Infoblox

Will look for pillar data infoblox:server, infoblox:user, infoblox:password if not passed to functions

New in version 2016.3.0.

**depends**

- requests

`salt.modules.infoblox.add_record`(*name*, *value*, *record\_type*, *dns\_view*, *infoblox\_server=None*, *infoblox\_user=None*, *infoblox\_password=None*, *infoblox\_api\_version='v1.4.2'*, *sslVerify=True*)

add a record to an infoblox dns view

**name** the record name

**value**

the value for the entry can make use of infoblox functions for next available IP, like ``func:nextavailableip:10.1.0.0/24'`

**record\_type** the record type (cname, a, host, etc)

**dns\_view** the DNS view to add the record to

**infoblox\_server** the infoblox server hostname (can also use the infoblox:server pillar)

**infoblox\_user** the infoblox user to connect with (can also use the infoblox:user pillar)

**infoblox\_password** the infoblox user's password (can also use the infoblox:password pillar)

**infoblox\_api\_version** the infoblox api version to use

**sslVerify** should ssl verification be done on the connection to the Infoblox REST API

CLI Example:

```
salt 'myminion' infoblox.add_record alias.network.name canonical.network.name
↳ MyView
```

```
salt.modules.infoblox.delete_record(name, dns_view, record_type, infoblox_server=None,
                                   infoblox_user=None, infoblox_password=None,
                                   infoblox_api_version='v1.4.2', sslVerify=True)
```

delete a record

**name** name of the record

**dns\_view** the DNS view to remove the record from

**record\_type** the record type (a, cname, host, etc)

**infoblox\_server** the infoblox server hostname (can also use the infoblox:server pillar)

**infoblox\_user** the infoblox user to connect with (can also use the infoblox:user pillar)

**infoblox\_password** the infoblox user's password (can also use the infoblox:password pillar)

**infoblox\_api\_version** the infoblox api version to use

**sslVerify** should ssl verification be done on the connection to the Infoblox REST API

CLI Example:

```
salt my-minion infoblox.delete_record some.dns.record MyInfobloxView A
↳ sslVerify=False
```

```
salt.modules.infoblox.get_network(network_name, network_view=None, infoblox_server=None,
                                  infoblox_user=None, infoblox_password=None,
                                  infoblox_api_version='v1.4.2', sslVerify=True)
```

get a network from infoblox

**network\_name** The name of the network in IPAM

**network\_view** The name of the network view the network belongs to

**infoblox\_server** the infoblox server hostname (can also use the infoblox:server pillar)

**infoblox\_user** the infoblox user to connect with (can also use the infoblox:user pillar)

**infoblox\_password** the infoblox user's password (can also use the infoblox:password pillar)

**infoblox\_api\_version** the infoblox api version to use

**sslVerify** should ssl verification be done on the connection to the Infoblox REST API

CLI Example:

```
salt myminion infoblox.get_network '10.0.0.0/8'
```

```
salt.modules.infoblox.get_record(record_name, record_type='host', infoblox_server=None,
                                 infoblox_user=None, infoblox_password=None, dns_view=None,
                                 infoblox_api_version='v1.4.2', sslVerify=True)
```

get a record from infoblox

**record\_name** name of the record to search for

**record\_type** type of record to search for (host, cname, a, etc...defaults to host)

**infoblox\_server** the infoblox server hostname (can also use the infoblox:server pillar)

**infoblox\_user** the infoblox user to connect with (can also use the infoblox:user pillar)

**infoblox\_password** the infoblox user's password (can also use the infoblox:password pillar)

**dns\_view** the infoblox DNS view to search, if not specified all views are searched

**infoblox\_api\_version** the infoblox api version to use

**sslVerify** should ssl verification be done on the connection to the Infoblox REST API

CLI Example:

```
salt myminion infoblox.get_record some.host.com A sslVerify=False
```

```
salt.modules.infoblox.update_record(name, value, dns_view, record_type, in-
                                foblox_server=None, infoblox_user=None, in-
                                foblox_password=None, infoblox_api_version='v1.4.2',
                                sslVerify=True)
```

update an entry to an infoblox dns view

**name** the dns name

**value** the value for the record

**record\_type** the record type (a, cname, etc)

**dns\_view** the DNS view to add the record to

**infoblox\_server** the infoblox server hostname (can also use the infoblox:server pillar)

**infoblox\_user** the infoblox user to connect with (can also use the infoblox:user pillar)

**infoblox\_password** the infoblox user's password (can also use the infoblox:password pillar)

**infoblox\_api\_version** the infoblox api version to use

**sslVerify** should ssl verification be done on the connection to the Infoblox REST API

CLI Example:

```
salt '*' infoblox.update_record alias.network.name canonical.network.name
→MyInfobloxView cname sslVerify=False
```

#### 14.7.154 salt.modules.ini\_manage

Edit ini files

**maintainer** <akilesh1597@gmail.com>

**maturity** new

**depends** re

**platform** all

(for example /etc/sysctl.conf)

```
salt.modules.ini_manage.get_option(file_name, section, option, separator='=')
```

Get value of a key from a section in an ini file. Returns None if no matching key was found.

API Example:

```
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.get_option',
      [path_to_ini_file, section_name, option])
```

CLI Example:

```
salt '*' ini.get_option /path/to/ini section_name option_name
```

```
salt.modules.ini_manage.get_section(file_name, section, separator='=')
```

Retrieve a section from an ini file. Returns the section as dictionary. If the section is not found, an empty dictionary is returned.

API Example:

```
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.get_section',
      [path_to_ini_file, section_name])
```

CLI Example:

```
salt '*' ini.get_section /path/to/ini section_name
```

`salt.modules.ini_manage.remove_option`(*file\_name*, *section*, *option*, *separator*='=')

Remove a key/value pair from a section in an ini file. Returns the value of the removed key, or None if nothing was removed.

API Example:

```
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.remove_option',
      [path_to_ini_file, section_name, option])
```

CLI Example:

```
salt '*' ini.remove_option /path/to/ini section_name option_name
```

`salt.modules.ini_manage.remove_section`(*file\_name*, *section*, *separator*='=')

Remove a section in an ini file. Returns the removed section as dictionary, or None if nothing was removed.

API Example:

```
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.remove_section',
      [path_to_ini_file, section_name])
```

CLI Example:

```
salt '*' ini.remove_section /path/to/ini section_name
```

`salt.modules.ini_manage.set_option`(*file\_name*, *sections*=None, *separator*='=')

Edit an ini file, replacing one or more sections. Returns a dictionary containing the changes made.

**file\_name** path of ini\_file

**sections** [None] A dictionary representing the sections to be edited ini file The keys are the section names and the values are the dictionary containing the options If the ini file does not contain sections the keys and values represent the options

**separator** [=] A character used to separate keys and values. Standard ini files use the '=' character.

New in version 2016.11.0.

API Example:

```
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.set_option',
      ['path_to_ini_file', '{"section_to_change": {"key": "value"}}'])
```

CLI Example:

```
salt '*' ini.set_option /path/to/ini '{section_foo: {key: value}}'
```

## 14.7.155 salt.modules.inspectlib package

### Submodules

#### salt.modules.inspectlib.collector module

salt.modules.inspectlib.collector.**is\_alive**(*pidfile*)

Check if PID is still alive.

salt.modules.inspectlib.collector.**main**(*dbfile, pidfile, mode*)

Main analyzer routine.

#### salt.modules.inspectlib.dbhandle module

class salt.modules.inspectlib.dbhandle.**DBHandleBase**(*path*)

Handle for the *volatile* database, which serves the purpose of caching the inspected data. This database can be destroyed or corrupted, so it should be simply re-created from scratch.

**close**()

Close the database connection.

**flush**(*table*)

Flush the table.

**open**(*new=False*)

Init the database, if required.

**purge**()

Purge whole database.

#### salt.modules.inspectlib.exceptions module

exception salt.modules.inspectlib.exceptions.**InspectorKiwiProcessorException**

Kiwi builder/exporter exception.

exception salt.modules.inspectlib.exceptions.**InspectorQueryException**

Exception that is only for the inspector query.

exception salt.modules.inspectlib.exceptions.**InspectorSnapshotException**

Snapshot exception.

exception salt.modules.inspectlib.exceptions.**SIException**

System information exception.

#### salt.modules.inspectlib.query module

class salt.modules.inspectlib.query.**Query**(*scope, cachedir=None*)

Query the system. This class is actually puts all Salt features together, so there would be no need to pick it from various places.

class salt.modules.inspectlib.query.**SysInfo**(*systype*)

System information.

## Module contents

**class** `salt.modules.inspectlib.EnvLoader` (*cachedir=None, piddir=None, pidfilename=None*)  
Load environment.

### 14.7.156 salt.modules.inspectlib.entities module

**class** `salt.modules.inspectlib.entities.AllowedDir`  
Allowed directories

**class** `salt.modules.inspectlib.entities.IgnoredDir`  
Ignored directories

**class** `salt.modules.inspectlib.entities.Package`  
Package.

**class** `salt.modules.inspectlib.entities.PackageCfgFile`  
Config file, belongs to the package

**class** `salt.modules.inspectlib.entities.PayloadFile`  
Payload file.

### 14.7.157 salt.modules.inspectlib.fsdb module

codeauthor :email:`Bo Maryniuk <bo@suse.de>`

**class** `salt.modules.inspectlib.fsdb.CsvDB` (*path*)  
File-based CSV database. This database is in-memory operating relatively small plain text csv files.

**close**()  
Close the database.

Returns

**create\_table\_from\_object** (*obj*)  
Create a table from the object. NOTE: This method doesn't stores anything.

Parameters **obj** --

Returns

**delete** (*obj, matches=None, mt=None, lt=None, eq=None*)  
Delete object from the database.

Parameters

- **obj** --
- **matches** --
- **mt** --
- **lt** --
- **eq** --

Returns

**flush** (*table*)  
Flush table.

Parameters **table** --

**Returns**

**get** (*obj*, *matches=None*, *mt=None*, *lt=None*, *eq=None*)  
Get objects from the table.

**Parameters**

- **table\_name** --
- **matches** -- Regexp.
- **mt** -- More than.
- **lt** -- Less than.
- **eq** -- Equals.

**Returns**

**is\_closed**()  
Return if the database is closed.

**Returns**

**list**()  
List all the databases on the given path.

**Returns**

**list\_tables**()  
Load existing tables and their descriptions.

**Returns**

**new**()  
Create a new database and opens it.

**Returns**

**open** (*dbname=None*)  
Open database from the path with the name or latest. If there are no yet databases, create a new implicitly.

**Returns**

**purge** (*dbid*)  
Purge the database.

**Parameters** **dbid** --**Returns**

**store** (*obj*, *distinct=False*)  
Store an object in the table.

**Parameters**

- **obj** -- An object to store
- **distinct** -- Store object only if there is none identical of such. If at least one field is different, store it.

**Returns**

**update** (*obj*, *matches=None*, *mt=None*, *lt=None*, *eq=None*)  
Update object(s) in the database.

**Parameters**

- **obj** --
- **matches** --
- **mt** --
- **lt** --
- **eq** --

Returns

**class** salt.modules.inspectlib.fsdb.**CsvDBEntity**  
 Serializable object for the table.

#### 14.7.158 salt.modules.inspectlib.kiwiproc module

**class** salt.modules.inspectlib.kiwiproc.**KiwiExporter**(*grains, format*)  
 Exports system description as Kiwi configuration.

**export**(*name*)  
 Export to the Kiwi config.xml as text.

Returns

**load**(*\*\*descr*)  
 Load data by keys.

Parameters **data** --

Returns

#### 14.7.159 salt.modules.inspector module

Module for full system inspection.

**salt.modules.inspector.build**(*format='qcow2', path='/tmp/'*)  
 Build an image from a current system description. The image is a system image can be output in bootable ISO or QCOW2 formats.

Node uses the image building library Kiwi to perform the actual build.

Parameters:

- **format**: Specifies output format: ``qcow2`` or ``iso``. Default: *qcow2*.
- **path**: Specifies output path where to store built image. Default: */tmp*.

CLI Example:

```
salt myminion inspector.build
salt myminion inspector.build format=iso path=/opt/builds/
```

**salt.modules.inspector.delete**(*all=False, \*databases*)

Remove description snapshots from the system.

::parameter: all. Default: False. Remove all snapshots, if set to True.

CLI example:

```
salt myminion inspector.delete <ID> <ID1> <ID2>..
salt myminion inspector.delete all=True
```

`salt.modules.inspector.export` (*local=False, path='/tmp', format='qcow2'*)

Export an image description for Kiwi.

Parameters:

- local**: Specifies True or False if the export has to be in the local file. Default: False.
- path**: If *local=True*, then specifies the path where file with the Kiwi description is written. Default: */tmp*.

CLI Example:

```
salt myminion inspector.export
salt myminion inspector.export format=iso path=/opt/builds/
```

`salt.modules.inspector.inspect` (*mode='all', priority=19, \*\*kwargs*)

Start node inspection and save the data to the database for further query.

Parameters:

- mode**: Clarify inspection mode: configuration, payload, all (default)  
**payload**
  - **filter**: Comma-separated directories to track payload.
- priority**: (advanced) Set priority of the inspection. Default is low priority.

CLI Example:

```
salt '*' inspector.inspect
salt '*' inspector.inspect configuration
salt '*' inspector.inspect payload filter=/opt,/ext/oracle
```

`salt.modules.inspector.query` (*\*args, \*\*kwargs*)

Query the node for specific information.

Parameters:

- scope**: Specify scope of the query.
  - System**: Return system data.
  - Software**: Return software information.
  - Services**: Return known services.
  - Identity**: Return user accounts information for this system.
    - accounts** Can be either `'local'`, `'remote'` or `'all'` (equal to `''local,remote''`). Remote accounts cannot be resolved on all systems, but only those, which supports `'passwd -S -a'`.
    - disabled** True (or False, default) to return only disabled accounts.
  - payload**: Payload scope parameters:
    - filter** Include only results which path starts from the filter string.
    - time** Display time in Unix ticks or format according to the configured TZ (default) Values: ticks, tz (default)
    - size** Format size. Values: B, KB, MB, GB
    - type** Include payload type. Values (comma-separated): directory (or dir), link, file (default)  
Example (returns everything): `type=directory,link,file`
    - owners** Resolve UID/GID to an actual names or leave them numeric (default). Values: name (default), id
    - brief** Return just a list of payload elements, if True. Default: False.

**-all:** Return all information (default).

CLI Example:

```
salt '*' inspector.query scope=system
salt '*' inspector.query scope=payload type=file,link filter=/etc size=Kb
↳brief=False
```

**salt.modules.inspector.snapshots()**

List current description snapshots.

CLI Example:

```
salt myminion inspector.snapshots
```

### 14.7.160 salt.modules.introspect

Functions to perform introspection on a minion, and return data in a format usable by Salt States

**salt.modules.introspect.enabled\_service\_owners()**

Return which packages own each of the services that are currently enabled.

CLI Example:

```
salt myminion introspect.enabled_service_owners
```

**salt.modules.introspect.running\_service\_owners**(*exclude*=(`'/dev'`, `'/home'`, `'/media'`, `'/proc'`, `'/run'`, `'/sys/'`, `'/tmp'`, `'/var'`))

Determine which packages own the currently running services. By default, excludes files whose full path starts with `/dev`, `/home`, `/media`, `/proc`, `/run`, `/sys`, `/tmp` and `/var`. This can be overridden by passing in a new list to `exclude`.

CLI Example:

```
salt myminion introspect.running_service_owners
```

**salt.modules.introspect.service\_highstate**(*requires*=`True`)

Return running and enabled services in a highstate structure. By default also returns package dependencies for those services, which means that package definitions must be created outside this function. To drop the package dependencies, set `requires` to `False`.

CLI Example:

```
salt myminion introspect.service_highstate salt myminion introspect.service_highstate
requires=False
```

### 14.7.161 salt.modules.ipmi

Support IPMI commands over LAN. This module does not talk to the local systems hardware through IPMI drivers. It uses a python module *pyghmi*.

**depends** Python module *pyghmi*. You can install *pyghmi* using `pip`:

```
pip install pyghmi
```

**configuration** The following configuration defaults can be define (pillar or config files):

```
ipmi.config:
  api_host: 127.0.0.1
  api_user: admin
  api_pass: apassword
```

```
api_port: 623
api_kg: None
```

Usage can override the config defaults:

```
salt-call ipmi.get_user api_host=myipmienabled.system
                        api_user=admin api_pass=pass
                        uid=1
```

`salt.modules.ipmi.create_user` (*uid*, *name*, *password*, *channel=14*, *callback=False*, *link\_auth=True*, *ipmi\_msg=True*, *privilege\_level='administrator'*, *\*\*kwargs*)  
create/ensure a user is created with provided settings.

#### Parameters

- **privilege\_level** -- User Privilege Limit. (Determines the maximum privilege level that the user is allowed to switch to on the specified channel.) \* *callback* \* *user* \* *operator* \* *administrator* \* *proprietary* \* *no\_access*
- **kwargs** --
  - *api\_host*=127.0.0.1
  - *api\_user*=admin
  - *api\_pass*=example
  - *api\_port*=623
  - *api\_kg*=None

CLI Examples:

```
salt-call ipmi.create_user uid=2 name=steverweber api_host=172.168.0.7 api_
↳pass=nevertell
```

`salt.modules.ipmi.fast_connect_test` (*\*\*kwargs*)

Returns True if connection success. This uses an aggressive timeout value!

#### Parameters **kwargs** --

- *api\_host*=127.0.0.1
- *api\_user*=admin
- *api\_pass*=example
- *api\_port*=623
- *api\_kg*=None

CLI Examples:

```
salt-call ipmi.fast_connect_test api_host=172.168.0.9
```

`salt.modules.ipmi.get_bootdev` (*\*\*kwargs*)

Get current boot device override information.

Provides the current requested boot device. Be aware that not all IPMI devices support this. Even in BMCs that claim to, occasionally the BIOS or UEFI fail to honor it. This is usually only applicable to the next reboot.

#### Parameters **kwargs** --

- *api\_host*=127.0.0.1
- *api\_user*=admin
- *api\_pass*=example

- `api_port=623`
- `api_kg=None`

CLI Example:

```
salt-call ipmi.get_bootdev api_host=127.0.0.1 api_user=admin api_pass=pass
```

`salt.modules.ipmi.get_channel_access(channel=14, read_mode='non_volatile', **kwargs)`  
 :param kwargs:api\_host='127.0.0.1' api\_user='admin' api\_pass='example' api\_port=623

Parameters

- **channel** -- number [1:7]
- **read\_mode** --
  - `non_volatile` = get non-volatile Channel Access
  - `volatile` = get present volatile (active) setting of Channel Access
- **kwargs** --
  - `api_host=127.0.0.1`
  - `api_user=admin`
  - `api_pass=example`
  - `api_port=623`
  - `api_kg=None`

**return** A Python dict with the following keys/values:

```
{
  alerting:
  per_msg_auth:
  user_level_auth:
  access_mode: { (ONE OF)
    0: 'disabled',
    1: 'pre_boot',
    2: 'always',
    3: 'shared'
  }
  privilege_level: { (ONE OF)
    1: 'callback',
    2: 'user',
    3: 'operator',
    4: 'administrator',
    5: 'proprietary',
  }
}
```

CLI Examples:

```
salt-call ipmi.get_channel_access channel=1
```

`salt.modules.ipmi.get_channel_info(channel=14, **kwargs)`

Get channel info

Parameters

- **channel** -- number [1:7]
- **kwargs** --

- api\_host=127.0.0.1
- api\_user=admin
- api\_pass=example
- api\_port=623
- api\_kg=None

**return** channel session supports:

```
- no_session: channel is session-less
- single: channel is single-session
- multi: channel is multi-session
- auto: channel is session-based (channel could alternate between
      single- and multi-session operation, as can occur with a
      serial/modem channel that supports connection mode auto-detect)
```

CLI Examples:

```
salt-call ipmi.get_channel_info
```

`salt.modules.ipmi.get_channel_max_user_count(channel=14, **kwargs)`

Get max users in channel

**Parameters**

- **channel** -- number [1:7]
- **kwargs** --
  - api\_host=127.0.0.1
  - api\_user=admin
  - api\_pass=example
  - api\_port=623
  - api\_kg=None

**Returns** int -- often 16

CLI Examples:

```
salt-call ipmi.get_channel_max_user_count
```

`salt.modules.ipmi.get_health(**kwargs)`

Get Summarize health

This provides a summary of the health of the managed system. It additionally provides an iterable list of reasons for warning, critical, or failed assessments.

good health: {'badreadings': [], 'health': 0}

**Parameters** **kwargs** --

- api\_host=127.0.0.1
- api\_user=admin
- api\_pass=example
- api\_port=623
- api\_kg=None

CLI Example:

```
salt-call ipmi.get_health api_host=127.0.0.1 api_user=admin api_pass=pass
```

`salt.modules.ipmi.get_power(**kwargs)`

Get current power state

The response, if successful, should contain 'powerstate' key and either 'on' or 'off' to indicate current state.

**Parameters** **kwargs** --

- `api_host=127.0.0.1`
- `api_user=admin`
- `api_pass=example`
- `api_port=623`
- `api_kg=None`

CLI Example:

```
salt-call ipmi.get_power api_host=127.0.0.1 api_user=admin api_pass=pass
```

`salt.modules.ipmi.get_sensor_data(**kwargs)`

Get sensor readings

Iterates sensor reading objects

**Parameters** **kwargs** --

- `api_host=127.0.0.1`
- `api_user=admin`
- `api_pass=example`
- `api_port=623`
- `api_kg=None`

CLI Example:

```
salt-call ipmi.get_sensor_data api_host=127.0.0.1 api_user=admin api_pass=pass
```

`salt.modules.ipmi.get_user(uid, channel=14, **kwargs)`

Get user from uid and access on channel

**Parameters**

- **uid** -- user number [1:16]
- **channel** -- number [1:7]
- **kwargs** --
  - `api_host=127.0.0.1`
  - `api_user=admin`
  - `api_pass=example`
  - `api_port=623`
  - `api_kg=None`

return

```
name: (str)
uid: (int)
channel: (int)
```

```

access:
  - callback (bool)
  - link_auth (bool)
  - ipmi_msg (bool)
  - privilege_level: (str)[callback, user, operator, administrator,
                        proprietary, no_access]

```

CLI Examples:

```
salt-call ipmi.get_user uid=2
```

`salt.modules.ipmi.get_user_access`(*uid*, *channel=14*, *\*\*kwargs*)

Get user access

Parameters

- **uid** -- user number [1:16]
- **channel** -- number [1:7]
- **kwargs** --
  - `api_host=127.0.0.1`
  - `api_user=admin`
  - `api_pass=example`
  - `api_port=623`
  - `api_kg=None`

return

```

channel_info:
  - max_user_count = maximum number of user IDs on this channel
  - enabled_users = count of User ID slots presently in use
  - users_with_fixed_names = count of user IDs with fixed names
access:
  - callback
  - link_auth
  - ipmi_msg
  - privilege_level: [reserved, callback, user, operator,
                    administrator, proprietary, no_access]

```

CLI Examples:

```
salt-call ipmi.get_user_access uid=2
```

`salt.modules.ipmi.get_user_name`(*uid*, *return\_none\_on\_error=True*, *\*\*kwargs*)

Get user name

Parameters

- **uid** -- user number [1:16]
- **return\_none\_on\_error** -- return None on error
- **kwargs** --
  - `api_host=127.0.0.1`
  - `api_user=admin`
  - `api_pass=example`
  - `api_port=623`

– api\_kg=None

CLI Examples:

```
salt-call ipmi.get_user_name uid=2
```

`salt.modules.ipmi.get_users(channel=14, **kwargs)`

get list of users and access information

Parameters

- **channel** -- number [1:7]
- **kwargs** --
  - api\_host=127.0.0.1
  - api\_user=admin
  - api\_pass=example
  - api\_port=623
  - api\_kg=None

Returns

- name: (str)
- uid: (int)
- channel: (int)
- access:
  - callback (bool)
  - link\_auth (bool)
  - ipmi\_msg (bool)
  - privilege\_level: (str)[callback, user, operator, administrator, proprietary, no\_access]

CLI Examples:

```
salt-call ipmi.get_users api_host=172.168.0.7
```

`salt.modules.ipmi.raw_command(netfn, command, bridge_request=None, data=(), retry=True, delay_xmit=None, **kwargs)`

Send raw ipmi command

This allows arbitrary IPMI bytes to be issued. This is commonly used for certain vendor specific commands.

Parameters

- **netfn** -- Net function number
- **command** -- Command value
- **bridge\_request** -- The target slave address and channel number for the bridge request.
- **data** -- Command data as a tuple or list
- **kwargs** --
  - api\_host=127.0.0.1
  - api\_user=admin

- api\_pass=example
- api\_port=623
- api\_kg=None

**Returns** dict -- The response from IPMI device

CLI Examples:

```
salt-call ipmi.raw_command netfn=0x06 command=0x46 data=[0x02]
# this will return the name of the user with id 2 in bytes
```

`salt.modules.ipmi.set_bootdev`(bootdev='default', persist=False, uefiboost=False, \*\*kwargs)

Set boot device to use on next reboot

**Parameters**

- **bootdev** --
  - network: Request network boot
  - hd: Boot from hard drive
  - safe: Boot from hard drive, requesting `safe mode`
  - optical: boot from CD/DVD/BD drive
  - setup: Boot into setup utility
  - default: remove any IPMI directed boot device request
- **persist** -- If true, ask that system firmware use this device beyond next boot. Be aware many systems do not honor this
- **uefiboost** -- If true, request UEFI boot explicitly. Strictly speaking, the spec suggests that if not set, the system should BIOS boot and offers no ``don't care" option. In practice, this flag not being set does not preclude UEFI boot on any system I've encountered.
- **kwargs** --
  - api\_host=127.0.0.1
  - api\_user=admin
  - api\_pass=example
  - api\_port=623
  - api\_kg=None

**Returns** dict or True -- If callback is not provided, the response

CLI Examples:

```
salt-call ipmi.set_bootdev bootdev=network persist=True
```

`salt.modules.ipmi.set_channel_access`(channel=14, access\_update\_mode='non\_volatile', alerting=False, per\_msg\_auth=False, user\_level\_auth=False, access\_mode='always', privilege\_update\_mode='non\_volatile', privilege\_level='administrator', \*\*kwargs)

Set channel access

**Parameters**

- **channel** -- number [1:7]

- **access\_update\_mode** --
  - `dont\_change` = don't set or change Channel Access
  - `non\_volatile` = set non-volatile Channel Access
  - `volatile` = set volatile (active) setting of Channel Access
- **alerting** --
 

PEF Alerting Enable/Disable

  - True = enable PEF Alerting
  - False = disable PEF Alerting on this channel

(Alert Immediate command can still be used to generate alerts)
- **per\_msg\_auth** --
 

Per-message Authentication

  - True = enable
  - False = disable Per-message Authentication. [Authentication required to activate any session on this channel, but authentication not used on subsequent packets for the session.]
- **user\_level\_auth** --
 

User Level Authentication Enable/Disable.

  - True = enable User Level Authentication. All User Level commands are to be authenticated per the Authentication Type that was negotiated when the session was activated.
  - False = disable User Level Authentication. Allow User Level commands to be executed without being authenticated. If the option to disable User Level Command authentication is accepted, the BMC will accept packets with Authentication Type set to None if they contain user level commands. For outgoing packets, the BMC returns responses with the same Authentication Type that was used for the request.
- **access\_mode** -- Access Mode for IPMI messaging (PEF Alerting is enabled/disabled separately from IPMI messaging)
  - disabled = disabled for IPMI messaging
  - pre\_boot = pre-boot only channel only available when system is in a powered down state or in BIOS prior to start of boot.
  - always = channel always available regardless of system mode. BIOS typically dedicates the serial connection to the BMC.
  - shared = same as always available, but BIOS typically leaves the serial port available for software use.
- **privilege\_update\_mode** -- Channel Privilege Level Limit. This value sets the maximum privilege level that can be accepted on the specified channel.
  - dont\_change = don't set or change channel Privilege Level Limit
  - non\_volatile = non-volatile Privilege Level Limit according
  - volatile = volatile setting of Privilege Level Limit
- **privilege\_level** --

**Channel Privilege Level Limit**

- reserved = unused
- callback
- user
- operator
- administrator
- proprietary = used by OEM

**• kwargs --**

- api\_host=127.0.0.1
- api\_user=admin
- api\_pass=example
- api\_port=623
- api\_kg=None

CLI Examples:

```
salt-call ipmi.set_channel_access privilege_level='administrator'
```

**salt.modules.ipmi.set\_identify** (*on=True, duration=600, \*\*kwargs*)

Request identify light

Request the identify light to turn off, on for a duration, or on indefinitely. Other than error exceptions,

**Parameters**

- **on** -- Set to True to force on or False to force off
- **duration** -- Set if wanting to request turn on for a duration in seconds, None = indefinitely.
- **kwargs** --
  - api\_host=127.0.0.1
  - api\_user=admin
  - api\_pass=example
  - api\_port=623
  - api\_kg=None

CLI Examples:

```
salt-call ipmi.set_identify
```

**salt.modules.ipmi.set\_power** (*state='power\_on', wait=True, \*\*kwargs*)

Request power state change

**Parameters**

- **name** --
  - power\_on -- system turn on
  - power\_off -- system turn off (without waiting for OS)
  - shutdown -- request OS proper shutdown

- reset -- reset (without waiting for OS)
- boot -- If system is off, then `on`, else `reset`
- **ensure** -- If (bool True), do not return until system actually completes requested state change for 300 seconds. If a non-zero (int), adjust the wait time to the requested number of seconds
- **kwargs** --
  - api\_host=127.0.0.1
  - api\_user=admin
  - api\_pass=example
  - api\_port=623
  - api\_kg=None

**Returns** dict -- A dict describing the response retrieved

CLI Examples:

```
salt-call ipmi.set_power state=shutdown wait=True
```

```
salt.modules.ipmi.set_user_access(uid, channel=14, callback=True, link_auth=True, ipmi_msg=True, privilege_level='administrator', **kwargs)
```

Set user access

**Parameters**

- **uid** -- user number [1:16]
- **channel** -- number [1:7]
- **callback** --

**User Restricted to Callback**

- False = User Privilege Limit is determined by the User Privilege Limit parameter, below, for both callback and non-callback connections.
- True = User Privilege Limit is determined by the User Privilege Limit parameter for callback connections, but is restricted to Callback level for non-callback connections. Thus, a user can only initiate a Callback when they `call in` to the BMC, but once the callback connection has been made, the user could potentially establish a session as an Operator.
- **link\_auth** -- User Link authentication enable/disable (used to enable whether this user's name and password information will be used for link authentication, e.g. PPP CHAP) for the given channel. Link authentication itself is a global setting for the channel and is enabled/disabled via the serial/modem configuration parameters.
- **ipmi\_msg** -- User IPMI Messaging: (used to enable/disable whether this user's name and password information will be used for IPMI Messaging. In this case, `IPMI Messaging` refers to the ability to execute generic IPMI commands that are not associated with a particular payload type. For example, if IPMI Messaging is disabled for a user, but that user is enabled for activating the SOL payload type, then IPMI commands associated with SOL and session management, such as Get SOL Configuration Parameters and Close Session are available, but generic IPMI commands such as Get SEL Time are unavailable.)
- **privilege\_level** -- User Privilege Limit. (Determines the maximum privilege level that the user is allowed to switch to on the specified channel.)

- callback
- user
- operator
- administrator
- proprietary
- no\_access
- **kwargs** --
  - api\_host=127.0.0.1
  - api\_user=admin
  - api\_pass=example
  - api\_port=623
  - api\_kg=None

CLI Examples:

```
salt-call ipmi.set_user_access uid=2 privilege_level='operator'
```

`salt.modules.ipmi.set_user_name`(*uid*, *name*, *\*\*kwargs*)

Set user name

**Parameters**

- **uid** -- user number [1:16]
- **name** -- username (limit of 16bytes)
- **kwargs** --
  - api\_host=127.0.0.1
  - api\_user=admin
  - api\_pass=example
  - api\_port=623
  - api\_kg=None

CLI Examples:

```
salt-call ipmi.set_user_name uid=2 name='steverweber'
```

`salt.modules.ipmi.set_user_password`(*uid*, *mode='set\_password'*, *password=None*, *\*\*kwargs*)

Set user password and (modes)

**Parameters**

- **uid** -- id number of user. see: `get_names_uid()['name']`
- **mode** --
  - disable = disable user connections
  - enable = enable user connections
  - set\_password = set or ensure password
  - test\_password = test password is correct
- **password** -- max 16 char string (optional when mode is [disable or enable])

- **kwargs** --
  - api\_host=127.0.0.1
  - api\_user=admin
  - api\_pass=example
  - api\_port=623
  - api\_kg=None

**Returns** True on success when mode = test\_password, return False on bad password

CLI Example:

```
salt-call ipmi.set_user_password api_host=127.0.0.1 api_user=admin api_pass=pass
                                uid=1 password=newPass
salt-call ipmi.set_user_password uid=1 mode=enable
```

`salt.modules.ipmi.user_delete`(*uid*, *channel=14*, *\*\*kwargs*)

Delete user (helper)

**Parameters**

- **uid** -- user number [1:16]
- **channel** -- number [1:7]
- **kwargs** --
  - api\_host=127.0.0.1
  - api\_user=admin
  - api\_pass=example
  - api\_port=623
  - api\_kg=None

CLI Examples:

```
salt-call ipmi.user_delete uid=2
```

### 14.7.162 salt.modules.ipset

Support for ipset

`salt.modules.ipset.add`(*set=None*, *entry=None*, *family='ipv4'*, *\*\*kwargs*)

Append an entry to the specified set.

CLI Example:

```
salt '*' ipset.add setname 192.168.1.26
salt '*' ipset.add setname 192.168.0.3,AA:BB:CC:DD:EE:FF
```

`salt.modules.ipset.check`(*set=None*, *entry=None*, *family='ipv4'*)

Check that an entry exists in the specified set.

**set** The ipset name

**entry** An entry in the ipset. This parameter can be a single IP address, a range of IP addresses, or a subnet block. Example:

```
192.168.0.1
192.168.0.2-192.168.0.19
192.168.0.0/25
```

**family** IP protocol version: ipv4 or ipv6

CLI Example:

```
salt '*' ipset.check setname '192.168.0.1 comment "Hello"'
```

`salt.modules.ipset.check_set` (*set=None, family='ipv4'*)

Check that given ipset set exists.

New in version 2014.7.0.

CLI Example:

```
salt '*' ipset.check_set setname
```

`salt.modules.ipset.delete` (*set=None, entry=None, family='ipv4', \*\*kwargs*)

Delete an entry from the specified set.

CLI Example:

```
salt '*' ipset.delete setname 192.168.0.3,AA:BB:CC:DD:EE:FF
```

`salt.modules.ipset.delete_set` (*set=None, family='ipv4'*)

New in version 2014.7.0.

Delete ipset set.

CLI Example:

```
salt '*' ipset.delete_set custom_set
```

IPv6:

```
salt '*' ipset.delete_set custom_set family=ipv6
```

`salt.modules.ipset.flush` (*set=None, family='ipv4'*)

Flush entries in the specified set, Flush all sets if set is not specified.

CLI Example:

```
salt '*' ipset.flush
```

```
salt '*' ipset.flush set
```

IPv6:

```
salt '*' ipset.flush
```

```
salt '*' ipset.flush set
```

`salt.modules.ipset.list_sets` (*family='ipv4'*)

New in version 2014.7.0.

List all ipset sets.

CLI Example:

```
salt '*' ipset.list_sets
```

`salt.modules.ipset.new_set` (*set=None, set\_type=None, family='ipv4', comment=False, \*\*kwargs*)  
 New in version 2014.7.0.

Create new custom set

CLI Example:

```
salt '*' ipset.new_set custom_set list:set

salt '*' ipset.new_set custom_set list:set comment=True

IPv6:
salt '*' ipset.new_set custom_set list:set family=ipv6
```

`salt.modules.ipset.rename_set` (*set=None, new\_set=None, family='ipv4'*)  
 New in version 2014.7.0.

Delete ipset set.

CLI Example:

```
salt '*' ipset.rename_set custom_set new_set=new_set_name

IPv6:
salt '*' ipset.rename_set custom_set new_set=new_set_name family=ipv6
```

`salt.modules.ipset.test` (*set=None, entry=None, family='ipv4', \*\*kwargs*)  
 Test if an entry is in the specified set.

CLI Example:

```
salt '*' ipset.test setname 192.168.0.2

IPv6:
salt '*' ipset.test setname fd81:fc56:9ac7::/48
```

`salt.modules.ipset.version` ()  
 Return version from ipset --version

CLI Example:

```
salt '*' ipset.version
```

### 14.7.163 salt.modules.iptables

Support for iptables

#### Configuration Options

The following options can be set in the *minion config*, minion grains, minion pillar, or *master config*<*configuration-salt-master*>.

- `iptables.save_filters`: List of REGEX strings to FILTER OUT matching lines
  - This is useful for filtering out chains, rules, etc that you do not wish to persist, such as ephemeral Docker rules.
  - The default is to not filter out anything.

```
iptables.save_filters:
- "-j CATTLE_PREROUTING"
- "-j DOCKER"
- "-A POSTROUTING"
- "-A CATTLE_POSTROUTING"
- "-A FORWARD"
```

`salt.modules.iptables.append`(*table='filter', chain=None, rule=None, family='ipv4'*)

Append a rule to the specified table/chain.

**This function accepts a rule in a standard iptables command format**, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```
salt '*' iptables.append filter INPUT \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT'

IPv6:
salt '*' iptables.append filter INPUT \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT' \
    family=ipv6
```

`salt.modules.iptables.build_rule`(*table='filter', chain=None, command=None, position='', full=None, family='ipv4', \*\*kwargs*)

Build a well-formatted iptables rule based on kwargs. A *table* and *chain* are not required, unless *full* is True.

If *full* is True, then *table*, *chain* and *command* are required. *command* may be specified as either a short option ('I') or a long option (--insert). This will return the iptables command, exactly as it would be used from the command line.

If a position is required (as with -I or -D), it may be specified as *position*. This will only be useful if *full* is True.

If *connstate* is passed in, it will automatically be changed to *state*.

To pass in jump options that doesn't take arguments, pass in an empty string.

CLI Examples:

```
salt '*' iptables.build_rule match=state \
    connstate=RELATED,ESTABLISHED jump=ACCEPT

salt '*' iptables.build_rule filter INPUT command=I position=3 \
    full=True match=state state=RELATED,ESTABLISHED jump=ACCEPT

salt '*' iptables.build_rule filter INPUT command=A \
    full=True match=state state=RELATED,ESTABLISHED \
    source='127.0.0.1' jump=ACCEPT

.. Invert Rules
salt '*' iptables.build_rule filter INPUT command=A \
    full=True match=state state=RELATED,ESTABLISHED \
    source='! 127.0.0.1' jump=ACCEPT

salt '*' iptables.build_rule filter INPUT command=A \
    full=True match=state state=RELATED,ESTABLISHED \
    destination='not 127.0.0.1' jump=ACCEPT

IPv6:
salt '*' iptables.build_rule match=state \
```

```

connstate=RELATED,ESTABLISHED jump=ACCEPT \
family=ipv6
salt '*' iptables.build_rule filter INPUT command=I position=3 \
full=True match=state state=RELATED,ESTABLISHED jump=ACCEPT \
family=ipv6

```

`salt.modules.iptables.check`(*table='filter', chain=None, rule=None, family='ipv4'*)

Check for the existence of a rule in the table and chain

**This function accepts a rule in a standard iptables command format**, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```

salt '*' iptables.check filter INPUT \
rule='-m state --state RELATED,ESTABLISHED -j ACCEPT'

IPv6:
salt '*' iptables.check filter INPUT \
rule='-m state --state RELATED,ESTABLISHED -j ACCEPT' \
family=ipv6

```

`salt.modules.iptables.check_chain`(*table='filter', chain=None, family='ipv4'*)

New in version 2014.1.0.

Check for the existence of a chain in the table

CLI Example:

```

salt '*' iptables.check_chain filter INPUT

IPv6:
salt '*' iptables.check_chain filter INPUT family=ipv6

```

`salt.modules.iptables.delete`(*table, chain=None, position=None, rule=None, family='ipv4'*)

Delete a rule from the specified table/chain, specifying either the rule in its entirety, or the rule's position in the chain.

**This function accepts a rule in a standard iptables command format**, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Examples:

```

salt '*' iptables.delete filter INPUT position=3
salt '*' iptables.delete filter INPUT \
rule='-m state --state RELATED,ESTABLISHED -j ACCEPT'

IPv6:
salt '*' iptables.delete filter INPUT position=3 family=ipv6
salt '*' iptables.delete filter INPUT \
rule='-m state --state RELATED,ESTABLISHED -j ACCEPT' \
family=ipv6

```

`salt.modules.iptables.delete_chain`(*table='filter', chain=None, family='ipv4'*)

New in version 2014.1.0.

Delete custom chain to the specified table.

CLI Example:

```
salt '*' iptables.delete_chain filter CUSTOM_CHAIN
```

IPv6:

```
salt '*' iptables.delete_chain filter CUSTOM_CHAIN family=ipv6
```

`salt.modules.iptables.flush`(*table='filter', chain='', family='ipv4'*)

Flush the chain in the specified table, flush all chains in the specified table if not specified chain.

CLI Example:

```
salt '*' iptables.flush filter INPUT
```

IPv6:

```
salt '*' iptables.flush filter INPUT family=ipv6
```

`salt.modules.iptables.get_policy`(*table='filter', chain=None, family='ipv4'*)

Return the current policy for the specified table/chain

CLI Example:

```
salt '*' iptables.get_policy filter INPUT
```

IPv6:

```
salt '*' iptables.get_policy filter INPUT family=ipv6
```

`salt.modules.iptables.get_rules`(*family='ipv4'*)

Return a data structure of the current, in-memory rules

CLI Example:

```
salt '*' iptables.get_rules
```

IPv6:

```
salt '*' iptables.get_rules family=ipv6
```

`salt.modules.iptables.get_saved_policy`(*table='filter', chain=None, conf\_file=None, family='ipv4'*)

Return the current policy for the specified table/chain

CLI Examples:

```
salt '*' iptables.get_saved_policy filter INPUT
salt '*' iptables.get_saved_policy filter INPUT \
    conf_file=/etc/iptables.saved
```

IPv6:

```
salt '*' iptables.get_saved_policy filter INPUT family=ipv6
salt '*' iptables.get_saved_policy filter INPUT \
    conf_file=/etc/iptables.saved family=ipv6
```

`salt.modules.iptables.get_saved_rules`(*conf\_file=None, family='ipv4'*)

Return a data structure of the rules in the conf file

CLI Example:

```
salt '*' iptables.get_saved_rules
```

IPv6:

```
salt '*' iptables.get_saved_rules family=ipv6
```

`salt.modules.iptables.insert` (*table='filter', chain=None, position=None, rule=None, family='ipv4'*)

Insert a rule into the specified table/chain, at the specified position.

**This function accepts a rule in a standard iptables command format**, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

**If the position specified is a negative number, then the insert will be** performed counting from the end of the list. For instance, a position of -1 will insert the rule as the second to last rule. To insert a rule in the last position, use the append function instead.

CLI Examples:

```
salt '*' iptables.insert filter INPUT position=3 \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT'

IPv6:
salt '*' iptables.insert filter INPUT position=3 \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT' \
    family=ipv6
```

`salt.modules.iptables.new_chain` (*table='filter', chain=None, family='ipv4'*)

New in version 2014.1.0.

Create new custom chain to the specified table.

CLI Example:

```
salt '*' iptables.new_chain filter CUSTOM_CHAIN

IPv6:
salt '*' iptables.new_chain filter CUSTOM_CHAIN family=ipv6
```

`salt.modules.iptables.save` (*filename=None, family='ipv4'*)

Save the current in-memory rules to disk

CLI Example:

```
salt '*' iptables.save /etc/sysconfig/iptables

IPv6:
salt '*' iptables.save /etc/sysconfig/iptables family=ipv6
```

`salt.modules.iptables.set_policy` (*table='filter', chain=None, policy=None, family='ipv4'*)

Set the current policy for the specified table/chain

CLI Example:

```
salt '*' iptables.set_policy filter INPUT ACCEPT

IPv6:
salt '*' iptables.set_policy filter INPUT ACCEPT family=ipv6
```

`salt.modules.iptables.version` (*family='ipv4'*)

Return version from iptables --version

CLI Example:

```
salt '*' iptables.version

IPv6:
salt '*' iptables.version family=ipv6
```

### 14.7.164 salt.modules.iwtools module

Support for Wireless Tools for Linux

`salt.modules.iwtools.list_interfaces` (*style=None*)  
List all of the wireless interfaces

CLI Example:  
`salt minion iwtools.list_interfaces`

`salt.modules.iwtools.scan` (*iface, style=None*)  
List networks on a wireless interface

CLI Examples:  
`salt minion iwtools.scan wlp3s0` `salt minion iwtools.scan wlp3s0 list`

`salt.modules.iwtools.set_mode` (*iface, mode*)  
List networks on a wireless interface

CLI Example:  
`salt minion iwtools.set_mode wlp3s0 Managed`

### 14.7.165 salt.modules.jboss7

Module for managing JBoss AS 7 through the CLI interface.

New in version 2015.5.0.

In order to run each function, `jboss_config` dictionary with the following properties must be passed:

- `cli_path`: the path to `jboss-cli` script, for example: ``/opt/jboss/jboss-7.0/bin/jboss-cli.sh``
- `controller`: the IP address and port of controller, for example: `10.11.12.13:9999`
- `cli_user`: username to connect to jboss administration console if necessary
- `cli_password`: password to connect to jboss administration console if necessary

Example:

```
jboss_config:
  cli_path: '/opt/jboss/jboss-7.0/bin/jboss-cli.sh'
  controller: 10.11.12.13:9999
  cli_user: 'jbossadm'
  cli_password: 'jbossadm'
```

`salt.modules.jboss7.create_datasource` (*jboss\_config, name, datasource\_properties, profile=None*)

Create datasource in running jboss instance

**jboss\_config** Configuration dictionary with properties specified above.

**name** Datasource name

**datasource\_properties**

A dictionary of datasource properties to be created:

- `driver-name`: `mysql`
- `connection-url`: ``jdbc:mysql://localhost:3306/sampleDatabase``
- `jndi-name`: ``java:jboss/datasources/sampleDS``
- `user-name`: `sampleuser`

- password: secret
- min-pool-size: 3
- use-java-context: True

**profile** The profile name (JBoss domain mode only)

CLI Example:

```
salt '*' jboss7.create_datasource '{"cli_path": "integration.modules.sysmod.
↳ SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user":
↳ "jbossadm", "cli_password": "jbossadm"}' 'my_datasource' '{"driver-name": "mysql
↳ ", "connection-url": "jdbc:mysql://localhost:3306/sampleDatabase", "jndi-name":
↳ "java:jboss/datasources/sampleDS", "user-name": "sampleuser", "password":
↳ "secret", "min-pool-size": 3, "use-java-context": True}'
```

**salt.modules.jboss7.create\_simple\_binding**(*jboss\_config*, *binding\_name*, *value*, *profile=None*)

Create a simple jndi binding in the running jboss instance

**jboss\_config** Configuration dictionary with properties specified above.

**binding\_name** Binding name to be created

**value** Binding value

**profile** The profile name (JBoss domain mode only)

CLI Example:

```
salt '*' jboss7.create_simple_binding \
    '{"cli_path": "integration.modules.sysmod.SysModuleTest.test_valid_docs", \
    "controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_password":
↳ "jbossadm"}' \
    my_binding_name my_binding_value
```

**salt.modules.jboss7.deploy**(*jboss\_config*, *source\_file*)

Deploy the application on the jboss instance from the local file system where minion is running.

**jboss\_config** Configuration dictionary with properties specified above.

**source\_file** Source file to deploy from

CLI Example:

```
salt '*' jboss7.deploy '{"cli_path": "integration.modules.sysmod.SysModuleTest.
↳ test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm",
↳ "cli_password": "jbossadm"}' /opt/deploy_files/my_deploy
```

**salt.modules.jboss7.list\_deployments**(*jboss\_config*)

List all deployments on the jboss instance

**jboss\_config**

Configuration dictionary with properties specified above.

CLI Example:

```
salt '*' jboss7.list_deployments '{"cli_path": "integration.modules.sysmod.
↳ SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user
↳ ": "jbossadm", "cli_password": "jbossadm"}'
```

**salt.modules.jboss7.read\_datasource**(*jboss\_config*, *name*, *profile=None*)

Read datasource properties in the running jboss instance.

**jboss\_config** Configuration dictionary with properties specified above.

**name** Datasource name

**profile** Profile name (JBoss domain mode only)

CLI Example:

```
salt '*' jboss7.read_datasource '{"cli_path": "integration.modules.sysmod.
↳ SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user":
↳ "jbossadm", "cli_password": "jbossadm}"'
```

`salt.modules.jboss7.read_simple_binding(jboss_config, binding_name, profile=None)`

Read jndi binding in the running jboss instance

**jboss\_config** Configuration dictionary with properties specified above.

**binding\_name** Binding name to be created

**profile** The profile name (JBoss domain mode only)

CLI Example:

```

```

```
salt '*' jboss7.read_simple_binding '{"cli_path": "integration.modules.sysmod.SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_password": "jbossadm"}' my_binding_name
```

`salt.modules.jboss7.reload(jboss_config, host=None)`

Reload running jboss instance

**jboss\_config** Configuration dictionary with properties specified above.

**host** The name of the host. JBoss domain mode only - and required if running in domain mode. The host name is the `name` attribute of the `host` element in `host.xml`

CLI Example:

```
salt '*' jboss7.reload '{"cli_path": "integration.modules.sysmod.SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_password": "jbossadm}"'
```

`salt.modules.jboss7.remove_datasource(jboss_config, name, profile=None)`

Remove an existing datasource from the running jboss instance.

**jboss\_config** Configuration dictionary with properties specified above.

**name** Datasource name

**profile** The profile (JBoss domain mode only)

CLI Example:

```
salt '*' jboss7.remove_datasource '{"cli_path": "integration.modules.sysmod.SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_password": "jbossadm"}' my_datasource_name
```

`salt.modules.jboss7.status(jboss_config, host=None, server_config=None)`

Get status of running jboss instance.

**jboss\_config** Configuration dictionary with properties specified above.

**host** The name of the host. JBoss domain mode only - and required if running in domain mode. The host name is the `name` attribute of the `host` element in `host.xml`

**server\_config** The name of the Server Configuration. JBoss Domain mode only - and required if running in domain mode.

CLI Example:

```
salt '*' jboss7.status '{"cli_path": "integration.modules.sysmod.SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_password": "jbossadm}"'
```

`salt.modules.jboss7.stop_server(jboss_config, host=None)`

Stop running jboss instance

**jboss\_config** Configuration dictionary with properties specified above.

**host** The name of the host. JBoss domain mode only - and required if running in domain mode. The host name is the `name` attribute of the `host` element in `host.xml`

CLI Example:

```
salt '*' jboss7.stop_server '{"cli_path": "integration.modules.sysmod.
↳ SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user":
↳ "jbossadm", "cli_password": "jbossadm"}'
```

**salt.modules.jboss7.undeploy**(*jboss\_config, deployment*)

Undeploy the application from jboss instance

**jboss\_config** Configuration dictionary with properties specified above.

**deployment** Deployment name to undeploy

CLI Example:

```
salt '*' jboss7.undeploy '{"cli_path": "integration.modules.sysmod.SysModuleTest.
↳ test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm",
↳ "cli_password": "jbossadm"}' my_deployment
```

**salt.modules.jboss7.update\_datasource**(*jboss\_config, name, new\_properties, profile=None*)

Update an existing datasource in running jboss instance. If the property doesn't exist it will be created, if it does, it will be updated with the new value

**jboss\_config** Configuration dictionary with properties specified above.

**name** Datasource name

**new\_properties**

A dictionary of datasource properties to be updated. For example:

- driver-name: mysql
- connection-url: `jdbc:mysql://localhost:3306/sampleDatabase`
- jndi-name: `java:jboss/datasources/sampleDS`
- user-name: sampleuser
- password: secret
- min-pool-size: 3
- use-java-context: True

**profile** The profile name (JBoss domain mode only)

CLI Example:

```
salt '*' jboss7.update_datasource '{"cli_path": "integration.modules.sysmod.
↳ SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user":
↳ "jbossadm", "cli_password": "jbossadm"}' 'my_datasource' '{"driver-name": "mysql
↳ ", "connection-url": "jdbc:mysql://localhost:3306/sampleDatabase", "jndi-name":
↳ "java:jboss/datasources/sampleDS", "user-name": "sampleuser", "password":
↳ "secret", "min-pool-size": 3, "use-java-context": True}'
```

**salt.modules.jboss7.update\_simple\_binding**(*jboss\_config, binding\_name, value, profile=None*)

Update the simple jndi binding in the running jboss instance

**jboss\_config** Configuration dictionary with properties specified above.

**binding\_name** Binding name to be updated

**value** New binding value

**profile** The profile name (JBoss domain mode only)

CLI Example:

```
salt '*' jboss7.update_simple_binding '{"cli_path": "integration.modules.sysmod.
↳SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user":
↳"jbossadm", "cli_password": "jbossadm"}' my_binding_name my_binding_value
```

### 14.7.166 salt.modules.jboss7\_cli

Module for low-level interaction with JbossAS7 through CLI.

This module exposes two ways of interaction with the CLI, either through commands or operations.

---

**Note:** Following JBoss documentation (<https://developer.jboss.org/wiki/CommandLineInterface>): ``Operations are considered a low level but comprehensive way to manage the AS controller, i.e. if it can't be done with operations it can't be done in any other way. Commands, on the other hand, are more user-friendly in syntax, although most of them still translate into operation requests and some of them even into a few composite operation requests, i.e. commands also simplify some management operations from the user's point of view."`

---

The difference between calling a command or operation is in handling the result. Commands return a zero return code if operation is successful or return non-zero return code and print an error to standard output in plain text, in case of an error.

Operations return a json-like structure, that contain more information about the result. In case of a failure, they also return a specific return code. This module parses the output from the operations and returns it as a dictionary so that an execution of an operation can then be verified against specific errors.

In order to run each function, `jboss_config` dictionary with the following properties must be passed:

- `cli_path`: the path to jboss-cli script, for example: ``/opt/jboss/jboss-7.0/bin/jboss-cli.sh'`
- `controller`: the IP address and port of controller, for example: `10.11.12.13:9999`
- `cli_user`: username to connect to jboss administration console if necessary
- `cli_password`: password to connect to jboss administration console if necessary

Example:

```
jboss_config:
  cli_path: '/opt/jboss/jboss-7.0/bin/jboss-cli.sh'
  controller: 10.11.12.13:9999
  cli_user: 'jbossadm'
  cli_password: 'jbossadm'
```

`salt.modules.jboss7_cli.run_command(jboss_config, command, fail_on_error=True)`

Execute a command against jboss instance through the CLI interface.

**jboss\_config** Configuration dictionary with properties specified above.

**command** Command to execute against jboss instance

**fail\_on\_error (default=True)** Is true, raise `CommandExecutionException` exception if execution fails. If false, ``success'` property of the returned dictionary is set to False

CLI Example:

```
salt '*' jboss7_cli.run_command '{"cli_path": "integration.modules.sysmod.
↳SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user":
↳"jbossadm", "cli_password": "jbossadm"}' my_command
```

`salt.modules.jboss7_cli.run_operation(jboss_config, operation, fail_on_error=True, retries=1)`

Execute an operation against jboss instance through the CLI interface.

**jboss\_config** Configuration dictionary with properties specified above.

**operation** An operation to execute against jboss instance

**fail\_on\_error (default=True)** Is true, raise CommandExecutionException exception if execution fails. If false, 'success' property of the returned dictionary is set to False

**retries:** Number of retries in case of ``JBAS012144: Could not connect to remote" error.

CLI Example:

```
salt '*' jboss7_cli.run_operation '{"cli_path": "integration.modules.sysmod.
↳ SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user":
↳ "jbossadm", "cli_password": "jbossadm"}' my_operation
```

### 14.7.167 salt.modules.jenkins module

Module for controlling Jenkins

**depends** python-jenkins

New in version 2016.3.0.

**depends** python-jenkins Python module (not to be confused with jenkins)

**configuration** This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
jenkins:
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

**salt.modules.jenkins.build\_job** (*name=None, parameters=None*)

Initiate a build for the provided job.

**Parameters**

- **name** -- The name of the job is check if it exists.
- **parameters** -- Parameters to send to the job.

**Returns** True is successful, otherwise raise an exception.

CLI Example:

```
salt '*' jenkins.build_job jobname
```

**salt.modules.jenkins.create\_job** (*name=None, config\_xml=None, saltenv='base'*)

Return the configuration file.

**Parameters**

- **name** -- The name of the job is check if it exists.
- **config\_xml** -- The configuration file to use to create the job.
- **saltenv** -- The environment to look for the file in.

**Returns** The configuration file used for the job.

CLI Example:

```
salt '*' jenkins.create_job jobname
salt '*' jenkins.create_job jobname config_xml='salt://jenkins/config.xml'
```

`salt.modules.jenkins.delete_job`(*name=None*)

Return true is job is deleted successfully.

**Parameters** **name** -- The name of the job to delete.

**Returns** Return true if job is deleted successfully.

CLI Example:

```
salt '*' jenkins.delete_job jobname
```

`salt.modules.jenkins.disable_job`(*name=None*)

Return true is job is disabled successfully.

**Parameters** **name** -- The name of the job to disable.

**Returns** Return true if job is disabled successfully.

CLI Example:

```
salt '*' jenkins.disable_job jobname
```

`salt.modules.jenkins.enable_job`(*name=None*)

Return true is job is enabled successfully.

**Parameters** **name** -- The name of the job to enable.

**Returns** Return true if job is enabled successfully.

CLI Example:

```
salt '*' jenkins.enable_job jobname
```

`salt.modules.jenkins.get_job_config`(*name=None*)

Return the current job configuration for the provided job.

**Parameters** **name** -- The name of the job to return the configuration for.

**Returns** The configuration for the job specified.

CLI Example:

```
salt '*' jenkins.get_job_config jobname
```

`salt.modules.jenkins.get_job_info`(*name=None*)

Return information about the Jenkins job.

**Parameters** **name** -- The name of the job is check if it exists.

**Returns** Information about the Jenkins job.

CLI Example:

```
salt '*' jenkins.get_job_info jobname
```

`salt.modules.jenkins.get_jobs`()

Return the currently configured jobs.

**Returns** The currently configured jobs.

CLI Example:

```
salt '*' jenkins.get_jobs
```

`salt.modules.jenkins.get_version`()

Return version of Jenkins

**Returns** The version of Jenkins

CLI Example:

```
salt '*' jenkins.get_version
```

`salt.modules.jenkins.job_exists` (*name=None*)

Check whether the job exists in configured Jenkins jobs.

**Parameters** **name** -- The name of the job is check if it exists.

**Returns** True if job exists, False if job does not exist.

CLI Example:

```
salt '*' jenkins.job_exists jobname
```

`salt.modules.jenkins.job_status` (*name=None*)

Return the current status, enabled or disabled, of the job.

**Parameters** **name** -- The name of the job to return status for

**Returns** Return true if enabled or false if disabled.

CLI Example:

```
salt '*' jenkins.job_status jobname
```

`salt.modules.jenkins.plugin_installed` (*name*)

New in version 2016.11.0.

Return if the plugin is installed for the provided plugin name.

**Parameters** **name** -- The name of the parameter to confirm installation.

**Returns** True if plugin exists, False if plugin does not exist.

CLI Example:

```
salt '*' jenkins.plugin_installed pluginName
```

`salt.modules.jenkins.run` (*script*)

New in version 2017.7.0.

Execute a groovy script on the jenkins master

**Parameters** **script** -- The groovy script

CLI Example:

`salt.modules.jenkins.update_job` (*name=None, config\_xml=None, saltenv='base'*)

Return the updated configuration file.

**Parameters**

- **name** -- The name of the job is check if it exists.
- **config\_xml** -- The configuration file to use to create the job.
- **saltenv** -- The environment to look for the file in.

**Returns** The configuration file used for the job.

CLI Example:

```
salt '*' jenkins.update_job jobname
salt '*' jenkins.update_job jobname config_xml='salt://jenkins/config.xml'
```

### 14.7.168 salt.modules.junos

Module to interact with Junos devices.

maturity new

dependencies junos-eznc, jxmlease

---

**Note:** Those who wish to use junos-eznc (PyEZ) version >= 2.1.0, must use the latest salt code from github until the next release.

---

Refer to *junos* for information on connecting to junos proxy.

`salt.modules.junos.cli` (*command=None, format='text', \*\*kwargs*)

Executes the CLI commands and returns the output in specified format. (default is text) The output can also be stored in a file.

Usage:

```
salt 'device_name' junos.cli 'show system commit'

salt 'device_name' junos.cli 'show version' dev_timeout=40

salt 'device_name' junos.cli 'show system alarms' 'xml' dest=/home/user/cli_
↳output.txt
```

#### Parameters

- **Required** --

- `command`: The command that need to be executed on Junos CLI. (default = None)

- **Optional** --

- `format`: Format in which to get the CLI output. (text or xml, default = `text`)
- `kwargs`: Keyworded arguments which can be provided like-
  - \* `dev_timeout`: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
  - \* `dest`: The destination file where the CLI output can be stored. (default = None)

`salt.modules.junos.commit` (*\*\*kwargs*)

To commit the changes loaded in the candidate configuration.

Usage:

```
salt 'device_name' junos.commit comment='Committing via saltstack' detail=True

salt 'device_name' junos.commit dev_timeout=60 confirm=10

salt 'device_name' junos.commit sync=True dev_timeout=90
```

#### Parameters **Optional** --

- `kwargs`: Keyworded arguments which can be provided like-

- `dev_timeout`: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
- `comment`: Provide a comment to the commit. (default = None)

- confirm: Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the given time unless the commit is confirmed.
- sync: On dual control plane systems, requests that the candidate configuration on one control plane be copied to the other control plane, checked for correct syntax, and committed on both Routing Engines. (default = False)
- force\_sync: On dual control plane systems, force the candidate configuration on one control plane to be copied to the other control plane.
- full: When set to True requires all the daemons to check and evaluate the new configuration.
- detail: When true return commit detail.

`salt.modules.junos.commit_check()`

Perform a commit check on the configuration.

Usage:

```
salt 'device_name' junos.commit_check
```

`salt.modules.junos.diff(id=0)`

Gives the difference between the candidate and the current configuration.

Usage:

```
salt 'device_name' junos.diff 3
```

Parameters **Optional** --

- id: The rollback id value [0-49]. (default = 0)

`salt.modules.junos.facts()`

Displays the facts gathered during the connection. These facts are also stored in Salt grains.

Usage:

```
salt 'device_name' junos.facts
```

`salt.modules.junos.facts_refresh()`

Reload the facts dictionary from the device. Usually only needed if, the device configuration is changed by some other actor. This function will also refresh the facts stored in the salt grains.

Usage:

```
salt 'device_name' junos.facts_refresh
```

`salt.modules.junos.file_copy(src=None, dest=None)`

Copies the file from the local device to the junos device.

Usage:

```
salt 'device_name' junos.file_copy /home/m2/info.txt info_copy.txt
```

Parameters **Required** --

- src: The source path where the file is kept.
- dest: The destination path where the file will be copied.

`salt.modules.junos.install_config` (*path=None, \*\*kwargs*)

Installs the given configuration file into the candidate configuration. Commits the changes if the commit checks or throws an error.

Usage:

```
salt 'device_name' junos.install_config 'salt://production/network/routers/config.
↳set'

salt 'device_name' junos.install_config 'salt://templates/replace_config.conf'
↳replace=True comment='Committed via SaltStack'

salt 'device_name' junos.install_config 'salt://my_new_configuration.conf' dev_
↳timeout=300 diffs_file='/salt/confs/old_config.conf' overwrite=True

salt 'device_name' junos.install_config 'salt://syslog_template.conf' template_
↳vars='{"syslog_host": "10.180.222.7"}'
```

### Parameters

#### • Required --

- `path`: Path where the configuration/template file is present. If the file has a `.conf` extension, the content is treated as text format. If the file has a `.xml` extension, the content is treated as XML format. If the file has a `*.set` extension, the content is treated as Junos OS `set` commands.(default = None)

#### • Optional --

- `kwargs`: Keyworded arguments which can be provided like-

- \* `mode`: The mode in which the configuration is locked. (Options: private, dynamic, batch, exclusive; default= exclusive)
- \* `dev_timeout`: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
- \* `overwrite`: Set to True if you want this file is to completely replace the configuration file. (default = False)
- \* `replace`: Specify whether the configuration file uses `replace:` statements. Those statements under the `replace` tag will only be changed. (default = False)
- \* `format`: Determines the format of the contents.
- \* `update`: Compare a complete loaded configuration against the candidate configuration. For each hierarchy level or configuration object that is different in the two configurations, the version in the loaded configuration replaces the version in the candidate configuration. When the configuration is later committed, only system processes that are affected by the changed configuration elements parse the new configuration. This action is supported from PyEZ 2.1 (default = False)
- \* `comment`: Provide a comment to the commit. (default = None)
- \* `confirm`: Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the given time unless the commit is confirmed.
- \* `diffs_file`: Path to the file where the diff (difference in old configuration and the committed configuration) will be stored.(default = None) Note that the

file will be stored on the proxy minion. To push the files to the master use the salt's following execution module: `cp.push`

- \* `template_vars`: Variables to be passed into the template processing engine in addition to those present in `__pillar__`, `__opts__`, `__grains__`, etc. You may reference these variables in your template like so: `{{ template_vars["var_name"] }}`

`salt.modules.junos.install_os` (*path=None, \*\*kwargs*)

Installs the given image on the device. After the installation is complete the device is rebooted, if `reboot=True` is given as a keyworded argument.

Usage:

```
salt 'device_name' junos.install_os 'salt://images/junos_image.tgz' reboot=True
salt 'device_name' junos.install_os 'salt://junos_16_1.tgz' dev_timeout=300
```

#### Parameters

- **Required** --

- `path`: Path where the image file is present on the proxy minion.

- **Optional** --

- `kwargs`: keyworded arguments to be given such as `dev_timeout`, `reboot` etc
  - \* `dev_timeout`: Set NETCONF RPC timeout. Can be used to RPCs which take a while to execute. (default = 30 seconds)
  - \* `reboot`: Whether to reboot after installation (default = False)
  - \* `no_copy`: When True the software package will not be SCP'd to the device. (default = False)

`salt.modules.junos.load` (*path=None, \*\*kwargs*)

Loads the configuration from the file provided onto the device.

Usage:

```
salt 'device_name' junos.load 'salt://production/network/routers/config.set'
salt 'device_name' junos.load 'salt://templates/replace_config.conf' replace=True
salt 'device_name' junos.load 'salt://my_new_configuration.conf' overwrite=True
salt 'device_name' junos.load 'salt://syslog_template.conf' template_vars='{
↳ "syslog_host": "10.180.222.7"}'
```

#### Parameters

- **Required** --

- `path`: Path where the configuration/template file is present. If the file has a `.conf` extension, the content is treated as text format. If the file has a `.xml` extension, the content is treated as XML format. If the file has a `*.set` extension, the content is treated as Junos OS `set` commands.(default = None)

- **Optional** --

- `kwargs`: Keyworded arguments which can be provided like-

- \* `overwrite`: Set to True if you want this file is to completely replace the configuration file. (default = False)
- \* `replace`: Specify whether the configuration file uses ``replace:" statements. Those statements under the `replace' tag will only be changed. (default = False)
- \* `format`: Determines the format of the contents.
- \* `update`: Compare a complete loaded configuration against the candidate configuration. For each hierarchy level or configuration object that is different in the two configurations, the version in the loaded configuration replaces the version in the candidate configuration. When the configuration is later committed, only system processes that are affected by the changed configuration elements parse the new configuration. This action is supported from PyEZ 2.1 (default = False)
- \* `template_vars`: Variables to be passed into the template processing engine in addition to those present in `__pillar__`, `__opts__`, `__grains__`, etc. You may reference these variables in your template like so: `{{ template_vars["var_name"] }}`

`salt.modules.junos.lock()`

Attempts an exclusive lock on the candidate configuration. This is a non-blocking call.

---

**Note:** Any user who wishes to use `lock`, must necessarily unlock the configuration too. Ensure `unlock` is called in the same orchestration run in which the lock is called.

---

Usage:

```
salt 'device_name' junos.lock
```

`salt.modules.junos.ping(dest_ip=None, **kwargs)`

To send ping RPC to a device.

Usage:

```
salt 'device_name' junos.ping '8.8.8.8' count=5
salt 'device_name' junos.ping '8.8.8.8' ttl=1 rapid=True
```

#### Parameters

- **Required** --

- `dest_ip`: The IP which is to be pinged. (default = None)

- **Optional** --

- `kwargs`: Keyworded arguments which can be provided like-

- \* `dev_timeout`: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
- \* `rapid`: Setting this to True executes ping at 100pps instead of 1pps. (default = False)
- \* `ttl`: Maximum number of IP routers (IP hops) allowed between source and destination.
- \* `routing_instance`: Name of the routing instance to use to send the ping.

- \* interface: Interface used to send traffic out.
- \* count: Number of packets to send. (default = 5)

`salt.modules.junos.rollback`(*id=0, \*\*kwargs*)

To rollback the last committed configuration changes and commit the same.

Usage:

```
salt 'device_name' junos.rollback 10
```

Parameters **Optional** --

- **id**: The rollback id value [0-49]. (default = 0)
- **kwargs**: Keyworded arguments which can be provided like-
  - **dev\_timeout**: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
  - **comment**: Provide a comment to the commit. (default = None)
  - **confirm**: Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the given time unless the commit is confirmed.
  - **diffs\_file**: Path to the file where any diffs will be written. (default = None)

`salt.modules.junos.rpc`(*cmd=None, dest=None, format='xml', \*\*kwargs*)

This function executes the rpc provided as arguments on the junos device. The returned data can be stored in a file.

Usage:

```
salt 'device' junos.rpc 'get_config' '/var/log/config.txt' 'text' filter='
↳<configuration><system/></configuration>'

salt 'device' junos.rpc 'get-interface-information' '/home/user/interface.xml'
↳interface_name='lo0' terse=True

salt 'device' junos.rpc 'get-chassis-inventory'
```

Parameters

- **Required** --
  - **cmd**: The rpc to be executed. (default = None)
- **Optional** --
  - **dest**: Destination file where the rpc output is stored. (default = None) Note that the file will be stored on the proxy minion. To push the files to the master use the salt's following execution module: *cp.push*
  - **format**: The format in which the rpc reply is received from the device. (default = xml)
  - **kwargs**: keyworded arguments taken by rpc call like-
    - \* **dev\_timeout**: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default= 30 seconds)
    - \* **filter**: Only to be used with 'get-config' rpc to get specific configuration.
    - \* **terse**: Amount of information you want.

\* `interface_name`: Name of the interface whose information you want.

`salt.modules.junos.set_hostname` (`hostname=None`, `**kwargs`)

To set the name of the device.

Usage:

```
salt 'device_name' junos.set_hostname salt-device
```

#### Parameters

- **Required** --

- `hostname`: The name to be set. (default = None)

- **Optional** --

- `kwargs`: Keyworded arguments which can be provided like-

- \* `dev_timeout`: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)

- \* `comment`: Provide a comment to the commit. (default = None)

- \* `confirm`: Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the given time unless the commit is confirmed.

`salt.modules.junos.shutdown` (`**kwargs`)

Shut down (power off) or reboot a device running Junos OS. This includes all Routing Engines in a Virtual Chassis or a dual Routing Engine system.

Usage:

```
salt 'device_name' junos.shutdown reboot=True
salt 'device_name' junos.shutdown shutdown=True in_min=10
salt 'device_name' junos.shutdown shutdown=True
```

#### Parameters **Optional** --

- `kwargs`:

- `shutdown`: Set this to true if you want to shutdown the machine. (default=False, this is a safety mechanism so that the user does not accidentally shutdown the junos device.)

- `reboot`: Whether to reboot instead of shutdown. (default=False) Note that either one of the above arguments has to be specified (shutdown or reboot) for this function to work.

- `at`: Date and time the reboot should take place. The string must match the junos cli reboot syntax (To be used only if `reboot=True`)

- `in_min`: Specify delay in minutes for shutdown

`salt.modules.junos.unlock` ()

Unlocks the candidate configuration.

Usage:

```
salt 'device_name' junos.unlock
```

`salt.modules.junos.zeroize()`  
Resets the device to default factory settings

Usage:

```
salt 'device_name' junos.zeroize
```

### 14.7.169 salt.modules.k8s

Salt module to manage Kubernetes cluster

New in version 2016.3.0.

Roadmap:

- Add creation of K8S objects (pod, rc, service, ...)
- Add replace of K8S objects (pod, rc, service, ...)
- Add deletion of K8S objects (pod, rc, service, ...)
- Add rolling update
- Add (auto)scaling

`salt.modules.k8s.create_namespace(name, apiserver_url=None)`

New in version 2016.3.0.

Create kubernetes namespace from the name, similar to the functionality added to kubectl since v.1.2.0: ..  
code-block:: bash

```
kubectl create namespaces namespace-name
```

CLI Example:

```
salt '*' k8s.create_namespace namespace_name
salt '*' k8s.create_namespace namespace_name http://kube-master.cluster.local
```

`salt.modules.k8s.create_secret(namespace, name, sources, apiserver_url=None, force=False, update=False, saltenv='base')`

New in version 2016.3.0.

Create k8s secrets in the defined namespace from the list of files

CLI Example:

```
salt '*' k8s.create_secret namespace_name secret_name sources
salt '*' k8s.create_secret namespace_name secret_name sources
http://kube-master.cluster.local
```

`sources` are either dictionary of {name: path, name1: path} pairs or array of strings defining paths.

Example of paths array:

```
['/full/path/filename',
 ``file:///full/path/filename",
 ``salt://secret/storage/file.txt",
 ``http://user:password@securesite.com/secret-file.json"]
```

Example of dictionaries:

```
{'nameit': '/full/path/filename', name2: ``salt://secret/storage/file.txt"}
```

optional parameters accepted:

update=[false] default value is false if set to false, and secret is already present on the cluster - warning will be returned and no changes to the secret will be done. In case it is set to ``true" and secret is present but data is differ - secret will be updated.

force=[true] default value is true if the to False, secret will not be created in case one of the files is not valid kubernetes secret. e.g. capital letters in secret name or \_ in case force is set to True, wrong files will be skipped but secret will be created any way.

saltenv=['base'] default value is base in case `salt://` path is used, this parameter can change the visibility of files

`salt.modules.k8s.delete_secret(namespace, name, apiserver_url=None, force=True)`

New in version 2016.3.0.

Delete kubernetes secret in the defined namespace. Namespace is the mandatory parameter as well as name.

CLI Example:

```
salt '*' k8s.delete_secret namespace_name secret_name
salt '*' k8s.delete_secret namespace_name secret_name http://kube-master.cluster.
↳ local
```

`salt.modules.k8s.get_labels(node=None, apiserver_url=None)`

New in version 2016.3.0.

Get labels from the current node

CLI Example:

```
salt '*' k8s.get_labels
salt '*' k8s.get_labels kube-node.cluster.local http://kube-master.cluster.local
```

`salt.modules.k8s.get_namespaces(namespace='', apiserver_url=None)`

New in version 2016.3.0.

Get one or all kubernetes namespaces.

If namespace parameter is omitted, all namespaces will be returned back to user, similar to following kubectl example:

```
kubectl get namespaces -o json
```

In case namespace is set by user, the output will be similar to the one from kubectl:

```
kubectl get namespaces namespace_name -o json
```

CLI Example:

```
salt '*' k8s.get_namespaces
salt '*' k8s.get_namespaces namespace_name http://kube-master.cluster.local
```

`salt.modules.k8s.get_secrets(namespace, name='', apiserver_url=None, decode=False, brief=False)`

Get k8s namespaces

CLI Example:

```
salt '*' k8s.get_secrets namespace_name
salt '*' k8s.get_secrets namespace_name secret_name http://kube-master.cluster.
↳local
```

`salt.modules.k8s.label_absent` (*name*, *node=None*, *apiserver\_url=None*)

New in version 2016.3.0.

Delete label to the current node

CLI Example:

```
salt '*' k8s.label_absent hw/disktype
salt '*' k8s.label_absent hw/disktype kube-node.cluster.local http://kube-master.
↳cluster.local
```

`salt.modules.k8s.label_folder_absent` (*name*, *node=None*, *apiserver\_url=None*)

New in version 2016.3.0.

Delete label folder to the current node

CLI Example:

```
salt '*' k8s.label_folder_absent hw
salt '*' k8s.label_folder_absent hw/ kube-node.cluster.local http://kube-master.
↳cluster.local
```

`salt.modules.k8s.label_present` (*name*, *value*, *node=None*, *apiserver\_url=None*)

New in version 2016.3.0.

Set label to the current node

CLI Example:

```
salt '*' k8s.label_present hw/disktype ssd
salt '*' k8s.label_present hw/disktype ssd kube-node.cluster.local http://kube-
↳master.cluster.local
```

`salt.modules.k8s.update_secret` (*namespace*, *name*, *sources*, *apiserver\_url=None*, *force=True*, *saltenv='base'*)

New in version 2016.3.0.

alias to `k8s.create_secret` with `update=true`

CLI Example:

```
salt '*' k8s.update_secret namespace_name secret_name sources [apiserver_url]
↳[force=true] [update=false] [saltenv='base']
```

*sources* are either dictionary of {*name*: *path*, *name1*: *path*} pairs or array of strings defining paths.

Example of paths array:

```
['/full/path/filename',
 ``file:///full/path/filename'',
 ``salt://secret/storage/file.txt'',
 ``http://user:password@securesite.com/secret-file.json"]
```

Example of dictionaries:

```
{`nameit': `~/full/path/filename', name2: ``salt://secret/storage/file.txt"}
```

optional parameters accepted:

**force**=[true] default value is true if the to False, secret will not be created in case one of the files is not valid kubernetes secret. e.g. capital letters in secret name or `_` in case force is set to True, wrong files will be skipped but secret will be created any way.

**saltenv**=['base'] default value is base in case ``salt://'` path is used, this parameter can change the visibility of files

### 14.7.170 salt.modules.kapacitor module

Kapacitor execution module.

**configuration** This module accepts connection configuration details either as parameters or as configuration settings in `/etc/salt/minion` on the relevant minions:

```
kapacitor.host: 'localhost'
kapacitor.port: 9092
```

This data can also be passed into pillar. Options passed into `opts` will overwrite options passed into pillar.

New in version 2016.11.0.

**salt.modules.kapacitor.define\_task**(*name*, *tick\_script*, *task\_type*='stream', *database*=None, *retention\_policy*='default')

Define a task. Serves as both create/update.

**name** Name of the task.

**tick\_script** Path to the TICK script for the task. Can be a `salt://` source.

**task\_type** Task type. Defaults to ``stream'`

**database** Which database to fetch data from. Defaults to None, which will use the default database in InfluxDB.

**retention\_policy** Which retention policy to fetch data from. Defaults to ``default'`.

CLI Example:

```
salt '*' kapacitor.define_task cpu salt://kapacitor/cpu.tick database=telegraf
```

**salt.modules.kapacitor.delete\_task**(*name*)

Delete a kapacitor task.

**name** Name of the task to delete.

CLI Example:

```
salt '*' kapacitor.delete_task cpu
```

**salt.modules.kapacitor.disable\_task**(*name*)

Disable a kapacitor task.

**name** Name of the task to disable.

CLI Example:

```
salt '*' kapacitor.disable_task cpu
```

**salt.modules.kapacitor.enable\_task**(*name*)

Enable a kapacitor task.

**name** Name of the task to enable.

CLI Example:

```
salt '*' kapacitor.enable_task cpu
```

`salt.modules.kapacitor.get_task(name)`

Get a dict of data on a task.

**name** Name of the task to get information about.

CLI Example:

```
salt '*' kapacitor.get_task cpu
```

`salt.modules.kapacitor.version(*args, **kwargs)`

Get the kapacitor version.

### 14.7.171 salt.modules.kerberos

Manage Kerberos KDC

**configuration** In order to manage your KDC you will need to generate a keytab that can authenticate without requiring a password.

```
# ktadd -k /root/secure.keytab kadmin/admin kadmin/changepw
```

On the KDC minion you will need to add the following to the minion configuration file so Salt knows what keytab to use and what principal to authenticate as.

```
auth_keytab: /root/auth.keytab
auth_principal: kadmin/admin
```

`salt.modules.kerberos.create_keytab(name, keytab, enctypees=None)`

Create keytab

CLI Example:

```
salt 'kdc.example.com' kerberos.create_keytab host/host1.example.com host1.
↳example.com.keytab
```

`salt.modules.kerberos.create_principal(name, enctypees=None)`

Create Principal

CLI Example:

```
salt 'kdc.example.com' kerberos.create_principal host/example.com
```

`salt.modules.kerberos.delete_principal(name)`

Delete Principal

CLI Example:

```
salt 'kdc.example.com' kerberos.delete_principal host/example.com@EXAMPLE.COM
```

`salt.modules.kerberos.get_policy(name)`

Get policy details

CLI Example:

```
salt 'kdc.example.com' kerberos.get_policy my_policy
```

`salt.modules.kerberos.get_principal(name)`

Get princial details

CLI Example:

```
salt 'kdc.example.com' kerberos.get_principal root/admin
```

`salt.modules.kerberos.get_privs()`

Current privileges

CLI Example:

```
salt 'kdc.example.com' kerberos.get_privs
```

`salt.modules.kerberos.list_policies()`

List policies

CLI Example:

```
salt 'kdc.example.com' kerberos.list_policies
```

`salt.modules.kerberos.list_principals()`

Get all principals

CLI Example:

```
salt 'kde.example.com' kerberos.list_principals
```

### 14.7.172 salt.modules.key

Functions to view the minion's public key information

`salt.modules.key.finger(hash_type=None)`

Return the minion's public key fingerprint

**hash\_type** The hash algorithm used to calculate the fingerprint

CLI Example:

```
salt '*' key.finger
```

`salt.modules.key.finger_master(hash_type=None)`

Return the fingerprint of the master's public key on the minion.

**hash\_type** The hash algorithm used to calculate the fingerprint

CLI Example:

```
salt '*' key.finger_master
```

### 14.7.173 salt.modules.keyboard

Module for managing keyboards on supported POSIX-like systems using systemd, or such as Redhat, Debian and Gentoo.

`salt.modules.keyboard.get_sys()`

Get current system keyboard setting

CLI Example:

```
salt '*' keyboard.get_sys
```

`salt.modules.keyboard.get_x()`

Get current X keyboard setting

CLI Example:

```
salt '*' keyboard.get_x
```

`salt.modules.keyboard.set_sys(layout)`

Set current system keyboard setting

CLI Example:

```
salt '*' keyboard.set_sys dvorak
```

`salt.modules.keyboard.set_x(layout)`

Set current X keyboard setting

CLI Example:

```
salt '*' keyboard.set_x dvorak
```

### 14.7.174 salt.modules.keystone

Module for handling openstack keystone calls.

**optdepends**

- keystoneclient Python adapter

**configuration** This module is not usable until the following are specified either in a pillar or in the minion's config file:

```
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.tenant_id: f80919baedab48ec8931f200c65a50df
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
```

OR (for token based authentication)

```
keystone.token: 'ADMIN'
keystone.endpoint: 'http://127.0.0.1:35357/v2.0'
```

If configuration for multiple openstack accounts is required, they can be set up as different configuration profiles. For example:

```
openstack1:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.tenant_id: f80919baedab48ec8931f200c65a50df
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'

openstack2:
```

```
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.tenant_id: f80919baedab48ec8931f200c65a50df
keystone.auth_url: 'http://127.0.0.2:5000/v2.0/'
```

With this configuration in place, any of the keystone functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' keystone.tenant_list profile=openstack1
```

`salt.modules.keystone.api_version` (*profile=None, \*\*connection\_args*)  
Returns the API version derived from endpoint's response.

CLI Example:

```
salt '*' keystone.api_version
```

`salt.modules.keystone.auth` (*profile=None, \*\*connection\_args*)  
Set up keystone credentials. Only intended to be used within Keystone-enabled modules.

CLI Example:

```
salt '*' keystone.auth
```

`salt.modules.keystone.ec2_credentials_create` (*user\_id=None, name=None, tenant\_id=None, tenant=None, profile=None, \*\*connection\_args*)

Create EC2-compatible credentials for user per tenant

CLI Examples:

```
salt '*' keystone.ec2_credentials_create name=admin tenant=admin

salt '*' keystone.ec2_credentials_create user_
↳ id=c965f79c4f864eaaa9c3b41904e67082 tenant_
↳ id=722787eb540849158668370dc627ec5f
```

`salt.modules.keystone.ec2_credentials_delete` (*user\_id=None, name=None, access\_key=None, profile=None, \*\*connection\_args*)

Delete EC2-compatible credentials

CLI Examples:

```
salt '*' keystone.ec2_credentials_delete 860f8c2c38ca4fab989f9bc56a061a64
↳ access_key=5f66d2f24f604b8bb9cd28886106f442

salt '*' keystone.ec2_credentials_delete name=admin access_
↳ key=5f66d2f24f604b8bb9cd28886106f442
```

`salt.modules.keystone.ec2_credentials_get` (*user\_id=None, name=None, access=None, profile=None, \*\*connection\_args*)  
Return ec2\_credentials for a user (keystone ec2-credentials-get)

CLI Examples:

```

salt '*' keystone.ec2_credentials_get c965f79c4f864eaaa9c3b41904e67082
↳access=722787eb540849158668370
salt '*' keystone.ec2_credentials_get user_id=c965f79c4f864eaaa9c3b41904e67082
↳access=722787eb540849158668370
salt '*' keystone.ec2_credentials_get name=nova
↳access=722787eb540849158668370dc627ec5f

```

`salt.modules.keystone.ec2_credentials_list`(*user\_id=None, name=None, profile=None, \*\*connection\_args*)

Return a list of ec2\_credentials for a specific user (keystone ec2-credentials-list)

CLI Examples:

```

salt '*' keystone.ec2_credentials_list 298ce377245c4ec9b70e1c639c89e654
salt '*' keystone.ec2_credentials_list user_id=298ce377245c4ec9b70e1c639c89e654
salt '*' keystone.ec2_credentials_list name=jack

```

`salt.modules.keystone.endpoint_create`(*service, publicurl=None, internalurl=None, adminurl=None, region=None, profile=None, url=None, interface=None, \*\*connection\_args*)

Create an endpoint for an Openstack service

CLI Examples:

```

salt 'v2' keystone.endpoint_create nova 'http://public/url' 'http://internal/url'
↳'http://adminurl/url' region

salt 'v3' keystone.endpoint_create nova url='http://public/url' interface='public'
↳' region='RegionOne'

```

`salt.modules.keystone.endpoint_delete`(*service, region=None, profile=None, interface=None, \*\*connection\_args*)

Delete endpoints of an Openstack service

CLI Examples:

```

salt 'v2' keystone.endpoint_delete nova [region=RegionOne]

salt 'v3' keystone.endpoint_delete nova interface=admin [region=RegionOne]

```

`salt.modules.keystone.endpoint_get`(*service, region=None, profile=None, interface=None, \*\*connection\_args*)

Return a specific endpoint (keystone endpoint-get)

CLI Example:

```

salt 'v2' keystone.endpoint_get nova [region=RegionOne]

salt 'v3' keystone.endpoint_get nova interface=admin [region=RegionOne]

```

`salt.modules.keystone.endpoint_list`(*profile=None, \*\*connection\_args*)

Return a list of available endpoints (keystone endpoints-list)

CLI Example:

```

salt '*' keystone.endpoint_list

```

`salt.modules.keystone.project_create`(*name, domain, description=None, enabled=True, profile=None, \*\*connection\_args*)

Create a keystone project. Overrides keystone tenant\_create form api V2. For keystone api V3.

New in version 2016.11.0.

**name** The project name, which must be unique within the owning domain.

**domain** The domain name.

**description** The project description.

**enabled** Enables or disables the project.

**profile** Configuration profile - if configuration for multiple openstack accounts required.

CLI Examples:

```
salt '*' keystone.project_create nova default description='Nova Compute Project'
salt '*' keystone.project_create test default enabled=False
```

**salt.modules.keystone.project\_delete**(*project\_id=None, name=None, profile=None, \*\*connection\_args*)

Delete a project (keystone project-delete). Overrides keystone tenant-delete form api V2. For keystone api V3 only.

New in version 2016.11.0.

**project\_id** The project id.

**name** The project name.

**profile** Configuration profile - if configuration for multiple openstack accounts required.

CLI Examples:

```
salt '*' keystone.project_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.project_delete project_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.project_delete name=demo
```

**salt.modules.keystone.project\_get**(*project\_id=None, name=None, profile=None, \*\*connection\_args*)

Return a specific projects (keystone project-get) Overrides keystone tenant-get form api V2. For keystone api V3 only.

New in version 2016.11.0.

**project\_id** The project id.

**name** The project name.

**profile** Configuration profile - if configuration for multiple openstack accounts required.

CLI Examples:

```
salt '*' keystone.project_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.project_get project_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.project_get name=nova
```

**salt.modules.keystone.project\_list**(*profile=None, \*\*connection\_args*)

Return a list of available projects (keystone projects-list). Overrides keystone tenants-list form api V2. For keystone api V3 only.

New in version 2016.11.0.

**profile** Configuration profile - if configuration for multiple openstack accounts required.

CLI Example:

```
salt '*' keystone.project_list
```

**salt.modules.keystone.project\_update**(*project\_id=None, name=None, description=None, enabled=None, profile=None, \*\*connection\_args*)

Update a tenant's information (keystone project-update) The following fields may be updated: name, description, enabled. Can only update name if targeting by ID

Overrides keystone tenant\_update form api V2. For keystone api V3 only.

New in version 2016.11.0.

**project\_id** The project id.  
**name** The project name, which must be unique within the owning domain.  
**description** The project description.  
**enabled** Enables or disables the project.  
**profile** Configuration profile - if configuration for multiple openstack accounts required.  
 CLI Examples:

```
salt '*' keystone.project_update name=admin enabled=True
salt '*' keystone.project_update c965f79c4f864eaaa9c3b41904e67082 name=admin
↳email=admin@domain.com
```

**salt.modules.keystone.role\_create**(*name*, *profile=None*, *\*\*connection\_args*)  
 Create a named role.

CLI Example:

```
salt '*' keystone.role_create admin
```

**salt.modules.keystone.role\_delete**(*role\_id=None*, *name=None*, *profile=None*, *\*\*connection\_args*)  
 Delete a role (keystone role-delete)

CLI Examples:

```
salt '*' keystone.role_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.role_delete role_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.role_delete name=admin
```

**salt.modules.keystone.role\_get**(*role\_id=None*, *name=None*, *profile=None*, *\*\*connection\_args*)  
 Return a specific roles (keystone role-get)

CLI Examples:

```
salt '*' keystone.role_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.role_get role_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.role_get name=nova
```

**salt.modules.keystone.role\_list**(*profile=None*, *\*\*connection\_args*)  
 Return a list of available roles (keystone role-list)

CLI Example:

```
salt '*' keystone.role_list
```

**salt.modules.keystone.service\_create**(*name*, *service\_type*, *description=None*, *profile=None*, *\*\*connection\_args*)  
 Add service to Keystone service catalog

CLI Examples:

```
salt '*' keystone.service_create nova compute 'OpenStack Compute Service'
```

**salt.modules.keystone.service\_delete**(*service\_id=None*, *name=None*, *profile=None*, *\*\*connection\_args*)  
 Delete a service from Keystone service catalog

CLI Examples:

```
salt '*' keystone.service_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.service_delete name=nova
```

`salt.modules.keystone.service_get` (*service\_id=None, name=None, profile=None, \*\*connection\_args*)

Return a specific services (keystone service-get)

CLI Examples:

```
salt '*' keystone.service_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.service_get service_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.service_get name=nova
```

`salt.modules.keystone.service_list` (*profile=None, \*\*connection\_args*)

Return a list of available services (keystone services-list)

CLI Example:

```
salt '*' keystone.service_list
```

`salt.modules.keystone.tenant_create` (*name, description=None, enabled=True, profile=None, \*\*connection\_args*)

Create a keystone tenant

CLI Examples:

```
salt '*' keystone.tenant_create nova description='nova tenant'
salt '*' keystone.tenant_create test enabled=False
```

`salt.modules.keystone.tenant_delete` (*tenant\_id=None, name=None, profile=None, \*\*connection\_args*)

Delete a tenant (keystone tenant-delete)

CLI Examples:

```
salt '*' keystone.tenant_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.tenant_delete tenant_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.tenant_delete name=demo
```

`salt.modules.keystone.tenant_get` (*tenant\_id=None, name=None, profile=None, \*\*connection\_args*)

Return a specific tenants (keystone tenant-get)

CLI Examples:

```
salt '*' keystone.tenant_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.tenant_get tenant_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.tenant_get name=nova
```

`salt.modules.keystone.tenant_list` (*profile=None, \*\*connection\_args*)

Return a list of available tenants (keystone tenants-list)

CLI Example:

```
salt '*' keystone.tenant_list
```

`salt.modules.keystone.tenant_update` (*tenant\_id=None, name=None, description=None, enabled=None, profile=None, \*\*connection\_args*)

Update a tenant's information (keystone tenant-update) The following fields may be updated: name, description, enabled. Can only update name if targeting by ID

CLI Examples:

```
salt '*' keystone.tenant_update name=admin enabled=True
salt '*' keystone.tenant_update c965f79c4f864eaaa9c3b41904e67082 name=admin
↳email=admin@domain.com
```

`salt.modules.keystone.token_get` (*profile=None, \*\*connection\_args*)  
Return the configured tokens (keystone token-get)

CLI Example:

```
salt '*' keystone.token_get c965f79c4f864eaaa9c3b41904e67082
```

`salt.modules.keystone.user_create` (*name, password, email, tenant\_id=None, enabled=True, profile=None, project\_id=None, description=None, \*\*connection\_args*)

Create a user (keystone user-create)

CLI Examples:

```
salt '*' keystone.user_create name=jack password=zero email=jack@halloweentown.
↳org tenant_id=a28a7b5a999a455f84b1f5210264375e enabled=True
```

`salt.modules.keystone.user_delete` (*user\_id=None, name=None, profile=None, \*\*connection\_args*)

Delete a user (keystone user-delete)

CLI Examples:

```
salt '*' keystone.user_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.user_delete user_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.user_delete name=nova
```

`salt.modules.keystone.user_get` (*user\_id=None, name=None, profile=None, \*\*connection\_args*)  
Return a specific users (keystone user-get)

CLI Examples:

```
salt '*' keystone.user_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.user_get user_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.user_get name=nova
```

`salt.modules.keystone.user_list` (*profile=None, \*\*connection\_args*)  
Return a list of available users (keystone user-list)

CLI Example:

```
salt '*' keystone.user_list
```

`salt.modules.keystone.user_password_update` (*user\_id=None, name=None, password=None, profile=None, \*\*connection\_args*)

Update a user's password (keystone user-password-update)

CLI Examples:

```
salt '*' keystone.user_password_update c965f79c4f864eaaa9c3b41904e67082
↳password=12345
salt '*' keystone.user_password_update user_id=c965f79c4f864eaaa9c3b41904e67082
↳password=12345
salt '*' keystone.user_password_update name=nova password=12345
```

```
salt.modules.keystone.user_role_add(user_id=None, user=None, tenant_id=None, tenant=None,
                                     role_id=None, role=None, profile=None, project_id=None,
                                     project_name=None, **connection_args)
```

Add role for user in tenant (keystone user-role-add)

CLI Examples:

```
salt '*' keystone.user_role_add user_id=298ce377245c4ec9b70e1c639c89e654 tenant_
↳id=7167a092ece84bae8cead4bf9d15bb3b role_id=ce377245c4ec9b70e1c639c89e8cead4
salt '*' keystone.user_role_add user=admin tenant=admin role=admin
```

```
salt.modules.keystone.user_role_list(user_id=None, tenant_id=None, user_name=None,
                                       tenant_name=None, profile=None, project_id=None,
                                       project_name=None, **connection_args)
```

Return a list of available user\_roles (keystone user-roles-list)

CLI Examples:

```
salt '*' keystone.user_role_list user_id=298ce377245c4ec9b70e1c639c89e654 tenant_
↳id=7167a092ece84bae8cead4bf9d15bb3b
salt '*' keystone.user_role_list user_name=admin tenant_name=admin
```

```
salt.modules.keystone.user_role_remove(user_id=None, user=None, tenant_id=None, ten-
                                       ant=None, role_id=None, role=None, profile=None,
                                       project_id=None, project_name=None, **connec-
                                       tion_args)
```

Remove role for user in tenant (keystone user-role-remove)

CLI Examples:

```
salt '*' keystone.user_role_remove user_id=298ce377245c4ec9b70e1c639c89e654
↳tenant_id=7167a092ece84bae8cead4bf9d15bb3b role_
↳id=ce377245c4ec9b70e1c639c89e8cead4
salt '*' keystone.user_role_remove user=admin tenant=admin role=admin
```

```
salt.modules.keystone.user_update(user_id=None, name=None, email=None, enabled=None, ten-
                                   ant=None, profile=None, project=None, description=None,
                                   **connection_args)
```

Update a user's information (keystone user-update) The following fields may be updated: name, email, enabled, tenant. Because the name is one of the fields, a valid user id is required.

CLI Examples:

```
salt '*' keystone.user_update user_id=c965f79c4f864eaaa9c3b41904e67082
↳name=newname
salt '*' keystone.user_update c965f79c4f864eaaa9c3b41904e67082 name=newname
↳email=newemail@domain.com
```

```
salt.modules.keystone.user_verify_password(user_id=None, name=None, password=None,
                                             profile=None, **connection_args)
```

Verify a user's password

CLI Examples:

```
salt '*' keystone.user_verify_password name=test password=foobar
salt '*' keystone.user_verify_password user_id=c965f79c4f864eaaa9c3b41904e67082
↳password=foobar
```

### 14.7.175 salt.modules.kmod

Module to manage Linux kernel modules

`salt.modules.kmod.available()`

Return a list of all available kernel modules

CLI Example:

```
salt '*' kmod.available
```

`salt.modules.kmod.check_available(mod)`

Check to see if the specified kernel module is available

CLI Example:

```
salt '*' kmod.check_available kvm
```

`salt.modules.kmod.is_loaded(mod)`

Check to see if the specified kernel module is loaded

CLI Example:

```
salt '*' kmod.is_loaded kvm
```

`salt.modules.kmod.load(mod, persist=False)`

Load the specified kernel module

**mod** Name of module to add

**persist** Write module to /etc/modules to make it load on system reboot

CLI Example:

```
salt '*' kmod.load kvm
```

`salt.modules.kmod.lsmmod()`

Return a dict containing information about currently loaded modules

CLI Example:

```
salt '*' kmod.lsmmod
```

`salt.modules.kmod.mod_list(only_persist=False)`

Return a list of the loaded module names

**only\_persist** Only return the list of loaded persistent modules

CLI Example:

```
salt '*' kmod.mod_list
```

`salt.modules.kmod.remove(mod, persist=False, comment=True)`

Remove the specified kernel module

**mod** Name of module to remove

**persist** Also remove module from /etc/modules

**comment** If persist is set don't remove line from /etc/modules but only comment it

CLI Example:

```
salt '*' kmod.remove kvm
```

## 14.7.176 salt.modules.kubernetes

Module for handling kubernetes calls.

### optdepends

- kubernetes Python client

**configuration** The k8s API settings are provided either in a pillar, in the minion's config file, or in master's config file:

```
kubernetes.user: admin
kubernetes.password: verybadpass
kubernetes.api_url: 'http://127.0.0.1:8080'
kubernetes.certificate-authority-data: '...'
kubernetes.client-certificate-data: '....n
kubernetes.client-key-data: '...'
kubernetes.certificate-authority-file: '/path/to/ca.crt'
kubernetes.client-certificate-file: '/path/to/client.crt'
kubernetes.client-key-file: '/path/to/client.key'
```

These settings can be also overridden by adding `api_url`, `api_user`, `api_password`, `api_certificate_authority_file`, `api_client_certificate_file` or `api_client_key_file` parameters when calling a function:

The data format for `kubernetes.*-data` values is the same as provided in `kubeconfig`. It's base64 encoded certificates/keys in one line.

For an item only one field should be provided. Either a `data` or a `file` entry. In case both are provided the `file` entry is preferred.

`salt.modules.kubernetes.configmaps(namespace='default', **kwargs)`

Return a list of kubernetes configmaps defined in the namespace

CLI Examples:

```
salt '*' kubernetes.configmaps
salt '*' kubernetes.configmaps namespace=default
```

`salt.modules.kubernetes.create_configmap(name, namespace, data, source, template, saltenv, **kwargs)`

Creates the kubernetes configmap as defined by the user.

`salt.modules.kubernetes.create_deployment(name, namespace, metadata, spec, source, template, saltenv, **kwargs)`

Creates the kubernetes deployment as defined by the user.

`salt.modules.kubernetes.create_namespace(name, **kwargs)`

Creates a namespace with the specified name.

**CLI Example:** `salt '*' kubernetes.create_namespace salt salt '*' kubernetes.create_namespace name=salt`

`salt.modules.kubernetes.create_pod(name, namespace, metadata, spec, source, template, saltenv, **kwargs)`

Creates the kubernetes deployment as defined by the user.

`salt.modules.kubernetes.create_secret(name, namespace, data, source, template, saltenv, **kwargs)`

Creates the kubernetes secret as defined by the user.

`salt.modules.kubernetes.create_service(name, namespace, metadata, spec, source, template, saltenv, **kwargs)`

Creates the kubernetes service as defined by the user.

`salt.modules.kubernetes.delete_configmap`(*name*, *namespace='default'*, *\*\*kwargs*)  
Deletes the kubernetes configmap defined by name and namespace

CLI Examples:

```
salt '*' kubernetes.delete_configmap settings default
salt '*' kubernetes.delete_configmap name=settings namespace=default
```

`salt.modules.kubernetes.delete_deployment`(*name*, *namespace='default'*, *\*\*kwargs*)  
Deletes the kubernetes deployment defined by name and namespace

CLI Examples:

```
salt '*' kubernetes.delete_deployment my-nginx
salt '*' kubernetes.delete_deployment name=my-nginx namespace=default
```

`salt.modules.kubernetes.delete_namespace`(*name*, *\*\*kwargs*)  
Deletes the kubernetes namespace defined by name

CLI Examples:

```
salt '*' kubernetes.delete_namespace salt
salt '*' kubernetes.delete_namespace name=salt
```

`salt.modules.kubernetes.delete_pod`(*name*, *namespace='default'*, *\*\*kwargs*)  
Deletes the kubernetes pod defined by name and namespace

CLI Examples:

```
salt '*' kubernetes.delete_pod guestbook-708336848-5nl8c default
salt '*' kubernetes.delete_pod name=guestbook-708336848-5nl8c namespace=default
```

`salt.modules.kubernetes.delete_secret`(*name*, *namespace='default'*, *\*\*kwargs*)  
Deletes the kubernetes secret defined by name and namespace

CLI Examples:

```
salt '*' kubernetes.delete_secret confidential default
salt '*' kubernetes.delete_secret name=confidential namespace=default
```

`salt.modules.kubernetes.delete_service`(*name*, *namespace='default'*, *\*\*kwargs*)  
Deletes the kubernetes service defined by name and namespace

CLI Examples:

```
salt '*' kubernetes.delete_service my-nginx default
salt '*' kubernetes.delete_service name=my-nginx namespace=default
```

`salt.modules.kubernetes.deployments`(*namespace='default'*, *\*\*kwargs*)  
Return a list of kubernetes deployments defined in the namespace

CLI Examples:

```
salt '*' kubernetes.deployments
salt '*' kubernetes.deployments namespace=default
```

`salt.modules.kubernetes.namespaces`(*\*\*kwargs*)  
Return the names of the available namespaces

CLI Examples:

```
salt '*' kubernetes.namespaces
salt '*' kubernetes.namespaces api_url=http://myhost:port api_user=my-user
```

`salt.modules.kubernetes.node`(*name*, *\*\*kwargs*)  
Return the details of the node identified by the specified name

CLI Examples:

```
salt '*' kubernetes.node name='minikube'
```

`salt.modules.kubernetes.node_add_label`(*node\_name*, *label\_name*, *label\_value*, *\*\*kwargs*)  
Set the value of the label identified by *label\_name* to *label\_value* on the node identified by the name *node\_name*. Creates the label if not present.

CLI Examples:

```
salt '*' kubernetes.node_add_label node_name="minikube" label_name="foo"
↪ "label_value="bar"
```

`salt.modules.kubernetes.node_labels`(*name*, *\*\*kwargs*)  
Return the labels of the node identified by the specified name

CLI Examples:

```
salt '*' kubernetes.node_labels name="minikube"
```

`salt.modules.kubernetes.node_remove_label`(*node\_name*, *label\_name*, *\*\*kwargs*)  
Removes the label identified by *label\_name* from the node identified by the name *node\_name*.

CLI Examples:

```
salt '*' kubernetes.node_remove_label node_name="minikube" label_name=
↪ "foo"
```

`salt.modules.kubernetes.nodes`(*\*\*kwargs*)  
Return the names of the nodes composing the kubernetes cluster

CLI Examples:

```
salt '*' kubernetes.nodes
salt '*' kubernetes.nodes api_url=http://myhost:port api_user=my-user
```

`salt.modules.kubernetes.ping`(*\*\*kwargs*)  
Checks connections with the kubernetes API server. Returns True if the connection can be established, False otherwise.

CLI Example: `salt '*' kubernetes.ping`

`salt.modules.kubernetes.pods`(*namespace='default'*, *\*\*kwargs*)  
Return a list of kubernetes pods defined in the namespace

CLI Examples:

```
salt '*' kubernetes.pods
salt '*' kubernetes.pods namespace=default
```

`salt.modules.kubernetes.replace_configmap`(*name*, *data*, *source*, *template*, *saltenv*, *namespace='default'*, *\*\*kwargs*)  
Replaces an existing configmap with a new one defined by name and namespace, having the specified data.

`salt.modules.kubernetes.replace_deployment`(*name*, *metadata*, *spec*, *source*, *template*, *saltenv*, *namespace='default'*, *\*\*kwargs*)

Replaces an existing deployment with a new one defined by name and namespace, having the specified metadata and spec.

`salt.modules.kubernetes.replace_secret`(*name*, *data*, *source*, *template*, *saltenv*, *namespace='default'*, *\*\*kwargs*)

Replaces an existing secret with a new one defined by name and namespace, having the specified data.

`salt.modules.kubernetes.replace_service`(*name*, *metadata*, *spec*, *source*, *template*, *old\_service*, *saltenv*, *namespace='default'*, *\*\*kwargs*)

Replaces an existing service with a new one defined by name and namespace, having the specified metadata and spec.

`salt.modules.kubernetes.secrets`(*namespace='default'*, *\*\*kwargs*)

Return a list of kubernetes secrets defined in the namespace

CLI Examples:

```
salt '*' kubernetes.secrets
salt '*' kubernetes.secrets namespace=default
```

`salt.modules.kubernetes.services`(*namespace='default'*, *\*\*kwargs*)

Return a list of kubernetes services defined in the namespace

CLI Examples:

```
salt '*' kubernetes.services
salt '*' kubernetes.services namespace=default
```

`salt.modules.kubernetes.show_configmap`(*name*, *namespace='default'*, *\*\*kwargs*)

Return the kubernetes configmap defined by name and namespace.

CLI Examples:

```
salt '*' kubernetes.show_configmap game-config default
salt '*' kubernetes.show_configmap name=game-config namespace=default
```

`salt.modules.kubernetes.show_deployment`(*name*, *namespace='default'*, *\*\*kwargs*)

Return the kubernetes deployment defined by name and namespace

CLI Examples:

```
salt '*' kubernetes.show_deployment my-nginx default
salt '*' kubernetes.show_deployment name=my-nginx namespace=default
```

`salt.modules.kubernetes.show_namespace`(*name*, *\*\*kwargs*)

Return information for a given namespace defined by the specified name

CLI Examples:

```
salt '*' kubernetes.show_namespace kube-system
```

`salt.modules.kubernetes.show_pod`(*name*, *namespace='default'*, *\*\*kwargs*)

Return POD information for a given pod name defined in the namespace

CLI Examples:

```
salt '*' kubernetes.show_pod guestbook-708336848-fqr2x
salt '*' kubernetes.show_pod guestbook-708336848-fqr2x namespace=default
```

`salt.modules.kubernetes.show_secret`(*name*, *namespace='default'*, *decode=False*, *\*\*kwargs*)  
Return the kubernetes secret defined by name and namespace. The secrets can be decoded if specified by the user. Warning: this has security implications.

CLI Examples:

```
salt '*' kubernetes.show_secret confidential default
salt '*' kubernetes.show_secret name=confidential namespace=default
salt '*' kubernetes.show_secret name=confidential decode=True
```

`salt.modules.kubernetes.show_service`(*name*, *namespace='default'*, *\*\*kwargs*)  
Return the kubernetes service defined by name and namespace

CLI Examples:

```
salt '*' kubernetes.show_service my-nginx default
salt '*' kubernetes.show_service name=my-nginx namespace=default
```

### 14.7.177 salt.modules.launchctl

Module for the management of MacOS systems that use launchd/launchctl

---

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `'service.start' is not available`), see [here](#).

---

#### depends

- plistlib Python module

`salt.modules.launchctl.available`(*job\_label*)  
Check that the given service is available.

CLI Example:

```
salt '*' service.available com.openssh.sshd
```

`salt.modules.launchctl.disabled`(*job\_label*, *runas=None*)  
Return True if the named service is disabled, false otherwise

CLI Example:

```
salt '*' service.disabled <service label>
```

`salt.modules.launchctl.enabled`(*job\_label*, *runas=None*)  
Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.enabled <service label>
```

`salt.modules.launchctl.get_all`()  
Return all installed services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.launchctl.missing`(*job\_label*)

The inverse of `service.available` Check that the given service is not available.

CLI Example:

```
salt '*' service.missing com.openssh.sshd
```

`salt.modules.launchctl.restart`(*job\_label*, *runas=None*)

Restart the named service

CLI Example:

```
salt '*' service.restart <service label>
```

`salt.modules.launchctl.start`(*job\_label*, *runas=None*)

Start the specified service

CLI Example:

```
salt '*' service.start <service label>
salt '*' service.start org.ntp.ntpd
salt '*' service.start /System/Library/LaunchDaemons/org.ntp.ntpd.plist
```

`salt.modules.launchctl.status`(*job\_label*, *runas=None*)

Return the status for a service, returns a bool whether the service is running.

CLI Example:

```
salt '*' service.status <service label>
```

`salt.modules.launchctl.stop`(*job\_label*, *runas=None*)

Stop the specified service

CLI Example:

```
salt '*' service.stop <service label>
salt '*' service.stop org.ntp.ntpd
salt '*' service.stop /System/Library/LaunchDaemons/org.ntp.ntpd.plist
```

## 14.7.178 salt.modules.layman

Support for Layman

`salt.modules.layman.add`(*overlay*)

Add the given overlay from the cached remote list to your locally installed overlays. Specify `ALL` to add all overlays from the remote list.

Return a list of the new overlay(s) added:

CLI Example:

```
salt '*' layman.add <overlay name>
```

`salt.modules.layman.delete`(*overlay*)

Remove the given overlay from the your locally installed overlays. Specify `ALL` to remove all overlays.

Return a list of the overlays(s) that were removed:

CLI Example:

```
salt '*' layman.delete <overlay name>
```

`salt.modules.layman.list_all()`  
List all overlays, including remote ones.  
Return a list of available overlays:  
CLI Example:

```
salt '*' layman.list_all
```

`salt.modules.layman.list_local()`  
List the locally installed overlays.  
Return a list of installed overlays:  
CLI Example:

```
salt '*' layman.list_local
```

`salt.modules.layman.sync(overlay='ALL')`  
Update the specified overlay. Use `ALL` to synchronize all overlays. This is the default if no overlay is specified.  
**overlay** Name of the overlay to sync. (Defaults to `ALL`)  
CLI Example:

```
salt '*' layman.sync
```

### 14.7.179 salt.modules.ldap3

#### Query and modify an LDAP database (alternative interface)

New in version 2016.3.0.

This is an alternative to the `ldap` interface provided by the `ldapmod` execution module.

##### depends

- `ldap` Python module

**exception** `salt.modules.ldap3.LDAPError(message, cause=None)`  
Base class of all LDAP exceptions raised by backends.

This is only used for errors encountered while interacting with the LDAP server; usage errors (e.g., invalid backend name) will have a different type.

**Variables** **cause** -- backend exception object, if applicable

`salt.modules.ldap3.add(connect_spec, dn, attributes)`  
Add an entry to an LDAP database.

##### Parameters

- **connect\_spec** -- See the documentation for the `connect_spec` parameter for `connect()`.
- **dn** -- Distinguished name of the entry.
- **attributes** -- Non-empty dict mapping each of the new entry's attributes to a non-empty iterable of values.

**Returns** True if successful, raises an exception otherwise.

CLI example:

```
salt '*' ldap3.add "{
  'url': 'ldaps://ldap.example.com/',
  'bind': {
    'method': 'simple',
    'password': 'secret',
  },
}" "dn='dc=example,dc=com'" "attributes={'example': 'values'}"
```

`salt.modules.ldap3.change`(*connect\_spec*, *dn*, *before*, *after*)

Modify an entry in an LDAP database.

This does the same thing as *modify()*, but with a simpler interface. Instead of taking a list of directives, it takes a before and after view of an entry, determines the differences between the two, computes the directives, and executes them.

Any attribute value present in *before* but missing in *after* is deleted. Any attribute value present in *after* but missing in *before* is added. Any attribute value in the database that is not mentioned in either *before* or *after* is not altered. Any attribute value that is present in both *before* and *after* is ignored, regardless of whether that attribute value exists in the database.

#### Parameters

- **connect\_spec** -- See the documentation for the `connect_spec` parameter for `connect()`.
- **dn** -- Distinguished name of the entry.
- **before** -- The expected state of the entry before modification. This is a dict mapping each attribute name to an iterable of values.
- **after** -- The desired state of the entry after modification. This is a dict mapping each attribute name to an iterable of values.

**Returns** True if successful, raises an exception otherwise.

CLI example:

```
salt '*' ldap3.change "{
  'url': 'ldaps://ldap.example.com/',
  'bind': {
    'method': 'simple',
    'password': 'secret'
  }
}" dn='cn=admin,dc=example,dc=com'
before="{ 'example_value': 'before_val' }"
after="{ 'example_value': 'after_val' }"
```

`salt.modules.ldap3.connect`(*connect\_spec=None*)

Connect and optionally bind to an LDAP server.

**Parameters** **connect\_spec** -- This can be an LDAP connection object returned by a previous call to `connect()` (in which case the argument is simply returned), `None` (in which case an empty dict is used), or a dict with the following keys:

- **'backend'** Optional; default depends on which Python LDAP modules are installed. Name of the Python LDAP module to use. Only `'ldap'` is supported at the moment.
- **'url'** Optional; defaults to `'ldapi:///'`. URL to the LDAP server.
- **'bind'** Optional; defaults to `None`. Describes how to bind an identity to the LDAP connection. If `None`, an anonymous connection is made. Valid keys:

- **'method'** Optional; defaults to None. The authentication method to use. Valid values include but are not necessarily limited to 'simple', 'sasl', and None. If None, an anonymous connection is made. Available methods depend on the chosen backend.
- **'mechanism'** Optional; defaults to 'EXTERNAL'. The SASL mechanism to use. Ignored unless the method is 'sasl'. Available methods depend on the chosen backend and the server's capabilities.
- **'credentials'** Optional; defaults to None. An object specific to the chosen SASL mechanism and backend that represents the authentication credentials. Ignored unless the method is 'sasl'.

For the 'ldap' backend, this is a dictionary. If None, an empty dict is used. Keys:

- \* **'args'** Optional; defaults to an empty list. A list of arguments to pass to the SASL mechanism constructor. See the SASL mechanism constructor documentation in the `ldap.sasl` Python module.
- \* **'kwargs'** Optional; defaults to an empty dict. A dict of keyword arguments to pass to the SASL mechanism constructor. See the SASL mechanism constructor documentation in the `ldap.sasl` Python module.
- **'dn'** Optional; defaults to an empty string. The distinguished name to bind.
- **'password'** Optional; defaults to an empty string. Password for binding. Ignored if the method is 'sasl'.
- **'tls'** Optional; defaults to None. A backend-specific object containing settings to override default TLS behavior.

For the 'ldap' backend, this is a dictionary. Not all settings in this dictionary are supported by all versions of `python-ldap` or the underlying TLS library. If None, an empty dict is used. Possible keys:

- **'starttls'** If present, initiate a TLS connection using StartTLS. (The value associated with this key is ignored.)
- **'cacertdir'** Set the path of the directory containing CA certificates.
- **'cacertfile'** Set the pathname of the CA certificate file.
- **'certfile'** Set the pathname of the certificate file.
- **'cipher\_suite'** Set the allowed cipher suite.
- **'crlcheck'** Set the CRL evaluation strategy. Valid values are 'none', 'peer', and 'all'.
- **'crlfile'** Set the pathname of the CRL file.
- **'dhfile'** Set the pathname of the file containing the parameters for Diffie-Hellman ephemeral key exchange.
- **'keyfile'** Set the pathname of the certificate key file.
- **'newctx'** If present, instruct the underlying TLS library to create a new TLS context. (The value associated with this key is ignored.)
- **'protocol\_min'** Set the minimum protocol version.

- **'random\_file'** Set the pathname of the random file when `/dev/random` and `/dev/urandom` are not available.
- **'require\_cert'** Set the certificate validation policy. Valid values are `'never'`, `'hard'`, `'demand'`, `'allow'`, and `'try'`.
- **'opts'** Optional; defaults to None. A backend-specific object containing options for the backend.

For the `'ldap'` backend, this is a dictionary of OpenLDAP options to set. If None, an empty dict is used. Each key is the name of an OpenLDAP option constant without the `'LDAP_OPT_'` prefix, then converted to lower case.

### Returns

an object representing an LDAP connection that can be used as the `connect_spec` argument to any of the functions in this module (to avoid the overhead of making and terminating multiple connections).

This object should be used as a context manager. It is safe to nest with statements.

CLI example:

```
salt '*' ldap3.connect "{
  'url': 'ldaps://ldap.example.com/',
  'bind': {
    'method': 'simple',
    'dn': 'cn=admin,dc=example,dc=com',
    'password': 'secret'}
}"
```

`salt.modules.ldap3.delete(connect_spec, dn)`

Delete an entry from an LDAP database.

### Parameters

- **connect\_spec** -- See the documentation for the `connect_spec` parameter for `connect()`.
- **dn** -- Distinguished name of the entry.

**Returns** True if successful, raises an exception otherwise.

CLI example:

```
salt '*' ldap3.delete "{
  'url': 'ldaps://ldap.example.com/',
  'bind': {
    'method': 'simple',
    'password': 'secret'}
}" dn='cn=admin,dc=example,dc=com'
```

`salt.modules.ldap3.modify(connect_spec, dn, directives)`

Modify an entry in an LDAP database.

### Parameters

- **connect\_spec** -- See the documentation for the `connect_spec` parameter for `connect()`.
- **dn** -- Distinguished name of the entry.
- **directives** -- Iterable of directives that indicate how to modify the entry. Each directive is a tuple of the form `(op, attr, vals)`, where:

- `op` identifies the modification operation to perform. One of:

- \* 'add' to add one or more values to the attribute
  - \* 'delete' to delete some or all of the values from the attribute. If no values are specified with this operation, all of the attribute's values are deleted. Otherwise, only the named values are deleted.
  - \* 'replace' to replace all of the attribute's values with zero or more new values
- attr names the attribute to modify
  - vals is an iterable of values to add or delete

**Returns** True if successful, raises an exception otherwise.

CLI example:

```
salt '*' ldap3.modify "{
  'url': 'ldaps://ldap.example.com/',
  'bind': {
    'method': 'simple',
    'password': 'secret'}
}" dn='cn=admin,dc=example,dc=com'
directives="('add', 'example', ['example_val'])"
```

`salt.modules.ldap3.search(connect_spec, base, scope='subtree', filterstr='(objectClass=*)', attrlist=None, attrsonly=0)`

Search an LDAP database.

#### Parameters

- **connect\_spec** -- See the documentation for the `connect_spec` parameter for `connect()`.
- **base** -- Distinguished name of the entry at which to start the search.
- **scope** -- One of the following:
  - 'subtree' Search the base and all of its descendants.
  - 'base' Search only the base itself.
  - 'onelevel' Search only the base's immediate children.
- **filterstr** -- String representation of the filter to apply in the search.
- **attrlist** -- Limit the returned attributes to those in the specified list. If None, all attributes of each entry are returned.
- **attrsonly** -- If non-zero, don't return any attribute values.

**Returns** a dict of results. The dict is empty if there are no results. The dict maps each returned entry's distinguished name to a dict that maps each of the matching attribute names to a list of its values.

CLI example:

```
salt '*' ldap3.search "{
  'url': 'ldaps://ldap.example.com/',
  'bind': {
    'method': 'simple',
    'dn': 'cn=admin,dc=example,dc=com',
    'password': 'secret',
  },
}" "base='dc=example,dc=com'"
```

## 14.7.180 salt.modules.ldapmod

Salt interface to LDAP commands

### depends

- ldap Python module

**configuration** In order to connect to LDAP, certain configuration is required in the minion config on the LDAP server. The minimum configuration items that must be set are:

```
ldap.basedn: dc=acme,dc=com (example values, adjust to suit)
```

If your LDAP server requires authentication then you must also set:

```
ldap.anonymous: False
ldap.binddn: admin
ldap.bindpw: password
```

In addition, the following optional values may be set:

```
ldap.server: localhost (default=localhost, see warning below)
ldap.port: 389 (default=389, standard port)
ldap.tls: False (default=False, no TLS)
ldap.no_verify: False (default=False, verify TLS)
ldap.anonymous: True (default=True, bind anonymous)
ldap.scope: 2 (default=2, ldap.SCOPE_SUBTREE)
ldap.attrs: [saltAttr] (default=None, return all attributes)
```

**Warning:** At the moment this module only recommends connection to LDAP services listening on localhost. This is deliberate to avoid the potentially dangerous situation of multiple minions sending identical update commands to the same LDAP server. It's easy enough to override this behavior, but badness may ensue - you have been warned.

`salt.modules.ldapmod.search` (*filter*, *dn=None*, *scope=None*, *attrs=None*, *\*\*kwargs*)

Run an arbitrary LDAP query and return the results.

CLI Example:

```
salt 'ldaphost' ldap.search "filter=cn=myhost"
```

Return data:

```
{'myhost': {'count': 1,
            'results': [['cn=myhost,ou=hosts,o=acme,c=gb',
                        {'saltKeyValue': ['ntpserver=ntp.acme.local',
                                           'foo=myfoo'],
                         'saltState': ['foo', 'bar']}]},
            'time': {'human': '1.2ms', 'raw': '0.00123'}}}
```

Search and connection options can be overridden by specifying the relevant option as key=value pairs, for example:

```
salt 'ldaphost' ldap.search filter=cn=myhost dn=ou=hosts,o=acme,c=gb
scope=1 attrs=' server=localhost port=7393 tls=True bindpw=ssh'
```

### 14.7.181 salt.modules.linux\_acl

Support for Linux File Access Control Lists

The Linux ACL module requires the *getfacl* and *setfacl* binaries.

**salt.modules.linux\_acl.delfacl**(*acl\_type*, *acl\_name*=',', \*args, \*\*kwargs)

Remove specific ACL from the specified file(s)

CLI Examples:

```
salt '*' acl.delfacl user myuser /tmp/house/kitchen
salt '*' acl.delfacl default:group mygroup /tmp/house/kitchen
salt '*' acl.delfacl d:u myuser /tmp/house/kitchen
salt '*' acl.delfacl g myuser /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.delfacl user myuser /tmp/house/kitchen recursive=True
```

**salt.modules.linux\_acl.getfacl**( \*args, \*\*kwargs)

Return (extremely verbose) map of ACLs on specified file(s)

CLI Examples:

```
salt '*' acl.getfacl /tmp/house/kitchen
salt '*' acl.getfacl /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.getfacl /tmp/house/kitchen /tmp/house/livingroom recursive=True
```

**salt.modules.linux\_acl.modfacl**(*acl\_type*, *acl\_name*=',', *perms*=',', \*args, \*\*kwargs)

Add or modify a ACL for the specified file(s)

CLI Examples:

```
salt '*' acl.modfacl user myuser rwx /tmp/house/kitchen
salt '*' acl.modfacl default:group mygroup rx /tmp/house/kitchen
salt '*' acl.modfacl d:u myuser 7 /tmp/house/kitchen
salt '*' acl.modfacl g mygroup 0 /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.modfacl user myuser rwx /tmp/house/kitchen recursive=True
```

**salt.modules.linux\_acl.version**()

Return facl version from getfacl --version

CLI Example:

```
salt '*' acl.version
```

**salt.modules.linux\_acl.wipefacls**( \*args, \*\*kwargs)

Remove all ACLs from the specified file(s)

CLI Examples:

```
salt '*' acl.wipefacls /tmp/house/kitchen
salt '*' acl.wipefacls /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.wipefacls /tmp/house/kitchen /tmp/house/livingroom recursive=True
```

### 14.7.182 salt.modules.linux\_ip module

The networking module for Non-RH/Deb Linux distros

**salt.modules.linux\_ip.down**(*iface*, *iface\_type*=None)

Shutdown a network interface

CLI Example:

```
salt '*' ip.down eth0
```

`salt.modules.linux_ip.get_interface`(*iface*)

Return the contents of an interface script

CLI Example:

```
salt '*' ip.get_interface eth0
```

`salt.modules.linux_ip.get_routes`(*iface=None*)

Return the current routing table

CLI Examples:

```
salt '*' ip.get_routes
salt '*' ip.get_routes eth0
```

`salt.modules.linux_ip.up`(*iface, iface\_type=None*)

Start up a network interface

CLI Example:

```
salt '*' ip.up eth0
```

### 14.7.183 salt.modules.linux\_lvm

Support for Linux LVM2

`salt.modules.linux_lvm.fullversion`()

Return all version info from lvm version

CLI Example:

```
salt '*' lvm.fullversion
```

`salt.modules.linux_lvm.lvcreate`(*lvname, vgname, size=None, extents=None, snapshot=None, pv=None, thinvolume=False, thinpool=False, \*\*kwargs*)

Create a new logical volume, with option for which physical volume to be used

CLI Examples:

```
salt '*' lvm.lvcreate new_volume_name    vg_name size=10G
salt '*' lvm.lvcreate new_volume_name    vg_name extents=100 pv=/dev/sdb
salt '*' lvm.lvcreate new_snapshot       vg_name snapshot=volume_name size=3G
```

New in version to\_complete.

Support for thin pools and thin volumes

CLI Examples:

```
salt '*' lvm.lvcreate new_thinpool_name  vg_name size=20G
↳thinpool=True
salt '*' lvm.lvcreate new_thinvolume_name vg_name/thinpool_name size=10G
↳thinvolume=True
```

`salt.modules.linux_lvm.lvdisplay` (*lvname*=``)

Return information about the logical volume(s)

CLI Examples:

```
salt '*' lvm.lvdisplay
salt '*' lvm.lvdisplay /dev/vg_myserver/root
```

`salt.modules.linux_lvm.lvremove` (*lvname*, *vgname*)

Remove a given existing logical volume from a named existing volume group

CLI Example:

```
salt '*' lvm.lvrmove lvname vgname force=True
```

`salt.modules.linux_lvm.lvresize` (*size*, *lpath*)

Return information about the logical volume(s)

CLI Examples:

```
salt '*' lvm.lvresize +12M /dev/mapper/vg1-test
```

`salt.modules.linux_lvm.pvcreate` (*devices*, *override*=True, *\*\*kwargs*)

Set a physical device to be used as an LVM physical volume

**override** Skip devices, if they are already LVM physical volumes

CLI Examples:

```
salt mymachine lvm.pvcreate /dev/sdb1,/dev/sdb2
salt mymachine lvm.pvcreate /dev/sdb1 dataalignmentoffset=7s
```

`salt.modules.linux_lvm.pvdisplay` (*pvname*=``, *real*=False)

Return information about the physical volume(s)

**pvname** physical device name

**real** dereference any symlinks and report the real device

New in version 2015.8.7.

CLI Examples:

```
salt '*' lvm.pvdisplay
salt '*' lvm.pvdisplay /dev/md0
```

`salt.modules.linux_lvm.pvremove` (*devices*, *override*=True)

Remove a physical device being used as an LVM physical volume

**override** Skip devices, if they are already not used as LVM physical volumes

CLI Examples:

```
salt mymachine lvm.pvremove /dev/sdb1,/dev/sdb2
```

`salt.modules.linux_lvm.version` ()

Return LVM version from lvm version

CLI Example:

```
salt '*' lvm.version
```

`salt.modules.linux_lvm.vgcreate` (*vgname*, *devices*, *\*\*kwargs*)

Create an LVM volume group

CLI Examples:

```
salt mymachine lvm.vgcreate my_vg /dev/sdb1,/dev/sdb2
salt mymachine lvm.vgcreate my_vg /dev/sdb1 clustered=y
```

`salt.modules.linux_lvm.vgdisplay`(*vgname*='')  
Return information about the volume group(s)

CLI Examples:

```
salt '*' lvm.vgdisplay
salt '*' lvm.vgdisplay nova-volumes
```

`salt.modules.linux_lvm.vgextend`(*vgname*, *devices*)  
Add physical volumes to an LVM volume group

CLI Examples:

```
salt mymachine lvm.vgextend my_vg /dev/sdb1,/dev/sdb2
salt mymachine lvm.vgextend my_vg /dev/sdb1
```

`salt.modules.linux_lvm.vgremove`(*vgname*)  
Remove an LVM volume group

CLI Examples:

```
salt mymachine lvm.vgremove vgname
salt mymachine lvm.vgremove vgname force=True
```

#### 14.7.184 salt.modules.linux\_sysctl

Module for viewing and modifying sysctl parameters

`salt.modules.linux_sysctl.assign`(*name*, *value*)  
Assign a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.assign net.ipv4.ip_forward 1
```

`salt.modules.linux_sysctl.default_config`()  
Linux hosts using systemd 207 or later ignore `/etc/sysctl.conf` and only load from `/etc/sysctl.d/*.conf`. This function will do the proper checks and return a default config file which will be valid for the Minion. Hosts running systemd  $\geq$  207 will use `/etc/sysctl.d/99-salt.conf`.

CLI Example:

```
salt -G 'kernel:Linux' sysctl.default_config
```

`salt.modules.linux_sysctl.get`(*name*)  
Return a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.get net.ipv4.ip_forward
```

`salt.modules.linux_sysctl.persist`(*name*, *value*, *config=None*)  
Assign and persist a simple sysctl parameter for this minion. If `config` is not specified, a sensible default will be chosen using `sysctl.default_config`.

CLI Example:

```
salt '*' sysctl.persist net.ipv4.ip_forward 1
```

`salt.modules.linux_sysctl.show`(*config\_file=False*)

Return a list of sysctl parameters for this minion

**config:** Pull the data from the system configuration file instead of the live data.

CLI Example:

```
salt '*' sysctl.show
```

### 14.7.185 salt.modules.localemod

Module for managing locales on POSIX-like systems.

`salt.modules.localemod.avail`(*locale*)

Check if a locale is available.

New in version 2014.7.0.

CLI Example:

```
salt '*' locale.avail 'en_US.UTF-8'
```

`salt.modules.localemod.gen_locale`(*locale, \*\*kwargs*)

Generate a locale. Options:

New in version 2014.7.0.

**Parameters locale** -- Any locale listed in `/usr/share/i18n/locales` or `/usr/share/i18n/SUPPORTED` for Debian and Gentoo based distributions, which require the charmap to be specified as part of the locale when generating it.

**verbose** Show extra warnings about errors that are normally ignored.

CLI Example:

```
salt '*' locale.gen_locale en_US.UTF-8
salt '*' locale.gen_locale 'en_IE.UTF-8 UTF-8' # Debian/Gentoo only
```

`salt.modules.localemod.get_locale`()

Get the current system locale

CLI Example:

```
salt '*' locale.get_locale
```

`salt.modules.localemod.list_avail`()

Lists available (compiled) locales

CLI Example:

```
salt '*' locale.list_avail
```

`salt.modules.localemod.set_locale`(*locale*)

Sets the current system locale

CLI Example:

```
salt '*' locale.set_locale 'en_US.UTF-8'
```

### 14.7.186 salt.modules.locate

Module for using the locate utilities

`salt.modules.locate.locate` (*pattern*, *database=''*, *limit=0*, *\*\*kwargs*)  
 Performs a file lookup. Valid options (and their defaults) are:

```
basename=False
count=False
existing=False
follow=True
ignore=False
nofollow=False
wholename=True
regex=False
database=<locate's default database>
limit=<integer, not set by default>
```

See the manpage for `locate(1)` for further explanation of these options.

CLI Example:

```
salt '*' locate.locate
```

`salt.modules.locate.stats`()  
 Returns statistics about the locate database

CLI Example:

```
salt '*' locate.stats
```

`salt.modules.locate.updatedb`()  
 Updates the locate database

CLI Example:

```
salt '*' locate.updatedb
```

`salt.modules.locate.version`()  
 Returns the version of locate

CLI Example:

```
salt '*' locate.version
```

### 14.7.187 salt.modules.logadm

Module for managing Solaris logadm based log rotations.

`salt.modules.logadm.remove` (*name*, *conf\_file='/etc/logadm.conf'*)  
 Remove log pattern from logadm

CLI Example:

```
salt '*' logadm.remove myapplog
```

`salt.modules.logadm.rotate`(*name*, *pattern=False*, *count=False*, *age=False*, *size=False*, *copy=True*, *conf\_file='/etc/logadm.conf'*)

Set up pattern for logging.

CLI Example:

```
salt '*' logadm.rotate myapplog pattern='/var/log/myapp/*.log' count=7
```

`salt.modules.logadm.show_conf`(*conf\_file='/etc/logadm.conf'*)

Show parsed configuration

CLI Example:

```
salt '*' logadm.show_conf
```

## 14.7.188 salt.modules.logmod module

### On-demand logging

New in version 2017.7.0.

The sole purpose of this module is logging messages in the (proxy) minion. It comes very handy when debugging complex Jinja templates, for example:

```
{%- for var in range(10) %}  
  {%- do salt.log.info(var) -%}  
{%- endfor %}
```

CLI Example:

```
salt '*' log.error 'Please dont do that, this module is not for CLI use!'
```

`salt.modules.logmod.critical`(*message*)

Log message at level CRITICAL.

`salt.modules.logmod.debug`(*message*)

Log message at level DEBUG.

`salt.modules.logmod.error`(*message*)

Log message at level ERROR.

`salt.modules.logmod.exception`(*message*)

Log message at level EXCEPTION.

`salt.modules.logmod.info`(*message*)

Log message at level INFO.

`salt.modules.logmod.warning`(*message*)

Log message at level WARNING.

## 14.7.189 salt.modules.logrotate

Module for managing logrotate.

`salt.modules.logrotate.get(key, value=None, conf_file='/etc/logrotate.conf')`

Get the value for a specific configuration line.

**Parameters**

- **key** (*str*) -- The command or stanza block to configure.
- **value** (*str*) -- The command value or command of the block specified by the key parameter.
- **conf\_file** (*str*) -- The logrotate configuration file.

**Returns** The value for a specific configuration line.

**Return type** `bool|int|str`

CLI Example:

```
salt '*' logrotate.get rotate
salt '*' logrotate.get /var/log/wtmp rotate /etc/logrotate.conf
```

`salt.modules.logrotate.set(key, value, setting=None, conf_file='/etc/logrotate.conf')`

Set a new value for a specific configuration line.

**Parameters**

- **key** (*str*) -- The command or block to configure.
- **value** (*str*) -- The command value or command of the block specified by the key parameter.
- **setting** (*str*) -- The command value for the command specified by the value parameter.
- **conf\_file** (*str*) -- The logrotate configuration file.

**Returns** A boolean representing whether all changes succeeded.

**Return type** `bool`

CLI Example:

```
salt '*' logrotate.set rotate 2
```

Can also be used to set a single value inside a multiline configuration block. For instance, to change rotate in the following block:

```
/var/log/wtmp {
  monthly
  create 0664 root root
  rotate 1
}
```

Use the following command:

```
salt '*' logrotate.set /var/log/wtmp rotate 2
```

This module also has the ability to scan files inside an include directory, and make changes in the appropriate file.

`salt.modules.logrotate.show_conf(conf_file='/etc/logrotate.conf')`

Show parsed configuration

**Parameters** **conf\_file** (*str*) -- The logrotate configuration file.

**Returns** The parsed configuration.

**Return type** `dict`

CLI Example:

```
salt '*' logrotate.show_conf
```

### 14.7.190 salt.modules.lvs

Support for LVS (Linux Virtual Server)

**salt.modules.lvs.add\_server** (*protocol=None, service\_address=None, server\_address=None, packet\_forward\_method='dr', weight=1, \*\*kwargs*)

Add a real server to a virtual service.

**protocol** The service protocol(only support tcp, udp and fwmark service).

**service\_address** The LVS service address.

**server\_address** The real server address.

**packet\_forward\_method** The LVS packet forwarding method(dr for direct routing, tunnel for tunneling, nat for network access translation).

**weight** The capacity of a server relative to the others in the pool.

CLI Example:

```
salt '*' lvs.add_server tcp 1.1.1.1:80 192.168.0.11:8080 nat 1
```

**salt.modules.lvs.add\_service** (*protocol=None, service\_address=None, scheduler='wlc'*)

Add a virtual service.

**protocol** The service protocol(only support tcp, udp and fwmark service).

**service\_address** The LVS service address.

**scheduler** Algorithm for allocating TCP connections and UDP datagrams to real servers.

CLI Example:

```
salt '*' lvs.add_service tcp 1.1.1.1:80 rr
```

**salt.modules.lvs.check\_server** (*protocol=None, service\_address=None, server\_address=None, \*\*kwargs*)

Check the real server exists in the specified service.

CLI Example:

```
salt '*' lvs.check_server tcp 1.1.1.1:80 192.168.0.11:8080
```

**salt.modules.lvs.check\_service** (*protocol=None, service\_address=None, \*\*kwargs*)

Check the virtual service exists.

CLI Example:

```
salt '*' lvs.check_service tcp 1.1.1.1:80
```

**salt.modules.lvs.clear** ()

Clear the virtual server table

CLI Example:

```
salt '*' lvs.clear
```

**salt.modules.lvs.delete\_server** (*protocol=None, service\_address=None, server\_address=None*)

Delete the realserver from the virtual service.

**protocol** The service protocol(only support tcp, udp and fwmark service).

**service\_address** The LVS service address.

**server\_address** The real server address.

CLI Example:

```
salt '*' lvs.delete_server tcp 1.1.1.1:80 192.168.0.11:8080
```

**salt.modules.lvs.delete\_service** (*protocol=None, service\_address=None*)

Delete the virtual service.

**protocol** The service protocol(only support tcp, udp and fwmark service).

**service\_address** The LVS service address.

CLI Example:

```
salt '*' lvs.delete_service tcp 1.1.1.1:80
```

**salt.modules.lvs.edit\_server** (*protocol=None, service\_address=None, server\_address=None, packet\_forward\_method=None, weight=None, \*\*kwargs*)

Edit a real server to a virtual service.

**protocol** The service protocol(only support tcp, udp and fwmark service).

**service\_address** The LVS service address.

**server\_address** The real server address.

**packet\_forward\_method** The LVS packet forwarding method(dr for direct routing, tunnel for tunneling, nat for network access translation).

**weight** The capacity of a server relative to the others in the pool.

CLI Example:

```
salt '*' lvs.edit_server tcp 1.1.1.1:80 192.168.0.11:8080 nat 1
```

**salt.modules.lvs.edit\_service** (*protocol=None, service\_address=None, scheduler=None*)

Edit the virtual service.

**protocol** The service protocol(only support tcp, udp and fwmark service).

**service\_address** The LVS service address.

**scheduler** Algorithm for allocating TCP connections and UDP datagrams to real servers.

CLI Example:

```
salt '*' lvs.edit_service tcp 1.1.1.1:80 rr
```

**salt.modules.lvs.get\_rules**()

Get the virtual server rules

CLI Example:

```
salt '*' lvs.get_rules
```

**salt.modules.lvs.list** (*protocol=None, service\_address=None*)

List the virtual server table if service\_address is not specified. If a service\_address is selected, list this service only.

CLI Example:

```
salt '*' lvs.list
```

**salt.modules.lvs.zero** (*protocol=None, service\_address=None*)

Zero the packet, byte and rate counters in a service or all services.

CLI Example:

```
salt '*' lvs.zero
```

## 14.7.191 salt.modules.lxc

Control Linux Containers via Salt

**depends** lxc package for distribution

lxc >= 1.0 (even beta alpha) is required

**salt.modules.lxc.add\_veth**(*name, interface\_name, bridge=None, path=None*)

Add a veth to a container. Note : this function doesn't update the container config, just add the interface at runtime

**name** Name of the container

**interface\_name** Name of the interface in the container

**bridge** Name of the bridge to attach the interface to (facultative)

CLI Examples:

```
salt '*' lxc.add_veth container_name eth1 br1
salt '*' lxc.add_veth container_name eth1
```

**salt.modules.lxc.apply\_network\_profile**(*name, network\_profile, nic\_opts=None, path=None*)

New in version 2015.5.0.

Apply a network profile to a container

**network\_profile** profile name or default values (dict)

**nic\_opts** values to override in defaults (dict) indexed by nic card names

**path** path to the container parent

New in version 2015.8.0.

CLI Examples:

```
salt 'minion' lxc.apply_network_profile web1 centos
salt 'minion' lxc.apply_network_profile web1 centos \
    nic_opts="{ 'eth0': { 'mac': 'xx:xx:xx:xx:xx:xx' } }"
salt 'minion' lxc.apply_network_profile web1 \
    "{ 'eth0': { 'mac': 'xx:xx:xx:xx:xx:yy' } }"
    nic_opts="{ 'eth0': { 'mac': 'xx:xx:xx:xx:xx:xx' } }"
```

The special case to disable use of ethernet nics:

```
salt 'minion' lxc.apply_network_profile web1 centos \
    "{eth0: {disable: true}}"
```

**salt.modules.lxc.attachable**(*name, path=None*)

Return True if the named container can be attached to via the lxc-attach command

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt 'minion' lxc.attachable ubuntu
```

**salt.modules.lxc.bootstrap**(*name, config=None, approve\_key=True, install=True, pub\_key=None, priv\_key=None, bootstrap\_url=None, force\_install=False, unconditional\_install=False, path=None, bootstrap\_delay=None, bootstrap\_args=None, bootstrap\_shell=None*)

Install and configure salt in a container.

**config** Minion configuration options. By default, the master option is set to the target host's master.

**approve\_key** Request a pre-approval of the generated minion key. Requires that the salt-master be configured to either auto-accept all keys or expect a signing request from the target host. Default: True

**path** path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

**pub\_key** Explicit public key to pressed the minion with (optional). This can be either a filepath or a string representing the key

**priv\_key** Explicit private key to pressed the minion with (optional). This can be either a filepath or a string representing the key

**bootstrap\_delay** Delay in seconds between end of container creation and bootstrapping. Useful when waiting for container to obtain a DHCP lease.

New in version 2015.5.0.

**bootstrap\_url** url, content or filepath to the salt bootstrap script

**bootstrap\_args** salt bootstrap script arguments

**bootstrap\_shell** shell to execute the script into

**install** Whether to attempt a full installation of salt-minion if needed.

**force\_install** Force installation even if salt-minion is detected, this is the way to run vendor bootstrap scripts even if a salt minion is already present in the container

**unconditional\_install** Run the script even if the container seems seeded

CLI Examples:

```
salt 'minion' lxc.bootstrap container_name [config=config_data] \
    [approve_key=(True|False)] [install=(True|False)]
```

`salt.modules.lxc.clone`(*name, orig, profile=None, network\_profile=None, nic\_opts=None, \*\*kwargs*)

Create a new container as a clone of another container

**name** Name of the container

**orig** Name of the original container to be cloned

**profile** Profile to use in container cloning (see `lxc.get_container_profile`). Values in a profile will be overridden by the **Container Cloning Arguments** listed below.

**path** path to the container parent directory default: `/var/lib/lxc` (system)

New in version 2015.8.0.

#### Container Cloning Arguments

**snapshot** Use Copy On Write snapshots (LVM)

**size** [1G] Size of the volume to create. Only applicable if `backing=lvm`.

**backing** The type of storage to use. Set to `lvm` to use an LVM group. Defaults to filesystem within `/var/lib/lxc`.

**network\_profile** Network profile to use for container

New in version 2015.8.0.

**nic\_opts** give extra opts overriding network profile values

New in version 2015.8.0.

CLI Examples:

```
salt '*' lxc.clone myclone orig=orig_container
salt '*' lxc.clone myclone orig=orig_container snapshot=True
```

`salt.modules.lxc.cloud_init`(*name, vm\_=None, \*\*kwargs*)

Thin wrapper to `lxc.init` to be used from the saltcloud `lxc` driver

**name** Name of the container may be `None` and then guessed from saltcloud mapping

**vm\_** saltcloud mapping defaults for the vm

CLI Example:

```
salt '*' lxc.cloud_init foo
```

`salt.modules.lxc.cloud_init_interface`(*name, vm\_=None, \*\*kwargs*)

Interface between `salt.cloud.lxc` driver and `lxc.init` `vm_` is a mapping of vm opts in the salt.cloud format as documented for the `lxc` driver.

This can be used either:

- from the salt cloud driver
- because you find the argument to give easier here than using directly lxc.init

**Warning:** BE REALLY CAREFUL CHANGING DEFAULTS !!! IT'S A RETRO COMPATIBLE INTERFACE WITH THE SALT CLOUD DRIVER (ask kiorky).

**name** name of the lxc container to create

**pub\_key** public key to preseed the minion with. Can be the keycontent or a filepath

**priv\_key** private key to preseed the minion with. Can be the keycontent or a filepath

**path** path to the container parent directory (default: /var/lib/lxc)

New in version 2015.8.0.

**profile** profile selection

**network\_profile** network profile selection

**nic\_opts** per interface settings compatibles with network profile (ipv4/ipv6/link/gateway/mac/netmask)

eg:

```
- {'eth0': {'mac': '00:16:3e:01:29:40',
           'gateway': None, (default)
           'link': 'br0', (default)
           'gateway': None, (default)
           'netmask': '', (default)
           'ip': '22.1.4.25'}}
```

**unconditional\_install** given to lxc.bootstrap (see relative doc)

**force\_install** given to lxc.bootstrap (see relative doc)

**config** any extra argument for the salt minion config

**dnsservers** list of DNS servers to set inside the container (Defaults to 8.8.8.8 and 4.4.4.4 until Oxygen release)

**dns\_via\_dhcp** do not set the dns servers, let them be set by the dhcp. (Defaults to False until Oxygen release)

**autostart** autostart the container at boot time

**password** administrative password for the container

**bootstrap\_delay** delay before launching bootstrap script at Container init

**Warning:** Legacy but still supported options:

**from\_container** which container we use as a template when running lxc.clone

**image** which template do we use when we are using lxc.create. This is the default mode unless you specify something in from\_container

**backing** which backing store to use. Values can be: overlayfs, dir(default), lvm, zfs, btrfs

**fstype** When using a blockdevice level backing store, which filesystem to use on

**size** When using a blockdevice level backing store, which size for the filesystem to use on

**snapshot** Use snapshot when cloning the container source

**vgname** if using LVM: vgname

**lvname** if using LVM: lvname

**thinpool:** if using LVM: thinpool

**ip** ip for the primary nic

**mac** mac address for the primary nic

```

netmask netmask for the primary nic (24) = vm_.get('netmask', '24')
bridge bridge for the primary nic (lxcbr0)
gateway network gateway for the container
additional_ips additional ips which will be wired on the main bridge (br0) which is connected to internet.
    Be aware that you may use manual virtual mac addresses provided by you provider (online, ovh,
    etc). This is a list of mappings {ip: ``, mac: ``, netmask:``} Set gateway to None and an interface with
    a gateway to escape from another interface that eth0. eg:
    - {'mac': '00:16:3e:01:29:40',
      'gateway': None, (default)
      'link': 'br0', (default)
      'netmask': '', (default)
      'ip': '22.1.4.25'}
users administrative users for the container default: [root] and [root, ubuntu] on ubuntu
default_nic name of the first interface, you should really not override this
  
```

CLI Example:

```
salt '*' lxc.cloud_init_interface foo
```

`salt.modules.lxc.copy_to` (*name, source, dest, overwrite=False, makedirs=False, path=None*)  
 Changed in version 2015.8.0: Function renamed from `lxc.cp` to `lxc.copy_to` for consistency with other container types. `lxc.cp` will continue to work, however. For versions 2015.2.x and earlier, use `lxc.cp`.

Copy a file or directory from the host into a container

**name** Container name

**source** File to be copied to the container

**path** path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

**dest** Destination on the container. Must be an absolute path.

Changed in version 2015.5.0: If the destination is a directory, the file will be copied into that directory.

**overwrite** [False] Unless this option is set to `True`, then if a file exists at the location specified by the `dest` argument, an error will be raised.

New in version 2015.8.0.

**makedirs** : False

Create the parent directory on the container if it does not already exist.

New in version 2015.5.0.

CLI Example:

```
salt 'minion' lxc.copy_to /tmp/foo /root/foo
salt 'minion' lxc.cp /tmp/foo /root/foo
```

`salt.modules.lxc.create` (*name, config=None, profile=None, network\_profile=None, nic\_opts=None, \*\*kwargs*)

Create a new container.

**name** Name of the container

**config** The config file to use for the container. Defaults to system-wide config (usually in `/etc/lxc/lxc.conf`).

**profile** Profile to use in container creation (see [lxc.get\\_container\\_profile](#)). Values in a profile will be overridden by the **Container Creation Arguments** listed below.

**network\_profile** Network profile to use for container

New in version 2015.5.0.

### Container Creation Arguments

**template** The template to use. For example, `ubuntu` or `fedora`. For a full list of available templates, check out the `lxc.templates` function.

Conflicts with the `image` argument.

---

**Note:** The `download` template requires the following three parameters to be defined in options:

- **dist** - The name of the distribution
- **release** - Release name/version
- **arch** - Architecture of the container

The available images can be listed using the `lxc.images` function.

---

**options** Template-specific options to pass to the `lxc-create` command. These correspond to the long options (ones beginning with two dashes) that the template script accepts. For example:

```
options={'dist': "centos", "release": "6", "arch": "amd64"}
```

For available template options, refer to the `lxc` template scripts which are usually located under `/usr/share/lxc/templates`, or run `lxc-create -t <template> -h`.

**image** A tar archive to use as the rootfs for the container. Conflicts with the `template` argument.

**backing** The type of storage to use. Set to `lvm` to use an LVM group. Defaults to filesystem within `/var/lib/lxc`.

**fstype** Filesystem type to use on LVM logical volume

**size** [1G] Size of the volume to create. Only applicable if `backing=lvm`.

**vgname** [`lxc`] Name of the LVM volume group in which to create the volume for this container. Only applicable if `backing=lvm`.

**lvname** Name of the LVM logical volume in which to create the volume for this container. Only applicable if `backing=lvm`.

**thinpool** Name of a pool volume that will be used for thin-provisioning this container. Only applicable if `backing=lvm`.

**nic\_opts** give extra opts overriding network profile values

**path** parent path for the container creation (default: `/var/lib/lxc`)

**zfsroot** Name of the ZFS root in which to create the volume for this container. Only applicable if `backing=zfs`. (default: `tank/lxc`)

New in version 2015.8.0.

`salt.modules.lxc.destroy` (*name*, *stop=False*, *path=None*)

Destroy the named container.

**Warning:** Destroys all data associated with the container.

**path** path to the container parent directory (default: `/var/lib/lxc`)

New in version 2015.8.0.

**stop** [`False`] If `True`, the container will be destroyed even if it is running/frozen.

Changed in version 2015.5.0: Default value changed to `False`. This more closely matches the behavior of `lxc-destroy` (1), and also makes it less likely that an accidental command will destroy a running container that was being used for important things.

CLI Examples:

```
salt '*' lxc.destroy foo
salt '*' lxc.destroy foo stop=True
```

`salt.modules.lxc.edit_conf`(*conf\_file*, *out\_format*='simple', *read\_only*=False, *lxc\_config*=None, *\*\*kwargs*)

Edit an LXC configuration file. If a setting is already present inside the file, its value will be replaced. If it does not exist, it will be appended to the end of the file. Comments and blank lines will be kept in-tact if they already exist in the file.

**out\_format**: Set to simple if you need backward compatibility (multiple items for a simple key is not supported)

**read\_only**: return only the edited configuration without applying it to the underlying lxc configuration file

**lxc\_config**: List of dict containing lxc configuration items For network configuration, you also need to add the device it belongs to, otherwise it will default to eth0. Also, any change to a network parameter will result in the whole network reconfiguration to avoid mismatches, be aware of that !

After the file is edited, its contents will be returned. By default, it will be returned in simple format, meaning an unordered dict (which may not represent the actual file order). Passing in an *out\_format* of `commented` will return a data structure which accurately represents the order and content of the file.

CLI Example:

```
salt 'minion' lxc.edit_conf /etc/lxc/mycontainer.conf \
  out_format=commented lxc.network.type=veth
salt 'minion' lxc.edit_conf /etc/lxc/mycontainer.conf \
  out_format=commented \
  lxc_config="[{'lxc.network.name': 'eth0', \
               'lxc.network.ipv4': '1.2.3.4'}, \
              {'lxc.network.name': 'eth2', \
               'lxc.network.ipv4': '1.2.3.5'}, \
              {'lxc.network.gateway': '1.2.3.1'}]"
```

`salt.modules.lxc.exists`(*name*, *path*=None)

Returns whether the named container exists.

**path** path to the container parent directory (default: /var/lib/lxc)

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.exists name
```

`salt.modules.lxc.freeze`(*name*, *\*\*kwargs*)

Freeze the named container

**path** path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

**start** [False] If True and the container is stopped, the container will be started before attempting to freeze.

New in version 2015.5.0.

**use\_vt** run the command through VT

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.freeze name
```

`salt.modules.lxc.get_container_profile`(*name*=None, *\*\*kwargs*)

New in version 2015.5.0.

Gather a pre-configured set of container configuration parameters. If no arguments are passed, an empty profile is returned.

Profiles can be defined in the minion or master config files, or in pillar or grains, and are loaded using `config.get`. The key under which LXC profiles must be configured is

`lxc.container_profile.profile_name`. An example container profile would be as follows:

```
lxc.container_profile:
  ubuntu:
    template: ubuntu
    backing: lvm
    vgname: lxc
    size: 1G
```

Parameters set in a profile can be overridden by passing additional container creation arguments (such as the ones passed to `lxc.create`) to this function.

A profile can be defined either as the name of the profile, or a dictionary of variable names and values. See the LXC Tutorial for more information on how to use LXC profiles.

CLI Example:

```
salt-call lxc.get_container_profile centos
salt-call lxc.get_container_profile ubuntu template=ubuntu backing=overlayfs
```

`salt.modules.lxc.get_network_profile` (*name=None, \*\*kwargs*)

New in version 2015.5.0.

Gather a pre-configured set of network configuration parameters. If no arguments are passed, the following default profile is returned:

```
{'eth0': {'link': 'br0', 'type': 'veth', 'flags': 'up'}}
```

Profiles can be defined in the minion or master config files, or in pillar or grains, and are loaded using `config.get`. The key under which LXC profiles must be configured is `lxc.network_profile`. An example network profile would be as follows:

```
lxc.network_profile.centos:
  eth0:
    link: br0
    type: veth
    flags: up
```

To disable networking entirely:

```
lxc.network_profile.centos:
  eth0:
    disable: true
```

Parameters set in a profile can be overridden by passing additional arguments to this function.

A profile can be passed either as the name of the profile, or a dictionary of variable names and values. See the LXC Tutorial for more information on how to use network profiles.

**Warning:** The `ipv4`, `ipv6`, `gateway`, and `link` (bridge) settings in network profiles will only work if the container doesn't redefine the network configuration (for example in `/etc/sysconfig/network-scripts/ifcfg-<interface_name>` on RHEL/CentOS, or `/etc/network/interfaces` on Debian/Ubuntu/etc.)

CLI Example:

```
salt-call lxc.get_network_profile default
```

`salt.modules.lxc.get_parameter` (*name*, *parameter*, *path=None*)

Returns the value of a cgroup parameter for a container

**path** path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.get_parameter container_name memory.limit_in_bytes
```

`salt.modules.lxc.get_pid` (*name*, *path=None*)

Returns a container pid. Throw an exception if the container isn't running.

CLI Example:

```
salt '*' lxc.get_pid name
```

`salt.modules.lxc.get_root_path` (*path*)

Get the configured lxc root for containers

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.get_root_path
```

`salt.modules.lxc.images` (*dist=None*)

New in version 2015.5.0.

List the available images for LXC's download template.

**dist** [None] Filter results to a single Linux distribution

CLI Examples:

```
salt myminion lxc.images
salt myminion lxc.images dist=centos
```

`salt.modules.lxc.info` (*name*, *path=None*)

Returns information about a container

**path** path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.info name
```

`salt.modules.lxc.init` (*name*, *config=None*, *cpuset=None*, *cpushare=None*, *memory=None*, *profile=None*, *network\_profile=None*, *nic\_opts=None*, *cpu=None*, *autostart=True*, *password=None*, *password\_encrypted=None*, *users=None*, *dnsservers=None*, *searchdomains=None*, *bridge=None*, *gateway=None*, *pub\_key=None*, *priv\_key=None*, *force\_install=False*, *unconditional\_install=False*, *bootstrap\_delay=None*, *bootstrap\_args=None*, *bootstrap\_shell=None*, *bootstrap\_url=None*, **\*\*kwargs**)

Initialize a new container.

This is a partial idempotent function as if it is already provisioned, we will reset a bit the lxc configuration file but much of the hard work will be escaped as markers will prevent re-execution of harmful tasks.

**name** Name of the container

**image** A tar archive to use as the rootfs for the container. Conflicts with the `template` argument.

**cpus** Select a random number of cpu cores and assign it to the cpuset, if the cpuset option is set then this option will be ignored

**cpuset** Explicitly define the cpus this container will be bound to

**cpushare** cgroups cpu shares

**autostart** autostart container on reboot

**memory** cgroups memory limit, in MB

Changed in version 2015.5.0: If no value is passed, no limit is set. In earlier Salt versions, not passing this value causes a 1024MB memory limit to be set, and it was necessary to pass `memory=0` to set no limit.

**gateway** the ipv4 gateway to use the default does nothing more than lxcutils does

**bridge** the bridge to use the default does nothing more than lxcutils does

**network\_profile** Network profile to use for the container

New in version 2015.5.0.

**nic\_opts** Extra options for network interfaces, will override

```
{"eth0": {"hwaddr": "aa:bb:cc:dd:ee:ff", "ipv4": "10.1.1.1", "ipv6": "2001:db8::ff00:42:8329"}}
```

or

```
{"eth0": {"hwaddr": "aa:bb:cc:dd:ee:ff", "ipv4": "10.1.1.1/24", "ipv6": "2001:db8::ff00:42:8329"}}
```

**users** Users for which the password defined in the `password` param should be set. Can be passed as a comma separated list or a python list. Defaults to just the `root` user.

**password** Set the initial password for the users defined in the `users` parameter

**password\_encrypted** [False] Set to `True` to denote a password hash instead of a plaintext password

New in version 2015.5.0.

**profile** A LXC profile (defined in config or pillar). This can be either a real profile mapping or a string to retrieve it in configuration

**start** Start the newly-created container

**dnsservers** list of dns servers to set in the container, default [] (no setting)

**seed** Seed the container with the minion config. Default: `True`

**install** If salt-minion is not already installed, install it. Default: `True`

**config** Optional config parameters. By default, the id is set to the name of the container.

**master** salt master (default to minion's master)

**master\_port** salt master port (default to minion's master port)

**pub\_key** Explicit public key to preseed the minion with (optional). This can be either a filepath or a string representing the key

**priv\_key** Explicit private key to preseed the minion with (optional). This can be either a filepath or a string representing the key

**approve\_key** If explicit preseeding is not used; Attempt to request key approval from the master. Default: `True`

**path** path to the container parent directory default: `/var/lib/lxc` (system)

New in version 2015.8.0.

**clone\_from** Original from which to use a clone operation to create the container. Default: `None`

**bootstrap\_delay** Delay in seconds between end of container creation and bootstrapping. Useful when waiting for container to obtain a DHCP lease.

New in version 2015.5.0.

**bootstrap\_url** See `lxc.bootstrap`

**bootstrap\_shell** See `lxc.bootstrap`

**bootstrap\_args** See `lxc.bootstrap`

**force\_install** Force installation even if salt-minion is detected, this is the way to run vendor bootstrap scripts even if a salt minion is already present in the container

**unconditional\_install** Run the script even if the container seems seeded

CLI Example:

```
salt 'minion' lxc.init name [cpuset=cgroups_cpuset] \
    [cpushare=cgroups_cpushare] [memory=cgroups_memory] \
    [nic=nic_profile] [profile=lxc_profile] \
    [nic_opts=nic_opts] [start=(True|False)] \
    [seed=(True|False)] [install=(True|False)] \
    [config=minion_config] [approve_key=(True|False)] \
    [clone_from=original] [autostart=True] \
    [priv_key=/path_or_content] [pub_key=/path_or_content] \
    [bridge=lxcbr0] [gateway=10.0.3.1] \
    [dnsservers[dns1,dns2]] \
    [users=[foo]] [password='secret'] \
    [password_encrypted=(True|False)]
```

**salt.modules.lxc.list**(*extra=False, limit=None, path=None*)

List containers classified by state

**extra** Also get per-container specific info. This will change the return data. Instead of returning a list of containers, a dictionary of containers and each container's output from *lxc.info*.

**path** path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

**limit** Return output matching a specific state (**frozen**, **running**, or **stopped**).

New in version 2015.5.0.

CLI Examples:

```
salt '*' lxc.list
salt '*' lxc.list extra=True
salt '*' lxc.list limit=running
```

**salt.modules.lxc.ls**(*active=None, cache=True, path=None*)

Return a list of the containers available on the minion

**path** path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

**active** If True, return only active (i.e. running) containers

New in version 2015.5.0.

CLI Example:

```
salt '*' lxc.ls
salt '*' lxc.ls active=True
```

**salt.modules.lxc.read\_conf**(*conf\_file, out\_format='simple'*)

Read in an LXC configuration file. By default returns a simple, unsorted dict, but can also return a more detailed structure including blank lines and comments.

**out\_format**: set to 'simple' if you need the old and unsupported behavior. This won't support the multiple lxc values (eg: multiple network nics)

CLI Examples:

```
salt 'minion' lxc.read_conf /etc/lxc/mycontainer.conf
salt 'minion' lxc.read_conf /etc/lxc/mycontainer.conf out_format=commented
```

**salt.modules.lxc.reboot**(*name, path=None*)

Reboot a container.

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Examples:

```
salt 'minion' lxc.reboot myvm
```

**salt.modules.lxc.reconfigure**(*name*, *cpu*=None, *cpuset*=None, *cpushare*=None, *memory*=None, *profile*=None, *network\_profile*=None, *nic\_opts*=None, *bridge*=None, *gateway*=None, *autostart*=None, *utsname*=None, *rootfs*=None, *path*=None, *\*\*kwargs*)

Reconfigure a container.

This only applies to a few property

**name** Name of the container.

**utsname** utsname of the container.

New in version 2016.3.0.

**rootfs** rootfs of the container.

New in version 2016.3.0.

**cpu** Select a random number of cpu cores and assign it to the cpuset, if the cpuset option is set then this option will be ignored

**cpuset** Explicitly define the cpus this container will be bound to

**cpushare** cgroups cpu shares.

**autostart** autostart container on reboot

**memory** cgroups memory limit, in MB. (0 for nolimit, None for old default 1024MB)

**gateway** the ipv4 gateway to use the default does nothing more than lxcutils does

**bridge** the bridge to use the default does nothing more than lxcutils does

**nic** Network interfaces profile (defined in config or pillar).

**nic\_opts** Extra options for network interfaces, will override

```
{"eth0": {"mac": "aa:bb:cc:dd:ee:ff", "ipv4": "10.1.1.1", "ipv6": "2001:db8::ff00:42:8329"}}
```

or

```
{"eth0": {"mac": "aa:bb:cc:dd:ee:ff", "ipv4": "10.1.1.1/24", "ipv6": "2001:db8::ff00:42:8329"}}
```

**path** path to the container parent

New in version 2015.8.0.

CLI Example:

```
salt-call -lall mc_lxc_fork.reconfigure foobar nic_opts="{ 'eth1': { 'mac': '00:16:↪3e:dd:ee:44' } }" memory=4
```

**salt.modules.lxc.restart**(*name*, *path*=None, *lxc\_config*=None, *force*=False)

New in version 2015.5.0.

Restart the named container. If the container was not running, the container will merely be started.

**name** The name of the container

**path** path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

**lxc\_config** path to a lxc config file config file will be guessed from container name otherwise

New in version 2015.8.0.

**force** [False] If True, the container will be force-stopped instead of gracefully shut down

CLI Example:

```
salt myminion lxc.restart name
```

`salt.modules.lxc.retcode`(*name*, *cmd*, *no\_start=False*, *preserve\_state=True*, *stdin=None*, *python\_shell=True*, *output\_loglevel='debug'*, *use\_vt=False*, *path=None*, *ignore\_retcode=False*, *chroot\_fallback=False*, *keep\_env='http\_proxy, https\_proxy, no\_proxy'*)

New in version 2015.5.0.

Run `cmd.retcode` within a container

**Warning:** Many shell builtins do not work, failing with stderr similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed in stderr if the command being run does not exist. If the retcode is nonzero and not what was expected, try using `lxc.run_stderr` or `lxc.run_all`.

**name** Name of the container in which to run the command

**cmd** Command to run

**no\_start** [False] If the container is not running, don't start it

**preserve\_state** [True] After running the command, return the container to its previous state

**path** path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

**stdin** [None] Standard input to be used for the command

**output\_loglevel** [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

**use\_vt** [False] Use SaltStack's `utils.vt` to stream output to console `output=all`.

**keep\_env** [http\_proxy,https\_proxy,no\_proxy] A list of env vars to preserve. May be passed as comma-delimited list.

**chroot\_fallback** if the container is not running, try to run the command using `chroot` default: `false`

CLI Example:

```
salt myminion lxc.retcode mycontainer 'ip addr show'
```

`salt.modules.lxc.run`(*name*, *cmd*, *no\_start=False*, *preserve\_state=True*, *stdin=None*, *python\_shell=True*, *output\_loglevel='debug'*, *use\_vt=False*, *path=None*, *ignore\_retcode=False*, *chroot\_fallback=False*, *keep\_env='http\_proxy, https\_proxy, no\_proxy'*)

New in version 2015.8.0.

Run `cmd.run` within a container

**Warning:** Many shell builtins do not work, failing with stderr similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed in stderr if the command being run does not exist. If no output is returned using this function, try using `lxc.run_stderr` or `lxc.run_all`.

**name** Name of the container in which to run the command

**cmd** Command to run

**path** path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

**no\_start** [False] If the container is not running, don't start it

**preserve\_state** [True] After running the command, return the container to its previous state

**stdin** [None] Standard input to be used for the command

**output\_loglevel** [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

**use\_vt** [False] Use SaltStack's `utils.vt` to stream output to console. Assumes `output=all`.

**chroot\_fallback** if the container is not running, try to run the command using `chroot` default: `false`

**keep\_env** [http\_proxy,https\_proxy,no\_proxy] A list of env vars to preserve. May be passed as comma-delimited list.

CLI Example:

```
salt myminion lxc.run mycontainer 'ifconfig -a'
```

```
salt.modules.lxc.run_all(name, cmd, no_start=False, preserve_state=True, stdin=None,
python_shell=True, output_loglevel='debug', use_vt=False, path=None,
ignore_retcode=False, chroot_fallback=False, keep_env='http_proxy,
https_proxy, no_proxy')
```

New in version 2015.5.0.

Run `cmd.run_all` within a container

---

**Note:** While the command is run within the container, it is initiated from the host. Therefore, the PID in the return dict is from the host, not from the container.

---

**Warning:** Many shell builtins do not work, failing with `stderr` similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed in `stderr` if the command being run does not exist.

**name** Name of the container in which to run the command

**path** path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

**cmd** Command to run

**no\_start** [False] If the container is not running, don't start it

**preserve\_state** [True] After running the command, return the container to its previous state

**stdin** [None] Standard input to be used for the command

**output\_loglevel** [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

**use\_vt** [False] Use SaltStack's `utils.vt` to stream output to console `output=all`.

**keep\_env** [http\_proxy,https\_proxy,no\_proxy] A list of env vars to preserve. May be passed as comma-delimited list.

**chroot\_fallback** if the container is not running, try to run the command using `chroot` default: `false`

CLI Example:

```
salt myminion lxc.run_all mycontainer 'ip addr show'
```

```
salt.modules.lxc.run_stderr(name, cmd, no_start=False, preserve_state=True, stdin=None,
python_shell=True, output_loglevel='debug', use_vt=False, path=None,
ignore_retcode=False, chroot_fallback=False, keep_env='http_proxy,
https_proxy, no_proxy')
```

New in version 2015.5.0.

Run `cmd.run_stderr` within a container

**Warning:** Many shell builtins do not work, failing with stderr similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed if the command being run does not exist.

**name** Name of the container in which to run the command

**cmd** Command to run

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

**no\_start** [False] If the container is not running, don't start it

**preserve\_state** [True] After running the command, return the container to its previous state

**stdin** [None] Standard input to be used for the command

**output\_loglevel** [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

**use\_vt** [False] Use SaltStack's `utils.vt` to stream output to console `output=all`.

**keep\_env** [http\_proxy,https\_proxy,no\_proxy] A list of env vars to preserve. May be passed as comma-delimited list.

**chroot\_fallback** if the container is not running, try to run the command using `chroot` default: `false`

CLI Example:

```
salt myminion lxc.run_stderr mycontainer 'ip addr show'
```

`salt.modules.lxc.run_stdout`(*name, cmd, no\_start=False, preserve\_state=True, stdin=None, python\_shell=True, output\_loglevel='debug', use\_vt=False, path=None, ignore\_retcode=False, chroot\_fallback=False, keep\_env='http\_proxy, https\_proxy, no\_proxy'*)

New in version 2015.5.0.

Run `cmd.run_stdout` within a container

**Warning:** Many shell builtins do not work, failing with stderr similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed in stderr if the command being run does not exist. If no output is returned using this function, try using `lxc.run_stderr` or `lxc.run_all`.

**name** Name of the container in which to run the command

**cmd** Command to run

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

**no\_start** [False] If the container is not running, don't start it

**preserve\_state** [True] After running the command, return the container to its previous state

**stdin** [None] Standard input to be used for the command

**output\_loglevel** [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

**use\_vt** [False] Use SaltStack's `utils.vt` to stream output to console `output=all`.

**keep\_env** [http\_proxy,https\_proxy,no\_proxy] A list of env vars to preserve. May be passed as comma-delimited list.

**chroot\_fallback** if the container is not running, try to run the command using `chroot` default: `false`

CLI Example:

```
salt myminion lxc.run_stdout mycontainer 'ifconfig -a'
```

`salt.modules.lxc.running_systemd`(*name*, *cache=True*, *path=None*)

Determine if systemd is running  
**path** path to the container parent

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.running_systemd ubuntu
```

`salt.modules.lxc.search_lxc_bridge`()

Search the first bridge which is potentially available as LXC bridge

CLI Example:

```
salt '*' lxc.search_lxc_bridge
```

`salt.modules.lxc.search_lxc_bridges`()

Search which bridges are potentially available as LXC bridges

CLI Example:

```
salt '*' lxc.search_lxc_bridges
```

`salt.modules.lxc.set_dns`(*name*, *dnsservers=None*, *searchdomains=None*, *path=None*)

Changed in version 2015.5.0: The `dnsservers` and `searchdomains` parameters can now be passed as a comma-separated list.

Update `/etc/resolv.conf`

**path**

path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.set_dns ubuntu "['8.8.8.8', '4.4.4.4']"
```

`salt.modules.lxc.set_parameter`(*name*, *parameter*, *value*, *path=None*)

Set the value of a cgroup parameter for a container.

**path** path to the container parent directory default: `/var/lib/lxc` (system)

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.set_parameter name parameter value
```

`salt.modules.lxc.set_password`(*name*, *users*, *password*, *encrypted=True*, *path=None*)

Changed in version 2015.5.0: Function renamed from `set_pass` to `set_password`. Additionally, this function now supports (and defaults to using) a password hash instead of a plaintext password.

Set the password of one or more system users inside containers

**users** Comma-separated list (or python list) of users to change password

**password** Password to set for the specified user(s)

**encrypted** [True] If true, password must be a password hash. Set to False to set a plaintext password (not recommended).

New in version 2015.5.0.

**path** path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.set_pass container-name root '$6$uJ2uAyLU$KoI67t8As/
↳0fXtJ0PcHKGXmUpcoYUcVR2K6x93walnShTCQvjRwq25yIkiCB0qgbfdKQSFnAo28/ek6716vEV1'
salt '*' lxc.set_pass container-name root foo encrypted=False
```

**salt.modules.lxc.start**(*name*, *\*\*kwargs*)

Start the named container

**path** path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

**lxc\_config** path to a lxc config file config file will be guessed from container name otherwise

New in version 2015.8.0.

**use\_vt** run the command through VT

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.start name
```

**salt.modules.lxc.state**(*name*, *path=None*)

Returns the state of a container.

**path** path to the container parent directory (default: /var/lib/lxc)

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.state name
```

**salt.modules.lxc.stop**(*name*, *kill=False*, *path=None*, *use\_vt=None*)

Stop the named container

**path** path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

**kill: False** Do not wait for the container to stop, kill all tasks in the container. Older LXC versions will stop containers like this irrespective of this argument.

Changed in version 2015.5.0: Default value changed to False

**use\_vt** run the command through VT

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.stop name
```

**salt.modules.lxc.systemd\_running\_state**(*name*, *path=None*)

Get the operational state of a systemd based container

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.systemd_running_state ubuntu
```

**salt.modules.lxc.templates**()

New in version 2015.5.0.

List the available LXC template scripts installed on the minion

CLI Examples:

```
salt myminion lxc.templates
```

**salt.modules.lxc.test\_bare\_started\_state**(*name*, *path=None*)

Test if a non systemd container is fully started For now, it consists only to test if the container is attachable  
**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.test_bare_started_state ubuntu
```

**salt.modules.lxc.test\_sd\_started\_state**(*name*, *path=None*)

Test if a systemd container is fully started  
**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.test_sd_started_state ubuntu
```

**salt.modules.lxc.unfreeze**(*name*, *path=None*, *use\_vt=None*)

Unfreeze the named container.  
**path** path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

**use\_vt** run the command through VT

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.unfreeze name
```

**salt.modules.lxc.update\_lxc\_conf**(*name*, *lxc\_conf*, *lxc\_conf\_unset*, *path=None*)

Edit LXC configuration options  
**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.update_lxc_conf ubuntu \  
    lxc_conf="{['network.ipv4.ip':'10.0.3.5']}" \  
    lxc_conf_unset=["lxc.utsname"]
```

**salt.modules.lxc.version**()

Return the actual lxc client version

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.version
```

**salt.modules.lxc.wait\_started**(*name*, *path=None*, *timeout=300*)

Check that the system has fully inited

This is actually very important for systemD based containers

see <https://github.com/saltstack/salt/issues/23847>

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.wait_started ubuntu
```

**salt.modules.lxc.write\_conf**(*conf\_file, conf*)

Write out an LXC configuration file

This is normally only used internally. The format of the data structure must match that which is returned from `lxc.read_conf()`, with `out_format` set to `commented`.

An example might look like:

```
[
  {'lxc.utsname': '$CONTAINER_NAME'},
  '# This is a commented line\n',
  '\n',
  {'lxc.mount': '$CONTAINER_FSTAB'},
  {'lxc.rootfs': {'comment': 'This is another test',
                  'value': 'This is another test'}},
  '\n',
  {'lxc.network.type': 'veth'},
  {'lxc.network.flags': 'up'},
  {'lxc.network.link': 'br0'},
  {'lxc.network.mac': '$CONTAINER_MACADDR'},
  {'lxc.network.ipv4': '$CONTAINER_IPADDR'},
  {'lxc.network.name': '$CONTAINER_DEVICENAME'},
]
```

CLI Example:

```
salt 'minion' lxc.write_conf /etc/lxc/mycontainer.conf \
  out_format=commented
```

### 14.7.192 salt.modules.mac\_assistive module

This module allows you to manage assistive access on macOS minions with 10.9+

New in version 2016.3.0.

```
salt '*' assistive.install /usr/bin/osascript
```

**salt.modules.mac\_assistive.enable**(*app\_id, enabled=True*)

Enable or disable an existing assistive access application.

**app\_id** The bundle ID or command to set assistive access status.

**enabled** Sets enabled or disabled status. Default is True.

CLI Example:

```
salt '*' assistive.enable /usr/bin/osascript
salt '*' assistive.enable com.smileonmymac.textexpander enabled=False
```

**salt.modules.mac\_assistive.enabled**(*app\_id*)

Check if a bundle ID or command is listed in assistive access and enabled.

**app\_id** The bundle ID or command to retrieve assistive access status.

CLI Example:

```
salt '*' assistive.enabled /usr/bin/osascript
salt '*' assistive.enabled com.smileonmy_mac.textexpander
```

`salt.modules.mac_assistive.install(app_id, enable=True)`

Install a bundle ID or command as being allowed to use assistive access.

**app\_id** The bundle ID or command to install for assistive access.

**enabled** Sets enabled or disabled status. Default is True.

CLI Example:

```
salt '*' assistive.install /usr/bin/osascript
salt '*' assistive.install com.smileonmy_mac.textexpander
```

`salt.modules.mac_assistive.installed(app_id)`

Check if a bundle ID or command is listed in assistive access. This will not check to see if it's enabled.

**app\_id** The bundle ID or command to check installed status.

CLI Example:

```
salt '*' assistive.installed /usr/bin/osascript
salt '*' assistive.installed com.smileonmy_mac.textexpander
```

`salt.modules.mac_assistive.remove(app_id)`

Remove a bundle ID or command as being allowed to use assistive access.

**app\_id** The bundle ID or command to remove from assistive access list.

CLI Example:

```
salt '*' assistive.remove /usr/bin/osascript
salt '*' assistive.remove com.smileonmy_mac.textexpander
```

### 14.7.193 salt.modules.mac\_brew module

Homebrew for macOS

---

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to ``pkg.install' is not available`), see [here](#).

---

`salt.modules.mac_brew.available_version(*names, **kwargs)`

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation

Currently chooses stable versions, falling back to `devel` if that does not exist.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```

`salt.modules.mac_brew.info_installed(*names)`

Return the information of the named package(s) installed on the system.

New in version 2016.3.1.

**names** The names of the packages for which to return information.

CLI example:

```
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
```

`salt.modules.mac_brew.install`(*name=None, pkgs=None, taps=None, options=None, \*\*kwargs*)  
 Install the passed package(s) with `brew install`  
**name** The name of the formula to be installed. Note that this parameter is ignored if ``pkgs`` is passed.

CLI Example:

```
salt '*' pkg.install <package name>
```

**taps** Unofficial GitHub repos to use when updating and installing formulas.

CLI Example:

```
salt '*' pkg.install <package name> tap='<tap>'
salt '*' pkg.install zlib taps='homebrew/dupes'
salt '*' pkg.install php54 taps='["josegonzalez/php", "homebrew/dupes"]'
```

**options** Options to pass to `brew`. Only applies to initial install. Due to how `brew` works, modifying chosen options requires a full uninstall followed by a fresh install. Note that if ``pkgs`` is used, all options will be passed to all packages. Unrecognized options for a package will be silently ignored by `brew`.

CLI Example:

```
salt '*' pkg.install <package name> tap='<tap>'
salt '*' pkg.install php54 taps='["josegonzalez/php", "homebrew/dupes"]'
↳options='["--with-fpm"]'
```

Multiple Package Installation Options:

**pkgs** A list of formulas to install. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo", "bar"]'
```

Returns a dict containing the new package names and versions:

```
{<package>: {'old': '<old-version>',
             'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.install 'package package package'
```

`salt.modules.mac_brew.latest_version`(*\*names, \*\*kwargs*)  
 Return the latest version of the named package available for upgrade or installation  
 Currently chooses stable versions, falling back to `devel` if that does not exist.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```

`salt.modules.mac_brew.list_pkgs`(*versions\_as\_list=False, \*\*kwargs*)  
 List the packages currently installed in a dict:

```
{<package_name>: '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.mac_brew.list_upgrades` (*refresh=True, \*\*kwargs*)

Check whether or not an upgrade is available for all packages

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.mac_brew.refresh_db` ()

Update the homebrew package repository.

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.mac_brew.remove` (*name=None, pkgs=None, \*\*kwargs*)

Removes packages with `brew uninstall`.

**name** The name of the package to be deleted.

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>, <package2>, <package3>
salt '*' pkg.remove pkgs=['foo', 'bar']
```

`salt.modules.mac_brew.upgrade` (*refresh=True*)

Upgrade outdated, unpinned brews.

**refresh** Fetch the newest version of Homebrew and all formulae from GitHub before installing.

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.mac_brew.upgrade_available` (*pkg*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.mac_brew.version` (*\*names, \*\*kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3>
```

### 14.7.194 salt.modules.mac\_defaults module

Set defaults on Mac OS

**salt.modules.mac\_defaults.delete**(*domain, key, user=None*)  
Delete a default from the system

CLI Example:

```
salt '*' macdefaults.delete com.apple.CrashReporter DialogType
salt '*' macdefaults.delete NSGlobalDomain ApplePersistence
```

**domain** The name of the domain to delete from  
**key** The key of the given domain to delete  
**user** The user to delete the defaults with

**salt.modules.mac\_defaults.read**(*domain, key, user=None*)  
Write a default to the system

CLI Example:

```
salt '*' macdefaults.read com.apple.CrashReporter DialogType
salt '*' macdefaults.read NSGlobalDomain ApplePersistence
```

**domain** The name of the domain to read from  
**key** The key of the given domain to read from  
**user** The user to write the defaults to

**salt.modules.mac\_defaults.write**(*domain, key, value, type='string', user=None*)  
Write a default to the system

CLI Example:

```
salt '*' macdefaults.write com.apple.CrashReporter DialogType Server
salt '*' macdefaults.write NSGlobalDomain ApplePersistence True type=bool
```

**domain** The name of the domain to write to  
**key** The key of the given domain to write to  
**value** The value to write to the given key  
**type** The type of value to be written, valid types are string, data, int[eger], float, bool[ean], date, array, array-add, dict, dict-add  
**user** The user to write the defaults to

### 14.7.195 salt.modules.mac\_desktop module

macOS implementations of various commands in the ``desktop`` interface

**salt.modules.mac\_desktop.get\_output\_volume**()  
Get the output volume (range 0 to 100)

CLI Example:

```
salt '*' desktop.get_output_volume
```

`salt.modules.mac_desktop.lock()`

Lock the desktop session

CLI Example:

```
salt '*' desktop.lock
```

`salt.modules.mac_desktop.say(*words)`

Say some words.

**words** The words to execute the say command with.

CLI Example:

```
salt '*' desktop.say <word0> <word1> ... <wordN>
```

`salt.modules.mac_desktop.screensaver()`

Launch the screensaver.

CLI Example:

```
salt '*' desktop.screensaver
```

`salt.modules.mac_desktop.set_output_volume(volume)`

Set the volume of sound.

**volume** The level of volume. Can range from 0 to 100.

CLI Example:

```
salt '*' desktop.set_output_volume <volume>
```

### 14.7.196 salt.modules.mac\_group

Manage groups on Mac OS 10.7+

`salt.modules.mac_group.add(name, gid=None, **kwargs)`

Add the specified group

CLI Example:

```
salt '*' group.add foo 3456
```

`salt.modules.mac_group.adduser(group, name)`

Add a user in the group.

CLI Example:

```
salt '*' group.adduser foo bar
```

Verifies if a valid username `bar` as a member of an existing group `foo`, if not then adds it.

`salt.modules.mac_group.chgid(name, gid)`

Change the gid for a named group

CLI Example:

```
salt '*' group.chgid foo 4376
```

`salt.modules.mac_group.delete(name)`

Remove the named group

CLI Example:

```
salt '*' group.delete foo
```

`salt.modules.mac_group.deluser(group, name)`

Remove a user from the group

New in version 2016.3.0.

CLI Example:

```
salt '*' group.deluser foo bar
```

Removes a member user `bar` from a group `foo`. If group is not present then returns True.

`salt.modules.mac_group.getent(refresh=False)`

Return info on all groups

CLI Example:

```
salt '*' group.getent
```

`salt.modules.mac_group.info(name)`

Return information about a group

CLI Example:

```
salt '*' group.info foo
```

`salt.modules.mac_group.members(name, members_list)`

Replaces members of the group with a provided list.

New in version 2016.3.0.

CLI Example:

```
salt '*' group.members foo `user1,user2,user3,...`
```

Replaces a membership list for a local group `foo`.

### 14.7.197 salt.modules.mac\_keychain module

Install certificates into the keychain on Mac OS

New in version 2016.3.0.

`salt.modules.mac_keychain.get_default_keychain(user=None, domain='user')`

Get the default keychain

**user** The user to check the default keychain of

**domain** The domain to use valid values are user|system|common|dynamic, the default is user

CLI Example:

```
salt '*' keychain.get_default_keychain
```

`salt.modules.mac_keychain.get_friendly_name(cert, password)`

Get the friendly name of the given certificate

**cert** The certificate to install

**password** The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section

Note: The password given here will show up as plaintext in the returned job info.

CLI Example:

```
salt '*' keychain.get_friendly_name /tmp/test.p12 test123
```

`salt.modules.mac_keychain.get_hash`(*name*, *password=None*)

Returns the hash of a certificate in the keychain.

**name** The name of the certificate (which you can get from `keychain.get_friendly_name`) or the location of a p12 file.

**password** The password that is used in the certificate. Only required if your passing a p12 file. Note: This will be outputted to logs

CLI Example:

```
salt '*' keychain.get_hash /tmp/test.p12 test123
```

`salt.modules.mac_keychain.install`(*cert*, *password*, *keychain='/Library/Keychains/System.keychain'*, *allow\_any=False*, *keychain\_password=None*)

Install a certificate

**cert** The certificate to install

**password** The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section.

Note: The password given here will show up as plaintext in the job returned info.

**keychain** The keychain to install the certificate to, this defaults to `/Library/Keychains/System.keychain`

**allow\_any** Allow any application to access the imported certificate without warning

**keychain\_password** If your keychain is likely to be locked pass the password and it will be unlocked before running the import

Note: The password given here will show up as plaintext in the returned job info.

CLI Example:

```
salt '*' keychain.install test.p12 test123
```

`salt.modules.mac_keychain.list_certs`(*keychain='/Library/Keychains/System.keychain'*)

List all of the installed certificates

**keychain** The keychain to install the certificate to, this defaults to `/Library/Keychains/System.keychain`

CLI Example:

```
salt '*' keychain.list_certs
```

`salt.modules.mac_keychain.set_default_keychain`(*keychain*, *domain='user'*, *user=None*)

Set the default keychain

**keychain** The location of the keychain to set as default

**domain** The domain to use valid values are user|system|common|dynamic, the default is user

**user** The user to set the default keychain as

CLI Example:

```
salt '*' keychain.set_keychain /Users/fred/Library/Keychains/login.keychain
```

`salt.modules.mac_keychain.uninstall`(*cert\_name*, *keychain='/Library/Keychains/System.keychain'*, *keychain\_password=None*)

Uninstall a certificate from a keychain

**cert\_name** The name of the certificate to remove

**keychain** The keychain to install the certificate to, this defaults to `/Library/Keychains/System.keychain`

**keychain\_password** If your keychain is likely to be locked pass the password and it will be unlocked before running the import

Note: The password given here will show up as plaintext in the returned job info.

CLI Example:

```
salt '*' keychain.install test.p12 test123
```

**salt.modules.mac\_keychain.unlock\_keychain**(*keychain, password*)

Unlock the given keychain with the password

**keychain** The keychain to unlock

**password** The password to use to unlock the keychain.

Note: The password given here will show up as plaintext in the returned job info.

CLI Example:

```
salt '*' keychain.unlock_keychain /tmp/test.p12 test123
```

### 14.7.198 salt.modules.mac\_package module

Install pkg, dmg and .app applications on macOS minions.

**salt.modules.mac\_package.get\_mpkg\_ids**(*mpkg*)

Attempt to get the package IDs from a mounted .mpkg file

**Parameters** **mpkg** (*str*) -- The location of the mounted mpkg file

**Returns** List of package IDs

**Return type** *list*

CLI Example:

```
salt '*' macpackage.get_mpkg_ids /dev/disk2
```

**salt.modules.mac\_package.get\_pkg\_id**(*pkg*)

Attempt to get the package ID from a .pkg file

**Parameters** **pkg** (*str*) -- The location of the pkg file

**Returns** List of all of the package IDs

**Return type** *list*

CLI Example:

```
salt '*' macpackage.get_pkg_id /tmp/test.pkg
```

**salt.modules.mac\_package.install**(*pkg, target='LocalSystem', store=False, allow\_untrusted=False*)

Install a pkg file

**Parameters**

- **pkg** (*str*) -- The package to install
- **target** (*str*) -- The target in which to install the package to
- **store** (*bool*) -- Should the package be installed as if it was from the store?
- **allow\_untrusted** (*bool*) -- Allow the installation of untrusted packages?

**Returns** A dictionary containing the results of the installation

**Return type** *dict*

CLI Example:

```
salt '*' macpackage.install test.pkg
```

`salt.modules.mac_package.install_app(app, target='/Applications/')`

Install an app file by moving it into the specified Applications directory

**Parameters**

- **app** (*str*) -- The location of the .app file
- **target** (*str*) -- The target in which to install the package to Default is ``/Applications/``

**Returns** The results of the rsync command

**Return type** *str*

CLI Example:

```
salt '*' macpackage.install_app /tmp/tmp.app /Applications/
```

`salt.modules.mac_package.installed_pkgs()`

Return the list of installed packages on the machine

**Returns** List of installed packages

**Return type** *list*

CLI Example:

```
salt '*' macpackage.installed_pkgs
```

`salt.modules.mac_package.mount(dmg)`

Attempt to mount a dmg file to a temporary location and return the location of the pkg file inside

**Parameters** **dmg** (*str*) -- The location of the dmg file to mount

**Returns**

**Tuple containing the results of the command along with the mount point**

**Return type** *tuple*

CLI Example:

```
salt '*' macpackage.mount /tmp/software.dmg
```

`salt.modules.mac_package.uninstall_app(app)`

Uninstall an app file by removing it from the Applications directory

**Parameters** **app** (*str*) -- The location of the .app file

**Returns** True if successful, otherwise False

**Return type** *bool*

CLI Example:

```
salt '*' macpackage.uninstall_app /Applications/app.app
```

`salt.modules.mac_package.unmount(mountpoint)`

Attempt to unmount a dmg file from a temporary location

**Parameters** **mountpoint** (*str*) -- The location of the mount point

**Returns** The results of the hduil detach command

**Return type** *str*

CLI Example:

```
salt '*' macpackage.unmount /dev/disk2
```

### 14.7.199 salt.modules.mac\_pkgutil module

Installer support for macOS.

Installer is the native .pkg/.mpkg package manager for macOS.

`salt.modules.mac_pkgutil.forget(package_id)`

New in version 2016.3.0.

Remove the receipt data about the specified package. Does not remove files.

**Warning:** DO NOT use this command to fix broken package design

**Parameters** `package_id` (*str*) -- The name of the package to forget

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' pkgutil.forget com.apple.pkg.gcc4.2Leo
```

`salt.modules.mac_pkgutil.install(source, package_id)`

Install a .pkg from an URI or an absolute path.

**Parameters**

- **source** (*str*) -- The path to a package.

- **package\_id** (*str*) -- The package ID

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' pkgutil.install source=/vagrant/build_essentials.pkg package_id=com.
↳apple.pkg.gcc4.2Leo
```

`salt.modules.mac_pkgutil.is_installed(package_id)`

Returns whether a given package id is installed.

**Returns** True if installed, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' pkgutil.is_installed com.apple.pkg.gcc4.2Leo
```

`salt.modules.mac_pkgutil.list()`

List the installed packages.

**Returns** A list of installed packages

**Return type** `list`

CLI Example:

```
salt '*' pkgutil.list
```

## 14.7.200 salt.modules.mac\_ports module

Support for MacPorts under macOS.

This module has some caveats.

1. Updating the database of available ports is quite resource-intensive. However, `refresh=True` is the default for all operations that need an up-to-date copy of available ports. Consider `refresh=False` when you are sure no db update is needed.

2. In some cases MacPorts doesn't always realize when another copy of itself is running and will gleefully tromp all over the available ports database. This makes MacPorts behave in undefined ways until a fresh complete copy is retrieved.

Because of 1 and 2 it is possible to get the salt-minion into a state where `salt mac-machine pkg./something/` won't want to return. Use

```
salt-run jobs.active
```

on the master to check for potentially long-running calls to `port`.

Finally, ports database updates are always handled with `port selfupdate` as opposed to `port sync`. This makes sense in the MacPorts user community but may confuse experienced Linux admins as Linux package managers don't upgrade the packaging software when doing a package database update. In other words `salt mac-machine pkg.refresh_db` is more like `apt-get update; apt-get upgrade dpkg apt-get` than simply `apt-get update`.

`salt.modules.mac_ports.available_version(*names, **kwargs)`

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation

Options:

**refresh** Update ports with `port selfupdate`

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```

`salt.modules.mac_ports.install(name=None, refresh=False, pkgs=None, **kwargs)`

Install the passed package(s) with `port install`

**name** The name of the formula to be installed. Note that this parameter is ignored if `pkgs` is passed.

CLI Example:

```
salt '*' pkg.install <package name>
```

**version** Specify a version to `pkg` to install. Ignored if `pkgs` is specified.

CLI Example:

```
salt '*' pkg.install <package name>
salt '*' pkg.install git-core version='1.8.5.5'
```

**variant** Specify a variant to `pkg` to install. Ignored if `pkgs` is specified.

CLI Example:

```
salt '*' pkg.install <package name>
salt '*' pkg.install git-core version='1.8.5.5' variant='+credential_
↳osxkeychain+doc+pcr'
```

Multiple Package Installation Options:

**pkgs** A list of formulas to install. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs=['foo','bar']
salt '*' pkg.install pkgs=['foo@1.2','bar']
salt '*' pkg.install pkgs=['foo@1.2+ssl','bar@2.3']
```

Returns a dict containing the new package names and versions:

```
{<package>: {'old': '<old-version>',
              'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.install 'package package package'
```

`salt.modules.mac_ports.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation

Options:

**refresh** Update ports with port selfupdate

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```

`salt.modules.mac_ports.list_pkgs(versions_as_list=False, **kwargs)`

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.mac_ports.list_upgrades(refresh=True, **kwargs)`

Check whether or not an upgrade is available for all packages

Options:

**refresh** Update ports with port selfupdate

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.mac_ports.refresh_db()`

Update ports with port selfupdate

CLI Example:

```
salt mac pkg.refresh_db
```

`salt.modules.mac_ports.remove(name=None, pkgs=None, **kwargs)`

Removes packages with port uninstall.

**name** The name of the package to be deleted.

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>, <package2>, <package3>
salt '*' pkg.remove pkgs=['foo', 'bar']
```

`salt.modules.mac_ports.upgrade(refresh=True)`

Run a full upgrade using MacPorts `port upgrade outdated`

Options:

**refresh** Update ports with port selfupdate  
Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',  
              'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.mac_ports.upgrade_available(pkg, refresh=True)`  
Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.mac_ports.version(*names, **kwargs)`  
Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>  
salt '*' pkg.version <package1> <package2> <package3>
```

### 14.7.201 salt.modules.mac\_power module

Module for editing power settings on macOS

New in version 2016.3.0.

`salt.modules.mac_power.get_computer_sleep()`  
Display the amount of idle time until the computer sleeps.  
**Returns** A string representing the sleep settings for the computer  
**Return type** `str`

CLI Example:

```
..code-block:: bash  
salt '*' power.get_computer_sleep
```

`salt.modules.mac_power.get_display_sleep()`  
Display the amount of idle time until the display sleeps.  
**Returns** A string representing the sleep settings for the display  
**Return type** `str`

CLI Example:

```
..code-block:: bash  
salt '*' power.get_display_sleep
```

`salt.modules.mac_power.get_harddisk_sleep()`  
Display the amount of idle time until the hard disk sleeps.  
**Returns** A string representing the sleep settings for the hard disk  
**Return type** `str`

CLI Example:

```
..code-block:: bash  
salt '*' power.get_harddisk_sleep
```

`salt.modules.mac_power.get_restart_freeze()`

Displays whether 'restart on freeze' is on or off if supported

**Returns** A string value representing the "restart on freeze" settings

**Return type** *string*

CLI Example:

```
salt '*' power.get_restart_freeze
```

`salt.modules.mac_power.get_restart_power_failure()`

Displays whether 'restart on power failure' is on or off if supported

**Returns** A string value representing the "restart on power failure" settings

**Return type** *string*

CLI Example:

```
salt '*' power.get_restart_power_failure
```

`salt.modules.mac_power.get_sleep()`

Displays the amount of idle time until the machine sleeps. Settings for Computer, Display, and Hard Disk are displayed.

**Returns** A dictionary containing the sleep status for Computer, Display, and Hard Disk :rtype: dict

CLI Example:

```
salt '*' power.get_sleep
```

`salt.modules.mac_power.get_sleep_on_power_button()`

Displays whether 'allow power button to sleep computer' is on or off if supported

**Returns** A string value representing the "allow power button to sleep computer" settings :rtype: string

CLI Example:

```
salt '*' power.get_sleep_on_power_button
```

`salt.modules.mac_power.get_wake_on_modem()`

Displays whether 'wake on modem' is on or off if supported

**Returns** A string value representing the "wake on modem" settings

**Return type** *str*

CLI Example:

```
salt '*' power.get_wake_on_modem
```

`salt.modules.mac_power.get_wake_on_network()`

Displays whether 'wake on network' is on or off if supported

**Returns** A string value representing the "wake on network" settings

**Return type** *string*

CLI Example:

```
salt '*' power.get_wake_on_network
```

`salt.modules.mac_power.set_computer_sleep(minutes)`

Set the amount of idle time until the computer sleeps. Pass "Never" or "Off" to never sleep.

**Parameters** **minutes** -- Can be an integer between 1 and 180 or "Never" or "Off"

**Ptype** int, str

**Returns** True if successful, False if not

**Return type** *bool*

CLI Example:

```
salt '*' power.set_computer_sleep 120
salt '*' power.set_computer_sleep off
```

`salt.modules.mac_power.set_display_sleep`(*minutes*)

Set the amount of idle time until the display sleeps. Pass ``Never`` or ``Off`` to never sleep.

**Parameters** **minutes** -- Can be an integer between 1 and 180 or ``Never`` or ``Off``

**Ptype** int, str

**Returns** True if successful, False if not

**Return type** bool

CLI Example:

```
salt '*' power.set_display_sleep 120
salt '*' power.set_display_sleep off
```

`salt.modules.mac_power.set_hddisk_sleep`(*minutes*)

Set the amount of idle time until the hddisk sleeps. Pass ``Never`` or ``Off`` to never sleep.

**Parameters** **minutes** -- Can be an integer between 1 and 180 or ``Never`` or ``Off``

**Ptype** int, str

**Returns** True if successful, False if not

**Return type** bool

CLI Example:

```
salt '*' power.set_hddisk_sleep 120
salt '*' power.set_hddisk_sleep off
```

`salt.modules.mac_power.set_restart_freeze`(*enabled*)

Specifies whether the server restarts automatically after a system freeze. This setting doesn't seem to be editable. The command completes successfully but the setting isn't actually updated. This is probably a macOS. The functions remains in case they ever fix the bug.

**Parameters** **enabled** (*bool*) -- True to enable, False to disable. ``On`` and ``Off`` are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

**Returns** True if successful, False if not

**Return type** bool

CLI Example:

```
salt '*' power.set_restart_freeze True
```

`salt.modules.mac_power.set_restart_power_failure`(*enabled*)

Set whether or not the computer will automatically restart after a power failure.

**Parameters** **enabled** (*bool*) -- True to enable, False to disable. ``On`` and ``Off`` are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

**Returns** True if successful, False if not

**Return type** bool

CLI Example:

```
salt '*' power.set_restart_power_failure True
```

`salt.modules.mac_power.set_sleep`(*minutes*)

Sets the amount of idle time until the machine sleeps. Sets the same value for Computer, Display, and Hard Disk. Pass ``Never`` or ``Off`` for computers that should never sleep.

**Parameters** **minutes** -- Can be an integer between 1 and 180 or ``Never`` or ``Off``

**Ptype** int, str

**Returns** True if successful, False if not

**Return type** bool

CLI Example:

```
salt '*' power.set_sleep 120
salt '*' power.set_sleep never
```

`salt.modules.mac_power.set_sleep_on_power_button` (*enabled*)

Set whether or not the power button can sleep the computer.

**Parameters** **enabled** (*bool*) -- True to enable, False to disable. ``On`` and ``Off`` are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

**Returns** True if successful, False if not

**Return type** `bool`

CLI Example:

```
salt '*' power.set_sleep_on_power_button True
```

`salt.modules.mac_power.set_wake_on_modem` (*enabled*)

Set whether or not the computer will wake from sleep when modem activity is detected.

**Parameters** **enabled** (*bool*) -- True to enable, False to disable. ``On`` and ``Off`` are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

**Returns** True if successful, False if not

**Return type** `bool`

CLI Example:

```
salt '*' power.set_wake_on_modem True
```

`salt.modules.mac_power.set_wake_on_network` (*enabled*)

Set whether or not the computer will wake from sleep when network activity is detected.

**Parameters** **enabled** (*bool*) -- True to enable, False to disable. ``On`` and ``Off`` are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

**Returns** True if successful, False if not

**Return type** `bool`

CLI Example:

```
salt '*' power.set_wake_on_network True
```

### 14.7.202 salt.modules.mac\_service module

The service module for macOS .. versionadded:: 2016.3.0

`salt.modules.mac_service.available` (*name*)

Check that the given service is available.

**Parameters** **name** (*str*) -- The name of the service

**Returns** True if the service is available, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' service.available com.openssh.sshd
```

`salt.modules.mac_service.disable` (*name, runas=None*)

Disable a launchd service. Raises an error if the service fails to be disabled

**Parameters**

- **name** (*str*) -- Service label, file name, or full path

- **runas** (*str*) -- User to run launchctl commands

**Returns** True if successful or if the service is already disabled

Return type `bool`

CLI Example:

```
salt '*' service.disable org.cups.cupsd
```

`salt.modules.mac_service.disabled`(*name*, *runas=None*)

Check if the specified service is not enabled. This is the opposite of `service.enabled`

Parameters

- **name** (*str*) -- The name to look up
- **runas** (*str*) -- User to run launchctl commands

Returns True if the specified service is NOT enabled, otherwise False

Return type `bool`

CLI Example:

```
salt '*' service.disabled org.cups.cupsd
```

`salt.modules.mac_service.enable`(*name*, *runas=None*)

Enable a launchd service. Raises an error if the service fails to be enabled

Parameters

- **name** (*str*) -- Service label, file name, or full path
- **runas** (*str*) -- User to run launchctl commands

Returns True if successful or if the service is already enabled

Return type `bool`

CLI Example:

```
salt '*' service.enable org.cups.cupsd
```

`salt.modules.mac_service.enabled`(*name*, *runas=None*)

Check if the specified service is enabled

Parameters

- **name** (*str*) -- The name of the service to look up
- **runas** (*str*) -- User to run launchctl commands

Returns True if the specified service enabled, otherwise False

Return type `bool`

CLI Example:

```
salt '*' service.enabled org.cups.cupsd
```

`salt.modules.mac_service.get_all`(*runas=None*)

Return a list of services that are enabled or available. Can be used to find the name of a service.

Parameters **runas** (*str*) -- User to run launchctl commands

Returns A list of all the services available or enabled

Return type *list*

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.mac_service.get_enabled`(*runas=None*)

Return a list of all services that are enabled. Can be used to find the name of a service.

Parameters **runas** (*str*) -- User to run launchctl commands

Returns A list of all the services enabled on the system

Return type *list*

CLI Example:

```
salt '*' service.get_enabled
salt '*' service.get_enabled running=True
```

`salt.modules.mac_service.launchctl(sub_cmd, *args, **kwargs)`

Run a launchctl command and raise an error if it fails

**Parameters**

- **sub\_cmd** (*str*) -- Sub command supplied to launchctl
- **args** (*tuple*) -- Tuple containing additional arguments to pass to launchctl
- **kwargs** (*dict*) -- Dictionary containing arguments to pass to `cmd.run_all`
- **return\_stdout** (*bool*) -- A keyword argument. If true return the stdout of the launchctl command

**Returns** True if successful, raise `CommandExecutionError` if not, or the stdout of the launchctl command if requested

**Return type** bool, str

CLI Example:

```
salt '*' service.launchctl debug org.cups.cupsd
```

`salt.modules.mac_service.list(name=None, runas=None)`

Run launchctl list and return the output

**Parameters**

- **name** (*str*) -- The name of the service to list
- **runas** (*str*) -- User to run launchctl commands

**Returns** If a name is passed returns information about the named service, otherwise returns a list of all services and pids

**Return type** str

CLI Example:

```
salt '*' service.list
salt '*' service.list org.cups.cupsd
```

`salt.modules.mac_service.missing(name)`

The inverse of `service.available` Check that the given service is not available.

**Parameters** **name** (*str*) -- The name of the service

**Returns** True if the service is not available, otherwise False

**Return type** bool

CLI Example:

```
salt '*' service.missing com.openssh.sshd
```

`salt.modules.mac_service.restart(name, runas=None)`

Unloads and reloads a launchd service. Raises an error if the service fails to reload

**Parameters**

- **name** (*str*) -- Service label, file name, or full path
- **runas** (*str*) -- User to run launchctl commands

**Returns** True if successful

**Return type** bool

CLI Example:

```
salt '*' service.restart org.cups.cupsd
```

`salt.modules.mac_service.show`(*name*)

Show properties of a launchctl service

**Parameters** *name* (*str*) -- Service label, file name, or full path

**Returns** The service information if the service is found

**Return type** *dict*

CLI Example:

```
salt '*' service.show org.cups.cupsd # service label
salt '*' service.show org.cups.cupsd.plist # file name
salt '*' service.show /System/Library/LaunchDaemons/org.cups.cupsd.plist # full
↳path
```

`salt.modules.mac_service.start`(*name*, *runas=None*)

Start a launchd service. Raises an error if the service fails to start

---

**Note:** To start a service in macOS the service must be enabled first. Use `service.enable` to enable the service.

---

#### Parameters

- **name** (*str*) -- Service label, file name, or full path
- **runas** (*str*) -- User to run launchctl commands

**Returns** True if successful or if the service is already running

**Return type** *bool*

CLI Example:

```
salt '*' service.start org.cups.cupsd
```

`salt.modules.mac_service.status`(*name*, *sig=None*, *runas=None*)

Return the status for a service.

#### Parameters

- **name** (*str*) -- Used to find the service from launchctl. Can be any part of the service name or a regex expression.
- **sig** (*str*) -- Find the service with status.pid instead. Note that *name* must still be provided.
- **runas** (*str*) -- User to run launchctl commands

**Returns** The PID for the service if it is running, otherwise an empty string

**Return type** *str*

CLI Example:

```
salt '*' service.status cups
```

`salt.modules.mac_service.stop`(*name*, *runas=None*)

Stop a launchd service. Raises an error if the service fails to stop

---

**Note:** Though `service.stop` will unload a service in macOS, the service will start on next boot unless it is disabled. Use `service.disable` to disable the service

---

#### Parameters

- **name** (*str*) -- Service label, file name, or full path
  - **runas** (*str*) -- User to run launchctl commands
- Returns** True if successful or if the service is already stopped  
**Return type** `bool`

CLI Example:

```
salt '*' service.stop org.cups.cupsd
```

### 14.7.203 salt.modules.mac\_shadow module

New in version 2016.3.0.

Manage macOS local directory passwords and policies.

Note that it is usually better to apply password policies through the creation of a configuration profile.

`salt.modules.mac_shadow.del_password(name)`

Deletes the account password

**Parameters** **name** (*str*) -- The user name of the account

**Returns** True if successful, otherwise False

**Return type** `bool`

**Raises** `CommandExecutionError` on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.del_password username
```

`salt.modules.mac_shadow.get_account_created(name)`

Get the date/time the account was created

**Parameters** **name** (*str*) -- the username of the account

**Returns** the date/time the account was created (yyyy-mm-dd hh:mm:ss)

**Return type** `str`

**Raises** `CommandExecutionError` on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_account_created admin
```

`salt.modules.mac_shadow.get_change(name)`

Gets the date on which the password expires

**Parameters** **name** (*str*) -- the name of the user account

**Returns** The date the password will expire

**Return type** `str`

**Raises** `CommandExecutionError` on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_change username
```

`salt.modules.mac_shadow.get_expire(name)`

Gets the date on which the account expires

**Parameters** **name** (*str*) -- the name of the user account

**Returns** the date the account expires

**Return type** `str`

**Raises** `CommandExecutionError` on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_expire username
```

`salt.modules.mac_shadow.get_last_change(name)`

Get the date/time the account was changed

**Parameters** `name (str)` -- the username of the account

**Returns** the date/time the account was modified (yyyy-mm-dd hh:mm:ss)

**Return type** `str`

**Raises** `CommandExecutionError` on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_last_change admin
```

`salt.modules.mac_shadow.get_login_failed_count(name)`

Get the the number of failed login attempts

**Parameters** `name (str)` -- the username of the account

**Returns** The number of failed login attempts

**Return type** `int`

**Raises** `CommandExecutionError` on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_login_failed_count admin
```

`salt.modules.mac_shadow.get_login_failed_last(name)`

Get the date/time of the last failed login attempt

**Parameters** `name (str)` -- the username of the account

**Returns** the date/time of the last failed login attempt on this account

(yyyy-mm-dd hh:mm:ss) :rtype: `str`

**Raises** `CommandExecutionError` on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_login_failed_last admin
```

`salt.modules.mac_shadow.get_maxdays(name)`

Get the maximum age of the password

**Parameters** `name (str)` -- the username of the account

**Returns** the maximum age of the password in days

**Return type** `int`

**Raises** `CommandExecutionError` on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_maxdays admin 90
```

`salt.modules.mac_shadow.info(name)`

Return information for the specified user

**Parameters** `name (str)` -- the username

**Returns** A dictionary containing the user's shadow information

**Return type** `dict`

CLI Example:

```
salt '*' shadow.info admin
```

`salt.modules.mac_shadow.set_change(name, date)`

Sets the date on which the password expires. The user will be required to change their password. Format is mm/dd/yyyy

**Parameters**

- **name** (*str*) -- the name of the user account
- **date** (*date*) -- the date the password will expire. Must be in mm/dd/yyyy

format.

**Returns** True if successful, otherwise False

**Return type** `bool`

**Raises** `CommandExecutionError` on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.set_change username 09/21/2016
```

`salt.modules.mac_shadow.set_expire` (*name*, *date*)

Sets the date on which the account expires. The user will not be able to login after this date. Date format is mm/dd/yyyy

**Parameters**

- **name** (*str*) -- the name of the user account
- **date** (*datetime*) -- the date the account will expire. Format must be

mm/dd/yyyy

**Returns** True if successful, False if not

**Return type** `bool`

**Raises** `CommandExecutionError` on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.set_expire username 07/23/2015
```

`salt.modules.mac_shadow.set_inactdays` (*name*, *days*)

Set the number of inactive days before the account is locked. Not available in macOS

**Parameters**

- **name** (*str*) -- The user name
- **days** (*int*) -- The number of days

**Returns** Will always return False until macOS supports this feature.

**Return type** `bool`

CLI Example:

```
salt '*' shadow.set_inactdays admin 90
```

`salt.modules.mac_shadow.set_maxdays` (*name*, *days*)

Set the maximum age of the password in days

**Parameters**

- **name** (*str*) -- the username of the account
- **days** (*int*) -- the maximum age of the account in days

**Returns** True if successful, False if not

**Return type** `bool`

**Raises** `CommandExecutionError` on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.set_maxdays admin 90
```

`salt.modules.mac_shadow.set_mindays` (*name*, *days*)

Set the minimum password age in days. Not available in macOS.

**Parameters**

- **name** (*str*) -- The user name

- **days** (*int*) -- The number of days

**Returns** Will always return False until macOS supports this feature.

**Return type** `bool`

CLI Example:

```
salt '*' shadow.set_mindays admin 90
```

`salt.modules.mac_shadow.set_password(name, password)`

Set the password for a named user (insecure, the password will be in the process list while the command is running)

**Parameters** **name** (*str*) -- The name of the local user, which is assumed to be in the local directory service

**Parameters** **password** (*str*) -- The plaintext password to set

**Returns** True if successful, otherwise False

**Return type** `bool`

**Raises** `CommandExecutionError` on user not found or any other unknown error

CLI Example:

```
salt '*' mac_shadow.set_password macuser macpassword
```

`salt.modules.mac_shadow.set_warndays(name, days)`

Set the number of days before the password expires that the user will start to see a warning. Not available in macOS

**Parameters**

- **name** (*str*) -- The user name
- **days** (*int*) -- The number of days

**Returns** Will always return False until macOS supports this feature.

**Return type** `bool`

CLI Example:

```
salt '*' shadow.set_warndays admin 90
```

#### 14.7.204 salt.modules.mac\_softwareupdate module

Support for the softwareupdate command on MacOS.

`salt.modules.mac_softwareupdate.download(name)`

Download a named update so that it can be installed later with the `update` or `update_all` functions

**Parameters** **name** (*str*) -- The update to download.

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' softwareupdate.download <update name>
```

`salt.modules.mac_softwareupdate.download_all(recommended=False, restart=True)`

Download all available updates so that they can be installed later with the `update` or `update_all` functions. It returns a list of updates that are now downloaded.

**Parameters** **recommended** (*bool*) -- If set to True, only install the recommended updates. If set to False (default) all updates are installed.

**Parameters** **restart** (*bool*) -- Set this to False if you do not want to install updates that require a restart. Default is True

**Returns** A list containing all downloaded updates on the system.

Return type *list*

CLI Example:

```
salt '*' softwareupdate.download_all
```

`salt.modules.mac_softwareupdate.get_catalog()`

New in version 2016.3.0.

Get the current catalog being used for update lookups. Will return a url if a custom catalog has been specified. Otherwise the word 'Default' will be returned

**Returns** The catalog being used for update lookups

Return type *str*

CLI Example:

```
salt '*' softwareupdates.get_catalog
```

`salt.modules.mac_softwareupdate.ignore(name)`

Ignore a specific program update. When an update is ignored the '-' and version number at the end will be omitted, so 'SecUpd2014-001-1.0' becomes 'SecUpd2014-001'. It will be removed automatically if present. An update is successfully ignored when it no longer shows up after `list_updates`.

**Parameters** **name** -- The name of the update to add to the ignore list.

Ptype *str*

**Returns** True if successful, False if not

Return type *bool*

CLI Example:

```
salt '*' softwareupdate.ignore <update-name>
```

`salt.modules.mac_softwareupdate.list_available(recommended=False, restart=False)`

List all available updates.

**Parameters**

- **recommended** (*bool*) -- Show only recommended updates.
- **restart** (*bool*) -- Show only updates that require a restart.

**Returns** Returns a dictionary containing the updates

Return type *dict*

CLI Example:

```
salt '*' softwareupdate.list_available
```

`salt.modules.mac_softwareupdate.list_downloads()`

Return a list of all updates that have been downloaded locally.

**Returns** A list of updates that have been downloaded

Return type *list*

CLI Example:

```
salt '*' softwareupdate.list_downloads
```

`salt.modules.mac_softwareupdate.list_ignored()`

List all updates that have been ignored. Ignored updates are shown without the '-' and version number at the end, this is how the `softwareupdate` command works.

**Returns** The list of ignored updates

Return type *list*

CLI Example:

```
salt '*' softwareupdate.list_ignored
```

`salt.modules.mac_softwareupdate.reset_catalog()`

New in version 2016.3.0.

Reset the Software Update Catalog to the default.

**Returns** True if successful, False if not

**Return type** `bool`

CLI Example:

```
salt '*' softwareupdates.reset_catalog
```

`salt.modules.mac_softwareupdate.reset_ignored()`

Make sure the ignored updates are not ignored anymore, returns a list of the updates that are no longer ignored.

**Returns** True if the list was reset, Otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' softwareupdate.reset_ignored
```

`salt.modules.mac_softwareupdate.schedule_enable(enable)`

Enable/disable automatic update scheduling.

**Parameters** **enable** -- True/On/Yes/1 to turn on automatic updates. False/No/Off/0 to turn off automatic updates. If this value is empty, the current status will be returned. **:type:** `bool str`

**Returns** True if scheduling is enabled, False if disabled

**Return type** `bool`

CLI Example:

```
salt '*' softwareupdate.schedule_enable on|off
```

`salt.modules.mac_softwareupdate.schedule_enabled()`

Check the status of automatic update scheduling.

**Returns** True if scheduling is enabled, False if disabled - True: Automatic checking is on, - False: Automatic checking is off,

**Return type** `bool`

CLI Example:

```
salt '*' softwareupdate.schedule_enabled
```

`salt.modules.mac_softwareupdate.set_catalog(url)`

New in version 2016.3.0.

Set the Software Update Catalog to the URL specified

**Parameters** **url** (*str*) -- The url to the update catalog

**Returns** True if successful, False if not

**Return type** `bool`

CLI Example:

```
salt '*' softwareupdates.set_catalog http://swupd.local:8888/index.sucatalog
```

`salt.modules.mac_softwareupdate.update(name)`

Install a named update.

**Parameters** **name** (*str*) -- The name of the of the update to install.

**Returns** True if successfully updated, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' softwareupdate.update <update-name>
```

**salt.modules.mac\_softwareupdate.update\_all** (*recommended=False, restart=True*)  
Install all available updates. Returns a dictionary containing the name of the update and the status of its installation.

**Parameters** **recommended** (*bool*) -- If set to True, only install the recommended updates. If set to False (default) all updates are installed.

**Parameters** **restart** (*bool*) -- Set this to False if you do not want to install updates that require a restart. Default is True

**Returns** A dictionary containing the updates that were installed and the status of its installation. If no updates were installed an empty dictionary is returned. :rtype: dict - True: The update was installed. - False: The update was not installed.

CLI Example:

```
salt '*' softwareupdate.update_all
```

**salt.modules.mac\_softwareupdate.update\_available** (*name*)

Check whether or not an update is available with a given name.

**Parameters** **name** (*str*) -- The name of the update to look for

**Returns** True if available, False if not

**Return type** *bool*

CLI Example:

```
salt '*' softwareupdate.update_available <update-name>
salt '*' softwareupdate.update_available "<update with whitespace>"
```

### 14.7.205 salt.modules.mac\_sysctl module

Module for viewing and modifying sysctl parameters

**salt.modules.mac\_sysctl.assign** (*name, value*)

Assign a single sysctl parameter for this minion

**name** The name of the sysctl value to edit.

**value** The sysctl value to apply.

CLI Example:

```
salt '*' sysctl.assign net.inet.icmp.icmplim 50
```

**salt.modules.mac\_sysctl.get** (*name*)

Return a single sysctl parameter for this minion

**name** The name of the sysctl value to display.

CLI Example:

```
salt '*' sysctl.get hw.physmem
```

**salt.modules.mac\_sysctl.persist** (*name, value, config='/etc/sysctl.conf', apply\_change=False*)

Assign and persist a simple sysctl parameter for this minion

**name** The name of the sysctl value to edit.

**value** The sysctl value to apply.

**config** The location of the sysctl configuration file.

**apply\_change** Default is False; Default behavior only creates or edits the sysctl.conf file. If apply is set to True, the changes are applied to the system.

CLI Example:

```
salt '*' sysctl.persist net.inet.icmp.icmplim 50
salt '*' sysctl.persist coretemp_load NO config=/etc/sysctl.conf
```

`salt.modules.mac_sysctl.show`(*config\_file=False*)

Return a list of sysctl parameters for this minion

CLI Example:

```
salt '*' sysctl.show
```

## 14.7.206 salt.modules.mac\_system module

New in version 2016.3.0.

System module for sleeping, restarting, and shutting down the system on Mac OS X.

**Warning:** Using this module will enable `atrun` on the system if it is disabled.

`salt.modules.mac_system.get_boot_arch`()

Get the kernel architecture setting from `com.apple.Boot.plist`

**Returns** A string value representing the boot architecture setting

**Return type** `str`

CLI Example:

```
salt '*' system.get_boot_arch
```

`salt.modules.mac_system.get_computer_name`()

Gets the computer name

**Returns** The computer name

**Return type** `str`

CLI Example:

```
salt '*' system.get_computer_name
```

`salt.modules.mac_system.get_disable_keyboard_on_lock`()

Get whether or not the keyboard should be disabled when the X Serve enclosure lock is engaged.

**Returns** True if disable keyboard on lock is on, False if off

**Return type** `bool`

CLI Example:

```
..code-block:: bash
salt '*' system.get_disable_keyboard_on_lock
```

`salt.modules.mac_system.get_remote_events`()

Displays whether remote apple events are on or off.

**Returns** True if remote apple events are on, False if off

**Return type** `bool`

CLI Example:

```
salt '*' system.get_remote_events
```

`salt.modules.mac_system.get_remote_login`()

Displays whether remote login (SSH) is on or off.

**Returns** True if remote login is on, False if off

**Return type** `bool`

CLI Example:

```
salt '*' system.get_remote_login
```

`salt.modules.mac_system.get_restart_delay()`

Get the number of seconds after which the computer will start up after a power failure.

**Returns** A string value representing the number of seconds the system will delay restart after power loss :rtype: `str`

CLI Example:

```
salt '*' system.get_restart_delay
```

`salt.modules.mac_system.get_startup_disk()`

Displays the current startup disk

**Returns** The current startup disk

**Return type** `str`

CLI Example:

```
salt '*' system.get_startup_disk
```

`salt.modules.mac_system.get_subnet_name()`

Gets the local subnet name

**Returns** The local subnet name

**Return type** `str`

CLI Example:

```
salt '*' system.get_subnet_name
```

`salt.modules.mac_system.halt(at_time=None)`

Halt a running system

**Parameters** `at_time (str)` -- Any valid *at* expression. For example, some valid *at* expressions could be: - noon - midnight - fri - 9:00 AM - 2:30 PM tomorrow - now + 10 minutes

Note:: If you pass a time only, with no `AM/PM` designation, you have to double quote the parameter on the command line. For example: ``14:00``

CLI Example:

```
salt '*' system.halt
salt '*' system.halt 'now + 10 minutes'
```

`salt.modules.mac_system.list_startup_disks()`

List all valid startup disks on the system.

**Returns** A list of valid startup disks

**Return type** `list`

CLI Example:

```
salt '*' system.list_startup_disks
```

`salt.modules.mac_system.restart(at_time=None)`

Restart the system

**Parameters** `at_time (str)` -- Any valid *at* expression. For example, some valid *at* expressions could be: - noon - midnight - fri - 9:00 AM - 2:30 PM tomorrow - now + 10 minutes

Note:: If you pass a time only, with no `AM/PM` designation, you have to double quote the parameter on the command line. For example: ``14:00``

CLI Example:

```
salt '*' system.restart
salt '*' system.restart '12:00 PM fri'
```

`salt.modules.mac_system.set_boot_arch(arch='default')`

Set the kernel to boot in 32 or 64 bit mode on next boot.

---

**Note:** This command fails with the following error:

changes to kernel architecture failed to save!

The setting is not updated. This is either an apple bug, not available on the test system, or a result of system files now being locked down in macOS (SIP Protection).

---

**Parameters** `arch` (*str*) -- A string representing the desired architecture. If no value is passed, default is assumed. Valid values include: - i386 - x86\_64 - default

**Returns** True if successful, False if not

**Return type** `bool`

CLI Example:

```
salt '*' system.set_boot_arch i386
```

`salt.modules.mac_system.set_computer_name(name)`

Set the computer name

**Parameters** `name` (*str*) -- The new computer name

**Returns** True if successful, False if not

**Return type** `bool`

CLI Example:

```
salt '*' system.set_computer_name "Mike's Mac"
```

`salt.modules.mac_system.set_disable_keyboard_on_lock(enable)`

Get whether or not the keyboard should be disabled when the X Serve enclosure lock is engaged.

**Parameters** `enable` (*bool*) -- True to enable, False to disable. ``On`` and ``Off`` are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

**Returns** True if successful, False if not

**Return type** `bool`

CLI Example:

```
salt '*' system.set_disable_keyboard_on_lock False
```

`salt.modules.mac_system.set_remote_events(enable)`

Set whether the server responds to events sent by other computers (such as AppleScripts)

**Parameters** `enable` (*bool*) -- True to enable, False to disable. ``On`` and ``Off`` are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

**Returns** True if successful, False if not

**Return type** `bool`

CLI Example:

```
salt '*' system.set_remote_events On
```

`salt.modules.mac_system.set_remote_login(enable)`

Set the remote login (SSH) to either on or off.

**Parameters** `enable` (*bool*) -- True to enable, False to disable. ``On`` and ``Off`` are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

**Returns** True if successful, False if not

**Return type** `bool`

CLI Example:

```
salt '*' system.set_remote_login True
```

`salt.modules.mac_system.set_restart_delay(seconds)`

Set the number of seconds after which the computer will start up after a power failure.

**Warning:** This command fails with the following error:

```
Error,IOServiceOpen returned 0x10000003
```

The setting is not updated. This is an apple bug. It seems like it may only work on certain versions of Mac Server X. This article explains the issue in more detail, though it is quite old.

<http://lists.apple.com/archives/macos-x-server/2006/Jul/msg00967.html>

**Parameters** `seconds` (*int*) -- The number of seconds. Must be a multiple of 30

**Returns** True if successful, False if not

**Return type** `bool`

CLI Example:

```
salt '*' system.set_restart_delay 180
```

`salt.modules.mac_system.set_startup_disk(path)`

Set the current startup disk to the indicated path. Use `system.list_startup_disks` to find valid startup disks on the system.

**Parameters** `path` (*str*) -- The valid startup disk path

**Returns** True if successful, False if not

**Return type** `bool`

CLI Example:

```
salt '*' system.set_startup_disk /System/Library/CoreServices
```

`salt.modules.mac_system.set_subnet_name(name)`

Set the local subnet name

**Parameters** `name` (*str*) -- The new local subnet name

---

**Note:** Spaces are changed to dashes. Other special characters are removed.

---

**Returns** True if successful, False if not

**Return type** `bool`

CLI Example:

```
The following will be set as 'Mikes-Mac'
salt '*' system.set_subnet_name "Mike's Mac"
```

`salt.modules.mac_system.shutdown(at_time=None)`

Shutdown the system

Parameters **at\_time** (*str*) -- Any valid *at* expression. For example, some valid *at* expressions could be: - noon - midnight - fri - 9:00 AM - 2:30 PM tomorrow - now + 10 minutes

Note:: If you pass a time only, with no `AM/PM` designation, you have to double quote the parameter on the command line. For example: ``14:00``

CLI Example:

```
salt '*' system.shutdown
salt '*' system.shutdown 'now + 1 hour'
```

**salt.modules.mac\_system.sleep**(*at\_time=None*)

Sleep the system. If a user is active on the system it will likely fail to sleep.

Parameters **at\_time** (*str*) -- Any valid *at* expression. For example, some valid *at* expressions could be: - noon - midnight - fri - 9:00 AM - 2:30 PM tomorrow - now + 10 minutes

Note:: If you pass a time only, with no `AM/PM` designation, you have to double quote the parameter on the command line. For example: ``14:00``

CLI Example:

```
salt '*' system.sleep
salt '*' system.sleep '10:00 PM'
```

### 14.7.207 salt.modules.mac\_timezone module

Module for editing date/time settings on macOS

New in version 2016.3.0.

**salt.modules.mac\_timezone.get\_date**()

Displays the current date

**Returns** the system date

**Return type** *str*

CLI Example:

```
salt '*' timezone.get_date
```

**salt.modules.mac\_timezone.get\_hwclock**()

Get current hardware clock setting (UTC or localtime)

CLI Example:

```
salt '*' timezone.get_hwclock
```

**salt.modules.mac\_timezone.get\_offset**()

Displays the current time zone offset

**Returns** The current time zone offset

**Return type** *str*

CLI Example:

```
salt '*' timezone.get_offset
```

**salt.modules.mac\_timezone.get\_time**()

Get the current system time.

**Returns** The current time in 24 hour format

**Return type** *str*

CLI Example:

```
salt '*' timezone.get_time
```

`salt.modules.mac_timezone.get_time_server()`

Display the currently set network time server.

**Returns** the network time server

**Return type** `str`

CLI Example:

```
salt '*' timezone.get_time_server
```

`salt.modules.mac_timezone.get_using_network_time()`

Display whether network time is on or off

**Returns** True if network time is on, False if off

**Return type** `bool`

CLI Example:

```
salt '*' timezone.get_using_network_time
```

`salt.modules.mac_timezone.get_zone()`

Displays the current time zone

**Returns** The current time zone

**Return type** `str`

CLI Example:

```
salt '*' timezone.get_zone
```

`salt.modules.mac_timezone.get_zonecode()`

Displays the current time zone abbreviated code

**Returns** The current time zone code

**Return type** `str`

CLI Example:

```
salt '*' timezone.get_zonecode
```

`salt.modules.mac_timezone.list_zones()`

Displays a list of available time zones. Use this list when setting a time zone using `timezone.set_zone`

**Returns** a list of time zones

**Return type** `list`

CLI Example:

```
salt '*' timezone.list_zones
```

`salt.modules.mac_timezone.set_date(date)`

Set the current month, day, and year

**Parameters** **date** (`str`) -- The date to set. Valid date formats are:

- `%m:%d:%y`
- `%m:%d:%Y`
- `%m/%d/%y`
- `%m/%d/%Y`

**Returns** True if successful, False if not

**Return type** `bool`

**Raises** `SaltInvocationError` on Invalid Date format

**Raises** `CommandExecutionError` on failure

CLI Example:

```
salt '*' timezone.set_date 1/13/2016
```

`salt.modules.mac_timezone.set_hwclock(clock)`  
Sets the hardware clock to be either UTC or localtime

CLI Example:

```
salt '*' timezone.set_hwclock UTC
```

`salt.modules.mac_timezone.set_time(time)`  
Sets the current time. Must be in 24 hour format.  
**Parameters** `time` (*str*) -- The time to set in 24 hour format.  
The value must be double quoted. ie: ``17:46``  
**Returns** True if successful, False if not  
**Return type** `bool`  
**Raises** `SaltInvocationError` on Invalid Time format  
**Raises** `CommandExecutionError` on failure

CLI Example:

```
salt '*' timezone.set_time "17:34"
```

`salt.modules.mac_timezone.set_time_server(time_server='time.apple.com')`  
Designates a network time server. Enter the IP address or DNS name for the network time server.  
**Parameters** `time_server` -- IP or DNS name of the network time server. If nothing is passed the time server will be set to the macOS default of `time.apple.com` :type: str  
**Returns** True if successful, False if not  
**Return type** `bool`  
**Raises** `CommandExecutionError` on failure

CLI Example:

```
salt '*' timezone.set_time_server time.acme.com
```

`salt.modules.mac_timezone.set_using_network_time(enable)`  
Set whether network time is on or off.  
**Parameters** `enable` -- True to enable, False to disable. Can also use `on` or `off`  
**Type** str bool  
**Returns** True if successful, False if not  
**Return type** `bool`  
**Raises** `CommandExecutionError` on failure

CLI Example:

```
salt '*' timezone.set_using_network_time True
```

`salt.modules.mac_timezone.set_zone(time_zone)`  
Set the local time zone. Use `timezone.list_zones` to list valid `time_zone` arguments  
**Parameters** `time_zone` (*str*) -- The time zone to apply  
**Returns** True if successful, False if not  
**Return type** `bool`  
**Raises** `SaltInvocationError` on Invalid Timezone  
**Raises** `CommandExecutionError` on failure

CLI Example:

```
salt '*' timezone.set_zone America/Denver
```

`salt.modules.mac_timezone.zone_compare`(*time\_zone*)  
 Compares the given timezone name with the system timezone name.  
**Returns** True if they are the same, False if not  
**Return type** `bool`  
 CLI Example:

```
salt '*' timezone.zone_compare America/Boise
```

### 14.7.208 salt.modules.mac\_user

Manage users on Mac OS 10.7+

**Important:** If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to `'user.info' is not available`), see [here](#).

`salt.modules.mac_user.add`(*name, uid=None, gid=None, groups=None, home=None, shell=None, fullname=None, createhome=True, \*\*kwargs*)

Add a user to the minion

CLI Example:

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

`salt.modules.mac_user.chfullname`(*name, fullname*)  
 Change the user's Full Name

CLI Example:

```
salt '*' user.chfullname foo 'Foo Bar'
```

`salt.modules.mac_user.chgid`(*name, gid*)  
 Change the default group of the user

CLI Example:

```
salt '*' user.chgid foo 4376
```

`salt.modules.mac_user.chgroups`(*name, groups, append=False*)  
 Change the groups to which the user belongs. Note that the user's primary group does not have to be one of the groups passed, membership in the user's primary group is automatically assumed.  
**groups** Groups to which the user should belong, can be passed either as a python list or a comma-separated string  
**append** Instead of removing user from groups not included in the `groups` parameter, just add user to any groups for which they are not members  
 CLI Example:

```
salt '*' user.chgroups foo wheel,root
```

`salt.modules.mac_user.chhome`(*name, home, \*\*kwargs*)  
 Change the home directory of the user

CLI Example:

```
salt '*' user.chhome foo /Users/foo
```

`salt.modules.mac_user.chshell`(*name, shell*)

Change the default shell of the user

CLI Example:

```
salt '*' user.chshell foo /bin/zsh
```

`salt.modules.mac_user.chuid`(*name, uid*)

Change the uid for a named user

CLI Example:

```
salt '*' user.chuid foo 4376
```

`salt.modules.mac_user.delete`(*name, remove=False, force=False*)

Remove a user from the minion

CLI Example:

```
salt '*' user.delete name remove=True force=True
```

`salt.modules.mac_user.disable_auto_login`()

New in version 2016.3.0.

Disables auto login on the machine

**Returns** True if successful, False if not

**Return type** bool

CLI Example:

```
salt '*' user.disable_auto_login
```

`salt.modules.mac_user.enable_auto_login`(*name*)

New in version 2016.3.0.

Configures the machine to auto login with the specified user

**Parameters** *name* (*str*) -- The user account use for auto login

**Returns** True if successful, False if not

**Return type** bool

CLI Example:

```
salt '*' user.enable_auto_login stevej
```

`salt.modules.mac_user.get_auto_login`()

New in version 2016.3.0.

Gets the current setting for Auto Login

**Returns** If enabled, returns the user name, otherwise returns False

**Return type** str, bool

CLI Example:

```
salt '*' user.get_auto_login
```

`salt.modules.mac_user.getent`(*refresh=False*)

Return the list of all info for all users

CLI Example:

```
salt '*' user.getent
```

`salt.modules.mac_user.info(name)`

Return user information

CLI Example:

```
salt '*' user.info root
```

`salt.modules.mac_user.list_groups(name)`

Return a list of groups the named user belongs to.

name

The name of the user for which to list groups. Starting in Salt 2016.11.0, all groups for the user, including groups beginning with an underscore will be listed.

Changed in version 2016.11.0.

CLI Example:

```
salt '*' user.list_groups foo
```

`salt.modules.mac_user.list_users()`

Return a list of all users

CLI Example:

```
salt '*' user.list_users
```

`salt.modules.mac_user.primary_group(name)`

Return the primary group of the named user

New in version 2016.3.0.

CLI Example:

```
salt '*' user.primary_group saltadmin
```

`salt.modules.mac_user.rename(name, new_name)`

Change the username for a named user

CLI Example:

```
salt '*' user.rename name new_name
```

### 14.7.209 salt.modules.mac\_xattr module

This module allows you to manage extended attributes on files or directories

```
salt '*' xattr.list /path/to/file
```

`salt.modules.mac_xattr.clear(path)`

Causes the all attributes on the file/directory to be removed

**Parameters** `path` (*str*) -- The file(s) to get attributes from

**Returns** True if successful, otherwise False

**Raises** CommandExecutionError on file not found or any other unknown error

CLI Example:

```
salt '*' xattr.delete /path/to/file "com.test.attr"
```

`salt.modules.mac_xattr.delete(path, attribute)`

Removes the given attribute from the file

**Parameters**

- **path** (*str*) -- The file(s) to get attributes from
- **attribute** (*str*) -- The attribute name to be deleted from the

file/directory

**Returns** True if successful, otherwise False

**Return type** `bool`

**Raises** `CommandExecutionError` on file not found, attribute not found, and any other unknown error

CLI Example:

```
salt '*' xattr.delete /path/to/file "com.test.attr"
```

`salt.modules.mac_xattr.list(path, **kwargs)`

List all of the extended attributes on the given file/directory

**Parameters**

- **path** (*str*) -- The file(s) to get attributes from
- **hex** (*bool*) -- Return the values with forced hexadecimal values

**Returns** A dictionary containing extended attributes and values for the given file :rtype: dict

**Raises** `CommandExecutionError` on file not found or any other unknown error

CLI Example:

```
salt '*' xattr.list /path/to/file
salt '*' xattr.list /path/to/file hex=True
```

`salt.modules.mac_xattr.read(path, attribute, **kwargs)`

Read the given attributes on the given file/directory

**Parameters**

- **path** (*str*) -- The file to get attributes from
- **attribute** (*str*) -- The attribute to read
- **hex** (*bool*) -- Return the values with forced hexadecimal values

**Returns** A string containing the value of the named attribute

**Return type** `str`

**Raises** `CommandExecutionError` on file not found, attribute not found, and any other unknown error

CLI Example:

```
salt '*' xattr.read /path/to/file com.test.attr
salt '*' xattr.read /path/to/file com.test.attr hex=True
```

`salt.modules.mac_xattr.write(path, attribute, value, **kwargs)`

Causes the given attribute name to be assigned the given value

**Parameters**

- **path** (*str*) -- The file(s) to get attributes from
- **attribute** (*str*) -- The attribute name to be written to the file/directory
- **value** (*str*) -- The value to assign to the given attribute

- **hex** (*bool*) -- Set the values with forced hexadecimal values

**Returns** True if successful, otherwise False

**Return type** `bool`

**Raises** `CommandExecutionError` on file not found or any other unknown error

CLI Example:

```
salt '*' xattr.write /path/to/file "com.test.attr" "value"
```

### 14.7.210 salt.modules.makeconf

Support for modifying make.conf under Gentoo

`salt.modules.makeconf.append_cflags` (*value*)

Add to or create a new CFLAGS in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_cflags '-pipe'
```

`salt.modules.makeconf.append_cxxflags` (*value*)

Add to or create a new CXXFLAGS in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_cxxflags '-pipe'
```

`salt.modules.makeconf.append_emerge_default_opts` (*value*)

Add to or create a new EMERGE\_DEFAULT\_OPTS in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_emerge_default_opts '--jobs'
```

`salt.modules.makeconf.append_features` (*value*)

Add to or create a new FEATURES in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_features 'webrsync-gpg'
```

`salt.modules.makeconf.append_gentoo_mirrors` (*value*)

Add to or create a new GENTOO\_MIRRORS in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',  
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_gentoo_mirrors 'http://distfiles.gentoo.org'
```

`salt.modules.makeconf.append_makeopts` (*value*)

Add to or create a new MAKEOPTS in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',  
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_makeopts '-j3'
```

`salt.modules.makeconf.append_var` (*var*, *value*)

Add to or create a new variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',  
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_var 'LINGUAS' 'en'
```

`salt.modules.makeconf.cflags_contains` (*value*)

Verify if CFLAGS variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.cflags_contains '-pipe'
```

`salt.modules.makeconf.chost_contains` (*value*)

Verify if CHOST variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.chost_contains 'x86_64-pc-linux-gnu'
```

`salt.modules.makeconf.cxxflags_contains` (*value*)

Verify if CXXFLAGS variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.cxxflags_contains '-pipe'
```

`salt.modules.makeconf.emerge_default_opts_contains` (*value*)

Verify if EMERGE\_DEFAULT\_OPTS variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.emerge_default_opts_contains '--jobs'
```

`salt.modules.makeconf.features_contains` (*value*)

Verify if FEATURES variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.features_contains 'webrsync-gpg'
```

`salt.modules.makeconf.gentoo_mirrors_contains` (*value*)

Verify if GENTOO\_MIRRORS variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.gentoo_mirrors_contains 'http://distfiles.gentoo.org'
```

`salt.modules.makeconf.get_cflags` ()

Get the value of CFLAGS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_cflags
```

`salt.modules.makeconf.get_chost` ()

Get the value of CHOST variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_chost
```

`salt.modules.makeconf.get_cxxflags` ()

Get the value of CXXFLAGS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_cxxflags
```

`salt.modules.makeconf.get_emerge_default_opts` ()

Get the value of EMERGE\_DEFAULT\_OPTS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_emerge_default_opts
```

`salt.modules.makeconf.get_features()`

Get the value of FEATURES variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_features
```

`salt.modules.makeconf.get_gentoo_mirrors()`

Get the value of GENTOO\_MIRRORS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_gentoo_mirrors
```

`salt.modules.makeconf.get_makeopts()`

Get the value of MAKEOPTS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_makeopts
```

`salt.modules.makeconf.get_sync()`

Get the value of SYNC variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_sync
```

`salt.modules.makeconf.get_var(var)`

Get the value of a variable in make.conf

Return the value of the variable or None if the variable is not in make.conf

CLI Example:

```
salt '*' makeconf.get_var 'LINGUAS'
```

`salt.modules.makeconf.makeopts_contains(value)`

Verify if MAKEOPTS variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.makeopts_contains '-j3'
```

`salt.modules.makeconf.remove_var(var)`

Remove a variable from the make.conf

Return a dict containing the new value for the variable:

```
{'<variable>': {'old': '<old-value>',
                 'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.remove_var 'LINGUAS'
```

`salt.modules.makeconf.set_cflags`(*value*)

Set the CFLAGS variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                 'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_cflags '-march=native -O2 -pipe'
```

`salt.modules.makeconf.set_chost`(*value*)

Set the CHOST variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                 'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_chost 'x86_64-pc-linux-gnu'
```

`salt.modules.makeconf.set_cxxflags`(*value*)

Set the CXXFLAGS variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                 'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_cxxflags '-march=native -O2 -pipe'
```

`salt.modules.makeconf.set_emerge_default_opts`(*value*)

Set the EMERGE\_DEFAULT\_OPTS variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                 'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_emerge_default_opts '--jobs'
```

`salt.modules.makeconf.set_gentoo_mirrors`(*value*)

Set the GENTOO\_MIRRORS variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',  
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_gentoo_mirrors 'http://distfiles.gentoo.org'
```

`salt.modules.makeconf.set_makeopts`(*value*)

Set the MAKEOPTS variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',  
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_makeopts '-j3'
```

`salt.modules.makeconf.set_sync`(*value*)

Set the SYNC variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',  
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_sync 'rsync://rsync.namerica.gentoo.org/gentoo-portage'
```

`salt.modules.makeconf.set_var`(*var*, *value*)

Set a variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',  
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_var 'LINGUAS' 'en'
```

`salt.modules.makeconf.sync_contains`(*value*)

Verify if SYNC variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.sync_contains 'rsync://rsync.namerica.gentoo.org/gentoo-portage'
```

`salt.modules.makeconf.trim_cflags`(*value*)

Remove a value from CFLAGS variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',  
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_cflags '-pipe'
```

`salt.modules.makeconf.trim_cxxflags`(*value*)

Remove a value from CXXFLAGS variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_cxxflags '-pipe'
```

`salt.modules.makeconf.trim_emerge_default_opts`(*value*)

Remove a value from EMERGE\_DEFAULT\_OPTS variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_emerge_default_opts '--jobs'
```

`salt.modules.makeconf.trim_features`(*value*)

Remove a value from FEATURES variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_features 'webrsync-gpg'
```

`salt.modules.makeconf.trim_gentoo_mirrors`(*value*)

Remove a value from GENTOO\_MIRRORS variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_gentoo_mirrors 'http://distfiles.gentoo.org'
```

`salt.modules.makeconf.trim_makeopts`(*value*)

Remove a value from MAKEOPTS variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_makeopts '-j3'
```

`salt.modules.makeconf.trim_var`(*var*, *value*)

Remove a value from a variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',  
               'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_var 'LINGUAS' 'en'
```

`salt.modules.makeconf.var_contains`(*var*, *value*)

Verify if variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.var_contains 'LINGUAS' 'en'
```

### 14.7.211 salt.modules.marathon module

Module providing a simple management interface to a marathon cluster.

Currently this only works when run through a proxy minion.

New in version 2015.8.2.

`salt.modules.marathon.app`(*id*)

Return the current server configuration for the specified app.

CLI Example:

```
salt marathon-minion-id marathon.app my-app
```

`salt.modules.marathon.apps`()

Return a list of the currently installed app ids.

CLI Example:

```
salt marathon-minion-id marathon.apps
```

`salt.modules.marathon.has_app`(*id*)

Return whether the given app id is currently configured.

CLI Example:

```
salt marathon-minion-id marathon.has_app my-app
```

`salt.modules.marathon.info`()

Return configuration and status information about the marathon instance.

CLI Example:

```
salt marathon-minion-id marathon.info
```

`salt.modules.marathon.restart_app` (*id*, *restart=False*, *force=True*)

Restart the current server configuration for the specified app.

**Parameters**

- **restart** -- Restart the app
- **force** -- Override the current deployment

CLI Example:

```
salt marathon-minion-id marathon.restart_app my-app
```

By default, this will only check if the app exists in marathon. It does not check if there are any tasks associated with it or if the app is suspended.

```
salt marathon-minion-id marathon.restart_app my-app true true
```

The restart option needs to be set to True to actually issue a rolling restart to marathon.

The force option tells marathon to ignore the current app deployment if there is one.

`salt.modules.marathon.rm_app` (*id*)

Remove the specified app from the server.

CLI Example:

```
salt marathon-minion-id marathon.rm_app my-app
```

`salt.modules.marathon.update_app` (*id*, *config*)

Update the specified app with the given configuration.

CLI Example:

```
salt marathon-minion-id marathon.update_app my-app '<config yaml>'
```

### 14.7.212 salt.modules.match

The match module allows for match routines to be run and determine target specs

`salt.modules.match.compound` (*tgt*, *minion\_id=None*)

Return True if the minion ID matches the given compound target

**minion\_id** Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:

```
salt '*' match.compound 'L@cheese,foo and *'
```

`salt.modules.match.data` (*tgt*)

Return True if the minion matches the given data target

CLI Example:

```
salt '*' match.data 'spam:eggs'
```

`salt.modules.match.filter_by` (*lookup*, *tgt\_type='compound'*, *minion\_id=None*, *expr\_form=None*, *default='default'*)

Return the first match in a dictionary of target patterns

New in version 2014.7.0.

CLI Example:

```
salt '*' match.filter_by '{foo*: Foo!, bar*: Bar!}' minion_id=bar03
```

Pillar Example:

```
# Filter the data for the current minion into a variable:
{% set roles = salt['match.filter_by']({
    'web*': ['app', 'caching'],
    'db*': ['db'],
}, default='web*') %}

# Make the filtered data available to Pillar:
roles: {{ roles | yaml() }}
```

`salt.modules.match.glob(tgt, minion_id=None)`

Return True if the minion ID matches the given glob target

**minion\_id** Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:

```
salt '*' match.glob '*'
```

`salt.modules.match.grain(tgt, delimiter=':')`

Return True if the minion matches the given grain target. The `delimiter` argument can be used to specify a different delimiter.

CLI Example:

```
salt '*' match.grain 'os:Ubuntu'
salt '*' match.grain 'ipv6|2001:db8::ff00:42:8329' delimiter='|'
```

**delimiter** Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

**delim** Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.

Deprecated since version 2015.8.0.

`salt.modules.match.grain_pcre(tgt, delimiter=':')`

Return True if the minion matches the given grain\_pcre target. The `delimiter` argument can be used to specify a different delimiter.

CLI Example:

```
salt '*' match.grain_pcre 'os:Fedo.*'
salt '*' match.grain_pcre 'ipv6|2001:.*' delimiter='|'
```

**delimiter** Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

**delim** Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.

Deprecated since version 2015.8.0.

`salt.modules.match.ipcidr(tgt)`

Return True if the minion matches the given ipcidr target

CLI Example:

```
salt '*' match.ipcidr '192.168.44.0/24'
```

delimiter Pillar Example:

```
'172.16.0.0/12':
- match: ipcidr
- nodeclass: internal
```

`salt.modules.match.list(tgt, minion_id=None)`

Return True if the minion ID matches the given list target

**minion\_id** Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:

```
salt '*' match.list 'server1,server2'
```

`salt.modules.match.pcre(tgt, minion_id=None)`

Return True if the minion ID matches the given pcre target

**minion\_id** Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:

```
salt '*' match.pcre '.*'
```

`salt.modules.match.pillar(tgt, delimiter=:')`

Return True if the minion matches the given pillar target. The `delimiter` argument can be used to specify a different delimiter.

CLI Example:

```
salt '*' match.pillar 'cheese:foo'
salt '*' match.pillar 'clone_url|https://github.com/saltstack/salt.git' delimiter=
↳ '|'
```

**delimiter** Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

**delim** Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.

Deprecated since version 2015.8.0.

`salt.modules.match.pillar_pcre(tgt, delimiter=:')`

Return True if the minion matches the given pillar\_pcre target. The `delimiter` argument can be used to specify a different delimiter.

CLI Example:

```
salt '*' match.pillar_pcre 'cheese:(swiss|american)'
salt '*' match.pillar_pcre 'clone_url|https://github\.\com\/.*\.git' delimiter='|'
```

**delimiter** Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

**delim** Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.

Deprecated since version 2015.8.0.

`salt.modules.match.search_by` (*lookup*, *tgt\_type='compound'*, *minion\_id=None*)

Search a dictionary of target strings for matching targets

This is the inverse of `match.filter_by` and allows matching values instead of matching keys. A minion can be matched by multiple entries.

New in version 2017.7.0.

CLI Example:

```
salt '*' match.search_by '{web: [node1, node2], db: [node2, node]}'
```

Pillar Example:

```
{% set roles = salt.match.search_by({
  'web': ['G@os_family:Debian not nodeX'],
  'db': ['L@node2,node3 and G@datacenter:west'],
  'caching': ['node3', 'node4'],
}) %}

# Make the filtered data available to Pillar:
roles: {{ roles | yaml() }}
```

### 14.7.213 salt.modules.mattermost module

Module for sending messages to Mattermost

New in version 2017.7.0.

**configuration** This module can be used by either passing an `api_url` and `hook` directly or by specifying both in a configuration profile in the salt master/minion config. For example: .. code-block:: yaml

```
mattermost: hook: peWcBiMOS9HrZG15peWcBiMOS9HrZG15 api_url: https://
example.com
```

`salt.modules.mattermost.post_message` (*message*, *channel=None*, *username=None*, *api\_url=None*, *hook=None*)

Send a message to a Mattermost channel. :param channel: The channel name, either will work. :param username: The username of the poster. :param message: The message to send to the Mattermost channel. :param api\_url: The Mattermost api url, if not specified in the configuration. :param hook: The Mattermost hook, if not specified in the configuration. :return: Boolean if message was sent successfully. CLI Example: .. code-block:: bash

```
salt '*' mattermost.post_message message='Build is done'
```

### 14.7.214 salt.modules.mdadm

Salt module to manage RAID arrays with mdadm

`salt.modules.mdadm.assemble` (*name*, *devices*, *test\_mode=False*, *\*\*kwargs*)

Assemble a RAID device.

CLI Examples:

```
salt '*' raid.assemble /dev/md0 ['/dev/xvdd', '/dev/xvde']
```

**Note:** Adding `test_mode=True` as an argument will print out the mdadm command that would have been run.

**name** The name of the array to assemble.

**devices** The list of devices comprising the array to assemble.

**kwargs** Optional arguments to be passed to mdadm.

**returns**

**test\_mode=True:** Prints out the full command.

**test\_mode=False (Default):** Executes command on the host(s) and prints out the mdadm output.

For more info, read the mdadm manpage.

`salt.modules.mdadm.create` (*name, level, devices, metadata='default', test\_mode=False, \*\*kwargs*)  
Create a RAID device.

Changed in version 2014.7.0.

**Warning:** Use with CAUTION, as this function can be very destructive if not used properly!

CLI Examples:

```
salt '*' raid.create /dev/md0 level=1 chunk=256 devices="['/dev/xvdd', '/dev/xvde
→']" test_mode=True
```

**Note:** Adding `test_mode=True` as an argument will print out the mdadm command that would have been run.

**name** The name of the array to create.

**level** The RAID level to use when creating the raid.

**devices** A list of devices used to build the array.

**metadata** Version of metadata to use when creating the array.

**kwargs** Optional arguments to be passed to mdadm.

**returns**

**test\_mode=True:** Prints out the full command.

**test\_mode=False (Default):** Executes command on remote the host(s) and Prints out the mdadm output.

**Note:** It takes time to create a RAID array. You can check the progress in ``resync\_status`` field of the results from the following command:

```
salt '*' raid.detail /dev/md0
```

For more info, read the mdadm(8) manpage

`salt.modules.mdadm.destroy` (*device*)

Destroy a RAID device.

WARNING This will zero the superblock of all members of the RAID array..

CLI Example:

```
salt '*' raid.destroy /dev/md0
```

`salt.modules.mdadm.detail(device='/dev/md0')`

Show detail for a specified RAID device

CLI Example:

```
salt '*' raid.detail '/dev/md0'
```

`salt.modules.mdadm.list()`

List the RAID devices.

CLI Example:

```
salt '*' raid.list
```

`salt.modules.mdadm.save_config()`

Save RAID configuration to config file.

Same as: `mdadm --detail --scan >> /etc/mdadm/mdadm.conf`

Fixes this issue with Ubuntu REF: <http://askubuntu.com/questions/209702/why-is-my-raid-dev-md1-showing-up-as-dev-md126-is-mdadm-conf-being-ignored>

CLI Example:

```
salt '*' raid.save_config
```

`salt.modules.mdadm.stop()`

Shut down all arrays that can be shut down (i.e. are not currently in use).

CLI Example:

```
salt '*' raid.stop
```

### 14.7.215 salt.modules.mdata

Module for managing metadata in SmartOS Zones

New in version 2016.3.0.

**maintainer** Jorge Schrauwen <[sjorge@blackdot.be](mailto:sjorge@blackdot.be)>

**maturity** new

**platform** smartos

`salt.modules.mdata.delete(*keyname)`

Delete metadata

**prop** [string] name of property

CLI Example:

```
salt '*' mdata.get salt:role
salt '*' mdata.get user-script salt:role
```

`salt.modules.mdata.get(*keyname)`

Get metadata

**keyname** [string] name of key

---

**Note:** If no keynames are specified, we get all (public) properties

---

CLI Example:

```
salt '*' mdata.get salt:role
salt '*' mdata.get user-script salt:role
```

**salt.modules.mdata.list()**

List available metadata

CLI Example:

```
salt '*' mdata.list
```

**salt.modules.mdata.put(keyname, val)**

Put metadata

**prop** [string] name of property

**val** [string] value to set

CLI Example:

```
salt '*' mdata.list
```

### 14.7.216 salt.modules.memcached

Module for Management of Memcached Keys

New in version 2014.1.0.

**salt.modules.memcached.add(key, value, host='127.0.0.1', port=11211, time=0, min\_compress\_len=0)**

Add a key to the memcached server, but only if it does not exist. Returns False if the key already exists.

CLI Example:

```
salt '*' memcached.add <key> <value>
```

**salt.modules.memcached.decrement(key, delta=1, host='127.0.0.1', port=11211)**

Decrement the value of a key

CLI Example:

```
salt '*' memcached.decrement <key>
salt '*' memcached.decrement <key> 2
```

**salt.modules.memcached.delete(key, host='127.0.0.1', port=11211, time=0)**

Delete a key from memcache server

CLI Example:

```
salt '*' memcached.delete <key>
```

**salt.modules.memcached.get(key, host='127.0.0.1', port=11211)**

Retrieve value for a key

CLI Example:

```
salt '*' memcached.get <key>
```

`salt.modules.memcached.increment` (*key*, *delta=1*, *host='127.0.0.1'*, *port=11211*)

Increase the value of a key

CLI Example:

```
salt '*' memcached.increment <key>
salt '*' memcached.increment <key> 2
```

`salt.modules.memcached.replace` (*key*, *value*, *host='127.0.0.1'*, *port=11211*, *time=0*, *min\_compress\_len=0*)

Replace a key on the memcached server. This only succeeds if the key already exists. This is the opposite of `memcached.add`

CLI Example:

```
salt '*' memcached.replace <key> <value>
```

`salt.modules.memcached.set` (*key*, *value*, *host='127.0.0.1'*, *port=11211*, *time=0*, *min\_compress\_len=0*)

Set a key on the memcached server, overwriting the value if it exists.

CLI Example:

```
salt '*' memcached.set <key> <value>
```

`salt.modules.memcached.status` (*host='127.0.0.1'*, *port=11211*)

Get memcached status

CLI Example:

```
salt '*' memcached.status
```

### 14.7.217 salt.modules.mine

The function cache system allows for data to be stored on the master so it can be easily read by other minions

`salt.modules.mine.delete` (*fun*)

Remove specific function contents of minion. Returns True on success.

CLI Example:

```
salt '*' mine.delete 'network.interfaces'
```

`salt.modules.mine.flush` ()

Remove all mine contents of minion. Returns True on success.

CLI Example:

```
salt '*' mine.flush
```

`salt.modules.mine.get` (*tgt*, *fun*, *tgt\_type='glob'*, *exclude\_minion=False*, *expr\_form=None*)

Get data from the mine based on the target, function and *tgt\_type*

Targets can be matched based on any standard matching system that can be matched on the master via these keywords:

- glob
- pcre
- grain
- grain\_pcre

- compound
- pillar
- pillar\_pcre

Note that all pillar matches, whether using the compound matching system or the pillar matching system, will be exact matches, with globbing disabled.

**exclude\_minion** Excludes the current minion from the result set

CLI Example:

```
salt '*' mine.get '*' network.interfaces
salt '*' mine.get 'os:Fedora' network.interfaces grain
salt '*' mine.get 'os:Fedora and S@192.168.5.0/24' network.ipaddrs compound
```

#### See also:

Retrieving Mine data from Pillar and Orchestrate

This execution module is intended to be executed on minions. Master-side operations such as Pillar or Orchestrate that require Mine data should use the *Mine Runner module* instead; it can be invoked from a Pillar SLS file using the *saltutil.runner* module. For example:

```
{% set minion_ips = salt.saltutil.runner('mine.get',
    tgt='*',
    fun='network.ip_addrs',
    tgt_type='glob') %}
```

**salt.modules.mine.get\_docker** (*interfaces=None, cidrs=None, with\_container\_id=False*)

Get all mine data for `docker.get\_containers` and run an aggregation routine. The ``interfaces" parameter allows for specifying which network interfaces to select ip addresses from. The ``cidrs" parameter allows for specifying a list of cidrs which the ip address must match.

**with\_container\_id** Boolean, to expose container\_id in the list of results

New in version 2015.8.2.

CLI Example:

```
salt '*' mine.get_docker
salt '*' mine.get_docker interfaces='eth0'
salt '*' mine.get_docker interfaces='["eth0", "eth1"]'
salt '*' mine.get_docker cidrs='107.170.147.0/24'
salt '*' mine.get_docker cidrs='["107.170.147.0/24", "172.17.42.0/24"]'
salt '*' mine.get_docker interfaces='["eth0", "eth1"]' cidrs='["107.170.147.0/24
↵", "172.17.42.0/24"]'
```

**salt.modules.mine.send** (*func, \*args, \*\*kwargs*)

Send a specific function to the mine.

CLI Example:

```
salt '*' mine.send network.ip_addrs eth0
salt '*' mine.send eth0_ip_addrs mine_function=network.ip_addrs eth0
```

**salt.modules.mine.update** (*clear=False, mine\_functions=None*)

Execute the configured functions and send the data back up to the master. The functions to be executed are merged from the master config, pillar and minion config under the option *mine\_functions*:

```
mine_functions:
  network.ip_addrs:
    - eth0
  disk.usage: []
```

This function accepts the following arguments:

**clear:** **False** Boolean flag specifying whether updating will clear the existing mines, or will update. Default: *False* (update).

**mine\_functions** Update the mine data on certain functions only. This feature can be used when updating the mine for functions that require refresh at different intervals than the rest of the functions specified under *mine\_functions* in the minion/master config or pillar. A potential use would be together with the *scheduler*, for example:

```
schedule:
  lldp_mine_update:
    function: mine.update
    kwargs:
      mine_functions:
        net.lldp: []
    hours: 12
```

In the example above, the mine for *net.lldp* would be refreshed every 12 hours, while *network.ip\_addrs* would continue to be updated as specified in *mine\_interval*.

The function cache will be populated with information from executing these functions

CLI Example:

```
salt '*' mine.update
```

`salt.modules.mine.valid()`

List valid entries in mine configuration.

CLI Example:

```
salt '*' mine.valid
```

### 14.7.218 salt.modules.minion module

Module to provide information about minions

`salt.modules.minion.kill(timeout=15)`

Kill the salt minion.

**timeout** int seconds to wait for the minion to die.

If you have a monitor that restarts `salt-minion` when it dies then this is a great way to restart after a minion upgrade.

CLI example:

```
>$ salt minion[12] minion.kill
minion1:
-----
  killed:
    7874
  retcode:
    0
minion2:
-----
  killed:
    29071
  retcode:
    0
```

The result of the salt command shows the process ID of the minions and the results of a kill signal to the minion in as the retcode value: 0 is success, anything else is a failure.

### `salt.modules.minion.list()`

Return a list of accepted, denied, unaccepted and rejected keys. This is the same output as `salt-key -L`

CLI Example:

```
salt 'master' minion.list
```

### `salt.modules.minion.restart()`

Kill and restart the salt minion.

The configuration key `minion_restart_command` is an argv list for the command to restart the minion. If `minion_restart_command` is not specified or empty then the argv of the current process will be used.

if the configuration value `minion_restart_command` is not set and the `-d` (daemonize) argument is missing from argv then the minion *will* be killed but will *not* be restarted and will require the parent process to perform the restart. This behavior is intended for managed salt minion processes.

CLI example:

```
>$ salt minion[12] minion.restart
minion1:
-----
comment:
  - Restart using process argv:
  -   /home/omniture/install/bin/salt-minion
  -   -d
  -   -c
  -   /home/omniture/install/etc/salt
killed:
  10070
restart:
-----
stderr:
stdout:
retcode:
  0
minion2:
-----
comment:
  - Using configuration minion_restart_command:
  -   /home/omniture/install/bin/salt-minion
  -   --not-an-option
  -   -d
  -   -c
  -   /home/omniture/install/etc/salt
  - Restart failed
killed:
  10896
restart:
-----
stderr:
  Usage: salt-minion

  salt-minion: error: no such option: --not-an-option
stdout:
retcode:
  64
```

The result of the command shows the process ID of `minion1` that is shutdown (killed) and the results of the restart. If there is a failure in the restart it will be reflected in a non-zero `retcode` and possibly output in the `stderr` and/or `stdout` values along with addition information in the `comment` field as is demonstrated with `minion2`.

### 14.7.219 salt.modules.mod\_random

Provides access to randomness generators.

New in version 2014.7.0.

`salt.modules.mod_random.get_str(length=20)`

New in version 2014.7.0.

Returns a random string of the specified length.

**length** [20] Any valid number of bytes.

CLI Example:

```
salt '*' random.get_str 128
```

`salt.modules.mod_random.hash(value, algorithm='sha512')`

New in version 2014.7.0.

Encodes a value with the specified encoder.

**value** The value to be hashed.

**algorithm** [sha512] The algorithm to use. May be any valid algorithm supported by hashlib.

CLI Example:

```
salt '*' random.hash 'I am a string' md5
```

`salt.modules.mod_random.rand_int(start=1, end=10)`

Returns a random integer number between the start and end number.

**start** [1] Any valid integer number

**end** [10] Any valid integer number

CLI Example:

```
salt '*' random.rand_int 1 10
```

`salt.modules.mod_random.seed(range=10, hash=None)`

Returns a random number within a range. Optional hash argument can be any hashable object. If hash is omitted or None, the id of the minion is used.

**hash: None** Any hashable object.

**range: 10** Any valid integer number

CLI Example:

```
salt '*' random.seed 10 hash=None
```

`salt.modules.mod_random.shadow_hash(crypt_salt=None, password=None, algorithm='sha512')`

Generates a salted hash suitable for `/etc/shadow`.

**crypt\_salt** [None] Salt to be used in the generation of the hash. If one is not provided, a random salt will be generated.

**password** [None] Value to be salted and hashed. If one is not provided, a random password will be generated.

**algorithm** [sha512] Hash algorithm to use.

CLI Example:

```
salt '*' random.shadow_hash 'My5a1T' 'MyP@asswd' md5
```

`salt.modules.mod_random.str_encode`(*value*, *encoder*='base64')

New in version 2014.7.0.

**value** The value to be encoded.

**encoder** [base64] The encoder to use on the subsequent string.

CLI Example:

```
salt '*' random.str_encode 'I am a new string' base64
```

### 14.7.220 salt.modules.modjk

Control Modjk via the Apache Tomcat ``Status" worker (<http://tomcat.apache.org/connectors-doc/reference/status.html>)

Below is an example of the configuration needed for this module. This configuration data can be placed either in *grains* or pillar.

If using grains, this can be accomplished *statically* or via a *grain module*.

If using pillar, the yaml configuration can be placed directly into a pillar SLS file, making this both the easier and more dynamic method of configuring this module.

```
modjk:
  default:
    url: http://localhost/jkstatus
    user: modjk
    pass: secret
    realm: authentication realm for digest passwords
    timeout: 5
  otherVhost:
    url: http://otherVhost/jkstatus
    user: modjk
    pass: secret2
    realm: authentication realm2 for digest passwords
    timeout: 600
```

`salt.modules.modjk.bulk_activate`(*workers*, *lbn*, *profile*='default')

Activate all the given workers in the specific load balancer

CLI Examples:

```
salt '*' modjk.bulk_activate node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_activate node1,node2,node3 loadbalancer1 other-profile

salt '*' modjk.bulk_activate ["node1","node2","node3"] loadbalancer1
salt '*' modjk.bulk_activate ["node1","node2","node3"] loadbalancer1 other-profile
```

`salt.modules.modjk.bulk_disable`(*workers*, *lbn*, *profile*='default')

Disable all the given workers in the specific load balancer

CLI Examples:

```
salt '*' modjk.bulk_disable node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_disable node1,node2,node3 loadbalancer1 other-profile
```

```
salt '*' modjk.bulk_disable ["node1","node2","node3"] loadbalancer1
salt '*' modjk.bulk_disable ["node1","node2","node3"] loadbalancer1 other-profile
```

`salt.modules.modjk.bulk_recover` (*workers, lbn, profile='default'*)

Recover all the given workers in the specific load balancer

CLI Examples:

```
salt '*' modjk.bulk_recover node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_recover node1,node2,node3 loadbalancer1 other-profile

salt '*' modjk.bulk_recover ["node1","node2","node3"] loadbalancer1
salt '*' modjk.bulk_recover ["node1","node2","node3"] loadbalancer1 other-profile
```

`salt.modules.modjk.bulk_stop` (*workers, lbn, profile='default'*)

Stop all the given workers in the specific load balancer

CLI Examples:

```
salt '*' modjk.bulk_stop node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_stop node1,node2,node3 loadbalancer1 other-profile

salt '*' modjk.bulk_stop ["node1","node2","node3"] loadbalancer1
salt '*' modjk.bulk_stop ["node1","node2","node3"] loadbalancer1 other-profile
```

`salt.modules.modjk.dump_config` (*profile='default'*)

Dump the original configuration that was loaded from disk

CLI Examples:

```
salt '*' modjk.dump_config
salt '*' modjk.dump_config other-profile
```

`salt.modules.modjk.get_running` (*profile='default'*)

Get the current running config (not from disk)

CLI Examples:

```
salt '*' modjk.get_running
salt '*' modjk.get_running other-profile
```

`salt.modules.modjk.lb_edit` (*lbn, settings, profile='default'*)

Edit the loadbalancer settings

Note: <http://tomcat.apache.org/connectors-doc/reference/status.html> Data Parameters for the standard Update Action

CLI Examples:

```
salt '*' modjk.lb_edit loadbalancer1 '{"vlr': 1, 'vlt': 60}"
salt '*' modjk.lb_edit loadbalancer1 '{"vlr': 1, 'vlt': 60}" other-profile
```

`salt.modules.modjk.list_configured_members` (*lbn, profile='default'*)

Return a list of member workers from the configuration files

CLI Examples:

```
salt '*' modjk.list_configured_members loadbalancer1
salt '*' modjk.list_configured_members loadbalancer1 other-profile
```

`salt.modules.modjk.recover_all(lbn, profile='default')`

Set the all the workers in lbn to recover and activate them if they are not

CLI Examples:

```
salt '*' modjk.recover_all loadbalancer1
salt '*' modjk.recover_all loadbalancer1 other-profile
```

`salt.modules.modjk.reset_stats(lbn, profile='default')`

Reset all runtime statistics for the load balancer

CLI Examples:

```
salt '*' modjk.reset_stats loadbalancer1
salt '*' modjk.reset_stats loadbalancer1 other-profile
```

`salt.modules.modjk.version(profile='default')`

Return the modjk version

CLI Examples:

```
salt '*' modjk.version
salt '*' modjk.version other-profile
```

`salt.modules.modjk.worker_activate(worker, lbn, profile='default')`

Set the worker to activate state in the lbn load balancer

CLI Examples:

```
salt '*' modjk.worker_activate node1 loadbalancer1
salt '*' modjk.worker_activate node1 loadbalancer1 other-profile
```

`salt.modules.modjk.worker_disable(worker, lbn, profile='default')`

Set the worker to disable state in the lbn load balancer

CLI Examples:

```
salt '*' modjk.worker_disable node1 loadbalancer1
salt '*' modjk.worker_disable node1 loadbalancer1 other-profile
```

`salt.modules.modjk.worker_edit(worker, lbn, settings, profile='default')`

Edit the worker settings

Note: <http://tomcat.apache.org/connectors-doc/reference/status.html> Data Parameters for the standard Update Action

CLI Examples:

```
salt '*' modjk.worker_edit node1 loadbalancer1 '{"vwf': 500, 'vwd': 60}"
salt '*' modjk.worker_edit node1 loadbalancer1 '{"vwf': 500, 'vwd': 60}" other-
↪profile
```

`salt.modules.modjk.worker_recover(worker, lbn, profile='default')`

Set the worker to recover this module will fail if it is in OK state

CLI Examples:

```
salt '*' modjk.worker_recover node1 loadbalancer1
salt '*' modjk.worker_recover node1 loadbalancer1 other-profile
```

`salt.modules.modjk.worker_status`(*worker*, *profile='default'*)  
Return the state of the worker

CLI Examples:

```
salt '*' modjk.worker_status node1
salt '*' modjk.worker_status node1 other-profile
```

`salt.modules.modjk.worker_stop`(*worker*, *lbn*, *profile='default'*)  
Set the worker to stopped state in the lbn load balancer

CLI Examples:

```
salt '*' modjk.worker_activate node1 loadbalancer1
salt '*' modjk.worker_activate node1 loadbalancer1 other-profile
```

`salt.modules.modjk.workers`(*profile='default'*)  
Return a list of member workers and their status

CLI Examples:

```
salt '*' modjk.workers
salt '*' modjk.workers other-profile
```

### 14.7.221 salt.modules.mongodb

Module to provide MongoDB functionality to Salt

**configuration** This module uses PyMongo, and accepts configuration details as parameters as well as configuration settings:

```
mongodb.host: 'localhost'
mongodb.port: 27017
mongodb.user: ''
mongodb.password: ''
```

This data can also be passed into pillar. Options passed into `opts` will overwrite options passed into pillar.

`salt.modules.mongodb.db_exists`(*name*, *user=None*, *password=None*, *host=None*, *port=None*, *authdb=None*)  
Checks if a database exists in MongoDB

CLI Example:

```
salt '*' mongodb.db_exists <name> <user> <password> <host> <port>
```

`salt.modules.mongodb.db_list`(*user=None*, *password=None*, *host=None*, *port=None*, *authdb=None*)  
List all MongoDB databases

CLI Example:

```
salt '*' mongodb.db_list <user> <password> <host> <port>
```

`salt.modules.mongodb.db_remove`(*name*, *user=None*, *password=None*, *host=None*, *port=None*, *authdb=None*)  
Remove a MongoDB database

CLI Example:

```
salt '*' mongodb.db_remove <name> <user> <password> <host> <port>
```

`salt.modules.mongodb.find`(*collection*, *query=None*, *user=None*, *password=None*, *host=None*,  
*port=None*, *database='admin'*, *authdb=None*)

Find an object or list of objects in a collection

CLI Example:

```
salt '*' mongodb.find mycollection '[{"foo": "F00", "bar": "BAR"}]' <user>
↳ <password> <host> <port> <database>
```

`salt.modules.mongodb.insert`(*objects*, *collection*, *user=None*, *password=None*, *host=None*,  
*port=None*, *database='admin'*, *authdb=None*)

Insert an object or list of objects into a collection

CLI Example:

```
salt '*' mongodb.insert '[{"foo": "F00", "bar": "BAR"}, {"foo": "BAZ", "bar": "BAM"}]' mycollection <user> <password> <host> <port> <database>
```

`salt.modules.mongodb.remove`(*collection*, *query=None*, *user=None*, *password=None*, *host=None*,  
*port=None*, *database='admin'*, *w=1*, *authdb=None*)

Remove an object or list of objects into a collection

CLI Example:

```
salt '*' mongodb.remove mycollection '[{"foo": "F00", "bar": "BAR"}, {"foo": "BAZ", "bar": "BAM"}]' <user> <password> <host> <port> <database>
```

`salt.modules.mongodb.update_one`(*objects*, *collection*, *user=None*, *password=None*, *host=None*,  
*port=None*, *database='admin'*, *authdb=None*)

Update an object into a collection [http://api.mongodb.com/python/current/api/pymongo/collection.html#pymongo.collection.Collection.update\\_one](http://api.mongodb.com/python/current/api/pymongo/collection.html#pymongo.collection.Collection.update_one)

New in version 2016.11.0.

CLI Example:

```
salt '*' mongodb.update_one '{"_id": "my_minion"} {"bar": "BAR"}' mycollection
↳ <user> <password> <host> <port> <database>
```

`salt.modules.mongodb.user_create`(*name*, *passwd*, *user=None*, *password=None*, *host=None*,  
*port=None*, *database='admin'*, *authdb=None*, *roles=None*)

Create a MongoDB user

CLI Example:

```
salt '*' mongodb.user_create <user_name> <user_password> <roles> <user> <password>
↳ <host> <port> <database>
```

`salt.modules.mongodb.user_exists`(*name*, *user=None*, *password=None*, *host=None*, *port=None*,  
*database='admin'*, *authdb=None*)

Checks if a user exists in MongoDB

CLI Example:

```
salt '*' mongodb.user_exists <name> <user> <password> <host> <port> <database>
```

`salt.modules.mongodb.user_find`(*name*, *user=None*, *password=None*, *host=None*, *port=None*,  
*database='admin'*, *authdb=None*)

Get single user from MongoDB

CLI Example:

```
salt '*' mongodb.user_find <name> <user> <password> <host> <port> <database>
↳<authdb>
```

`salt.modules.mongodb.user_grant_roles`(*name*, *roles*, *database*, *user=None*, *password=None*,  
*host=None*, *port=None*, *authdb=None*)

Grant one or many roles to a MongoDB user

CLI Examples:

```
salt '*' mongodb.user_grant_roles johndoe '["readWrite"]' dbname admin adminpwd
↳localhost 27017
```

```
salt '*' mongodb.user_grant_roles janedoe '[{"role": "readWrite", "db": "dbname"}
↳, {"role": "read", "db": "otherdb"}]' dbname admin adminpwd localhost 27017
```

`salt.modules.mongodb.user_list`(*user=None*, *password=None*, *host=None*, *port=None*,  
*database='admin'*, *authdb=None*)

List users of a MongoDB database

CLI Example:

```
salt '*' mongodb.user_list <user> <password> <host> <port> <database>
```

`salt.modules.mongodb.user_remove`(*name*, *user=None*, *password=None*, *host=None*, *port=None*,  
*database='admin'*, *authdb=None*)

Remove a MongoDB user

CLI Example:

```
salt '*' mongodb.user_remove <name> <user> <password> <host> <port> <database>
```

`salt.modules.mongodb.user_revoke_roles`(*name*, *roles*, *database*, *user=None*, *password=None*,  
*host=None*, *port=None*, *authdb=None*)

Revoke one or many roles to a MongoDB user

CLI Examples:

```
salt '*' mongodb.user_revoke_roles johndoe '["readWrite"]' dbname admin adminpwd
↳localhost 27017
```

```
salt '*' mongodb.user_revoke_roles janedoe '[{"role": "readWrite", "db": "dbname"}
↳}, {"role": "read", "db": "otherdb"}]' dbname admin adminpwd localhost 27017
```

`salt.modules.mongodb.user_roles_exists`(*name*, *roles*, *database*, *user=None*, *password=None*,  
*host=None*, *port=None*, *authdb=None*)

Checks if a user of a MongoDB database has specified roles

CLI Examples:

```
salt '*' mongodb.user_roles_exists johndoe '["readWrite"]' dbname admin adminpwd
↳localhost 27017
```

```
salt '*' mongodb.user_roles_exists johndoe '[{"role": "readWrite", "db": "dbname"}, {"role": "read", "db": "otherdb"}]' dbname admin adminpwd localhost 27017
```

`salt.modules.mongodb.version`(*user=None, password=None, host=None, port=None, database='admin', authdb=None*)

Get MongoDB instance version

CLI Example:

```
salt '*' mongodb.version <user> <password> <host> <port> <database>
```

### 14.7.222 salt.modules.monit

Monit service module. This module will create a monit type service watcher.

`salt.modules.monit.configtest`()

New in version 2016.3.0.

Test monit configuration syntax

CLI Example:

```
salt '*' monit.configtest
```

`salt.modules.monit.id`(*reset=False*)

New in version 2016.3.0.

Return monit unique id.

**reset** [False] Reset current id and generate a new id when it's True.

CLI Example:

```
salt '*' monit.id [reset=True]
```

`salt.modules.monit.monitor`(*name*)

monitor service via monit

CLI Example:

```
salt '*' monit.monitor <service name>
```

`salt.modules.monit.reload`()

New in version 2016.3.0.

Reload monit configuration

CLI Example:

```
salt '*' monit.reload
```

`salt.modules.monit.restart`(*name*)

Restart service via monit

CLI Example:

```
salt '*' monit.restart <service name>
```

`salt.modules.monit.start`(*name*)

CLI Example:

```
salt '*' monit.start <service name>
```

`salt.modules.monit.status(svc_name='')`

Display a process status from monit

CLI Example:

```
salt '*' monit.status
salt '*' monit.status <service name>
```

`salt.modules.monit.stop(name)`

Stops service via monit

CLI Example:

```
salt '*' monit.stop <service name>
```

`salt.modules.monit.summary(svc_name='')`

Display a summary from monit

CLI Example:

```
salt '*' monit.summary
salt '*' monit.summary <service name>
```

`salt.modules.monit.unmonitor(name)`

Unmonitor service via monit

CLI Example:

```
salt '*' monit.unmonitor <service name>
```

`salt.modules.monit.validate()`

New in version 2016.3.0.

Check all services

CLI Example:

```
salt '*' monit.validate
```

`salt.modules.monit.version()`

New in version 2016.3.0.

Return version from monit -V

CLI Example:

```
salt '*' monit.version
```

### 14.7.223 salt.modules.moosefs

Module for gathering and managing information about MooseFS

`salt.modules.moosefs.dirinfo(path, opts=None)`

Return information on a directory located on the Moose

CLI Example:

```
salt '*' moosefs.dirinfo /path/to/dir/ [-[n][h|H]]
```

`salt.modules.moosefs.fileinfo`(*path*)  
Return information on a file located on the Moose  
CLI Example:

```
salt '*' moosefs.fileinfo /path/to/dir/
```

`salt.modules.moosefs.getgoal`(*path*, *opts=None*)  
Return goal(s) for a file or directory  
CLI Example:

```
salt '*' moosefs.getgoal /path/to/file [-[n][h|H]]
salt '*' moosefs.getgoal /path/to/dir/ [-[n][h|H][r]]
```

`salt.modules.moosefs.mounts`()  
Return a list of current MooseFS mounts  
CLI Example:

```
salt '*' moosefs.mounts
```

#### 14.7.224 salt.modules.mount

Salt module to manage Unix mounts and the fstab file

`salt.modules.mount.active`(*extended=False*)  
List the active mounts.

CLI Example:

```
salt '*' mount.active
```

`salt.modules.mount.automaster`(*config='/etc/auto\_salt'*)  
List the contents of the auto master

CLI Example:

```
salt '*' mount.automaster
```

`salt.modules.mount.fstab`(*config='/etc/fstab'*)  
Changed in version 2016.3.2.  
List the contents of the fstab

CLI Example:

```
salt '*' mount.fstab
```

`salt.modules.mount.is_fuse_exec`(*cmd*)  
Returns true if the command passed is a fuse mountable application.

CLI Example:

```
salt '*' mount.is_fuse_exec sshfs
```

`salt.modules.mount.is_mounted(name)`

New in version 2014.7.0.

Provide information if the path is mounted

CLI Example:

```
salt '*' mount.is_mounted /mnt/share
```

`salt.modules.mount.mount(name, device, mkmnt=False, fstype='', opts='defaults', user=None, util='mount')`

Mount a device

CLI Example:

```
salt '*' mount.mount /mnt/foo /dev/sdz1 True
```

`salt.modules.mount.remount(name, device, mkmnt=False, fstype='', opts='defaults', user=None)`

Attempt to remount a device, if the device is not already mounted, mount is called

CLI Example:

```
salt '*' mount.remount /mnt/foo /dev/sdz1 True
```

`salt.modules.mount.rm_automaster(name, device, config='/etc/auto_salt')`

Remove the mount point from the auto\_master

CLI Example:

```
salt '*' mount.rm_automaster /mnt/foo /dev/sdg
```

`salt.modules.mount.rm_fstab(name, device, config='/etc/fstab')`

Changed in version 2016.3.2.

Remove the mount point from the fstab

CLI Example:

```
salt '*' mount.rm_fstab /mnt/foo /dev/sdg
```

`salt.modules.mount.rm_vfstab(name, device, config='/etc/vfstab')`

New in version 2016.3.2.

Remove the mount point from the vfstab

CLI Example:

```
salt '*' mount.rm_vfstab /mnt/foo /device/c0t0d0p0
```

`salt.modules.mount.set_automaster(name, device, fstype, opts='', config='/etc/auto_salt', test=False, **kwargs)`

Verify that this mount is represented in the auto\_salt, change the mount to match the data passed, or add the mount if it is not present.

CLI Example:

```
salt '*' mount.set_automaster /mnt/foo /dev/sdz1 ext4
```

`salt.modules.mount.set_fstab(name, device, fstype, opts='defaults', dump=0, pass_num=0, config='/etc/fstab', test=False, match_on='auto', **kwargs)`

Verify that this mount is represented in the fstab, change the mount to match the data passed, or add the mount if it is not present.

CLI Example:

```
salt '*' mount.set_fstab /mnt/foo /dev/sdz1 ext4
```

`salt.modules.mount.set_vfstab`(*name*, *device*, *fstype*, *opts*='-', *device\_fsck*='-', *pass\_fsck*='-', *mount\_at\_boot*='yes', *config*='/etc/vfstab', *test*=False, *match\_on*='auto', *\*\*kwargs*)

..versionadded:: 2016.3.2 Verify that this mount is represented in the fstab, change the mount to match the data passed, or add the mount if it is not present.

CLI Example:

```
salt '*' mount.set_vfstab /mnt/foo /device/c0t0d0p0 ufs
```

`salt.modules.mount.swapoff`(*name*)

Deactivate a named swap mount

Changed in version 2016.3.2.

CLI Example:

```
salt '*' mount.swapoff /root/swapfile
```

`salt.modules.mount.swapon`(*name*, *priority*=None)

Activate a swap disk

Changed in version 2016.3.2.

CLI Example:

```
salt '*' mount.swapon /root/swapfile
```

`salt.modules.mount.swaps`()

Return a dict containing information on active swap

Changed in version 2016.3.2.

CLI Example:

```
salt '*' mount.swaps
```

`salt.modules.mount.umount`(*name*, *device*=None, *user*=None, *util*='mount')

Attempt to unmount a device by specifying the directory it is mounted on

CLI Example:

```
salt '*' mount.umount /mnt/foo
```

New in version 2015.5.0.

```
salt '*' mount.umount /mnt/foo /dev/xvdc1
```

`salt.modules.mount.vfstab`(*config*='/etc/vfstab')

New in version 2016.3.2.

List the contents of the vfstab

CLI Example:

```
salt '*' mount.vfstab
```

### 14.7.225 salt.modules.mssql

Module to provide MS SQL Server compatibility to salt.

#### depends

- FreeTDS
- pymssql Python module

**configuration** In order to connect to MS SQL Server, certain configuration is required in minion configs/pillars on the relevant minions. Some sample pillars might look like:

```
mssql.server: 'localhost'
mssql.port: 1433
mssql.user: 'sysdba'
mssql.password: 'Some preferable complex password'
mssql.database: ''
```

The default for the port is `1433` and for the database is `` (empty string); in most cases they can be left at the default setting. Options that are directly passed into functions will overwrite options from configs or pillars.

**salt.modules.mssql.db\_exists**(*database\_name*, *\*\*kwargs*)

Find if a specific database exists on the MS SQL server.

CLI Example:

```
salt minion mssql.db_exists database_name='DBNAME'
```

**salt.modules.mssql.db\_list**(*\*\*kwargs*)

Return the database list created on a MS SQL server.

CLI Example:

```
salt minion mssql.db_list
```

**salt.modules.mssql.db\_remove**(*database\_name*, *\*\*kwargs*)

Drops a specific database from the MS SQL server. It will not drop any of `master`, `model`, `msdb` or `tempdb`.

CLI Example:

```
salt minion mssql.db_remove database_name='DBNAME'
```

**salt.modules.mssql.login\_exists**(*login*, *\*\*kwargs*)

Find if a login exists in the MS SQL server.

CLI Example:

```
salt minion mssql.login_exists 'LOGIN'
```

**salt.modules.mssql.role\_create**(*role*, *owner=None*, *\*\*kwargs*)

Creates a new database role. If no owner is specified, the role will be owned by the user that executes CREATE ROLE, which is the user argument or mssql.user option.

CLI Example:

```
salt minion mssql.role_create role=product01 owner=sysdba
```

**salt.modules.mssql.role\_exists**(*role*, *\*\*kwargs*)

Checks if a role exists.

CLI Example:

```
salt minion mssql.role_exists db_owner
```

`salt.modules.mssql.role_list(**kwargs)`

Lists database roles.

CLI Example:

```
salt minion mssql.role_list
```

`salt.modules.mssql.role_remove(role, **kwargs)`

Remove a database role.

CLI Example:

```
salt minion mssql.role_create role=test_role01
```

`salt.modules.mssql.tsq_query(query, **kwargs)`

Run a SQL query and return query result as list of tuples, or a list of dictionaries if `as_dict` was passed, or an empty list if no data is available.

CLI Example:

```
salt minion mssql.tsq_query 'SELECT @@version as version' as_dict=True
```

`salt.modules.mssql.user_create(username, new_login_password=None, **kwargs)`

Creates a new user. If `new_login_password` is not specified, the user will be created without a login.

CLI Example:

```
salt minion mssql.user_create USERNAME database=DBNAME [new_login_
→password=PASSWORD]
```

`salt.modules.mssql.user_exists(username, **kwargs)`

Find if an user exists in a specific database on the MS SQL server.

---

**Note:** `database` argument is mandatory

---

CLI Example:

```
salt minion mssql.user_exists 'USERNAME' [database='DBNAME']
```

`salt.modules.mssql.user_list(**kwargs)`

Get the user list for a specific database on the MS SQL server.

CLI Example:

```
salt minion mssql.user_list [database='DBNAME']
```

`salt.modules.mssql.user_remove(username, **kwargs)`

Removes an user.

CLI Example:

```
salt minion mssql.user_remove USERNAME database=DBNAME
```

`salt.modules.mssql.version(**kwargs)`

Return the version of a MS SQL server.

CLI Example:

```
salt minion mssql.version
```

### 14.7.226 salt.modules.msteams module

Module for sending messages to MS Teams .. versionadded:: 2017.7.0 :configuration: This module can be used by either passing a hook\_url

directly or by specifying it in a configuration profile in the salt master/minion config. For example: ..

code-block:: yaml

```
msteams: hook_url: https://outlook.office.com/webhook/837
```

`salt.modules.msteams.post_card(message, hook_url=None, title=None, theme_color=None)`

Send a message to an MS Teams channel. :param message: The message to send to the MS Teams channel.

:param hook\_url: The Teams webhook URL, if not specified in the configuration. :param title: Optional title

for the posted card :param theme\_color: Optional hex color highlight for the posted card :return: Boolean if

message was sent successfully. CLI Example: .. code-block:: bash

```
salt '*' msteams.post_card message="Build is done"
```

### 14.7.227 salt.modules.munin

Run munin plugins/checks from salt and format the output as data.

`salt.modules.munin.list_plugins()`

List all the munin plugins

CLI Example:

```
salt '*' munin.list_plugins
```

`salt.modules.munin.run(plugins)`

Run one or more named munin plugins

CLI Example:

```
salt '*' munin.run uptime
salt '*' munin.run uptime,cpu,load,memory
```

`salt.modules.munin.run_all()`

Run all the munin plugins

CLI Example:

```
salt '*' munin.run_all
```

### 14.7.228 salt.modules.mysql

Module to provide MySQL compatibility to salt.

depends

- MySQLdb Python module

---

**Note:** On CentOS 5 (and possibly RHEL 5) both MySQL-python and python26-mysqldb need to be installed.

---

**configuration** In order to connect to MySQL, certain configuration is required in `/etc/salt/minion` on the relevant minions. Some sample configs might look like:

```
mysql.host: 'localhost'
mysql.port: 3306
mysql.user: 'root'
mysql.pass: ''
mysql.db: 'mysql'
mysql.unix_socket: '/tmp/mysql.sock'
mysql.charset: 'utf8'
```

You can also use a defaults file:

```
mysql.default_file: '/etc/mysql/debian.cnf'
```

Changed in version 2014.1.0: `'charset'` connection argument added. This is a MySQL charset, not a python one.

Changed in version 0.16.2: Connection arguments from the minion config file can be overridden on the CLI by using the arguments defined [here](#). Additionally, it is now possible to setup a user with no password.

`salt.modules.mysql.alter_db`(*name*, *character\_set=None*, *collate=None*, *\*\*connection\_args*)  
 Modify database using ALTER DATABASE `%(dbname)s` CHARACTER SET `%(charset)s` COLLATE `%(collation)s`; query.

CLI Example:

```
salt '*' mysql.alter_db testdb charset='latin1'
```

`salt.modules.mysql.db_check`(*name*, *table=None*, *\*\*connection\_args*)  
 Repairs the full database or just a given table

CLI Example:

```
salt '*' mysql.db_check dbname
salt '*' mysql.db_check dbname dbtable
```

`salt.modules.mysql.db_create`(*name*, *character\_set=None*, *collate=None*, *\*\*connection\_args*)  
 Adds a databases to the MySQL server.

**name** The name of the database to manage

**character\_set** The character set, if left empty the MySQL default will be used

**collate** The collation, if left empty the MySQL default will be used

CLI Example:

```
salt '*' mysql.db_create 'dbname'
salt '*' mysql.db_create 'dbname' 'utf8' 'utf8_general_ci'
```

`salt.modules.mysql.db_exists`(*name*, *\*\*connection\_args*)  
 Checks if a database exists on the MySQL server.

CLI Example:

```
salt '*' mysql.db_exists 'dbname'
```

`salt.modules.mysql.db_get`(*name*, *\*\*connection\_args*)  
 Return a list of databases of a MySQL server using the output from the SELECT DE-

```
FAULT_CHARACTER_SET_NAME,DEFAULT_COLLATION_NAME FROM INFORMATION-
TION_SCHEMA.SCHEMATA WHERE SCHEMA_NAME='dbname'; query.
```

CLI Example:

```
salt '*' mysql.db_get test
```

`salt.modules.mysql.db_list(**connection_args)`

Return a list of databases of a MySQL server using the output from the SHOW DATABASES query.

CLI Example:

```
salt '*' mysql.db_list
```

`salt.modules.mysql.db_optimize(name, table=None, **connection_args)`

Optimizes the full database or just a given table

CLI Example:

```
salt '*' mysql.db_optimize dbname
```

`salt.modules.mysql.db_remove(name, **connection_args)`

Removes a databases from the MySQL server.

CLI Example:

```
salt '*' mysql.db_remove 'dbname'
```

`salt.modules.mysql.db_repair(name, table=None, **connection_args)`

Repairs the full database or just a given table

CLI Example:

```
salt '*' mysql.db_repair dbname
```

`salt.modules.mysql.db_tables(name, **connection_args)`

Shows the tables in the given MySQL database (if exists)

CLI Example:

```
salt '*' mysql.db_tables 'database'
```

`salt.modules.mysql.file_query(database, file_name, **connection_args)`

Run an arbitrary SQL query from the specified file and return the the number of affected rows.

New in version 2017.7.0.

`database`

database to run script inside

`file_name`

File name of the script. This can be on the minion, or a file that is reachable by the fileserver

CLI Example:

```
salt '*' mysql.file_query mydb file_name=/tmp/sqlfile.sql
salt '*' mysql.file_query mydb file_name=salt://sqlfile.sql
```

Return data:

```
{'query time': {'human': '39.0ms', 'raw': '0.03899'}, 'rows affected': 1L}
```

`salt.modules.mysql.free_slave(**connection_args)`

Frees a slave from its master. This is a WIP, do not use.

CLI Example:

```
salt '*' mysql.free_slave
```

`salt.modules.mysql.get_master_status(**connection_args)`

Retrieves the master status from the minion.

Returns:

```
{'host.domain.com': {'Binlog_Do_DB': '',
                    'Binlog_Ignore_DB': '',
                    'File': 'mysql-bin.000021',
                    'Position': 107}}
```

CLI Example:

```
salt '*' mysql.get_master_status
```

`salt.modules.mysql.get_slave_status(**connection_args)`

Retrieves the slave status from the minion.

Returns:

```
{'host.domain.com': {'Connect_Retry': 60,
                    'Exec_Master_Log_Pos': 107,
                    'Last_Errno': 0,
                    'Last_Error': '',
                    'Last_IO_Errno': 0,
                    'Last_IO_Error': '',
                    'Last_SQL_Errno': 0,
                    'Last_SQL_Error': '',
                    'Master_Host': 'comet.scion-eng.com',
                    'Master_Log_File': 'mysql-bin.000021',
                    'Master_Port': 3306,
                    'Master_SSL_Allowed': 'No',
                    'Master_SSL_CA_File': '',
                    'Master_SSL_CA_Path': '',
                    'Master_SSL_Cert': '',
                    'Master_SSL_Cipher': '',
                    'Master_SSL_Key': '',
                    'Master_SSL_Verify_Server_Cert': 'No',
                    'Master_Server_Id': 1,
                    'Master_User': 'replu',
                    'Read_Master_Log_Pos': 107,
                    'Relay_Log_File': 'klo-relay-bin.000071',
                    'Relay_Log_Pos': 253,
                    'Relay_Log_Space': 553,
                    'Relay_Master_Log_File': 'mysql-bin.000021',
                    'Replicate_Do_DB': '',
                    'Replicate_Do_Table': '',
                    'Replicate_Ignore_DB': '',
                    'Replicate_Ignore_Server_Ids': '',
                    'Replicate_Ignore_Table': '',
                    'Replicate_Wild_Do_Table': '',
                    'Replicate_Wild_Ignore_Table': '',
                    'Seconds_Behind_Master': 0,
```

```
'Skip_Counter': 0,
'Slave_IO_Running': 'Yes',
'Slave_IO_State': 'Waiting for master to send event',
'Slave_SQL_Running': 'Yes',
'Until_Condition': 'None',
'Until_Log_File': '',
'Until_Log_Pos': 0}}
```

CLI Example:

```
salt '*' mysql.get_slave_status
```

`salt.modules.mysql.grant_add`(*grant, database, user, host='localhost', grant\_option=False, escape=True, ssl\_option=False, \*\*connection\_args*)

Adds a grant to the MySQL server.

For database, make sure you specify database.table or database.\*

CLI Example:

```
salt '*' mysql.grant_add          'SELECT,INSERT,UPDATE,...' 'database.*' 'frank'
↳ 'localhost'
```

`salt.modules.mysql.grant_exists`(*grant, database, user, host='localhost', grant\_option=False, escape=True, \*\*connection\_args*)

Checks to see if a grant exists in the database

CLI Example:

```
salt '*' mysql.grant_exists      'SELECT,INSERT,UPDATE,...' 'database.*'
↳ 'frank' 'localhost'
```

`salt.modules.mysql.grant_revoke`(*grant, database, user, host='localhost', grant\_option=False, escape=True, \*\*connection\_args*)

Removes a grant from the MySQL server.

CLI Example:

```
salt '*' mysql.grant_revoke      'SELECT,INSERT,UPDATE' 'database.*' 'frank'
↳ 'localhost'
```

`salt.modules.mysql.processlist`(*\*\*connection\_args*)

Retrieves the processlist from the MySQL server via ``SHOW FULL PROCESSLIST``.

**Returns:** a list of dicts, with each dict representing a process:

```
{'Command': 'Query', 'Host': 'localhost', 'Id': 39, 'Info': 'SHOW FULL PROCESSLIST',
  'Rows_examined': 0, 'Rows_read': 1, 'Rows_sent': 0, 'State': None, 'Time': 0, 'User': 'root', 'db':
  'mysql'}
```

CLI Example:

```
salt '*' mysql.processlist
```

`salt.modules.mysql.query`(*database, query, \*\*connection\_args*)

Run an arbitrary SQL query and return the results or the number of affected rows.

CLI Example:

```
salt '*' mysql.query mydb "UPDATE mytable set myfield=1 limit 1"
```

Return data:

```
{'query time': {'human': '39.0ms', 'raw': '0.03899'}, 'rows affected': 1L}
```

CLI Example:

```
salt '*' mysql.query mydb "SELECT id,name,cash from users limit 3"
```

Return data:

```
{'columns': ('id', 'name', 'cash'),
 'query time': {'human': '1.0ms', 'raw': '0.001'},
 'results': ((1L, 'User 1', Decimal('110.000000')),
             (2L, 'User 2', Decimal('215.636756')),
             (3L, 'User 3', Decimal('0.040000'))),
 'rows returned': 3L}
```

CLI Example:

```
salt '*' mysql.query mydb 'INSERT into users values (null,"user 4", 5)'
```

Return data:

```
{'query time': {'human': '25.6ms', 'raw': '0.02563'}, 'rows affected': 1L}
```

CLI Example:

```
salt '*' mysql.query mydb 'DELETE from users where id = 4 limit 1'
```

Return data:

```
{'query time': {'human': '39.0ms', 'raw': '0.03899'}, 'rows affected': 1L}
```

Jinja Example: Run a query on mydb and use row 0, column 0's data.

```
{{ salt['mysql.query']('mydb', 'SELECT info from mytable limit 1')['results'
↪ ]][0][0] }}
```

`salt.modules.mysql.quote_identifier` (*identifier*, *for\_grants=False*)

Return an identifier name (column, table, database, etc) escaped for MySQL

This means surrounded by `` character and escaping this character inside. It also means doubling the `%` character for MySQLdb internal usage.

#### Parameters

- **identifier** -- the table, column or database identifier
- **for\_grants** -- is False by default, when using database names on grant queries you should set it to True to also escape ``\_` and ``%" characters as requested by MySQL. Note that these characters should only be escaped when requesting grants on the database level (*my\_%db.\**) but not for table level grants (*my\_%db.`foo`*)

CLI Example:

```
salt '*' mysql.quote_identifier 'foo`bar'
```

`salt.modules.mysql.showglobal` (*\*\*connection\_args*)

Retrieves the show global variables from the minion.

**Returns::** show global variables full dict

CLI Example:

```
salt '*' mysql.showglobal
```

`salt.modules.mysql.showvariables(**connection_args)`

Retrieves the show variables from the minion.

**Returns::** show variables full dict

CLI Example:

```
salt '*' mysql.showvariables
```

`salt.modules.mysql.slave_lag(**connection_args)`

Return the number of seconds that a slave SQL server is lagging behind the master, if the host is not a slave it will return -1. If the server is configured to be a slave for replication but slave IO is not running then -2 will be returned. If there was an error connecting to the database or checking the slave status, -3 will be returned.

CLI Example:

```
salt '*' mysql.slave_lag
```

`salt.modules.mysql.status(**connection_args)`

Return the status of a MySQL server using the output from the SHOW STATUS query.

CLI Example:

```
salt '*' mysql.status
```

`salt.modules.mysql.tokenize_grant(grant)`

External wrapper function :param grant: :return: dict

CLI Example:

```
salt '*' mysql.tokenize_grant "GRANT SELECT, INSERT ON testdb.* TO
↪ 'testuser'@'localhost'"
```

`salt.modules.mysql.user_chpass(user, host='localhost', password=None, password_hash=None, allow_passwordless=False, unix_socket=None, password_column=None, **connection_args)`

Change password for a MySQL user

**host** Host for which this user/password combo applies

**password** The password to set for the new user. Will take precedence over the password\_hash option if both are specified.

**password\_hash** The password in hashed form. Be sure to quote the password because YAML doesn't like the \*. A password hash can be obtained from the mysql command-line client like so:

```
mysql> SELECT PASSWORD('mypass');
+-----+
| PASSWORD('mypass') |
+-----+
| *6C8989366EAF75BB670AD8EA7A7FC1176A95CEF4 |
+-----+
1 row in set (0.00 sec)
```

**allow\_passwordless** If True, then password and password\_hash can be omitted (or set to None) to permit a passwordless login.

New in version 0.16.2: The allow\_passwordless option was added.

CLI Examples:

```

salt '*' mysql.user_chpass frank localhost newpassword
salt '*' mysql.user_chpass frank localhost password_hash='hash'
salt '*' mysql.user_chpass frank localhost allow_passwordless=True

```

`salt.modules.mysql.user_create`(*user*, *host*='localhost', *password*=None, *password\_hash*=None, *allow\_passwordless*=False, *unix\_socket*=False, *password\_column*=None, *\*\*connection\_args*)

Creates a MySQL user

**host** Host for which this user/password combo applies

**password** The password to use for the new user. Will take precedence over the `password_hash` option if both are specified.

**password\_hash** The password in hashed form. Be sure to quote the password because YAML doesn't like the \*. A password hash can be obtained from the mysql command-line client like so:

```

mysql> SELECT PASSWORD('mypass');
+-----+
| PASSWORD('mypass') |
+-----+
| *6C8989366EAF75BB670AD8EA7A7FC1176A95CEF4 |
+-----+
1 row in set (0.00 sec)

```

**allow\_passwordless** If True, then `password` and `password_hash` can be omitted (or set to None) to permit a passwordless login.

**unix\_socket** If True and `allow_passwordless` is True then will be used `unix_socket` auth plugin.

New in version 0.16.2: The `allow_passwordless` option was added.

CLI Examples:

```

salt '*' mysql.user_create 'username' 'hostname' 'password'
salt '*' mysql.user_create 'username' 'hostname' password_hash='hash'
salt '*' mysql.user_create 'username' 'hostname' allow_passwordless=True

```

`salt.modules.mysql.user_exists`(*user*, *host*='localhost', *password*=None, *password\_hash*=None, *passwordless*=False, *unix\_socket*=False, *password\_column*=None, *\*\*connection\_args*)

Checks if a user exists on the MySQL server. A login can be checked to see if passwordless login is permitted by omitting `password` and `password_hash`, and using `passwordless=True`.

New in version 0.16.2: The `passwordless` option was added.

CLI Example:

```

salt '*' mysql.user_exists 'username' 'hostname' 'password'
salt '*' mysql.user_exists 'username' 'hostname' password_hash='hash'
salt '*' mysql.user_exists 'username' passwordless=True
salt '*' mysql.user_exists 'username' password_column='authentication_string'

```

`salt.modules.mysql.user_grants`(*user*, *host*='localhost', *\*\*connection\_args*)

Shows the grants for the given MySQL user (if it exists)

CLI Example:

```

salt '*' mysql.user_grants 'frank' 'localhost'

```

`salt.modules.mysql.user_info`(*user*, *host*='localhost', *\*\*connection\_args*)

Get full info on a MySQL user

CLI Example:

```
salt '*' mysql.user_info root localhost
```

`salt.modules.mysql.user_list(**connection_args)`

Return a list of users on a MySQL server

CLI Example:

```
salt '*' mysql.user_list
```

`salt.modules.mysql.user_remove(user, host='localhost', **connection_args)`

Delete MySQL user

CLI Example:

```
salt '*' mysql.user_remove frank localhost
```

`salt.modules.mysql.version(**connection_args)`

Return the version of a MySQL server using the output from the `SELECT VERSION()` query.

CLI Example:

```
salt '*' mysql.version
```

### 14.7.229 salt.modules.nacl

This module helps include encrypted passwords in pillars, grains and salt state files.

**depends** libnacl, <https://github.com/saltstack/libnacl>

This is often useful if you wish to store your pillars in source control or share your pillar data with others that you trust. I don't advise making your pillars public regardless if they are encrypted or not.

When generating keys and encrypting passwords use `--local` when using `salt-call` for extra security. Also consider using just the salt runner `nacl` when encrypting pillar passwords.

The `nacl` lib uses 32byte keys, these keys are base64 encoded to make your life more simple. To generate your *key* or *keyfile* you can use:

```
salt-call --local nacl.keygen keyfile=/root/.nacl
```

Now with your key, you can encrypt some data:

```
salt-call --local nacl.enc mypass keyfile=/root/.nacl
DRB7Q6/X5gGSRCTpZyxS6hX05LnIJIJ4ivbmUlBwj0llUA+uaVyvou3vJ4=
```

To decrypt the data:

```
salt-call --local nacl.dec data='DRB7Q6/
↳X5gGSRCTpZyxS6hX05LnIJIJ4ivbmUlBwj0llUA+uaVyvou3vJ4=' keyfile=/root/.nacl
mypass
```

The following optional configurations can be defined in the minion or master config. Avoid storing the config in pillars!

```
cat /etc/salt/master.d/nacl.conf
nacl.config:
  key: 'cKEzd4kXsbeCE7/nLTIqXwnUiD1ulG4NoeeYcCFpd9k='
  keyfile: /root/.nacl
```

When the key is defined in the master config you can use it from the nacl runner:

```
salt-run nacl.enc 'myotherpass'
```

Now you can create a pillar with protected data like:

```
pillarexample:
  user: root
  password: {{ salt.nacl.dec('DRB7Q6/
  →X5gGSRCtpZyxS6hX05LnLJIIJ4ivbmUlBwJ0llUA+uaVyvou3vJ4=') }}
```

Or do something interesting with grains like:

```
salt-call nacl.enc minionname:dbrole
AL24Z2C50lkReer3DuQTFdrNLchLuz3NGIhGjZkLtKRYry/b/CksWM809yskLwH2AGVLoEXI5jAa

salt minionname grains.setval role 'AL24Z2C50lkReer3DuQTFdrNLchLuz3NGIhGjZkLtKRYry/b/
→CksWM809yskLwH2AGVLoEXI5jAa'

{%- set r = grains.get('role') %}
{%- set role = None %}
{%- if r and 'nacl.dec' in salt %}
  {%- set r = salt['nacl.dec'](r,keyfile='/root/.nacl').split(':') %}
  {%- if opts['id'] == r[0] %}
    {%- set role = r[1] %}
  {%- endif %}
{%- endif %}
base:
  {%- if role %}
    '{{ opts['id'] }}':
      - {{ role }}
  {%- endif %}
```

Multi-line text items like certificates require a bit of extra work. You have to strip the new lines and replace them with ``\n'` characters. Certificates specifically require some leading white space when calling `nacl.enc` so that the ``--`` in the first line (commonly `-----BEGIN CERTIFICATE-----`) doesn't get interpreted as an argument to `nacl.enc`. For instance if you have a certificate file that lives in `cert.crt`:

```
cert=$(cat cert.crt |awk '{printf "%s\n", $0} END {print ""}'); salt-run nacl.enc "
→$cert"
```

Pillar data should look the same, even though the secret will be quite long. However, when calling multiline encrypted secrets from pillar in a state, use the following format to avoid issues with `/n` creating extra whitespace at the beginning of each line in the cert file:

```
secret.txt:
  file.managed:
    - template: jinja
    - user: user
    - group: group
    - mode: 700
    - contents: "{{{- salt['pillar.get']('secret') }}"
```

The ``{{{-`` will tell jinja to strip the whitespace from the beginning of each of the new lines.

`salt.modules.nacl.dec(data, **kwargs)`

Takes a key generated from `nacl.keygen` and decrypt some data.

CLI Examples:

```

salt-call --local nacl.dec pEXHQM6cuaF7A=
salt-call --local nacl.dec data='pEXHQM6cuaF7A=' keyfile=/root/.nacl
salt-call --local nacl.dec data='pEXHQM6cuaF7A=' key='cKEzd4kXsbeCE7/
↳nLTIqXwnUiD1ulg4NoeeYcCFpd9k='

```

`salt.modules.nacl.enc`(*data*, *\*\*kwargs*)

Takes a key generated from `nacl.keygen` and encrypt some data.

CLI Examples:

```

salt-call --local nacl.enc datatoenc
salt-call --local nacl.enc datatoenc keyfile=/root/.nacl
salt-call --local nacl.enc datatoenc key='cKEzd4kXsbeCE7/
↳nLTIqXwnUiD1ulg4NoeeYcCFpd9k='

```

`salt.modules.nacl.keygen`(*keyfile=None*)

Use libnacl to generate a private key

CLI Examples:

```

salt-call --local nacl.keygen
salt-call --local nacl.keygen keyfile=/root/.nacl
salt-call --local --out=newline_values_only nacl.keygen > /root/.nacl

```

### 14.7.230 salt.modules.nagios

Run nagios plugins/checks from salt and get the return as data.

`salt.modules.nagios.list_plugins`()

List all the nagios plugins

CLI Example:

```

salt '*' nagios.list_plugins

```

`salt.modules.nagios.retcode`(*plugin*, *args=""*, *key\_name=None*)

Run one nagios plugin and return retcode of the execution

`salt.modules.nagios.retcode_pillar`(*pillar\_name*)

Run one or more nagios plugins from pillar data and get the result of `cmd.retcode` The pillar have to be in this format:

```

-----
webserver:
  Ping_google:
    - check_icmp: 8.8.8.8
    - check_icmp: google.com
  Load:
    - check_load: -w 0.8 -c 1
  APT:
    - check_apt
-----

```

webserver is the role to check, the next keys are the group and the items the check with the arguments if needed

You must to group different checks(one o more) and always it will return the highest value of all the checks

CLI Example:

```
salt '*' nagios.retcode webserver
```

`salt.modules.nagios.run(plugin, args='')`

Run nagios plugin and return all the data execution with cmd.run

CLI Example:

```
salt '*' nagios.run check_apt
salt '*' nagios.run check_icmp '8.8.8.8'
```

`salt.modules.nagios.run_all(plugin, args='')`

Run nagios plugin and return all the data execution with cmd.run\_all

`salt.modules.nagios.run_all_pillar(pillar_name)`

Run one or more nagios plugins from pillar data and get the result of cmd.run\_all The pillar have to be in this format:

```
-----
webserver:
  Ping_google:
    - check_icmp: 8.8.8.8
    - check_icmp: google.com
  Load:
    - check_load: -w 0.8 -c 1
  APT:
    - check_apt
-----
```

webserver is the role to check, the next keys are the group and the items the check with the arguments if needed

You have to group different checks in a group

CLI Example:

```
salt '*' nagios.run webserver
```

`salt.modules.nagios.run_pillar(pillar_name)`

Run one or more nagios plugins from pillar data and get the result of cmd.run The pillar have to be in this format:

```
-----
webserver:
  Ping_google:
    - check_icmp: 8.8.8.8
    - check_icmp: google.com
  Load:
    - check_load: -w 0.8 -c 1
  APT:
    - check_apt
-----
```

webserver is the role to check, the next keys are the group and the items the check with the arguments if needed

You have to group different checks in a group

CLI Example:

```
salt '*' nagios.run webserver
```

### 14.7.231 salt.modules.nagios\_rpc

Check Host & Service status from Nagios via JSON RPC.

New in version 2015.8.0.

`salt.modules.nagios_rpc.host_status` (*hostname=None, \*\*kwargs*)

Check status of a particular host By default statuses are returned in a numeric format.

Parameters:

**hostname** The hostname to check the status of the service in Nagios.

**numeric** Turn to false in order to return status in text format ('OK' instead of 0, 'Warning' instead of 1 etc)

**Returns** status: 'OK', 'Warning', 'Critical' or 'Unknown'

CLI Example:

```
salt '*' nagios_rpc.host_status hostname=webserver.domain.com
salt '*' nagios_rpc.host_status hostname=webserver.domain.com numeric=False
```

`salt.modules.nagios_rpc.service_status` (*hostname=None, service=None, \*\*kwargs*)

Check status of a particular service on a host on it in Nagios. By default statuses are returned in a numeric format.

Parameters:

**hostname** The hostname to check the status of the service in Nagios.

**service** The service to check the status of in Nagios.

**numeric** Turn to false in order to return status in text format ('OK' instead of 0, 'Warning' instead of 1 etc)

**Returns** status: 'OK', 'Warning', 'Critical' or 'Unknown'

CLI Example:

```
salt '*' nagios_rpc.service_status hostname=webserver.domain.com service='HTTP'
salt '*' nagios_rpc.service_status hostname=webserver.domain.com service='HTTP'
↳numeric=False
```

### 14.7.232 salt.modules.namecheap\_dns module

Use this module to manage dns through the namecheap api. The Namecheap settings will be set in grains.

- This module uses the following python libraries to communicate to the namecheap API:

- requests

```
pip install requests
```

- As saltstack depends on requests this shouldn't be a problem
- The namecheap username, api key and url should be set in a minion configuration file or pillar

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
```

```
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```

`salt.modules.namecheap_dns.get_hosts(sld, tld)`  
Retrieves DNS host record settings for the requested domain.

returns a dictionary of information about the requested domain  
**sld** string sld of the domainname  
**tld** string tld of the domainname  
CLI Example:

```
salt 'my-minion' namecheap_domains_dns.get_hosts sld tld
```

`salt.modules.namecheap_dns.get_list(sld, tld)`  
Gets a list of DNS servers associated with the requested domain.

returns a dictionary of information about requested domain  
**sld** string sld of the domainname  
**tld** string tld of the domain name  
CLI Example:

```
salt 'my-minion' namecheap_domains_dns.get_list sld tld
```

`salt.modules.namecheap_dns.set_custom(sld, tld, nameservers)`  
Sets domain to use custom DNS servers.

returns True if the custom nameservers were set successfully  
**sld** string sld of the domainname  
**tld** string tld of the domain name  
**nameservers** array of strings List of nameservers to be associated with this domain  
CLI Example:

```
salt 'my-minion' namecheap_domains_dns.set_custom sld tld nameserver
```

`salt.modules.namecheap_dns.set_default(sld, tld)`  
Sets domain to use namecheap default DNS servers. Required for free services like Host record management, URL forwarding, email forwarding, dynamic dns and other value added services.

returns True if the domain was set to default  
**sld** string sld of the domainname  
**tld** string tld of the domain name  
CLI Example:

```
salt 'my-minion' namecheap_domains_dns.set_default sld tld
```

`salt.modules.namecheap_dns.set_hosts(sld, tld, hosts)`  
Sets DNS host records settings for the requested domain.

returns True if the host records were set successfully  
**sld** string sld of the domainname  
**tld** string tld of the domain name  
**hosts**

array of dictionaries each dictionary should contain the following keys: `hostname`, `recordtype`, and `address` `ttl` is optional, Default value is 1800 `mxpref` is optional but must be included with `emailtype`

`hostname` should be the subdomain/hostname `recordtype` should be A,AAAA,CNAME,MX,MXE,TXT,URL,URL301,FRAME `address` should be url or ip address

``ttl'` should be an integer between 60 to 60000  
CLI Example:

```
salt 'my-minion' namecheap_domains_dns.set_hosts sld tld hosts
```

### 14.7.233 salt.modules.namecheap\_domains module

Namecheap management

New in version 2017.7.0.

#### General Notes

Use this module to manage domains through the namecheap api. The Namecheap settings will be set in grains.

#### Installation Prerequisites

- This module uses the following python libraries to communicate to the namecheap API:

- requests

```
pip install requests
```

- As saltstack depends on requests this shouldn't be a problem

#### Prerequisite Configuration

- The namecheap username, api key and url should be set in a minion configuration file or pillar

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```

`salt.modules.namecheap_domains.check(*domains_to_check)`

Checks the availability of domains

**returns a dictionary where the domain name is the key and** the availability is the value of True/False

**domains\_to\_check** array of strings List of domains to check

CLI Example:

```
salt 'my-minion' namecheap_domains.check domain-to-check
```

`salt.modules.namecheap_domains.create(domain_name, years, **kwargs)`

Try to create the specified domain name for the specified number of years

**returns the following information in a dictionary** registered True/False amount charged for registration domainid unique integer value for the domain orderid unique integer value for the order transactionid unique integer value for the transaction whoisguardenable True,False if enabled for this domain non-realtimedomain True,False if domain registration is instant or not

CLI Example:

```
salt 'my-minion' namecheap_domains.create my-domain-name 2
```

`salt.modules.namecheap_domains.get_info(domain_name)`

Returns information about the requested domain

returns a dictionary of information about the domain\_name

**domain\_name** string Domain name to get information about

CLI Example:

```
salt 'my-minion' namecheap_domains.get_info my-domain-name
```

`salt.modules.namecheap_domains.get_list(list_type=None, search_term=None, page=None, page_size=None, sort_by=None)`

Returns a list of domains for the particular user as a list of objects offset by page length of page\_size

**list\_type**

string Possible values are ALL/EXPIRING/EXPIRED Default: ALL

**search\_term** string Keyword to look for on the domain list

**page**

integer Page to return Default: 1

**page\_size**

integer Number of domains to be listed in a page Minimum value is 10 and maximum value is 100 Default: 20

**sort\_by**

string Possible values are NAME/NAME\_DESC/EXPIREDATE/ EXPIREDATE\_DESC/CREATEDATE/CREATEDATE\_DESC

CLI Example:

```
salt 'my-minion' namecheap_domains.get_list
```

`salt.modules.namecheap_domains.get_tld_list()`

Returns a list of TLDs as objects

CLI Example:

```
salt 'my-minion' namecheap_domains.get_tld_list
```

`salt.modules.namecheap_domains.reactivate(domain_name)`

Try to reactivate the expired domain name

**returns the following information in a dictionary** issuccess bool indicates whether the domain was renewed successfully amount charged for reactivation orderid unique integer value for the order transactionid unique integer value for the transaction

CLI Example:

`salt.modules.namecheap_domains.renew(domain_name, years, promotion_code=None)`

Try to renew the specified expiring domain name for a specified number of years

**returns the following information in a dictionary** renew bool indicates whether the domain was renewed successfully domainid unique integer value for the domain orderid unique integer value for the order transactionid unique integer value for the transaction amount charged for renewal

**Required parameters:**

**domain\_name** string The domain name you wish to renew

CLI Example:

```
salt 'my-minion' namecheap_domains.renew my-domain-name 5
```

### 14.7.234 salt.modules.namecheap\_ns module

Use this module to manage nameservers through the namecheap api. The Namecheap settings will be set in grains.

- This module uses the following python libraries to communicate to the namecheap API:

- requests

```
pip install requests
```

- As saltstack depends on requests this shouldn't be a problem
- The namecheap username, api key and url should be set in a minion configuration file or pillar

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```

`salt.modules.namecheap_ns.create(sld, tld, nameserver, ip)`

Creates a new nameserver

returns True if the nameserver was created successfully

**sld** string SLD of the DomainName

**tld** string TLD of the DomainName

**nameserver** string Nameserver to create

**ip** string Nameserver IP address

CLI Example:

```
salt '*' namecheap_domains_ns.create sld tld nameserver ip
```

`salt.modules.namecheap_ns.delete(sld, tld, nameserver)`

Deletes a nameserver

returns True if the nameserver was deleted successfully

**sld** string SLD of the DomainName

**tld** string TLD of the DomainName

**nameserver** string Nameserver to create

CLI Example:

```
salt '*' namecheap_domains_ns.delete sld tld nameserver
```

`salt.modules.namecheap_ns.get_info(sld, tld, nameserver)`

Retrieves information about a registered nameserver

**returns the following information in a dictionary** ipaddress set for the nameserver domain name for which you are trying to get nameserver details status an array of status about the nameservers

**sld** string SLD of the DomainName

**tld** string TLD of the DomainName

**nameserver** string Nameserver to retrieve

CLI Example:

```
salt '*' namecheap_domains_ns.get_info sld tld nameserver
```

`salt.modules.namecheap_ns.update(sld, tld, nameserver, old_ip, new_ip)`

Deletes a nameserver

returns True if the nameserver was updated successfully  
**sld** string SLD of the DomainName  
**tld** string TLD of the DomainName  
**nameserver** string Nameserver to create  
**old\_ip** string existing ip address  
**new\_ip** string new ip address  
 CLI Example:

```
salt '*' namecheap_domains_ns.update sld tld nameserver old_ip new_ip
```

### 14.7.235 salt.modules.namecheap\_ssl module

Namecheap management

New in version 2017.7.0.

#### General Notes

Use this module to manage ssl certificates through the namecheap api. The Namecheap settings will be set in grains.

#### Installation Prerequisites

- This module uses the following python libraries to communicate to the namecheap API:

- requests

```
pip install requests
```

- As saltstack depends on requests this shouldn't be a problem

#### Prerequisite Configuration

- The namecheap username, api key and url should be set in a minion configuration file or pillar

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```

**salt.modules.namecheap\_ssl.activate**(*csr\_file*, *certificate\_id*, *web\_server\_type*, *ap-prover\_email=None*, *http\_dc\_validation=False*, *\*\*kwargs*)

Activates a newly purchased SSL certificate

returns a dictionary of result values

#### Required Parameters:

**csr** string Certificate Signing Request  
**certificate\_id** integer Unique ID of the SSL certificate you wish to activate  
**web\_server\_type**

string The type of certificate format to return

Possible values: apacheopenssl, apachessl, apacheraven, apachessleay, c2net, ibmhttp, iplanet, domino, dominogo4625, dominogo4626, netscape, zeusv3, apache2, apacheapachessl, cobaltseries, cpanel, ensim, hisphere, ipswitch, plesk, tomcat, weblogic, website, webstar, iis, other, iis4, iis5

#### approver\_email

**string** The email ID which is on the approver email list http\_dc\_validation must be set to False if this parameter is used

#### http\_dc\_validation

**bool** An indicator that shows if certificate should be activated using HTTP-based validation. Please specify True if you wish to use HTTP-based validation. approver\_email should be set to None if this parameter is used

**Other required parameters:** please see <https://www.namecheap.com/support/api/methods/ssl/activate.aspx>  
CLI Example:

```
salt.modules.namecheap_ssl.create(years, certificate_type, promotion_code=None,
                                   sans_to_add=None)
```

Creates a new SSL certificate

**returns a dictionary with the following values:** issuccess Indicates whether SSL order was successful orderid A unique integer value that represents the order transactionid A unique integer value that represents the transaction chargedamount The amount charged for the order certificateid A unique integer value that represents the SSL created The date on which the certificate is created expires The date on which the certificate expires ssltype Type of SSL certificate years Number of years for which the certificate is purchased status The current status of SSL certificate

#### Required parameters:

**years**

**integer** Number of years to register Default: 1

**certificate\_type**

**string** Type of SSL Certificate,

**Possible Values:** QuickSSL Premium, RapidSSL, RapidSSL Wildcard,

PremiumSSL, InstantSSL, PositiveSSL, PositiveSSL Wildcard, True BusinessID with EV, True BusinessID, True BusinessID Wildcard, True BusinessID Multi Domain, True BusinessID with EV Multi Domain, Secure Site, Secure Site Pro, Secure Site with EV, Secure Site Pro with EV, EssentialSSL, EssentialSSL Wildcard, InstantSSL Pro, PremiumSSL Wildcard, EV SSL, EV SSL SGC, SSL123, SSL Web Server, SGC Supercert, SSL Webserver EV, EV Multi Domain SSL, Multi Domain SSL, PositiveSSL Multi Domain, Unified Communications

#### Optional parameters:

**promotional\_code** string Promotional (coupon) code for the certificate

**sans\_to\_add**

**integer** This parameter defines the number of add-on domains to be purchased in addition to the default number of domains included with a multi-domain certificate. Each certificate that supports SANs has the default number of domains included. You may check the default number of domains included and the maximum number of domains that can be added to it in the table below.  
Default: 0

Provider	Product name	Default number of domains	Maximum number of domains	Maximum number of domains (domain from total domains of domains CSR is counted here) that can be

passed in SANStoADD parameter

Comodo PositiveSSL 3 100 97 Multi-Domain

Comodo Multi-Domain 3 100 97 SSL

Comodo EV Multi- 3 100 97 Domain SSL

Comodo Unified 3 100 97 Communications

GeoTrust QuickSSL 1 1 domain + The only  
Premium 4 subdomains supported value is 4

GeoTrust True 5 25 20 BusinessID with EV Multi-Domain

GeoTrust True Business 5 25 20 ID Multi- Domain

Thawte SSL Web 1 25 24 Server

Thawte SSL Web 1 25 24 Server with EV

Symantec Secure Site 1 25 24 Pro with EV

Symantec Secure Site 1 25 24 with EV

Symantec Secure Site 1 25 24 Pro

CLI Example:

```
salt.modules.namecheap_ssl.get_info(certificate_id, returncertificate=False, returntype=None)
```

Retrieves information about the requested SSL certificate

returns a dictionary of information about the SSL certificate with two keys ``ssl" contains the metadata information ``certificate" contains the details for the certificate like

the CSR, Approver, and certificate data

certificate\_id integer Unique ID of the SSL certificate

returncertificate bool True to ask for the certificate in response

returntype

string Type of returned certificate. Parameter takes ``Individual (for X.509 format) or PKCS7"

Required if returncertificate is True

CLI Example:

```
salt.modules.namecheap_ssl.get_list(**kwargs)
```

Returns a list of SSL certificates for a particular user

Optional parameters:

ListType

string Possible values: All,Processing,EmailSent,

TechnicalProblem,InProgress,Completed,

vated,Active,Cancelled,NewPurchase, NewRenewal

Deacti-

Default: All

SearchTerm string Keyword to look for on the SSL list

Page

integer Page to return Default: 1

PageSize

integer Total number of SSL certificates to display in a page Minimum value is 10 and maximum value is 100 Default: 20

SortBy

**string** Possible values are PURCHASEDATE,PURCHASEDATE\_DESC,  
SSLTYPE,SSLTYPE\_DESC, EXPIREDATETIME,EXPIREDATETIME\_DESC,  
Host\_Name,Host\_Name\_DESC

CLI Example:

```
salt.modules.namecheap_ssl.parse_csr(csr_file, certificate_type, http_dc_validation=False)
```

Parses the CSR

returns a dictionary of result values

Required parameters:

**csr\_file** string Certificate Signing Request File  
**certificate\_type**

**string** Type of SSL Certificate,

**Possible Values:** QuickSSL Premium, RapidSSL, RapidSSL Wildcard, PremiumSSL, InstantSSL, PositiveSSL, PositiveSSL Wildcard, True BusinessID with EV, True BusinessID, True BusinessID Wildcard, True BusinessID Multi Domain, True BusinessID with EV Multi Domain, Secure Site, Secure Site Pro, Secure Site with EV, Secure Site Pro with EV, EssentialSSL, EssentialSSL Wildcard, InstantSSL Pro, PremiumSSL Wildcard, EV SSL, EV SSL SGC, SSL123, SSL Web Server, SGC Supercert, SSL Webserver EV, EV Multi Domain SSL, Multi Domain SSL, PositiveSSL Multi Domain, Unified Communications

Optional parameter:

**http\_dc\_validation**

**bool** True if a Comodo certificate and validation should be done with files instead of emails and to return the info to do so

CLI Example:

```
salt.modules.namecheap_ssl.reissue(csr_file, certificate_id, web_server_type, approver_email=None, http_dc_validation=False, **kwargs)
```

Reissues a purchased SSL certificate

returns a dictionary of result values

**Required Parameters:**

**csr** string Certificate Signing Request  
**certificate\_id** integer Unique ID of the SSL certificate you wish to activate  
**web\_server\_type**

**string** The type of certificate format to return

**Possible values:** apacheopenssl, apachessl, apacheraven, apachessleay, c2net, ibmhttp, iplanet, domino, dominogo4625, dominogo4626, netscape, zeusv3, apache2, apacheapachessl, cobaltseries, cpanel, ensim, hisphere, ipswitch, plesk, tomcat, weblogic, website, webstar, iis, other, iis4, iis5

**approver\_email**

**string** The email ID which is on the approver email list *http\_dc\_validation* must be set to False if this parameter is used

**http\_dc\_validation**

**bool** An indicator that shows if certificate should be activated using HTTP-based validation. Please specify True if you wish to use HTTP-based validation. *approver\_email* should be set to None if this parameter is used

**Other required parameters:** please see <https://www.namecheap.com/support/api/methods/ssl/reissue.aspx>

CLI Example:

```
salt.modules.namecheap_ssl.renew(years, certificate_id, certificate_type, promotion_code=None)
```

Renews an SSL certificate if it is ACTIVE and Expires <= 30 days

returns a dictionary with the following values: orderid A unique integer value that represents the order transactionid A unique integer value that represents the transaction chargedamount The amount charged for the order certificateid A unique integer value that represents the SSL

Required parameters:

years

integer Number of years to register Default: 1

certificate\_id integer Unique identifier for the existing certificate to renew

certificate\_type

string Type of SSL Certificate,

Possible Values: QuickSSL Premium, RapidSSL, RapidSSL Wildcard, PremiumSSL, InstantSSL, PositiveSSL, PositiveSSL Wildcard, True BusinessID with EV, True BusinessID, True BusinessID Wildcard, True BusinessID Multi Domain, True BusinessID with EV Multi Domain, Secure Site, Secure Site Pro, Secure Site with EV, Secure Site Pro with EV, EssentialSSL, EssentialSSL Wildcard, InstantSSL Pro, PremiumSSL Wildcard, EV SSL, EV SSL SGC, SSL123, SSL Web Server, SGC Supercert, SSL Webserver EV, EV Multi Domain SSL, Multi Domain SSL, PositiveSSL Multi Domain, Unified Communications

Optional parameters:

promotional\_code string Promotional (coupon) code for the certificate

CLI Example:

### 14.7.236 salt.modules.namecheap\_users module

Namecheap management

New in version 2017.7.0.

#### General Notes

Use this module to manage users through the namecheap api. The Namecheap settings will be set in grains.

#### Installation Prerequisites

- This module uses the following python libraries to communicate to the namecheap API:

- requests

```
pip install requests
```

- As saltstack depends on requests this shouldn't be a problem

#### Prerequisite Configuration

- The namecheap username, api key and url should be set in a minion configuration file or pillar

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
```

```
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```

`salt.modules.namecheap_users.check_balances` (*minimum=100*)

Checks if the provided minimum value is present in the user's account.

Returns a boolean. Returns `False` if the user's account balance is less than the provided minimum or `True` if greater than the minimum.

**minimum** The value to check. Defaults to 100.

CLI Example:

```
salt 'my-minion' namecheap_users.check_balances
salt 'my-minion' namecheap_users.check_balances minimum=150
```

`salt.modules.namecheap_users.get_balances` ()

Gets information about fund in the user's account. This method returns the following information: Available Balance, Account Balance, Earned Amount, Withdrawable Amount and Funds Required for AutoRenew.

NOTE: If a domain setup with automatic renewal is expiring within the next 90 days, the FundsRequired-ForAutoRenew attribute shows the amount needed in your Namecheap account to complete auto renewal.

returns a dictionary of the results

CLI Example:

```
salt 'my-minion' namecheap_users.get_balances
```

## 14.7.237 salt.modules.napalm module

### NAPALM helpers

Helpers for the NAPALM modules.

New in version 2017.7.0.

`salt.modules.napalm.alive` (*\*args, \*\*kwargs*)

Returns the alive status of the connection layer. The output is a dictionary under the usual dictionary output of the NAPALM modules.

CLI Example:

```
salt '*' napalm.alive
```

Output Example:

```
result: True
out:
  is_alive: False
comment: ''
```

`salt.modules.napalm.call` (*\*args, \*\*kwargs*)

Execute arbitrary methods from the NAPALM library. To see the expected output, please consult the NAPALM documentation.

---

**Note:** This feature is not recommended to be used in production. It should be used for testing only!

---

CLI Example:

```
salt '*' napalm.call get_lldp_neighbors
salt '*' napalm.call get_firewall_policies
salt '*' napalm.call get_bgp_config group='my-group'
```

`salt.modules.napalm.compliance_report(*args, **kwargs)`

Return the compliance report.

**filepath** The absolute path to the validation file.

CLI Example:

```
salt '*' napalm.compliance_report ~/validate.yml
```

Validation File Example:

```
- get_facts:
  os_version: 4.17

- get_interfaces_ip:
  Management1:
    ipv4:
      10.0.2.14:
        prefix_length: 24
        _mode: strict
```

Output Example:

```
device1:
-----
comment:
out:
-----
  complies:
    False
  get_facts:
-----
    complies:
      False
    extra:
    missing:
    present:
-----
      os_version:
-----
        actual_value:
          15.1F6-S1.4
        complies:
          False
        nested:
          False
  get_interfaces_ip:
-----
    complies:
      False
    extra:
    missing:
      - Management1
    present:
```

```
-----
skipped:
result:
  True
```

`salt.modules.napalm.reconnect(*args, **kwargs)`

Reconnect the NAPALM proxy when the connection is dropped by the network device. The connection can be forced to be restarted using the `force` argument.

---

**Note:** This function can be used only when running proxy minions.

---

CLI Example:

```
salt '*' napalm.reconnect
salt '*' napalm.reconnect force=True
```

## 14.7.238 salt.modules.napalm\_acl module

### NAPALM ACL

Generate and load ACL (firewall) configuration on network devices.

New in version 2017.7.0.

**codeauthor** Mircea Ulinic <mircea@cloudflare.com>

**maturity** new

**depends** capirca, napalm

**platform** unix

### Dependencies

The firewall configuration is generated by [Capirca](#).

To be able to load configuration on network devices, it requires [NAPALM](#) library to be installed: `pip install napalm`. Please check [Installation](#) for complete details.

`salt.modules.napalm_acl.get_filter_pillar(filter_name, pillar_key='acl', pillarenv=None, saltenv=None)`

Helper that can be used inside a state SLS, in order to get the filter configuration given its name.

**filter\_name** The name of the filter.

**pillar\_key** The root key of the whole policy config.

**pillarenv** Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv** Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

`salt.modules.napalm_acl.get_term_pillar(filter_name, term_name, pillar_key='acl', pillarenv=None, saltenv=None)`

Helper that can be used inside a state SLS, in order to get the term configuration given its name, under a certain filter uniquely identified by its name.

**filter\_name** The name of the filter.

**term\_name** The name of the term.

**pillar\_key: acl** The root key of the whole policy config. Default: `acl`.

**pillarenv** Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv** Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

`salt.modules.napalm_acl.load_filter_config(*args, **kwargs)`

Generate and load the configuration of a policy filter.

---

**Note:** The order of the terms is very important. The configuration loaded on the device respects the order defined in the `terms` and/or inside the pillar.

When merging the `terms` with the pillar data, consider the `prepend` argument to make sure the order is correct!

---

**filter\_name** The name of the policy filter.

**filter\_options** Additional filter options. These options are platform-specific. See the complete list of `options`.

**terms** List of terms for this policy filter. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.

**prepend: True** When `merge_pillar` is set as `True`, the final list of terms generated by merging the terms from `terms` with those defined in the pillar (if any): new terms are prepended at the beginning, while existing ones will preserve the position. To add the new terms at the end of the list, set this argument to `False`.

**pillar\_key: acl** The key in the pillar containing the default attributes values. Default: `acl`.

**pillarenv** Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv** Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

**merge\_pillar: True** Merge the CLI variables with the pillar. Default: `True`.

The merge logic depends on the `prepend` argument and the CLI has higher priority than the pillar.

**only\_lower\_merge: False** Specify if it should merge only the `terms` fields. Otherwise it will try to merge also `filters` fields. Default: `False`. This option requires `merge_pillar`, otherwise it is ignored.

**revision\_id** Add a comment in the filter config having the description for the changes applied.

**revision\_no** The revision count.

**revision\_date: True** Boolean flag: display the date when the filter configuration was generated. Default: `True`.

**revision\_date\_format: %Y/%m/%d** The date format to be used when generating the perforce data. Default: `%Y/%m/%d (<year>/<month>/<day>)`.

**test: False** Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit: True** Commit? Default: `True`.

**debug: False** Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

The output is a dictionary having the same form as `net.load_config`.

CLI Example:

```
salt 'edge01.bjm01' netacl.load_filter_config my-filter pillar_key=netacl
↪ debug=True
```

Output Example:

```
edge01.bjm01:
-----
  already_configured:
    False
  comment:
```

```

diff:
  [edit firewall]
  +   family inet {

  +           source-port 5678-5680;
  +         }
  +         then accept;
  +       }
  +     }
  +   }
loaded_config:
  firewall {
    family inet {
      replace:
      /*
      ** $Date: 2017/03/22 $
      **
      */
      filter my-filter {
        interface-specific;
        term my-term {
          from {
            source-port [ 1234 1235 ];
          }
          then {
            reject;
          }
        }
        term my-other-term {
          from {
            protocol tcp;
            source-port 5678-5680;
          }
          then accept;
        }
      }
    }
  }
result:
  True

```

The filter configuration has been loaded from the pillar, having the following structure:

```
netacl:
- my-filter:
  terms:
  - my-term:
    source_port: [1234, 1235]
    action: reject
  - my-other-term:
    source_port:
      - [5678, 5680]
    protocol: tcp
    action: accept
```

`salt.modules.napalm_acl.load_policy_config(*args, **kwargs)`

Generate and load the configuration of the whole policy.

---

**Note:** The order of the filters and their terms is very important. The configuration loaded on the device respects the order defined in the `filters` and/or inside the pillar.

When merging the `filters` with the pillar data, consider the `prepend` argument to make sure the order is correct!

---

**filters** List of filters for this policy. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.

**prepend: True** When `merge_pillar` is set as `True`, the final list of filters generated by merging the filters from `filters` with those defined in the pillar (if any): new filters are prepended at the beginning, while existing ones will preserve the position. To add the new filters at the end of the list, set this argument to `False`.

**pillar\_key: acl** The key in the pillar containing the default attributes values. Default: `acl`.

**pillarenv** Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv** Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

**merge\_pillar: True** Merge the CLI variables with the pillar. Default: `True`.

The merge logic depends on the `prepend` argument and the CLI has higher priority than the pillar.

**only\_lower\_merge: False** Specify if it should merge only the filters and terms fields. Otherwise it will try to merge everything at the policy level. Default: `False`. This option requires `merge_pillar`, otherwise it is ignored.

**revision\_id** Add a comment in the policy config having the description for the changes applied.

**revision\_no** The revision count.

**revision\_date: True** Boolean flag: display the date when the policy configuration was generated. Default: `True`.

**revision\_date\_format: %Y/%m/%d** The date format to be used when generating the perforce data. Default: `%Y/%m/%d` (<year>/<month>/<day>).

**test: False** Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit: True** Commit? Default: `True`.

**debug: False** Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

The output is a dictionary having the same form as `net.load_config`.

CLI Example:

```
salt 'edge01.flw01' netacl.load_policy_config debug=True
```

Output Example:

```

edge01.flw01:
-----
already_configured:
  False

    - first-term:
      protocol:
        - icmp
      action: reject

```

`salt.modules.napalm_acl.load_term_config(*args, **kwargs)`

Generate and load the configuration of a policy term.

**filter\_name** The name of the policy filter.

**term\_name** The name of the term.

**filter\_options** Additional filter options. These options are platform-specific. See the complete list of [options](#).

**pillar\_key: acl** The key in the pillar containing the default attributes values. Default: `acl`. If the pillar contains the following structure:

```

firewall:
- my-filter:
  terms:
    - my-term:
      source_port: 1234
      source_address:
        - 1.2.3.4/32
        - 5.6.7.8/32

```

The `pillar_key` field would be specified as `firewall`.

**pillarenv** Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv** Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

**merge\_pillar: True** Merge the CLI variables with the pillar. Default: `True`.

The properties specified through the CLI have higher priority than the pillar.

**revision\_id** Add a comment in the term config having the description for the changes applied.

**revision\_no** The revision count.

**revision\_date: True** Boolean flag: display the date when the term configuration was generated. Default: `True`.

**revision\_date\_format: %Y/%m/%d** The date format to be used when generating the perform data. Default: `%Y/%m/%d (<year>/<month>/<day>)`.

**test: False** Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit: True** Commit? Default: `True`.

**debug: False** Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

**source\_service** A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a `source_port` and `protocol`.

As this module is available on Unix platforms only, it reads the [IANA](#) port assignment from `/etc/services`.

If the user requires additional shortcuts to be referenced, they can add entries under `/etc/services`, which can be managed using the `file state`.

**destination\_service** A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a `destination_port` and `protocol`. Allows the same options as `source_service`.

**\*\*term\_fields** Term attributes. To see what fields are supported, please consult the list of supported [keywords](#).

Some platforms have few other [optional](#) keywords.

---

**Note:** The following fields are accepted (some being platform-specific):

- action
- address
- address\_exclude
- comment
- counter
- expiration
- destination\_address
- destination\_address\_exclude
- destination\_port
- destination\_prefix
- forwarding\_class
- forwarding\_class\_except
- logging
- log\_name
- loss\_priority
- option
- policer
- port
- precedence
- principals
- protocol
- protocol\_except
- qos
- pan\_application
- routing\_instance
- source\_address
- source\_address\_exclude
- source\_port
- source\_prefix
- verbatim
- packet\_length
- fragment\_offset
- hop\_limit
- icmp\_type
- ether\_type
- traffic\_class\_count
- traffic\_type
- translated
- dscp\_set
- dscp\_match
- dscp\_except
- next\_ip
- flexible\_match\_range
- source\_prefix\_except
- destination\_prefix\_except
- vpn
- source\_tag
- destination\_tag
- source\_interface
- destination\_interface

- flattened
- flattened\_addr
- flattened\_saddr
- flattened\_daddr

---

**Note:** The following fields can be also a single value and a list of values:

- action
- address
- address\_exclude
- comment
- destination\_address
- destination\_address\_exclude
- destination\_port
- destination\_prefix
- forwarding\_class
- forwarding\_class\_except
- logging
- option
- port
- precedence
- principals
- protocol
- protocol\_except
- pan\_application
- source\_address
- source\_address\_exclude
- source\_port
- source\_prefix
- verbatim
- icmp\_type
- ether\_type
- traffic\_type
- dscp\_match
- dscp\_except
- flexible\_match\_range
- source\_prefix\_except
- destination\_prefix\_except
- source\_tag
- destination\_tag
- source\_service
- destination\_service

Example: `destination_address` can be either defined as:

```
destination_address: 172.17.17.1/24
```

or as a list of destination IP addresses:

```
destination_address:
- 172.17.17.1/24
- 172.17.19.1/24
```

or a list of services to be matched:

```
source_service:
- ntp
- snmp
- ldap
- bgpd
```

**Note:** The port fields `source_port` and `destination_port` can be used as above to select either a single value, either a list of values, but also they can select port ranges. Example:

```
source_port:
- [1000, 2000]
- [3000, 4000]
```

With the configuration above, the user is able to select the 1000-2000 and 3000-4000 source port ranges.

The output is a dictionary having the same form as `net.load_config`.

CLI Example:

```
salt 'edge01.bjm01' netacl.load_term_config filter-name term-name source_
↪address=1.2.3.4 destination_address=5.6.7.8 action=accept test=True debug=True
```

Output Example:

```
edge01.bjm01:
-----
already_configured:
  False
comment:
  Configuration discarded.
diff:
  [edit firewall]
  +   family inet {
  +     /*
  +     ** $Date: 2017/03/22 $
  +     **
  +     */
  +     filter filter-name {
  +       interface-specific;
  +       term term-name {
  +         from {
  +           source-address {
  +             1.2.3.4/32;
  +           }
  +           destination-address {
  +             5.6.7.8/32;
  +           }
  +         }
  +       then accept;
  +     }
  +   }
loaded_config:
  firewall {
    family inet {
```

```

replace:
  /*
  ** $Date: 2017/03/22 $
  **
  */
  filter filter-name {
    interface-specific;
    term term-name {
      from {
        source-address {
          1.2.3.4/32;
        }
        destination-address {
          5.6.7.8/32;
        }
      }
      then accept;
    }
  }
}
}
}
}
}
}
}
}
result:
  True

```

### 14.7.239 salt.modules.napalm\_bgp module

#### NAPALM BGP

Manages BGP configuration on network devices and provides statistics.

**codeauthor** Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>

**maturity** new

**depends** napalm

**platform** unix

#### Dependencies

- *napalm proxy minion*

New in version 2016.11.0.

`salt.modules.napalm_bgp.config(*args, **kwargs)`

Provides the BGP configuration on the device.

#### Parameters

- **group** -- Name of the group selected to display the configuration.
- **neighbor** -- IP Address of the neighbor to display the configuration.

If the group parameter is not specified, the neighbor setting will be ignored. :return: A dictionary containing the BGP configuration from the network device. The keys of the main dictionary are the group names.

Each group has the following properties:

- type (string)
- description (string)

- apply\_groups (string list)
- multihop\_ttl (int)
- multipath (True/False)
- local\_address (string)
- local\_as (int)
- remote\_as (int)
- import\_policy (string)
- export\_policy (string)
- remove\_private\_as (True/False)
- prefix\_limit (dictionary)
- neighbors (dictionary)

Each neighbor in the dictionary of neighbors provides:

- description (string)
- import\_policy (string)
- export\_policy (string)
- local\_address (string)
- local\_as (int)
- remote\_as (int)
- authentication\_key (string)
- prefix\_limit (dictionary)
- route\_reflector\_client (True/False)
- nhs (True/False)

CLI Example:

```
salt '*' bgp.config # entire BGP config
salt '*' bgp.config PEERS-GROUP-NAME # provides detail only about BGP group PEERS-
↳GROUP-NAME
salt '*' bgp.config PEERS-GROUP-NAME 172.17.17.1 # provides details only about
↳BGP neighbor 172.17.17.1,
# configured in the group PEERS-GROUP-NAME
```

Output Example:

```
{
  'PEERS-GROUP-NAME': {
    'type' : u'external',
    'description' : u'Here we should have a nice description',
    'apply_groups' : [u'BGP-PREFIX-LIMIT'],
    'import_policy' : u'PUBLIC-PEER-IN',
    'export_policy' : u'PUBLIC-PEER-OUT',
    'remove_private' : True,
    'multipath' : True,
    'multihop_ttl' : 30,
    'neighbors' : {
      '192.168.0.1': {
        'description' : 'Facebook [CDN]',
        'prefix_limit' : {
          'inet': {
            'unicast': {
              'limit': 100,
              'teardown': {
                'threshold' : 95,
                'timeout' : 5
              }
            }
          }
        }
      }
    }
  }
}
```

```

        'peer-as'      : 32934,
        'route_reflector': False,
        'nhs'         : True
    },
    '172.17.17.1': {
        'description' : 'Twitter [CDN]',
        'prefix_limit' : {
            'inet': {
                'unicast': {
                    'limit': 500,
                    'no-validate': 'IMPORT-FLOW-ROUTES'
                }
            }
        }
    }
    'peer_as'      : 13414
    'route_reflector': False,
    'nhs'         : False
}
}
}
}
}

```

`salt.modules.napalm_bgp.neighbors` (\*args, \*\*kwargs)

Provides details regarding the BGP sessions configured on the network device.

**Parameters** `neighbor` -- IP Address of a specific neighbor.

**Returns** A dictionary with the statistics of the all/selected BGP neighbors.

Outer dictionary keys represent the VRF name. Keys of inner dictionary represent the AS numbers, while the values are lists of dictionaries, having the following keys:

- up (True/False)
- local\_as (int)
- remote\_as (int)
- local\_address (string)
- routing\_table (string)
- local\_address\_configured (True/False)
- local\_port (int)
- remote\_address (string)
- remote\_port (int)
- multihop (True/False)
- multipath (True/False)
- remove\_private\_as (True/False)
- import\_policy (string)
- export\_policy (string)
- input\_messages (int)
- output\_messages (int)
- input\_updates (int)
- output\_updates (int)
- messages\_queued\_out (int)
- connection\_state (string)
- previous\_connection\_state (string)
- last\_event (string)
- suppress\_4byte\_as (True/False)
- local\_as\_prepend (True/False)
- holdtime (int)
- configured\_holdtime (int)
- keepalive (int)

- configured\_keepalive (int)
- active\_prefix\_count (int)
- received\_prefix\_count (int)
- accepted\_prefix\_count (int)
- suppressed\_prefix\_count (int)
- advertised\_prefix\_count (int)
- flap\_count (int)

CLI Example:

```
salt '*' bgp.neighbors # all neighbors
salt '*' bgp.neighbors 172.17.17.1 # only session with BGP neighbor(s) 172.17.17.1
```

Output Example:

```
{
  'default': {
    8121: [
      {
        'up' : True,
        'local_as' : 13335,
        'remote_as' : 8121,
        'local_address' : u'172.101.76.1',
        'local_address_configured' : True,
        'local_port' : 179,
        'remote_address' : u'192.247.78.0',
        'router_id' : u'192.168.0.1',
        'remote_port' : 58380,
        'multihop' : False,
        'import_policy' : u'4-NTT-TRANSIT-IN',
        'export_policy' : u'4-NTT-TRANSIT-OUT',
        'input_messages' : 123,
        'output_messages' : 13,
        'input_updates' : 123,
        'output_updates' : 5,
        'messages_queued_out' : 23,
        'connection_state' : u'Established',
        'previous_connection_state' : u'EstabSync',
        'last_event' : u'RecvKeepAlive',
        'suppress_4byte_as' : False,
        'local_as_prepend' : False,
        'holdtime' : 90,
        'configured_holdtime' : 90,
        'keepalive' : 30,
        'configured_keepalive' : 30,
        'active_prefix_count' : 132808,
        'received_prefix_count' : 566739,
        'accepted_prefix_count' : 566479,
        'suppressed_prefix_count' : 0,
        'advertise_prefix_count' : 0,
        'flap_count' : 27
      }
    ]
  }
}
```

## 14.7.240 salt.modules.napalm\_network module

### NAPALM Network

Basic methods for interaction with the network device through the virtual proxy `napalm`.

**codeauthor** Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>  
**maturity** new  
**depends** napalm  
**platform** unix

### Dependencies

- *napalm proxy minion*

New in version 2016.11.0.

Changed in version 2017.7.0.

`salt.modules.napalm_network.arp(*args, **kwargs)`

NAPALM returns a list of dictionaries with details of the ARP entries.

#### Parameters

- **interface** -- interface name to filter on
- **ipaddr** -- IP address to filter on
- **macaddr** -- MAC address to filter on

**Returns** List of the entries in the ARP table

CLI Example:

```
salt '*' net.arp
salt '*' net.arp macaddr='5c:5e:ab:da:3c:f0'
```

Example output:

```
[
  {
    'interface' : 'MgmtEth0/RSP0/CPU0/0',
    'mac'       : '5c:5e:ab:da:3c:f0',
    'ip'        : '172.17.17.1',
    'age'       : 1454496274.84
  },
  {
    'interface': 'MgmtEth0/RSP0/CPU0/0',
    'mac'       : '66:0e:94:96:e0:ff',
    'ip'        : '172.17.17.2',
    'age'       : 1435641582.49
  }
]
```

`salt.modules.napalm_network.cli(*args, **kwargs)`

Returns a dictionary with the raw output of all commands passed as arguments.

**Parameters** **commands** -- list of commands to be executed on the device

**Returns** a dictionary with the mapping between each command and its raw output

CLI Example:

```
salt '*' net.cli "show version" "show chassis fan"
```

Example output:

```
{
  u'show version and haiku': u'Hostname: re0.edge01.arn01
                             Model: mx480
                             Junos: 13.3R6.5
                             Help me, Obi-Wan
                             I just saw Episode Two
                             You're my only hope
                             ',
  u'show chassis fan' : u'Item          Status  RPM    Measurement
↳intermediate-speed   Top Rear Fan      OK      3840    Spinning at⊠
↳intermediate-speed   Bottom Rear Fan   OK      3840    Spinning at⊠
↳intermediate-speed   Top Middle Fan    OK      3900    Spinning at⊠
↳intermediate-speed   Bottom Middle Fan OK      3840    Spinning at⊠
↳intermediate-speed   Top Front Fan     OK      3810    Spinning at⊠
↳intermediate-speed   Bottom Front Fan  OK      3840    Spinning at⊠
                             '
}
```

`salt.modules.napalm_network.commit(*args, **kwargs)`  
Commits the configuration changes made on the network device.

CLI Example:

```
salt '*' net.commit
```

`salt.modules.napalm_network.compare_config(*args, **kwargs)`  
Returns the difference between the running config and the candidate config.

CLI Example:

```
salt '*' net.compare_config
```

`salt.modules.napalm_network.config(*args, **kwargs)`  
New in version 2017.7.0.

Return the whole configuration of the network device. By default, it will return all possible configuration sources supported by the network device. At most, there will be:

- running config
- startup config
- candidate config

To return only one of the configurations, you can use the `source` argument.

**source (optional)** Which configuration type you want to display, default is all of them.

Options:

- running
- candidate
- startup

**Returns**

The object returned is a dictionary with the following keys:

- **running (string):** Representation of the native running configuration.
- **candidate (string):** Representation of the native candidate configuration. If the device doesn't differentiate between running and startup configuration this will be an empty string.
- **startup (string):** Representation of the native startup configuration. If the device doesn't differentiate between running and startup configuration this will be an empty string.

CLI Example:

```
salt '*' net.config
salt '*' net.config source=candidate
```

`salt.modules.napalm_network.config_changed(*args, **kwargs)`

Will prompt if the configuration has been changed.

**Returns** A tuple with a boolean that specifies if the config was changed on the device. And a string that provides more details of the reason why the configuration was not changed.

CLI Example:

```
salt '*' net.config_changed
```

`salt.modules.napalm_network.config_control(*args, **kwargs)`

Will check if the configuration was changed. If differences found, will try to commit. In case commit unsuccessful, will try to rollback.

**Returns** A tuple with a boolean that specifies if the config was changed/committed/rolled back on the device. And a string that provides more details of the reason why the configuration was not committed properly.

CLI Example:

```
salt '*' net.config_control
```

`salt.modules.napalm_network.connected(*args, **kwargs)`

Specifies if the connection to the device succeeded.

CLI Example:

```
salt '*' net.connected
```

`salt.modules.napalm_network.discard_config(*args, **kwargs)`

Discards the changes applied.

CLI Example:

```
salt '*' net.discard_config
```

`salt.modules.napalm_network.environment(*args, **kwargs)`

Returns the environment of the device.

CLI Example:

```
salt '*' net.environment
```

Example output:

```

{
  'fans': {
    'Bottom Rear Fan': {
      'status': True
    },
    'Bottom Middle Fan': {
      'status': True
    },
    'Top Middle Fan': {
      'status': True
    },
    'Bottom Front Fan': {
      'status': True
    },
    'Top Front Fan': {
      'status': True
    },
    'Top Rear Fan': {
      'status': True
    }
  },
  'memory': {
    'available_ram': 16349,
    'used_ram': 4934
  },
  'temperature': {
    'FPC 0 Exhaust A': {
      'is_alert': False,
      'temperature': 35.0,
      'is_critical': False
    }
  },
  'cpu': {
    '1': {
      '%usage': 19.0
    },
    '0': {
      '%usage': 35.0
    }
  }
}

```

`salt.modules.napalm_network.facts(*args, **kwargs)`

Returns characteristics of the network device. :return: a dictionary with the following keys:

- uptime - Uptime of the device in seconds.
- vendor - Manufacturer of the device.
- model - Device model.
- hostname - Hostname of the device
- fqdn - Fqdn of the device
- os\_version - String with the OS version running on the device.
- serial\_number - Serial number of the device
- interface\_list - List of the interfaces of the device

CLI Example:

```
salt '*' net.facts
```

Example output:

```
{
  'os_version': u'13.3R6.5',
  'uptime': 10117140,
  'interface_list': [
    'lc-0/0/0',
    'pfe-0/0/0',
    'pfh-0/0/0',
    'xe-0/0/0',
    'xe-0/0/1',
    'xe-0/0/2',
    'xe-0/0/3',
    'gr-0/0/10',
    'ip-0/0/10'
  ],
  'vendor': u'Juniper',
  'serial_number': u'JN131356FBFA',
  'model': u'MX480',
  'hostname': u're0.edge05.syd01',
  'fqdn': u're0.edge05.syd01'
}
```

`salt.modules.napalm_network.interfaces(*args, **kwargs)`

Returns details of the interfaces on the device.

**Returns** Returns a dictionary of dictionaries. The keys for the first dictionary will be the interfaces in the devices.

CLI Example:

```
salt '*' net.interfaces
```

Example output:

```
{
  u'Management1': {
    'is_up': False,
    'is_enabled': False,
    'description': u'',
    'last_flapped': -1,
    'speed': 1000,
    'mac_address': u'dead:beef:dead',
  },
  u'Ethernet1': {
    'is_up': True,
    'is_enabled': True,
    'description': u'foo',
    'last_flapped': 1429978575.1554043,
    'speed': 1000,
    'mac_address': u'beef:dead:beef',
  }
}
```

`salt.modules.napalm_network.ipaddrs(*args, **kwargs)`

Returns IP addresses configured on the device.

**Returns** A dictionary with the IPv4 and IPv6 addresses of the interfaces. Returns all configured IP addresses on all interfaces as a dictionary of dictionaries. Keys of the main dictionary represent the name of the interface. Values of the main dictionary represent are dictionaries that may consist of two keys `ipv4` and `ipv6` (one, both or none) which are themselves dictionaries with the IP addresses as keys.

CLI Example:

```
salt '*' net.ipaddrs
```

Example output:

```
{
  u'FastEthernet8': {
    u'ipv4': {
      u'10.66.43.169': {
        'prefix_length': 22
      }
    }
  },
  u'Loopback555': {
    u'ipv4': {
      u'192.168.1.1': {
        'prefix_length': 24
      }
    },
    u'ipv6': {
      u'1::1': {
        'prefix_length': 64
      },
      u'2001:DB8:1::1': {
        'prefix_length': 64
      },
      u'FE80::3': {
        'prefix_length': u'N/A'
      }
    }
  }
}
```

`salt.modules.napalm_network.lldp(*args, **kwargs)`

Returns a detailed view of the LLDP neighbors.

**Parameters** `interface` -- interface name to filter on

**Returns** A dictionary with the LLDP neighbors. The keys are the interfaces with LLDP activated on.

CLI Example:

```
salt '*' net.lldp
salt '*' net.lldp interface='TenGigE0/0/0/8'
```

Example output:

```
{
  'TenGigE0/0/0/8': [
    {
      'parent_interface': u'Bundle-Ether8',
      'interface_description': u'TenGigE0/0/0/8',
      'remote_chassis_id': u'8c60.4f69.e96c',
      'remote_system_name': u'switch',
      'remote_port': u'Eth2/2/1',
      'remote_port_description': u'Ethernet2/2/1',
      'remote_system_description': u'Cisco Nexus Operating System (NX-OS)
↳ Software 7.1(0)N1(1a)
      TAC support: http://www.cisco.com/tac
```

```

        Copyright (c) 2002-2015, Cisco Systems, Inc. All rights reserved.',
        'remote_system_capab': u'B, R',
        'remote_system_enable_capab': u'B'
    }
]
}

```

`salt.modules.napalm_network.load_config(*args, **kwargs)`

Applies configuration changes on the device. It can be loaded from a file or from inline string. If you send both a filename and a string containing the configuration, the file has higher precedence.

By default this function will commit the changes. If there are no changes, it does not commit and the flag `already_configured` will be set as `True` to point this out.

To avoid committing the configuration, set the argument `test` to `True` and will discard (dry run).

To keep the changes but not commit, set `commit` to `False`.

To replace the config, set `replace` to `True`.

**filename** Path to the file containing the desired configuration. By default is `None`.

**text** String containing the desired configuration.

**test: False** Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit: True** Commit? Default: `True`.

**debug: False** Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

New in version 2016.11.2.

**replace: False** Load and replace the configuration. Default: `False`.

New in version 2016.11.2.

**Returns** a dictionary having the following keys:

- **result** (bool): if the config was applied successfully. It is `False` only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still `True` and so will be the `already_configured` flag (example below)
- **comment** (str): a message for the user
- **already\_configured** (bool): flag to check if there were no changes applied
- **loaded\_config** (str): the configuration loaded on the device. Requires `debug` to be set as `True`
- **diff** (str): returns the config changes applied

CLI Example:

```

salt '*' net.load_config text='ntp peer 192.168.0.1'
salt '*' net.load_config filename='/absolute/path/to/your/file'
salt '*' net.load_config filename='/absolute/path/to/your/file' test=True
salt '*' net.load_config filename='/absolute/path/to/your/file' commit=False

```

Example output:

`salt.modules.napalm_network.load_template(*args, **kwargs)`

Renders a configuration template (default: Jinja) and loads the result on the device.

By default this function will commit the changes. If there are no changes, it does not commit, discards the config and the flag `already_configured` will be set as `True` to point this out.

To avoid committing the configuration, set the argument `test` to `True` and will discard (dry run).

To preserve the changes, set `commit` to `False`. However, this is recommended to be used only in exceptional cases when there are applied few consecutive states and/or configuration changes. Otherwise the user might

forget that the config DB is locked and the candidate config buffer is not cleared/merged in the running config.

To replace the config, set `replace` to `True`.

**template\_name** Identifies path to the template source. The template can be either stored on the local machine, either remotely. The recommended location is under the `file_roots` as specified in the master config file. For example, let's suppose the `file_roots` is configured as:

```
file_roots:
  base:
    - /etc/salt/states
```

Placing the template under `/etc/salt/states/templates/example.jinja`, it can be used as `salt://templates/example.jinja`. Alternatively, for local files, the user can specify the absolute path. If remotely, the source can be retrieved via `http`, `https` or `ftp`.

Examples:

- `salt://my_template.jinja`
- `/absolute/path/to/my_template.jinja`
- `http://example.com/template.cheetah`
- `https://example.com/template.mako`
- `ftp://example.com/template.py`

**template\_source:** `None` Inline config template to be rendered and loaded on the device.

**template\_path:** `None` Required only in case the argument `template_name` provides only the file base-name when referencing a local template using the absolute path. E.g.: if `template_name` is specified as `my_template.jinja`, in order to find the template, this argument must be provided: `template_path: /absolute/path/to/`.

**template\_hash:** `None` Hash of the template file. Format: `{hash_type: 'md5', 'hsum': <md5sum>}`

New in version 2016.11.2.

**template\_hash\_name:** `None` When `template_hash` refers to a remote file, this specifies the filename to look for in that file.

New in version 2016.11.2.

**template\_group:** `root` Owner of file.

New in version 2016.11.2.

**template\_user:** `root` Group owner of file.

New in version 2016.11.2.

**template\_user:** `755` Permissions of file.

New in version 2016.11.2.

**saltenv:** `base` Specifies the template environment. This will influence the relative imports inside the templates.

New in version 2016.11.2.

**template\_engine:** `jinja` The following templates engines are supported:

- *cheetah*
- *genshi*
- *jinja*
- *mako*
- *py*
- *wempy*

New in version 2016.11.2.

**skip\_verify:** `True` If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.11.2.

**test:** **False** Dry run? If set to **True**, will apply the config, discard and return the changes. Default: **False** and will commit the changes on the device.

**commit:** **True** Commit? (default: **True**)

**debug:** **False** Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw result after the template was rendered.

New in version 2016.11.2.

**replace:** **False** Load and replace the configuration.

New in version 2016.11.2.

**defaults:** **None** Default variables/context passed to the template.

New in version 2016.11.2.

**\*\*template\_vars** Dictionary with the arguments/context to be used when the template is rendered.

---

**Note:** Do not explicitly specify this argument. This represents any other variable that will be sent to the template rendering system. Please see the examples below!

---

**Returns** a dictionary having the following keys:

- **result** (bool): if the config was applied successfully. It is **False** only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still **True** and so will be the `already_configured` flag (example below)
- **comment** (str): a message for the user
- **already\_configured** (bool): flag to check if there were no changes applied
- **loaded\_config** (str): the configuration loaded on the device, after rendering the template. Requires `debug` to be set as **True**
- **diff** (str): returns the config changes applied

The template can use variables from the `grains`, `pillar` or `opts`, for example:

```
{% set router_model = grains.get('model') -%}
{% set router_vendor = grains.get('vendor') -%}
{% set os_version = grains.get('version') -%}
{% set hostname = pillar.get('proxy', {}).get('host') -%}
{% if router_vendor|lower == 'juniper' %}
system {
    host-name {{hostname}};
}
{% elif router_vendor|lower == 'cisco' %}
hostname {{hostname}}
{% endif %}
```

CLI Examples:

```
salt '*' net.load_template set_ntp_peers peers=[192.168.0.1] # uses NAPALM
↳default templates

# inline template:
salt -G 'os:junos' net.load_template set_hostname template_source='system { host-
↳name {{host_name}}; }' host_name='MX480.lab'

# inline template using grains info:
salt -G 'os:junos' net.load_template set_hostname template_source='system
↳{ host-name {{grains.model}}.lab; }'
# if the device is a MX480, the command above will set the hostname as: MX480.lab

# inline template using pillar data:
```

```

salt -G 'os:junos' net.load_template set_hostname template_source='system { host-
↳name {{pillar.proxy.host}}; }'

salt '*' net.load_template my_template template_path='/tmp/tpl/' my_param='aaa'
↳# will commit
salt '*' net.load_template my_template template_path='/tmp/tpl/' my_param='aaa'
↳test=True # dry run

salt '*' net.load_template salt://templates/my_stuff.jinja debug=True #
↳equivalent of the next command
salt '*' net.load_template my_stuff.jinja template_path=salt://templates/
↳debug=True

# in case the template needs to include files that are not under the same path (e.
↳g. http://),
# to help the templating engine find it, you will need to specify the `saltenv`
↳argument:
salt '*' net.load_template my_stuff.jinja template_path=salt://templates saltenv=/
↳path/to/includes debug=True

# render a mako template:
salt '*' net.load_template salt://templates/my_stuff.mako template_engine=mako
↳debug=True

# render remote template
salt -G 'os:junos' net.load_template http://bit.ly/2fReJg7 test=True debug=True
↳peers=['192.168.0.1']
salt -G 'os:ios' net.load_template http://bit.ly/2gK0j20 test=True debug=True
↳peers=['192.168.0.1']

```

Example output:

```

{
  'comment': '',
  'already_configured': False,
  'result': True,
  'diff': '[edit system]+ host-name edge01.bjm01',
  'loaded_config': 'system { host-name edge01.bjm01; }'
}

```

`salt.modules.napalm_network.mac(*args, **kwargs)`

Returns the MAC Address Table on the device.

#### Parameters

- **address** -- MAC address to filter on
- **interface** -- Interface name to filter on
- **vlan** -- VLAN identifier

**Returns** A list of dictionaries representing the entries in the MAC Address Table

CLI Example:

```

salt '*' net.mac
salt '*' net.mac vlan=10

```

Example output:

```

[
  {

```

```

    'mac'      : '00:1c:58:29:4a:71',
    'interface' : 'xe-3/0/2',
    'static'   : False,
    'active'   : True,
    'moves'    : 1,
    'vlan'     : 10,
    'last_move' : 1454417742.58
  },
  {
    'mac'      : '8c:60:4f:58:e1:c1',
    'interface' : 'xe-1/0/1',
    'static'   : False,
    'active'   : True,
    'moves'    : 2,
    'vlan'     : 42,
    'last_move' : 1453191948.11
  }
]

```

`salt.modules.napalm_network.optics(*args, **kwargs)`

New in version 2017.7.0.

Fetches the power usage on the various transceivers installed on the network device (in dBm), and returns a view that conforms with the OpenConfig model `openconfig-platform-transceiver.yang`.

#### Returns

Returns a dictionary where the keys are as listed below:

- `intf_name` (unicode)
  - `physical_channels`
    - \* `channels` (list of dicts)
      - `index` (int)
      - `state`
        - input\_power**
          - instant (float)
          - avg (float)
          - min (float)
          - max (float)
        - output\_power**
          - instant (float)
          - avg (float)
          - min (float)
          - max (float)
        - laser\_bias\_current**
          - instant (float)
          - avg (float)
          - min (float)

max (float)

CLI Example:

```
salt '*' net.optics
```

**salt.modules.napalm\_network.ping**(*\*args*, *\*\*kwargs*)

Executes a ping on the network device and returns a dictionary as a result.

**destination** Hostname or IP address of remote host**source** Source address of echo request**ttl** IP time-to-live value (IPv6 hop-limit value) (1..255 hops)**timeout** Maximum wait time after sending final packet (seconds)**size** Size of request packets (0..65468 bytes)**count** Number of ping requests to send (1..2000000000 packets)**vrf** VRF (routing instance) for ping attempt

New in version 2016.11.4.

CLI Example:

```
salt '*' net.ping 8.8.8.8
salt '*' net.ping 8.8.8.8 ttl=3 size=65468
salt '*' net.ping 8.8.8.8 source=127.0.0.1 timeout=1 count=100
```

**salt.modules.napalm\_network.rollback**(*\*args*, *\*\*kwargs*)

Rollbacks the configuration.

CLI Example:

```
salt '*' net.rollback
```

**salt.modules.napalm\_network.traceroute**(*\*args*, *\*\*kwargs*)

Calls the method traceroute from the NAPALM driver object and returns a dictionary with the result of the traceroute command executed on the device.

**destination** Hostname or address of remote host**source** Source address to use in outgoing traceroute packets**ttl** IP maximum time-to-live value (or IPv6 maximum hop-limit value)**timeout** Number of seconds to wait for response (seconds)**vrf** VRF (routing instance) for traceroute attempt

New in version 2016.11.4.

CLI Example:

```
salt '*' net.traceroute 8.8.8.8
salt '*' net.traceroute 8.8.8.8 source=127.0.0.1 ttl=5 timeout=1
```

## 14.7.241 salt.modules.napalm\_ntp module

### NAPALM NTP

Manages NTP on network devices.

**codeauthor** Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>**maturity** new**depends** napalm**platform** unix

## Dependencies

- *NAPALM proxy minion*
- *NET basic features*

### See also:

*NTP peers management state*

New in version 2016.11.0.

`salt.modules.napalm_ntp.delete_peers(*args, **kwargs)`

Removes NTP peers configured on the device.

#### Parameters

- **peers** -- list of IP Addresses/Domain Names to be removed as NTP peers
- **(bool) (test)** -- discard loaded config. By default *test* is False (will not discard the changes)

**Commit commit (bool)** commit loaded config. By default *commit* is True (will commit the changes). Useful when

the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the *commit* option. For dry run use the *test* argument.

CLI Example:

```
salt '*' ntp.delete_peers 8.8.8.8 time.apple.com
salt '*' ntp.delete_peers 172.17.17.1 test=True # only displays the diff
salt '*' ntp.delete_peers 192.168.0.1 commit=False # preserves the changes, but
↳ does not commit
```

`salt.modules.napalm_ntp.delete_servers(*args, **kwargs)`

Removes NTP servers configured on the device.

#### Parameters

- **servers** -- list of IP Addresses/Domain Names to be removed as NTP servers
- **(bool) (test)** -- discard loaded config. By default *test* is False (will not discard the changes)

**Commit commit (bool)** commit loaded config. By default *commit* is True (will commit the changes). Useful when

the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the *commit* option. For dry run use the *test* argument.

CLI Example:

```
salt '*' ntp.delete_servers 8.8.8.8 time.apple.com
salt '*' ntp.delete_servers 172.17.17.1 test=True # only displays the diff
salt '*' ntp.delete_servers 192.168.0.1 commit=False # preserves the changes,
↳ but does not commit
```

`salt.modules.napalm_ntp.peers(*args, **kwargs)`

Returns a list the NTP peers configured on the network device.

**Returns** configured NTP peers as list.

CLI Example:

```
salt '*' ntp.peers
```

Example output:

```
[
  '192.168.0.1',
  '172.17.17.1',
  '172.17.17.2',
  '2400:cb00:6:1024::c71b:840a'
]
```

`salt.modules.napalm_ntp.servers(*args, **kwargs)`  
Returns a list of the configured NTP servers on the device.

CLI Example:

```
salt '*' ntp.servers
```

`salt.modules.napalm_ntp.set_peers(*args, **kwargs)`  
Configures a list of NTP peers on the device.

#### Parameters

- **peers** -- list of IP Addresses/Domain Names
- **(bool) (test)** -- discard loaded config. By default *test* is False (will not discard the changes)

**Commit commit (bool)** commit loaded config. By default *commit* is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the *commit* option. For dry run use the *test* argument.

CLI Example:

```
salt '*' ntp.set_peers 192.168.0.1 172.17.17.1 time.apple.com
salt '*' ntp.set_peers 172.17.17.1 test=True # only displays the diff
salt '*' ntp.set_peers 192.168.0.1 commit=False # preserves the changes, but
↳ does not commit
```

`salt.modules.napalm_ntp.set_servers(*args, **kwargs)`  
Configures a list of NTP servers on the device.

#### Parameters

- **servers** -- list of IP Addresses/Domain Names
- **(bool) (test)** -- discard loaded config. By default *test* is False (will not discard the changes)

**Commit commit (bool)** commit loaded config. By default *commit* is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the *commit* option. For dry run use the *test* argument.

CLI Example:

```
salt '*' ntp.set_servers 192.168.0.1 172.17.17.1 time.apple.com
salt '*' ntp.set_servers 172.17.17.1 test=True # only displays the diff
salt '*' ntp.set_servers 192.168.0.1 commit=False # preserves the changes, but
↳ does not commit
```

`salt.modules.napalm_ntp.stats(*args, **kwargs)`  
Returns a dictionary containing synchronization details of the NTP peers.  
**Parameters peer** -- Returns only the details of a specific NTP peer.

**Returns**

a list of dictionaries, with the following keys:

- remote
- referenceid
- synchronized
- stratum
- type
- when
- hostpoll
- reachability
- delay
- offset
- jitter

CLI Example:

```
salt '*' ntp.stats
```

Example output:

```
[
  {
    'remote'      : u'188.114.101.4',
    'referenceid' : u'188.114.100.1',
    'synchronized' : True,
    'stratum'     : 4,
    'type'        : u'-',
    'when'        : u'107',
    'hostpoll'    : 256,
    'reachability' : 377,
    'delay'       : 164.228,
    'offset'      : -13.866,
    'jitter'      : 2.695
  }
]
```

**14.7.242 salt.modules.napalm\_probes module****NAPALM Probes**

Manages RPM/SLA probes on the network device.

**codeauthor** Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>

**maturity** new

**depends** napalm

**platform** unix

**Dependencies**

- *napalm proxy minion*
- *NET basic features*

**See also:***Probes configuration management state*

New in version 2016.11.0.

`salt.modules.napalm_probes.config(*args, **kwargs)`

Returns the configuration of the RPM probes.

**Returns** A dictionary containing the configuration of the RPM/SLA probes.

CLI Example:

```
salt '*' probes.config
```

Output Example:

```
{
  'probe1': {
    'test1': {
      'probe_type' : 'icmp-ping',
      'target'     : '192.168.0.1',
      'source'     : '192.168.0.2',
      'probe_count' : 13,
      'test_interval': 3
    },
    'test2': {
      'probe_type' : 'http-ping',
      'target'     : '172.17.17.1',
      'source'     : '192.17.17.2',
      'probe_count' : 5,
      'test_interval': 60
    }
  }
}
```

`salt.modules.napalm_probes.delete_probes(*args, **kwargs)`

Removes RPM/SLA probes from the network device. Calls the configuration template `delete\_probes` from the NAPALM library, providing as input a rich formatted dictionary with the configuration details of the probes to be removed from the configuration of the device.

**Parameters** `probes` -- Dictionary with a similar format as the output dictionary of the function `config()`,where the details are not necessary. `:param test`: Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device. `:param commit`: Commit? (default: True) Sometimes it is not needed to commit the config immediatelyafter loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify `commit=False` and will not discard the config.**Raises** `MergeConfigException` -- If there is an error on the configuration sent.**Return a dictionary having the following keys**

- `result` (bool): if the config was applied successfully. It is *False* only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still *True* and so will be the *already\_configured* flag (example below) \* `comment` (str): a message for the user \* `already_configured` (bool): flag to check if there were no changes applied \* `diff` (str): returns the config changes applied

Input example:

```

probes = {
  'existing_probe':{
    'existing_test1': {},
    'existing_test2': {}
  }
}

```

`salt.modules.napalm_probes.results(*args, **kwargs)`

Provides the results of the measurements of the RPM/SLA probes.

:return a dictionary with the results of the probes.

CLI Example:

```
salt '*' probes.results
```

Output example:

```

{
  'probe1': {
    'test1': {
      'last_test_min_delay' : 63.120,
      'global_test_min_delay' : 62.912,
      'current_test_avg_delay' : 63.190,
      'global_test_max_delay' : 177.349,
      'current_test_max_delay' : 63.302,
      'global_test_avg_delay' : 63.802,
      'last_test_avg_delay' : 63.438,
      'last_test_max_delay' : 65.356,
      'probe_type' : 'icmp-ping',
      'rtt' : 63.138,
      'last_test_loss' : 0,
      'round_trip_jitter' : -59.0,
      'target' : '192.168.0.1',
      'source' : '192.168.0.2',
      'probe_count' : 15,
      'current_test_min_delay' : 63.138
    },
    'test2': {
      'last_test_min_delay' : 176.384,
      'global_test_min_delay' : 169.226,
      'current_test_avg_delay' : 177.098,
      'global_test_max_delay' : 292.628,
      'current_test_max_delay' : 180.055,
      'global_test_avg_delay' : 177.959,
      'last_test_avg_delay' : 177.178,
      'last_test_max_delay' : 184.671,
      'probe_type' : 'icmp-ping',
      'rtt' : 176.449,
      'last_test_loss' : 0,
      'round_trip_jitter' : -34.0,
      'target' : '172.17.17.1',
      'source' : '172.17.17.2',
      'probe_count' : 15,
      'current_test_min_delay' : 176.402
    }
  }
}

```

`salt.modules.napalm_probes.schedule_probes(*args, **kwargs)`

Will schedule the probes. On Cisco devices, it is not enough to define the probes, it is also necessary to schedule them. This method calls the configuration template `schedule\_probes` from the NAPALM library, providing as input a rich formatted dictionary with the names of the probes and the tests to be scheduled.

**Parameters** **probes** -- Dictionary with a similar format as the output dictionary of the function `config()`,

where the details are not necessary. :param test: Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device. :param commit: Commit? (default: True) Sometimes it is not needed to commit the config immediately

after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify `commit=False` and will not discard the config.

**Raises** **MergeConfigException** -- If there is an error on the configuration sent.

**Return a dictionary having the following keys**

- **result** (bool): if the config was applied successfully. It is *False* only in case of failure. In case

there are no changes to be applied and successfully performs all operations it is still *True* and so will be the *already\_configured* flag (example below) \* **comment** (str): a message for the user \* **already\_configured** (bool): flag to check if there were no changes applied \* **diff** (str): returns the config changes applied

Input example:

```
probes = {
    'new_probe': {
        'new_test1': {},
        'new_test2': {}
    }
}
```

`salt.modules.napalm_probes.set_probes(*args, **kwargs)`

Configures RPM/SLA probes on the device. Calls the configuration template `set\_probes` from the NAPALM library, providing as input a rich formatted dictionary with the configuration details of the probes to be configured.

**Parameters**

- **probes** -- Dictionary formatted as the output of the function `config()`
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False

and will commit the changes on the device. :param commit: Commit? (default: True) Sometimes it is not needed to commit the config immediately

after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify `commit=False` and will not discard the config.

**Raises** **MergeConfigException** -- If there is an error on the configuration sent.

**Return a dictionary having the following keys**

- **result** (bool): if the config was applied successfully. It is *False* only in case of failure. In case

there are no changes to be applied and successfully performs all operations it is still *True* and so will be the *already\_configured* flag (example below) \* **comment** (str): a message for the user \* **already\_configured** (bool): flag to check if there were no changes applied \* **diff** (str): returns the config changes applied

Input example - via state/script:

```

probes = {
  'new_probe':{
    'new_test1': {
      'probe_type'   : 'icmp-ping',
      'target'       : '192.168.0.1',
      'source'       : '192.168.0.2',
      'probe_count'  : 13,
      'test_interval': 3
    },
    'new_test2': {
      'probe_type'   : 'http-ping',
      'target'       : '172.17.17.1',
      'source'       : '192.17.17.2',
      'probe_count'  : 5,
      'test_interval': 60
    }
  }
}
set_probes(probes)

```

CLI Example - to push cahnges on the fly (not recommended):

```

salt 'junos_minion' probes.set_probes "'{'new_probe':{'new_test1':{'probe_type':
↪ 'icmp-ping', 'target':'192.168.0.1','source':'192.168.0.2','probe_
↪ count':13,'test_interval':3}}}" test=True

```

Output example - for the CLI example above:

```

junos_minion:
-----
already_configured:
  False
comment:
  Configuration discarded.
diff:
  [edit services rpm]
  + probe transit { ... }
  + probe new_probe {
  +   test new_test1 {
  +     probe-type icmp-ping;
  +     target address 192.168.0.1;
  +     probe-count 13;
  +     test-interval 3;
  +     source-address 192.168.0.2;
  +   }
  + }
result:
  True

```

### 14.7.243 salt.modules.napalm\_route module

#### NAPALM Route

Retrieves route details from network devices.

**codeauthor** Mircea Ulinic <mircea@cloudflare.com>

**maturity** new  
**depends** napalm  
**platform** unix

## Dependencies

- *NAPALM proxy minion*

New in version 2016.11.0.

`salt.modules.napalm_route.show(*args, **kwargs)`

Displays all details for a certain route learned via a specific protocol. If the protocol is not specified, will return all possible routes.

---

**Note:** This function return the routes from the RIB. In case the destination prefix is too short, there may be too many routes matched. Therefore in cases of devices having a very high number of routes it may be necessary to adjust the prefix length and request using a longer prefix.

---

**destination** destination prefix.

**protocol (optional)** protocol used to learn the routes to the destination.

Changed in version 2017.7.0.

CLI Example:

```
salt 'my_router' route.show
salt 'my_router' route.show 172.16.0.0/25 bgp
```

Output example:

```
{
  '172.16.0.0/25': [
    {
      'protocol': 'BGP',
      'last_active': True,
      'current_active': True,
      'age': 1178693,
      'routing_table': 'inet.0',
      'next_hop': '192.168.0.11',
      'outgoing_interface': 'xe-1/1/1.100',
      'preference': 170,
      'selected_next_hop': False,
      'protocol_attributes': {
        'remote_as': 65001,
        'metric': 5,
        'local_as': 13335,
        'as_path': '',
        'remote_address': '192.168.0.11',
        'metric2': 0,
        'local_preference': 0,
        'communities': [
          '0:2',
          'no-export'
        ],
        'preference2': -1
      }
    ]
  ]
}
```

```

    },
    'inactive_reason': ''
  },
  {
    'protocol': 'BGP',
    'last_active': False,
    'current_active': False,
    'age': 2359429,
    'routing_table': 'inet.0',
    'next_hop': '192.168.0.17',
    'outgoing_interface': 'xe-1/1/1.100',
    'preference': 170,
    'selected_next_hop': True,
    'protocol_attributes': {
      'remote_as': 65001,
      'metric': 5,
      'local_as': 13335,

      'remote_address': '192.168.0.17',
      'metric2': 0,
      'local_preference': 0,
      'communities': [
        '0:3',
        'no-export'
      ],
      'preference2': -1
    },
    'inactive_reason': 'Not Best in its group - Router ID'
  }
]
}

```

## 14.7.244 salt.modules.napalm\_snmp module

### NAPALM SNMP

Manages SNMP on network devices.

**codeauthor** Mircea Ulinic <mircea@cloudflare.com>

**maturity** new

**depends** napalm

**platform** unix

### Dependencies

- *NAPALM proxy minion*
- *NET basic features*

### See also:

*SNMP configuration management state*

New in version 2016.11.0.

`salt.modules.napalm_snmp.config(*args, **kwargs)`

Returns the SNMP configuration

CLI Example:

```
salt '*' snmp.config
```

`salt.modules.napalm_snmp.remove_config(*args, **kwargs)`

Removes a configuration element from the SNMP configuration.

Parameters

- **chassis\_id** -- (optional) Chassis ID
- **community** -- (optional) A dictionary having the following optional keys: \* **acl** (if any policy / ACL need to be set) \* **mode**: rw or ro. Default: ro
- **contact** -- Contact details
- **location** -- Location
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False

and will commit the changes on the device. :param **commit**: Commit? (default: True) Sometimes it is not needed to commit the config immediately

after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify **commit=False** and will not discard the config.

Raises **MergeConfigException** -- If there is an error on the configuration sent.

Return a dictionary having the following keys

- **result** (bool): if the config was applied successfully. It is *False* only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still *True* and so will be the *already\_configured* flag (example below) \* **comment** (str): a message for the user \* **already\_configured** (bool): flag to check if there were no changes applied \* **diff** (str): returns the config changes applied

CLI Example:

```
salt '*' snmp.remove_config community='abcd'
```

`salt.modules.napalm_snmp.update_config(*args, **kwargs)`

Updates the SNMP configuration.

Parameters

- **chassis\_id** -- (optional) Chassis ID
- **community** -- (optional) A dictionary having the following optional keys: \* **acl** (if any policy / ACL need to be set) \* **mode**: rw or ro. Default: ro
- **contact** -- Contact details
- **location** -- Location
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False

and will commit the changes on the device. :param **commit**: Commit? (default: True) Sometimes it is not needed to commit the config immediately

after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify **commit=False** and will not discard the config.

Raises **MergeConfigException** -- If there is an error on the configuration sent.

Return a dictionary having the following keys

- **result** (bool): if the config was applied successfully. It is *False* only in case of failure. In case

there are no changes to be applied and successfully performs all operations it is still *True* and so will be the *already\_configured* flag (example below) \* *comment* (str): a message for the user \* *already\_configured* (bool): flag to check if there were no changes applied \* *diff* (str): returns the config changes applied

CLI Example:

```
salt 'edge01.lon01' snmp.update_config location="Greenwich, UK" test=True
```

Output example (for the CLI example above):

```
edge01.lon01:
-----
already_configured:
  False
comment:
  Configuration discarded.
diff:
  [edit snmp]
  - location "London, UK";
  + location "Greenwich, UK";
result:
  True
```

### 14.7.245 salt.modules.napalm\_users module

#### NAPALM Users

Manages the configuration of the users on network devices.

**codeauthor** Mircea Ulinic <mircea@cloudflare.com>

**maturity** new

**depends** napalm

**platform** unix

#### Dependencies

- *NAPALM proxy minion*

#### See also:

*Users management state*

New in version 2016.11.0.

`salt.modules.napalm_users.config(*args, **kwargs)`

Returns the configuration of the users on the device

CLI Example:

```
salt '*' users.config
```

Output example:

```

{
  'mircea': {
    'level': 15,
    'password': '$1$0P70xKPa$4jt5/10cBTckk6I/w/',
    'sshkeys': [
      'ssh-rsa
↪AAAAB3NzaC1yc2EAAAADAQABAAQAC4pFn+shPwTb2yELO4L7NtQrKOJXNeCl1je
↪      l9STXVaGnRAnuc2PXL35vnWmcUq6YbUEcgUTRzzXfmeLJKuVJTJILMXii7h2xkbQp0YZIEs4P
↪      8ipwnRBAXFfk/ZcDsN3mjep4/yjN56ejk345jhk345jk345jk341p3A/

↪YW+7oH17Fk2HH+tw0L5PcWLHkWA4t60iXn16qDbIk/ze6jv2hDGdCdZ7oYQeCE55C
↪      CHOHMJWYfN3jcL4s0qv8/u6Ka1FVkv7iMmro7ChThoV/5snI4Ljf2wKqgHH7TFNaCfpU0WvHA
↪      nTs8zh0rGScSrtb mircea@master-roshi'
    ]
  }
}

```

`salt.modules.napalm_users.delete_users(*args, **kwargs)`

Removes users from the configuration of network devices.

#### Parameters

- **users** -- Dictionary formatted as the output of the function `config()`
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes.  
Default: False

and will commit the changes on the device. :param commit: Commit? (default: True) Sometimes it is not needed to commit the config immediately

after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify `commit=False` and will not discard the config.

**Raises MergeConfigException** -- If there is an error on the configuration sent.

**Return a dictionary having the following keys**

- **result** (bool): if the config was applied successfully. It is *False* only in case of failure.  
In case

there are no changes to be applied and successfully performs all operations it is still *True* and so will be the *already\_configured* flag (example below) \* **comment** (str): a message for the user \* **already\_configured** (bool): flag to check if there were no changes applied \* **diff** (str): returns the config changes applied

CLI Example:

```
salt '*' users.delete_users "{mircea: {}}"
```

`salt.modules.napalm_users.set_users(*args, **kwargs)`

Configures users on network devices.

#### Parameters

- **users** -- Dictionary formatted as the output of the function `config()`
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes.  
Default: False

and will commit the changes on the device. :param commit: Commit? (default: True) Sometimes it is not needed to commit the config immediately

after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify `commit=False` and will not discard the config.

**Raises MergeConfigException** -- If there is an error on the configuration sent.

**Return a dictionary having the following keys**

- **result** (bool): if the config was applied successfully. It is *False* only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still *True* and so will be the *already\_configured* flag (example below)
  - \* **comment** (str): a message for the user
  - \* **already\_configured** (bool): flag to check if there were no changes applied
  - \* **diff** (str): returns the config changes applied

CLI Example:

```
salt '*' users.set_users '{"mircea': {}}"
```

## 14.7.246 salt.modules.napalm\_yang\_mod module

### NAPALM YANG

NAPALM YANG basic operations.

New in version 2017.7.0.

`salt.modules.napalm_yang_mod.compliance_report(*args, **kwargs)`

Return the compliance report using YANG objects.

**data** Dictionary structured with respect to the models referenced.

**models** A list of models to be used when generating the config.

**filepath** The absolute path to the validation file.

CLI Example:

```
salt '*' napalm_yang.compliance_report {} models.openconfig_interfaces filepath=~/  
->validate.yml
```

Output Example:

```
{
  "skipped": [],
  "complies": true,
  "get_interfaces_ip": {
    "missing": [],
    "complies": true,
    "present": {
      "ge-0/0/0.0": {
        "complies": true,
        "nested": true
      }
    }
  },
  "extra": []
}
```

`salt.modules.napalm_yang_mod.diff(candidate, running, models)`

Returns the difference between two configuration entities structured according to the YANG model.

---

**Note:** This function is recommended to be used mostly as a state helper.

---

**candidate** First model to compare.

**running** Second model to compare.

**models** A list of models to be used when comparing.

CLI Example:

```
salt '*' napalm_yang.diff {} {} models.openconfig_interfaces
```

Output Example:

```
{
  "interfaces": {
    "interface": {
      "both": {
        "Port-Channel1": {
          "config": {
            "mtu": {
              "first": "0",
              "second": "9000"
            }
          }
        }
      },
      "first_only": [
        "Loopback0"
      ],
      "second_only": [
        "Loopback1"
      ]
    }
  }
}
```

`salt.modules.napalm_yang_mod.get_config(*args, **kwargs)`

Return the native config.

**data** Dictionary structured with respect to the models referenced.

**models** A list of models to be used when generating the config.

**profiles: None** Use certain profiles to generate the config. If not specified, will use the platform default profile(s).

CLI Example:

```
salt '*' napalm_yang.get_config {} models.openconfig_interfaces
```

Output Example:

```
interface et1
  ip address 192.168.1.1/24
  description Uplink1
  mtu 9000
interface et2
  ip address 192.168.2.1/24
  description Uplink2
  mtu 9000
```

`salt.modules.napalm_yang_mod.load_config(*args, **kwargs)`

Generate and load the config on the device using the OpenConfig or IETF models and device profiles.

**data** Dictionary structured with respect to the models referenced.

**models** A list of models to be used when generating the config.

**profiles: None** Use certain profiles to generate the config. If not specified, will use the platform default profile(s).

**test: False** Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.

**commit: True** Commit? Default: True.

**debug: False** Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

**replace: False** Should replace the config with the new generate one?

CLI Example:

```
salt '*' napalm_yang.load_config {} models.openconfig_interfaces test=True
↳ debug=True
```

Output Example:

```
device1:
-----
already_configured:
  False
comment:
diff:
  [edit interfaces ge-0/0/0]
  - mtu 1400;
  [edit interfaces ge-0/0/0 unit 0 family inet]
  - dhcp;
  [edit interfaces lo0]
  - unit 0 {
  -   description lo0.0;
  - }
  + unit 1 {
  +   description "new loopback";
  + }
loaded_config:

</interfaces>
</configuration>
result:
  True

```

`salt.modules.napalm_yang_mod.parse(*args, **kwargs)`

Parse configuration from the device.

**models** A list of models to be used when parsing.

**config: False** Parse config.

**state: False** Parse state.

**profiles: None** Use certain profiles to parse. If not specified, will use the device default profile(s).

CLI Example:

```
salt '*' napalm_yang.parse models.openconfig_interfaces
```

Output Example:

```
{
  "interfaces": {
    "interface": {
      ".local.": {
        "name": ".local.",
        "state": {
          "admin-status": "UP",

### 14.7.247 salt.modules.netaddress

Module for getting information about network addresses.

New in version 2016.3.0.

**depends** netaddr

**salt.modules.netaddress.cidr\_broadcast**(*cidr*)  
Get the broadcast address associated with a CIDR address.

CLI example:

```
salt myminion netaddress.cidr_netmask 192.168.0.0/20
```

**salt.modules.netaddress.cidr\_netmask**(*cidr*)  
Get the netmask address associated with a CIDR address.

CLI example:

```
salt myminion netaddress.cidr_netmask 192.168.0.0/20
```

**salt.modules.netaddress.list\_cidr\_ips**(*cidr*)  
Get a list of IP addresses from a CIDR.

CLI example:

```
salt myminion netaddress.list_cidr_ips 192.168.0.0/20
```

**salt.modules.netaddress.list\_cidr\_ips\_ipv6**(*cidr*)  
Get a list of IPv6 addresses from a CIDR.

CLI example:

```
salt myminion netaddress.list_cidr_ips_ipv6 192.168.0.0/20
```

### 14.7.248 salt.modules.netbsd\_sysctl

Module for viewing and modifying sysctl parameters

`salt.modules.netbsd_sysctl.assign(name, value)`

Assign a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.assign net.inet.icmp.icmplim 50
```

`salt.modules.netbsd_sysctl.get(name)`

Return a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.get hw.physmem
```

`salt.modules.netbsd_sysctl.persist(name, value, config='/etc/sysctl.conf')`

Assign and persist a simple sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.persist net.inet.icmp.icmplim 50
```

`salt.modules.netbsd_sysctl.show(config_file=False)`

Return a list of sysctl parameters for this minion

CLI Example:

```
salt '*' sysctl.show
```

### 14.7.249 salt.modules.netbsdservice

The service module for NetBSD

---

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `'service.start' is not available`), see [here](#).

---

`salt.modules.netbsdservice.available(name)`

Returns True if the specified service is available, otherwise returns False.

CLI Example:

```
salt '*' service.available sshd
```

`salt.modules.netbsdservice.disable(name, **kwargs)`

Disable the named service to start at boot

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.netbsdservice.disabled(name)`

Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.netbsdservice.enable(name, **kwargs)`  
Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.netbsdservice.enabled(name, **kwargs)`  
Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.netbsdservice.force_reload(name)`  
Force-reload the named service

CLI Example:

```
salt '*' service.force_reload <service name>
```

`salt.modules.netbsdservice.get_all()`  
Return all available boot services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.netbsdservice.get_disabled()`  
Return a set of services that are installed but disabled

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.netbsdservice.get_enabled()`  
Return a list of service that are enabled on boot

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.netbsdservice.missing(name)`  
The inverse of `service.available`. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.netbsdservice.reload(name)`  
Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.netbsdservice.restart(name)`  
Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.netbsdservice.start(name)`

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.netbsdservice.status(name, sig=None)`

Return the status for a service, returns a bool whether the service is running.

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.netbsdservice.stop(name)`

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

### 14.7.250 salt.modules.netscaler

Module to provide Citrix Netscaler compatibility to Salt (compatible with netscaler 9.2+)

New in version 2015.2.0.

**depends**

- nsnitro Python module

**Note:** You can install nsnitro using:

```
pip install nsnitro
```

**configuration** This module accepts connection configuration details either as parameters, or as configuration settings in `/etc/salt/minion` on the relevant minions

```
netscaler.host: 1.2.3.4
netscaler.user: user
netscaler.pass: password
```

This data can also be passed into pillar. Options passed into `opts` will overwrite options passed into pillar.

**CLI Examples** Calls relying on configuration passed using `/etc/salt/minion`, grains, or pillars: .. code-block:: bash

```
salt-call netscaler.server_exists server_name
```

Calls passing configuration as `opts` .. code-block:: bash

```
salt-call      netscaler.server_exists      server_name      netscaler_host=1.2.3.4
netscaler_user=username netscaler_pass=password salt-call netscaler.server_exists
server_name      netscaler_host=1.2.3.5      netscaler_user=username2
```

```
netcaler_pass=password2 salt-call netcaler.server_enable server_name2
netcaler_host=1.2.3.5 salt-call netcaler.server_up server_name3
netcaler_host=1.2.3.6 netcaler_useSSL=False
```

`salt.modules.netcaler.server_add(s_name, s_ip, s_state=None, **connection_args)`

Add a server Note: The default server state is ENABLED

CLI Example:

```
salt '*' netcaler.server_add 'serverName' 'serverIpAddress'
salt '*' netcaler.server_add 'serverName' 'serverIpAddress' 'serverState'
```

`salt.modules.netcaler.server_delete(s_name, **connection_args)`

Delete a server

CLI Example:

```
salt '*' netcaler.server_delete 'serverName'
```

`salt.modules.netcaler.server_disable(s_name, **connection_args)`

Disable a server globally

CLI Example:

```
salt '*' netcaler.server_disable 'serverName'
```

`salt.modules.netcaler.server_enable(s_name, **connection_args)`

Enables a server globally

CLI Example:

```
salt '*' netcaler.server_enable 'serverName'
```

`salt.modules.netcaler.server_enabled(s_name, **connection_args)`

Check if a server is enabled globally

CLI Example:

```
salt '*' netcaler.server_enabled 'serverName'
```

`salt.modules.netcaler.server_exists(s_name, ip=None, s_state=None, **connection_args)`

Checks if a server exists

CLI Example:

```
salt '*' netcaler.server_exists 'serverName'
```

`salt.modules.netcaler.server_update(s_name, s_ip, **connection_args)`

Update a server's attributes

CLI Example:

```
salt '*' netcaler.server_update 'serverName' 'serverIP'
```

`salt.modules.netcaler.service_disable(s_name, s_delay=None, **connection_args)`

Disable a service

CLI Example:

```
salt '*' netcaler.service_disable 'serviceName'
salt '*' netcaler.service_disable 'serviceName' 'delayInSeconds'
```

`salt.modules.netscaler.service_enable(s_name, **connection_args)`

Enable a service

CLI Example:

```
salt '*' netscaler.service_enable 'serviceName'
```

`salt.modules.netscaler.service_exists(s_name, **connection_args)`

Checks if a service exists

CLI Example:

```
salt '*' netscaler.service_exists 'serviceName'
```

`salt.modules.netscaler.service_up(s_name, **connection_args)`

Checks if a service is UP

CLI Example:

```
salt '*' netscaler.service_up 'serviceName'
```

`salt.modules.netscaler.servicegroup_add(sg_name, sg_type='HTTP', **connection_args)`

Add a new service group. If no service type is specified, HTTP will be used. Most common service types: HTTP, SSL, and SSL\_BRIDGE

CLI Example:

```
salt '*' netscaler.servicegroup_add 'serviceGroupName'
salt '*' netscaler.servicegroup_add 'serviceGroupName' 'serviceGroupType'
```

`salt.modules.netscaler.servicegroup_delete(sg_name, **connection_args)`

Delete a new service group

CLI Example:

```
salt '*' netscaler.servicegroup_delete 'serviceGroupName'
```

`salt.modules.netscaler.servicegroup_exists(sg_name, sg_type=None, **connection_args)`

Checks if a service group exists

CLI Example:

```
salt '*' netscaler.servicegroup_exists 'serviceGroupName'
```

`salt.modules.netscaler.servicegroup_server_add(sg_name, s_name, s_port, **connection_args)`

Add a server:port member to a servicegroup

CLI Example:

```
salt '*' netscaler.servicegroup_server_add 'serviceGroupName' 'serverName'
↳ 'serverPort'
```

`salt.modules.netscaler.servicegroup_server_delete(sg_name, s_name, s_port, **connection_args)`

Remove a server:port member from a servicegroup

CLI Example:

```
salt '*' netcaler.servicegroup_server_delete 'serviceGroupName' 'serverName'
↳ 'serverPort'
```

`salt.modules.netcaler.servicegroup_server_disable`(*sg\_name*, *s\_name*, *s\_port*, **\*\*connection\_args**)

Disable a server:port member of a servicegroup

CLI Example:

```
salt '*' netcaler.servicegroup_server_disable 'serviceGroupName' 'serverName'
↳ 'serverPort'
```

`salt.modules.netcaler.servicegroup_server_enable`(*sg\_name*, *s\_name*, *s\_port*, **\*\*connection\_args**)

Enable a server:port member of a servicegroup

CLI Example:

```
salt '*' netcaler.servicegroup_server_enable 'serviceGroupName' 'serverName'
↳ 'serverPort'
```

`salt.modules.netcaler.servicegroup_server_exists`(*sg\_name*, *s\_name*, *s\_port*=None, **\*\*connection\_args**)

Check if a server:port combination is a member of a servicegroup

CLI Example:

```
salt '*' netcaler.servicegroup_server_exists 'serviceGroupName' 'serverName'
↳ 'serverPort'
```

`salt.modules.netcaler.servicegroup_server_up`(*sg\_name*, *s\_name*, *s\_port*, **\*\*connection\_args**)

Check if a server:port combination is in state UP in a servicegroup

CLI Example:

```
salt '*' netcaler.servicegroup_server_up 'serviceGroupName' 'serverName'
↳ 'serverPort'
```

`salt.modules.netcaler.vserver_add`(*v\_name*, *v\_ip*, *v\_port*, *v\_type*, **\*\*connection\_args**)

Add a new lb vserver

CLI Example:

```
salt '*' netcaler.vserver_add 'vserverName' 'vserverIP' 'vserverPort'
↳ 'vserverType'
salt '*' netcaler.vserver_add 'alex.patate.chaude.443' '1.2.3.4' '443' 'SSL'
```

`salt.modules.netcaler.vserver_delete`(*v\_name*, **\*\*connection\_args**)

Delete a lb vserver

CLI Example:

```
salt '*' netcaler.vserver_delete 'vserverName'
```

`salt.modules.netcaler.vserver_exists`(*v\_name*, *v\_ip*=None, *v\_port*=None, *v\_type*=None, **\*\*connection\_args**)

Checks if a vserver exists

CLI Example:

```
salt '*' netcaler.vserver_exists 'vserverName'
```

`salt.modules.netcaler.vserver_servicegroup_add`(*v\_name*, *sg\_name*, *\*\*connection\_args*)

Bind a servicegroup to a vserver

CLI Example:

```
salt '*' netcaler.vserver_servicegroup_add 'vserverName' 'serviceGroupName'
```

`salt.modules.netcaler.vserver_servicegroup_delete`(*v\_name*, *sg\_name*, *\*\*connection\_args*)

Unbind a servicegroup from a vserver

CLI Example:

```
salt '*' netcaler.vserver_servicegroup_delete 'vserverName' 'serviceGroupName'
```

`salt.modules.netcaler.vserver_servicegroup_exists`(*v\_name*, *sg\_name*, *\*\*connection\_args*)

Checks if a servicegroup is tied to a vserver

CLI Example:

```
salt '*' netcaler.vserver_servicegroup_exists 'vserverName' 'serviceGroupName'
```

`salt.modules.netcaler.vserver_sslcert_add`(*v\_name*, *sc\_name*, *\*\*connection\_args*)

Binds a SSL certificate to a vserver

CLI Example:

```
salt '*' netcaler.vserver_sslcert_add 'vserverName' 'sslCertificateName'
```

`salt.modules.netcaler.vserver_sslcert_delete`(*v\_name*, *sc\_name*, *\*\*connection\_args*)

Unbinds a SSL certificate from a vserver

CLI Example:

```
salt '*' netcaler.vserver_sslcert_delete 'vserverName' 'sslCertificateName'
```

`salt.modules.netcaler.vserver_sslcert_exists`(*v\_name*, *sc\_name*, *\*\*connection\_args*)

Checks if a SSL certificate is tied to a vserver

CLI Example:

```
salt '*' netcaler.vserver_sslcert_exists 'vserverName' 'sslCertificateName'
```

### 14.7.251 salt.modules.network

Module for gathering and managing network information

`salt.modules.network.active_tcp`()

Return a dict containing information on all of the running TCP connections (currently linux and solaris only)

Changed in version 2015.8.4: Added support for SunOS

CLI Example:

```
salt '*' network.active_tcp
```

`salt.modules.network.arp()`

Return the arp table from the minion

Changed in version 2015.8.0: Added support for SunOS

CLI Example:

```
salt '*' network.arp
```

`salt.modules.network.calc_net(ip_addr, netmask=None)`

Returns the CIDR of a subnet based on an IP address (CIDR notation supported) and optional netmask.

CLI Example:

```
salt '*' network.calc_net 172.17.0.5 255.255.255.240
salt '*' network.calc_net 2a02:f6e:a000:80:84d8:8332:7866:4e07/64
```

New in version 2015.8.0.

`salt.modules.network.connect(host, port=None, **kwargs)`

Test connectivity to a host using a particular port from the minion.

New in version 2014.7.0.

CLI Example:

```
salt '*' network.connect archlinux.org 80
salt '*' network.connect archlinux.org 80 timeout=3
salt '*' network.connect archlinux.org 80 timeout=3 family=ipv4
salt '*' network.connect google-public-dns-a.google.com port=53 proto=udp timeout=3
```

`salt.modules.network.convert_cidr(cidr)`

returns the network and subnet mask of a cidr addr

New in version 2016.3.0.

CLI Example:

```
salt '*' network.convert_cidr 172.31.0.0/16
```

`salt.modules.network.default_route(family=None)`

Return default route(s) from routing table

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.default_route
```

`salt.modules.network.dig(host)`

Performs a DNS lookup with dig

CLI Example:

```
salt '*' network.dig archlinux.org
```

`salt.modules.network.get_bufsize(iface)`  
Return network buffer sizes as a dict (currently linux only)

CLI Example:

```
salt '*' network.get_bufsize eth0
```

`salt.modules.network.get_fqdn()`  
Get fully qualified domain name

CLI Example:

```
salt '*' network.get_fqdn
```

`salt.modules.network.get_hostname()`  
Get hostname

CLI Example:

```
salt '*' network.get_hostname
```

`salt.modules.network.get_route(ip)`  
Return routing information for given destination ip

New in version 2015.5.3.

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS) Added support for OpenBSD

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.get_route 10.10.10.10
```

`salt.modules.network.hw_addr(iface)`  
Return the hardware address (a.k.a. MAC address) for a given interface

CLI Example:

```
salt '*' network.hw_addr eth0
```

`salt.modules.network.hwaddr(iface)`  
This function is an alias of `hw_addr`.  
Return the hardware address (a.k.a. MAC address) for a given interface

CLI Example:

```
salt '*' network.hw_addr eth0
```

`salt.modules.network.ifacestartswith(cidr)`  
Retrieve the interface name from a specific CIDR

New in version 2016.11.0.

CLI Example:

```
salt '*' network.ifacestartswith 10.0
```

`salt.modules.network.in_subnet(cidr)`  
Returns True if host is within specified subnet, otherwise False.

CLI Example:

```
salt '*' network.in_subnet 10.0.0.0/16
```

`salt.modules.network.interface`(*iface*)

Return the inet address for a given interface

New in version 2014.7.0.

CLI Example:

```
salt '*' network.interface eth0
```

`salt.modules.network.interface_ip`(*iface*)

Return the inet address for a given interface

New in version 2014.7.0.

CLI Example:

```
salt '*' network.interface_ip eth0
```

`salt.modules.network.interfaces`()

Return a dictionary of information about all the interfaces on the minion

CLI Example:

```
salt '*' network.interfaces
```

`salt.modules.network.ip_addrs`(*interface=None, include\_loopback=False, cidr=None, type=None*)

Returns a list of IPv4 addresses assigned to the host. 127.0.0.1 is ignored, unless `'include_loopback=True'` is indicated. If `'interface'` is provided, then only IP addresses from that interface will be returned. Providing a CIDR via `'cidr="10.0.0.0/8"'` will return only the addresses which are within that subnet. If `'type'` is `'public'`, then only public addresses will be returned. Ditto for `'type='private'`.

CLI Example:

```
salt '*' network.ip_addrs
```

`salt.modules.network.ip_addrs6`(*interface=None, include\_loopback=False, cidr=None*)

Returns a list of IPv6 addresses assigned to the host. ::1 is ignored, unless `'include_loopback=True'` is indicated. If `'interface'` is provided, then only IP addresses from that interface will be returned. Providing a CIDR via `'cidr="2000::/3"'` will return only the addresses which are within that subnet.

CLI Example:

```
salt '*' network.ip_addrs6
```

`salt.modules.network.ip_in_subnet`(*ip\_addr, cidr*)

Returns True if given IP is within specified subnet, otherwise False.

CLI Example:

```
salt '*' network.ip_in_subnet 172.17.0.4 172.16.0.0/12
```

`salt.modules.network.ipaddrs`(*interface=None, include\_loopback=False, cidr=None, type=None*)

This function is an alias of `ip_addrs`.

Returns a list of IPv4 addresses assigned to the host. 127.0.0.1 is ignored, unless `'include_loopback=True'` is indicated. If `'interface'` is provided, then only IP addresses from that interface will be returned. Providing a CIDR via `'cidr="10.0.0.0/8"'` will return only the addresses

which are within that subnet. If `type` is `public`, then only public addresses will be returned. Ditto for `type`='private'.

CLI Example:

```
salt '*' network.ip_addrs
```

`salt.modules.network.ipaddrs6` (*interface=None, include\_loopback=False, cidr=None*)

This function is an alias of `ip_addrs6`.

Returns a list of IPv6 addresses assigned to the host. `::1` is ignored, unless `include\_loopback=True` is indicated. If `interface` is provided, then only IP addresses from that interface will be returned. Providing a CIDR via `cidr="2000::/3"` will return only the addresses which are within that subnet.

CLI Example:

```
salt '*' network.ip_addrs6
```

`salt.modules.network.iphexval` (*ip*)

Retrieve the hexadecimal representation of an IP address

New in version 2016.11.0.

CLI Example:

```
salt '*' network.iphexval 10.0.0.1
```

`salt.modules.network.is_loopback` (*ip\_addr*)

Check if the given IP address is a loopback address

New in version 2014.7.0.

Changed in version 2015.8.0: IPv6 support

CLI Example:

```
salt '*' network.is_loopback 127.0.0.1
```

`salt.modules.network.is_private` (*ip\_addr*)

Check if the given IP address is a private address

New in version 2014.7.0.

Changed in version 2015.8.0: IPv6 support

CLI Example:

```
salt '*' network.is_private 10.0.0.3
```

`salt.modules.network.mod_bufsize` (*iface, \*args, \*\*kwargs*)

Modify network interface buffers (currently linux only)

CLI Example:

```
salt '*' network.mod_bufsize tx=<val> rx=<val> rx-mini=<val> rx-jumbo=<val>
```

`salt.modules.network.mod_hostname` (*hostname*)

Modify hostname

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)

CLI Example:

```
salt '*' network.mod_hostname master.saltstack.com
```

`salt.modules.network.netstat()`  
Return information on open ports and states

---

**Note:** On BSD minions, the output contains PID info (where available) for each netstat entry, fetched from sockstat/fstat output.

---

Changed in version 2014.1.4: Added support for OpenBSD, FreeBSD, and NetBSD

Changed in version 2015.8.0: Added support for SunOS

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.netstat
```

`salt.modules.network.ping(host, timeout=False, return_boolean=False)`  
Performs an ICMP ping to a host

Changed in version 2015.8.0: Added support for SunOS

CLI Example:

```
salt '*' network.ping archlinux.org
```

New in version 2015.5.0.

Return a True or False instead of ping output.

```
salt '*' network.ping archlinux.org return_boolean=True
```

Set the time to wait for a response in seconds.

```
salt '*' network.ping archlinux.org timeout=3
```

`salt.modules.network.reverse_ip(ip_addr)`  
Returns the reversed IP address

Changed in version 2015.8.0: IPv6 support

CLI Example:

```
salt '*' network.reverse_ip 172.17.0.4
```

`salt.modules.network.routes(family=None)`  
Return currently configured routes from routing table

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.routes
```

`salt.modules.network.subnets(interfaces=None)`  
Returns a list of IPv4 subnets to which the host belongs

CLI Example:

```
salt '*' network.subnets
salt '*' network.subnets interfaces=eth1
```

`salt.modules.network.subnets6()`

Returns a list of IPv6 subnets to which the host belongs

CLI Example:

```
salt '*' network.subnets
```

`salt.modules.network.traceroute(host)`

Performs a traceroute to a 3rd party host

Changed in version 2015.8.0: Added support for SunOS

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.traceroute archlinux.org
```

`salt.modules.network.wol(mac, bcast='255.255.255.255', destport=9)`

Send Wake On Lan packet to a host

CLI Example:

```
salt '*' network.wol 08-00-27-13-69-77
salt '*' network.wol 080027136977 255.255.255.255 7
salt '*' network.wol 08:00:27:13:69:77 255.255.255.255 7
```

## 14.7.252 salt.modules.neutron

Module for handling OpenStack Neutron calls

**depends**

- neutronclient Python module

**configuration** This module is not usable until the user, password, tenant, and auth URL are specified either in a pillar or in the minion's config file. For example:

```
keystone.user: 'admin'
keystone.password: 'password'
keystone.tenant: 'admin'
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
keystone.region_name: 'RegionOne'
keystone.service_type: 'network'
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

```
openstack1:
  keystone.user: 'admin'
  keystone.password: 'password'
  keystone.tenant: 'admin'
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
  keystone.region_name: 'RegionOne'
```

```

keystone.service_type: 'network'

openstack2:
  keystone.user: 'admin'
  keystone.password: 'password'
  keystone.tenant: 'admin'
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/'
  keystone.region_name: 'RegionOne'
  keystone.service_type: 'network'

```

With this configuration in place, any of the neutron functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' neutron.network_list profile=openstack1
```

To use `keystoneauth1` instead of `keystoneclient`, include the `use_keystoneauth` option in the pillar or minion config.

---

**Note:** this is required to use keystone v3 as for authentication.

---

```

keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v3/'
keystone.region_name: 'RegionOne'
keystone.service_type: 'network'
keystone.use_keystoneauth: true
keystone.verify: '/path/to/custom/certs/ca-bundle.crt'

```

Note: by default the neutron module will attempt to verify its connection utilizing the system certificates. If you need to verify against another bundle of CA certificates or want to skip verification altogether you will need to specify the `verify` option. You can specify True or False to verify (or not) against system certificates, a path to a bundle or CA certs to check against, or None to allow keystoneauth to search for the certificates on its own.(defaults to True)

`salt.modules.neutron.add_gateway_router` (*router, ext\_network, profile=None*)

Adds an external network gateway to the specified router

CLI Example:

```
salt '*' neutron.add_gateway_router router-name ext-network-name
```

#### Parameters

- **router** -- ID or name of the router
- **ext\_network** -- ID or name of the external network the gateway
- **profile** -- Profile to build on (Optional)

**Returns** Added Gateway router information

`salt.modules.neutron.add_interface_router` (*router, subnet, profile=None*)

Adds an internal network interface to the specified router

CLI Example:

```
salt '*' neutron.add_interface_router router-name subnet-name
```

#### Parameters

- **router** -- ID or name of the router
- **subnet** -- ID or name of the subnet
- **profile** -- Profile to build on (Optional)

**Returns** Added interface information

`salt.modules.neutron.create_firewall_rule` (*protocol, action, profile=None, \*\*kwargs*)

Creates a new firewall rule

CLI Example:

```
salt '*' neutron.create_firewall_rule protocol action
      tenant_id=TENANT_ID name=NAME description=DESCRIPTION ip_version=IP_VERSION
      source_ip_address=SOURCE_IP_ADDRESS destination_ip_address=DESTINATION_IP_
      ←ADDRESS source_port=SOURCE_PORT
      destination_port=DESTINATION_PORT shared=SHARED enabled=ENABLED
```

#### Parameters

- **protocol** -- Protocol for the firewall rule, choose ``tcp``;``udp``;``icmp`` or ``None``.
- **action** -- Action for the firewall rule, choose ``allow`` or ``deny``.
- **tenant\_id** -- The owner tenant ID. (Optional)
- **name** -- Name for the firewall rule. (Optional)
- **description** -- Description for the firewall rule. (Optional)
- **ip\_version** -- IP protocol version, default: 4. (Optional)
- **source\_ip\_address** -- Source IP address or subnet. (Optional)
- **destination\_ip\_address** -- Destination IP address or subnet. (Optional)
- **source\_port** -- Source port (integer in [1, 65535] or range in a:b). (Optional)
- **destination\_port** -- Destination port (integer in [1, 65535] or range in a:b). (Optional)
- **shared** -- Set shared to True, default: False. (Optional)
- **enabled** -- To enable this rule, default: True. (Optional)

`salt.modules.neutron.create_floatingip` (*floating\_network, port=None, profile=None*)

Creates a new floatingIP

CLI Example:

```
salt '*' neutron.create_floatingip network-name port-name
```

#### Parameters

- **floating\_network** -- Network name or ID to allocate floatingIP from
- **port** -- Of the port to be associated with the floatingIP (Optional)
- **profile** -- Profile to build on (Optional)

**Returns** Created floatingIP information

`salt.modules.neutron.create_ikepolicy` (*name, profile=None, \*\*kwargs*)

Creates a new IKEPolicy

CLI Example:

```
salt '*' neutron.create_ikepolicy ikepolicy-name
      phase1_negotiation_mode=main auth_algorithm=sha1
      encryption_algorithm=aes-128 pfs=group5
```

#### Parameters

- **name** -- Name of the IKE policy
- **phase1\_negotiation\_mode** -- IKE Phase1 negotiation mode in lowercase, default: main (Optional)

- **auth\_algorithm** -- Authentication algorithm in lowercase, default: sha1 (Optional)
- **encryption\_algorithm** -- Encryption algorithm in lowercase. default: aes-128 (Optional)
- **pfs** -- Perfect Forward Security in lowercase, default: group5 (Optional)
- **units** -- IKE lifetime attribute. default: seconds (Optional)
- **value** -- IKE lifetime attribute. default: 3600 (Optional)
- **ike\_version** -- IKE version in lowercase, default: v1 (Optional)
- **profile** -- Profile to build on (Optional)
- **kwargs** --

**Returns** Created IKE policy information

`salt.modules.neutron.create_ipsec_site_connection`(*name, ipsecpolicy, ikepolicy, vpnservice, peer\_cidrs, peer\_address, peer\_id, psk, admin\_state\_up=True, profile=None, \*\*kwargs*)

Creates a new IPsecSiteConnection

CLI Example:

```
salt '*' neutron.show_ipsec_site_connection connection-name
      ipsec-policy-name ikepolicy-name vpnservice-name
      192.168.XXX.XXX/24 192.168.XXX.XXX 192.168.XXX.XXX secret
```

#### Parameters

- **name** -- Set friendly name for the connection
- **ipsecpolicy** -- IPsec policy ID or name associated with this connection
- **ikepolicy** -- IKE policy ID or name associated with this connection
- **vpnservice** -- VPN service instance ID or name associated with this connection
- **peer\_cidrs** -- Remote subnet(s) in CIDR format
- **peer\_address** -- Peer gateway public IPv4/IPv6 address or FQDN
- **peer\_id** -- Peer router identity for authentication Can be IPv4/IPv6 address, e-mail address, key id, or FQDN
- **psk** -- Pre-shared key string
- **initiator** -- Initiator state in lowercase, default: bi-directional
- **admin\_state\_up** -- Set admin state up to true or false, default: True (Optional)
- **mtu** -- size for the connection, default: 1500 (Optional)
- **dpd\_action** -- Dead Peer Detection attribute: hold/clear/disabled/ restart/restart-by-peer (Optional)
- **dpd\_interval** -- Dead Peer Detection attribute (Optional)
- **dpd\_timeout** -- Dead Peer Detection attribute (Optional)
- **profile** -- Profile to build on (Optional)

**Returns** Created IPsec site connection information

`salt.modules.neutron.create_ipsecpolicy`(*name, profile=None, \*\*kwargs*)

Creates a new IPsecPolicy

CLI Example:

```
salt '*' neutron.create_ipsecpolicy ipsecpolicy-name
      transform_protocol=esp auth_algorithm=sha1
      encapsulation_mode=tunnel encryption_algorithm=aes-128
```

#### Parameters

- **name** -- Name of the IPsec policy
- **transform\_protocol** -- Transform protocol in lowercase, default: esp (Optional)

- **auth\_algorithm** -- Authentication algorithm in lowercase, default: sha1 (Optional)
- **encapsulation\_mode** -- Encapsulation mode in lowercase, default: tunnel (Optional)
- **encryption\_algorithm** -- Encryption algorithm in lowercase, default:aes-128 (Optional)
- **pfs** -- Prefect Forward Security in lowercase, default: group5 (Optional)
- **units** -- IPSec lifetime attribute. default: seconds (Optional)
- **value** -- IPSec lifetime attribute. default: 3600 (Optional)
- **profile** -- Profile to build on (Optional)

**Returns** Created IPSec policy information

`salt.modules.neutron.create_network`(*name*, *router\_ext=None*, *admin\_state\_up=True*, *network\_type=None*, *physical\_network=None*, *segmentation\_id=None*, *shared=None*, *profile=None*)

Creates a new network

CLI Example:

```
salt '*' neutron.create_network network-name
salt '*' neutron.create_network network-name profile=openstack1
```

#### Parameters

- **name** -- Name of network to create
- **admin\_state\_up** -- should the state of the network be up? default: True (Optional)
- **router\_ext** -- True then if create the external network (Optional)
- **network\_type** -- the Type of network that the provider is such as GRE, VXLAN, VLAN, FLAT, or LOCAL (Optional)
- **physical\_network** -- the name of the physical network as neutron knows it (Optional)
- **segmentation\_id** -- the vlan id or GRE id (Optional)
- **shared** -- is the network shared or not (Optional)
- **profile** -- Profile to build on (Optional)

**Returns** Created network information

`salt.modules.neutron.create_port`(*name*, *network*, *device\_id=None*, *admin\_state\_up=True*, *profile=None*)

Creates a new port

CLI Example:

```
salt '*' neutron.create_port network-name port-name
```

#### Parameters

- **name** -- Name of port to create
- **network** -- Network name or ID
- **device\_id** -- ID of device (Optional)
- **admin\_state\_up** -- Set admin state up to true or false, default: true (Optional)
- **profile** -- Profile to build on (Optional)

**Returns** Created port information

`salt.modules.neutron.create_router`(*name*, *ext\_network=None*, *admin\_state\_up=True*, *profile=None*)

Creates a new router

CLI Example:

```
salt '*' neutron.create_router new-router-name
```

**Parameters**

- **name** -- Name of router to create (must be first)
- **ext\_network** -- ID or name of the external for the gateway (Optional)
- **admin\_state\_up** -- Set admin state up to true or false, default:true (Optional)
- **profile** -- Profile to build on (Optional)

**Returns** Created router information

`salt.modules.neutron.create_security_group` (*name=None, description=None, profile=None*)  
Creates a new security group

CLI Example:

```
salt '*' neutron.create_security_group security-group-name
↳description='Security group for servers'
```

**Parameters**

- **name** -- Name of security group (Optional)
- **description** -- Description of security group (Optional)
- **profile** -- Profile to build on (Optional)

**Returns** Created security group information

`salt.modules.neutron.create_security_group_rule` (*security\_group,* *re-*  
*mote\_group\_id=None,* *di-*  
*rection='ingress',* *proto-*  
*col=None,* *port\_range\_min=None,*  
*port\_range\_max=None,* *ether-*  
*type='IPv4', profile=None*)

Creates a new security group rule

CLI Example:

```
salt '*' neutron.show_security_group_rule security-group-rule-id
```

**Parameters**

- **security\_group** -- Security group name or ID to add rule
- **remote\_group\_id** -- Remote security group name or ID to apply rule (Optional)
- **direction** -- Direction of traffic: ingress/egress, default: ingress (Optional)
- **protocol** -- Protocol of packet: null/icmp/tcp/udp, default: null (Optional)
- **port\_range\_min** -- Starting port range (Optional)
- **port\_range\_max** -- Ending port range (Optional)
- **ethertype** -- IPv4/IPv6, default: IPv4 (Optional)
- **profile** -- Profile to build on (Optional)

**Returns** Created security group rule information

`salt.modules.neutron.create_subnet` (*network, cidr, name=None, ip\_version=4, profile=None*)  
Creates a new subnet

CLI Example:

```
salt '*' neutron.create_subnet network-name 192.168.1.0/24
```

**Parameters**

- **network** -- Network ID or name this subnet belongs to
- **cidr** -- CIDR of subnet to create (Ex. `192.168.1.0/24`)
- **name** -- Name of the subnet to create (Optional)
- **ip\_version** -- Version to use, default is 4(IPv4) (Optional)

- **profile** -- Profile to build on (Optional)

**Returns** Created subnet information

`salt.modules.neutron.create_vpnservice`(*subnet*, *router*, *name*, *admin\_state\_up=True*, *profile=None*)

Creates a new VPN service

CLI Example:

```
salt '*' neutron.create_vpnservice router-name name
```

#### Parameters

- **subnet** -- Subnet unique identifier for the VPN service deployment
- **router** -- Router unique identifier for the VPN service
- **name** -- Set a name for the VPN service
- **admin\_state\_up** -- Set admin state up to true or false, default:True (Optional)
- **profile** -- Profile to build on (Optional)

**Returns** Created VPN service information

`salt.modules.neutron.delete_firewall_rule`(*firewall\_rule*, *profile=None*)

Deletes the specified firewall\_rule

CLI Example:

```
salt '*' neutron.delete_firewall_rule firewall-rule
```

#### Parameters

- **firewall\_rule** -- ID or name of firewall rule to delete
- **profile** -- Profile to build on (Optional)

**Returns** True(Succeed) or False

`salt.modules.neutron.delete_floatingip`(*floatingip\_id*, *profile=None*)

Deletes the specified floating IP

CLI Example:

```
salt '*' neutron.delete_floatingip floatingip-id
```

#### Parameters

- **floatingip\_id** -- ID of floatingIP to delete
- **profile** -- Profile to build on (Optional)

**Returns** True(Succeed) or False

`salt.modules.neutron.delete_ikepolicy`(*ikepolicy*, *profile=None*)

Deletes the specified IKEPolicy

CLI Example:

```
salt '*' neutron.delete_ikepolicy ikepolicy-name
```

#### Parameters

- **ikepolicy** -- ID or name of IKE policy to delete
- **profile** -- Profile to build on (Optional)

**Returns** True(Succeed) or False

`salt.modules.neutron.delete_ipsec_site_connection`(*ipsec\_site\_connection*, *profile=None*)

Deletes the specified IPsecSiteConnection

CLI Example:

```
salt '*' neutron.delete_ipsec_site_connection connection-name
```

**Parameters**

- **ipsec\_site\_connection** -- ID or name of ipsec site connection to delete
- **profile** -- Profile to build on (Optional)

**Returns** True(Succeed) or False

`salt.modules.neutron.delete_ipsecpolicy` (*ipsecpolicy*, *profile=None*)

Deletes the specified IPsecPolicy

CLI Example:

```
salt '*' neutron.delete_ipsecpolicy ipsecpolicy-name
```

**Parameters**

- **ipsecpolicy** -- ID or name of IPsec policy to delete
- **profile** -- Profile to build on (Optional)

**Returns** True(Succeed) or False

`salt.modules.neutron.delete_network` (*network*, *profile=None*)

Deletes the specified network

CLI Example:

```
salt '*' neutron.delete_network network-name
salt '*' neutron.delete_network network-name profile=openstack1
```

**Parameters**

- **network** -- ID or name of network to delete
- **profile** -- Profile to build on (Optional)

**Returns** True(Succeed) or False

`salt.modules.neutron.delete_port` (*port*, *profile=None*)

Deletes the specified port

CLI Example:

```
salt '*' neutron.delete_network port-name
salt '*' neutron.delete_network port-name profile=openstack1
```

**Parameters**

- **port** -- port name or ID
- **profile** -- Profile to build on (Optional)

**Returns** True(Succeed) or False

`salt.modules.neutron.delete_quota` (*tenant\_id*, *profile=None*)

Delete the specified tenant's quota value

CLI Example:

```
salt '*' neutron.update_quota tenant-id
salt '*' neutron.update_quota tenant-id profile=openstack1
```

**Parameters**

- **tenant\_id** -- ID of tenant to quota delete
- **profile** -- Profile to build on (Optional)

**Returns** True(Delete succeed) or False(Delete failed)

`salt.modules.neutron.delete_router` (*router, profile=None*)

Delete the specified router

CLI Example:

```
salt '*' neutron.delete_router router-name
```

**Parameters**

- **router** -- ID or name of router to delete
- **profile** -- Profile to build on (Optional)

**Returns** True(Succeed) or False

`salt.modules.neutron.delete_security_group` (*security\_group, profile=None*)

Deletes the specified security group

CLI Example:

```
salt '*' neutron.delete_security_group security-group-name
```

**Parameters**

- **security\_group** -- ID or name of security group to delete
- **profile** -- Profile to build on (Optional)

**Returns** True(Succeed) or False

`salt.modules.neutron.delete_security_group_rule` (*security\_group\_rule\_id, profile=None*)

Deletes the specified security group rule

CLI Example:

```
salt '*' neutron.delete_security_group_rule security-group-rule-id
```

**Parameters**

- **security\_group\_rule\_id** -- ID of security group rule to delete
- **profile** -- Profile to build on (Optional)

**Returns** True(Succeed) or False

`salt.modules.neutron.delete_subnet` (*subnet, profile=None*)

Deletes the specified subnet

CLI Example:

```
salt '*' neutron.delete_subnet subnet-name
salt '*' neutron.delete_subnet subnet-name profile=openstack1
```

**Parameters**

- **subnet** -- ID or name of subnet to delete
- **profile** -- Profile to build on (Optional)

**Returns** True(Succeed) or False

`salt.modules.neutron.delete_vpnservice` (*vpnservice, profile=None*)

Deletes the specified VPN service

CLI Example:

```
salt '*' neutron.delete_vpnservice vpnservice-name
```

**Parameters**

- **vpnservice** -- ID or name of vpn service to delete
- **profile** -- Profile to build on (Optional)

**Returns** True(Succeed) or False

`salt.modules.neutron.get_quotas_tenant` (*profile=None*)  
Fetches tenant info in server's context for following quota operation

CLI Example:

```
salt '*' neutron.get_quotas_tenant
salt '*' neutron.get_quotas_tenant profile=openstack1
```

**Parameters** `profile` -- Profile to build on (Optional)

**Returns** Quotas information

`salt.modules.neutron.list_agents` (*profile=None*)

List agents.

CLI Example:

```
salt '*' neutron.list_agents
```

**Parameters** `profile` -- Profile to build on (Optional)

**Returns** agents message.

`salt.modules.neutron.list_extensions` (*profile=None*)

Fetches a list of all extensions on server side

CLI Example:

```
salt '*' neutron.list_extensions
salt '*' neutron.list_extensions profile=openstack1
```

**Parameters** `profile` -- Profile to build on (Optional)

**Returns** List of extensions

`salt.modules.neutron.list_firewall_rules` (*profile=None*)

Fetches a list of all firewall rules for a tenant CLI Example:

```
salt '*' neutron.list_firewall_rules
```

**Parameters** `profile` -- Profile to build on (Optional)

**Returns** List of firewall rules

`salt.modules.neutron.list_firewalls` (*profile=None*)

Fetches a list of all firewalls for a tenant CLI Example:

```
salt '*' neutron.list_firewalls
```

**Parameters** `profile` -- Profile to build on (Optional)

**Returns** List of firewalls

`salt.modules.neutron.list_floatingips` (*profile=None*)

Fetch a list of all floatingIPs for a tenant

CLI Example:

```
salt '*' neutron.list_floatingips
salt '*' neutron.list_floatingips profile=openstack1
```

**Parameters** `profile` -- Profile to build on (Optional)

**Returns** List of floatingIP

`salt.modules.neutron.list_ikepolicies` (*profile=None*)

Fetches a list of all configured IKEPolicies for a tenant

CLI Example:

```
salt '*' neutron.list_ikepolicies
salt '*' neutron.list_ikepolicies profile=openstack1
```

**Parameters** **profile** -- Profile to build on (Optional)

**Returns** List of IKE policy

**salt.modules.neutron.list\_ipsec\_site\_connections** (*profile=None*)

Fetches all configured IPsec Site Connections for a tenant

CLI Example:

```
salt '*' neutron.list_ipsec_site_connections
salt '*' neutron.list_ipsec_site_connections profile=openstack1
```

**Parameters** **profile** -- Profile to build on (Optional)

**Returns** List of IPsec site connection

**salt.modules.neutron.list\_ipsecpolicies** (*profile=None*)

Fetches a list of all configured IPsecPolicies for a tenant

CLI Example:

```
salt '*' neutron.list_ipsecpolicies ipsecpolicy-name
salt '*' neutron.list_ipsecpolicies ipsecpolicy-name profile=openstack1
```

**Parameters** **profile** -- Profile to build on (Optional)

**Returns** List of IPsec policy

**salt.modules.neutron.list\_l3\_agent\_hosting\_routers** (*router, profile=None*)

List L3 agents hosting a router.

CLI Example:

```
salt '*' neutron.list_l3_agent_hosting_routers router
```

:param router:router name or ID to query. :param profile: Profile to build on (Optional) :return: L3 agents message.

**salt.modules.neutron.list\_networks** (*profile=None*)

Fetches a list of all networks for a tenant

CLI Example:

```
salt '*' neutron.list_networks
salt '*' neutron.list_networks profile=openstack1
```

**Parameters** **profile** -- Profile to build on (Optional)

**Returns** List of network

**salt.modules.neutron.list\_ports** (*profile=None*)

Fetches a list of all networks for a tenant

CLI Example:

```
salt '*' neutron.list_ports
salt '*' neutron.list_ports profile=openstack1
```

**Parameters** **profile** -- Profile to build on (Optional)

**Returns** List of port

`salt.modules.neutron.list_quotas` (*profile=None*)

Fetches all tenants quotas

CLI Example:

```
salt '*' neutron.list_quotas
salt '*' neutron.list_quotas profile=openstack1
```

**Parameters** `profile` -- Profile to build on (Optional)

**Returns** List of quotas

`salt.modules.neutron.list_routers` (*profile=None*)

Fetches a list of all routers for a tenant

CLI Example:

```
salt '*' neutron.list_routers
salt '*' neutron.list_routers profile=openstack1
```

**Parameters** `profile` -- Profile to build on (Optional)

**Returns** List of router

`salt.modules.neutron.list_security_group_rules` (*profile=None*)

Fetches a list of all security group rules for a tenant

CLI Example:

```
salt '*' neutron.list_security_group_rules
salt '*' neutron.list_security_group_rules profile=openstack1
```

**Parameters** `profile` -- Profile to build on (Optional)

**Returns** List of security group rule

`salt.modules.neutron.list_security_groups` (*profile=None*)

Fetches a list of all security groups for a tenant

CLI Example:

```
salt '*' neutron.list_security_groups
salt '*' neutron.list_security_groups profile=openstack1
```

**Parameters** `profile` -- Profile to build on (Optional)

**Returns** List of security group

`salt.modules.neutron.list_subnets` (*profile=None*)

Fetches a list of all networks for a tenant

CLI Example:

```
salt '*' neutron.list_subnets
salt '*' neutron.list_subnets profile=openstack1
```

**Parameters** `profile` -- Profile to build on (Optional)

**Returns** List of subnet

`salt.modules.neutron.list_vpnservices` (*retrieve\_all=True, profile=None, \*\*kwargs*)

Fetches a list of all configured VPN services for a tenant

CLI Example:

```
salt '*' neutron.list_vpnservices
```

**Parameters**

- **retrieve\_all** -- True or False, default: True (Optional)
- **profile** -- Profile to build on (Optional)

**Returns** List of VPN service

`salt.modules.neutron.remove_gateway_router` (*router, profile=None*)

Removes an external network gateway from the specified router

CLI Example:

```
salt '*' neutron.remove_gateway_router router-name
```

**Parameters**

- **router** -- ID or name of router
- **profile** -- Profile to build on (Optional)

**Returns** True(Succeed) or False

`salt.modules.neutron.remove_interface_router` (*router, subnet, profile=None*)

Removes an internal network interface from the specified router

CLI Example:

```
salt '*' neutron.remove_interface_router router-name subnet-name
```

**Parameters**

- **router** -- ID or name of the router
- **subnet** -- ID or name of the subnet
- **profile** -- Profile to build on (Optional)

**Returns** True(Succeed) or False

`salt.modules.neutron.show_firewall` (*firewall, profile=None*)

Fetches information of a specific firewall rule

CLI Example:

```
salt '*' neutron.show_firewall firewall
```

**Parameters**

- **firewall** -- ID or name of firewall to look up
- **profile** -- Profile to build on (Optional)

**Returns** firewall information

`salt.modules.neutron.show_firewall_rule` (*firewall\_rule, profile=None*)

Fetches information of a specific firewall rule

CLI Example:

```
salt '*' neutron.show_firewall_rule firewall-rule-name
```

**Parameters**

- **ipsecpolicy** -- ID or name of firewall rule to look up
- **profile** -- Profile to build on (Optional)

**Returns** firewall rule information

`salt.modules.neutron.show_floatingip` (*floatingip\_id, profile=None*)

Fetches information of a certain floatingIP

CLI Example:

```
salt '*' neutron.show_floatingip floatingip-id
```

**Parameters**

- **floatingip\_id** -- ID of floatingIP to look up
- **profile** -- Profile to build on (Optional)

**Returns** Floating IP information

`salt.modules.neutron.show_ikepolicy` (*ikepolicy, profile=None*)

Fetches information of a specific IKEPolicy

CLI Example:

```
salt '*' neutron.show_ikepolicy ikepolicy-name
```

**Parameters**

- **ikepolicy** -- ID or name of ikepolicy to look up
- **profile** -- Profile to build on (Optional)

**Returns** IKE policy information

`salt.modules.neutron.show_ipsec_site_connection` (*ipsec\_site\_connection, profile=None*)

Fetches information of a specific IPsecSiteConnection

CLI Example:

```
salt '*' neutron.show_ipsec_site_connection connection-name
```

**Parameters**

- **ipsec\_site\_connection** -- ID or name of ipsec site connection to look up
- **profile** -- Profile to build on (Optional)

**Returns** IPsec site connection information

`salt.modules.neutron.show_ipsecpolicy` (*ipsecpolicy, profile=None*)

Fetches information of a specific IPsecPolicy

CLI Example:

```
salt '*' neutron.show_ipsecpolicy ipsecpolicy-name
```

**Parameters**

- **ipsecpolicy** -- ID or name of IPsec policy to look up
- **profile** -- Profile to build on (Optional)

**Returns** IPsec policy information

`salt.modules.neutron.show_network` (*network, profile=None*)

Fetches information of a certain network

CLI Example:

```
salt '*' neutron.show_network network-name
salt '*' neutron.show_network network-name profile=openstack1
```

**Parameters**

- **network** -- ID or name of network to look up
- **profile** -- Profile to build on (Optional)

**Returns** Network information

`salt.modules.neutron.show_port` (*port, profile=None*)

Fetches information of a certain port

CLI Example:

```
salt '*' neutron.show_port port-id
salt '*' neutron.show_port port-id profile=openstack1
```

**Parameters**

- **port** -- ID or name of port to look up
- **profile** -- Profile to build on (Optional)

**Returns** Port information

`salt.modules.neutron.show_quota`(*tenant\_id*, *profile=None*)

Fetches information of a certain tenant's quotas

CLI Example:

```
salt '*' neutron.show_quota tenant-id
salt '*' neutron.show_quota tenant-id profile=openstack1
```

**Parameters**

- **tenant\_id** -- ID of tenant
- **profile** -- Profile to build on (Optional)

**Returns** Quota information

`salt.modules.neutron.show_router`(*router*, *profile=None*)

Fetches information of a certain router

CLI Example:

```
salt '*' neutron.show_router router-name
```

**Parameters**

- **router** -- ID or name of router to look up
- **profile** -- Profile to build on (Optional)

**Returns** Router information

`salt.modules.neutron.show_security_group`(*security\_group*, *profile=None*)

Fetches information of a certain security group

CLI Example:

```
salt '*' neutron.show_security_group security-group-name
```

**Parameters**

- **security\_group** -- ID or name of security group to look up
- **profile** -- Profile to build on (Optional)

**Returns** Security group information

`salt.modules.neutron.show_security_group_rule`(*security\_group\_rule\_id*, *profile=None*)

Fetches information of a certain security group rule

CLI Example:

```
salt '*' neutron.show_security_group_rule security-group-rule-id
```

**Parameters**

- **security\_group\_rule\_id** -- ID of security group rule to look up
- **profile** -- Profile to build on (Optional)

**Returns** Security group rule information

`salt.modules.neutron.show_subnet`(*subnet*, *profile=None*)

Fetches information of a certain subnet

CLI Example:

```
salt '*' neutron.show_subnet subnet-name
```

#### Parameters

- **subnet** -- ID or name of subnet to look up
- **profile** -- Profile to build on (Optional)

Returns Subnet information

`salt.modules.neutron.show_vpnservice` (*vpnservice*, *profile=None*, *\*\*kwargs*)  
Fetches information of a specific VPN service

CLI Example:

```
salt '*' neutron.show_vpnservice vpnservice-name
```

#### Parameters

- **vpnservice** -- ID or name of vpn service to look up
- **profile** -- Profile to build on (Optional)

Returns VPN service information

`salt.modules.neutron.update_firewall_rule` (*firewall\_rule*, *protocol=None*, *action=None*, *name=None*, *description=None*, *ip\_version=None*, *source\_ip\_address=None*, *destination\_ip\_address=None*, *source\_port=None*, *destination\_port=None*, *shared=None*, *enabled=None*, *profile=None*)

Update a firewall rule

CLI Example:

```
salt '*' neutron.update_firewall_rule firewall_rule protocol=PROTOCOL
↳action=ACTION
    name=NAME description=DESCRIPTION ip_version=IP_VERSION
    source_ip_address=SOURCE_IP_ADDRESS destination_ip_address=DESTINATION_IP_
↳ADDRESS
    source_port=SOURCE_PORT destination_port=DESTINATION_PORT shared=SHARED
↳enabled=ENABLED
```

#### Parameters

- **firewall\_rule** -- ID or name of firewall rule to update.
- **protocol** -- Protocol for the firewall rule, choose ``tcp``;``udp``;``icmp`` or ``None``. (Optional)
- **action** -- Action for the firewall rule, choose ``allow`` or ``deny``. (Optional)
- **name** -- Name for the firewall rule. (Optional)
- **description** -- Description for the firewall rule. (Optional)
- **ip\_version** -- IP protocol version, default: 4. (Optional)
- **source\_ip\_address** -- Source IP address or subnet. (Optional)
- **destination\_ip\_address** -- Destination IP address or subnet. (Optional)
- **source\_port** -- Source port (integer in [1, 65535] or range in a:b). (Optional)
- **destination\_port** -- Destination port (integer in [1, 65535] or range in a:b). (Optional)
- **shared** -- Set shared to True, default: False. (Optional)
- **enabled** -- To enable this rule, default: True. (Optional)
- **profile** -- Profile to build on (Optional)

`salt.modules.neutron.update_floatingip` (*floatingip\_id*, *port=None*, *profile=None*)  
Updates a floatingIP

CLI Example:

```
salt '*' neutron.update_floatingip network-name port-name
```

#### Parameters

- **floatingip\_id** -- ID of floatingIP
- **port** -- ID or name of port, to associate floatingip to

*None* or do not specify to disassociate the floatingip (Optional) :param profile: Profile to build on (Optional)  
:return: Value of updated floating IP information

`salt.modules.neutron.update_network`(*network, name, profile=None*)

Updates a network

CLI Example:

```
salt '*' neutron.update_network network-name new-network-name
```

#### Parameters

- **network** -- ID or name of network to update
- **name** -- Name of this network
- **profile** -- Profile to build on (Optional)

**Returns** Value of updated network information

`salt.modules.neutron.update_port`(*port, name, admin\_state\_up=True, profile=None*)

Updates a port

CLI Example:

```
salt '*' neutron.update_port port-name network-name new-port-name
```

#### Parameters

- **port** -- Port name or ID
- **name** -- Name of this port
- **admin\_state\_up** -- Set admin state up to true or false, default: true (Optional)
- **profile** -- Profile to build on (Optional)

**Returns** Value of updated port information

`salt.modules.neutron.update_quota`(*tenant\_id, subnet=None, router=None, network=None, floatingip=None, port=None, security\_group=None, security\_group\_rule=None, profile=None*)

Update a tenant's quota

CLI Example:

```
salt '*' neutron.update_quota tenant-id subnet=40 router=50
network=10 floatingip=30 port=30
```

#### Parameters

- **tenant\_id** -- ID of tenant
- **subnet** -- Value of subnet quota (Optional)
- **router** -- Value of router quota (Optional)
- **network** -- Value of network quota (Optional)
- **floatingip** -- Value of floatingip quota (Optional)
- **port** -- Value of port quota (Optional)
- **security\_group** -- Value of security group (Optional)
- **security\_group\_rule** -- Value of security group rule (Optional)
- **profile** -- Profile to build on (Optional)

**Returns** Value of updated quota

`salt.modules.neutron.update_router`(*router*, *name=None*, *admin\_state\_up=None*, *profile=None*, *\*\*kwargs*)

Updates a router

CLI Example:

```
salt '*' neutron.update_router router_id name=new-router-name
      admin_state_up=True
```

#### Parameters

- **router** -- ID or name of router to update
- **name** -- Name of this router
- **ext\_network** -- ID or name of the external for the gateway (Optional)
- **admin\_state\_up** -- Set admin state up to true or false, default: true (Optional)
- **profile** -- Profile to build on (Optional)
- **kwargs** --

**Returns** Value of updated router information

`salt.modules.neutron.update_security_group`(*security\_group*, *name=None*, *description=None*, *profile=None*)

Updates a security group

CLI Example:

```
salt '*' neutron.update_security_group security-group-name new-
      security-group-name
```

#### Parameters

- **security\_group** -- ID or name of security group to update
- **name** -- Name of this security group (Optional)
- **description** -- Description of security group (Optional)
- **profile** -- Profile to build on (Optional)

**Returns** Value of updated security group information

`salt.modules.neutron.update_subnet`(*subnet*, *name*, *profile=None*)

Updates a subnet

CLI Example:

```
salt '*' neutron.update_subnet subnet-name new-subnet-name
```

#### Parameters

- **subnet** -- ID or name of subnet to update
- **name** -- Name of this subnet
- **profile** -- Profile to build on (Optional)

**Returns** Value of updated subnet information

`salt.modules.neutron.update_vpnservice`(*vpnservice*, *desc*, *profile=None*)

Updates a VPN service

CLI Example:

```
salt '*' neutron.update_vpnservice vpnservice-name desc='VPN Service1'
```

#### Parameters

- **vpnservice** -- ID or name of vpn service to update
- **desc** -- Set a description for the VPN service
- **profile** -- Profile to build on (Optional)

**Returns** Value of updated VPN service information

### 14.7.253 salt.modules.nfs3

Module for managing NFS version 3.

`salt.modules.nfs3.del_export(exports='/etc/exports', path=None)`  
Remove an export

CLI Example:

```
salt '*' nfs.del_export /media/storage
```

`salt.modules.nfs3.list_exports(exports='/etc/exports')`  
List configured exports

CLI Example:

```
salt '*' nfs.list_exports
```

### 14.7.254 salt.modules.nftables

Support for nftables

`salt.modules.nftables.append(table='filter', chain=None, rule=None, family='ipv4')`  
Append a rule to the specified table & chain.

This function accepts a rule in a standard nftables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```
salt '*' nftables.append filter input \
    rule='input tcp dport 22 log accept'

IPv6:
salt '*' nftables.append filter input \
    rule='input tcp dport 22 log accept' \
    family=ipv6
```

`salt.modules.nftables.build_rule(table=None, chain=None, command=None, position='', full=None, family='ipv4', **kwargs)`

Build a well-formatted nftables rule based on kwargs. A *table* and *chain* are not required, unless *full* is True.

If *full* is True, then *table*, *chain* and *command* are required. *command* may be specified as either insert, append, or delete. This will return the nftables command, exactly as it would be used from the command line.

If a position is required (as with *insert* or *delete*), it may be specified as *position*. This will only be useful if *full* is True.

If *connstate* is passed in, it will automatically be changed to *state*.

CLI Examples:

```
salt '*' nftables.build_rule match=state \
    connstate=RELATED,ESTABLISHED jump=ACCEPT
salt '*' nftables.build_rule filter input command=insert position=3 \
    full=True match=state state=related,established jump=accept

IPv6:
salt '*' nftables.build_rule match=state \
    connstate=related,established jump=accept \
```

```

family=ipv6
salt '*' nftables.build_rule filter input command=insert position=3 \
full=True match=state state=related,established jump=accept \
family=ipv6

```

`salt.modules.nftables.check`(*table='filter', chain=None, rule=None, family='ipv4'*)

Check for the existence of a rule in the table and chain

**This function accepts a rule in a standard nftables command format**, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```

salt '*' nftables.check filter input \
rule='input tcp dport 22 log accept'

IPv6:
salt '*' nftables.check filter input \
rule='input tcp dport 22 log accept' \
family=ipv6

```

`salt.modules.nftables.check_chain`(*table='filter', chain=None, family='ipv4'*)

New in version 2014.7.0.

Check for the existence of a chain in the table

CLI Example:

```

salt '*' nftables.check_chain filter input

IPv6:
salt '*' nftables.check_chain filter input family=ipv6

```

`salt.modules.nftables.check_table`(*table=None, family='ipv4'*)

Check for the existence of a table

CLI Example:

```

salt '*' nftables.check_table nat

```

`salt.modules.nftables.delete`(*table, chain=None, position=None, rule=None, family='ipv4'*)

**Delete a rule from the specified table & chain, specifying either the rule** in its entirety, or the rule's position in the chain.

**This function accepts a rule in a standard nftables command format**, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Examples:

```

salt '*' nftables.delete filter input position=3

salt '*' nftables.delete filter input \
rule='input tcp dport 22 log accept'

IPv6:
salt '*' nftables.delete filter input position=3 family=ipv6

salt '*' nftables.delete filter input \
rule='input tcp dport 22 log accept' \
family=ipv6

```

`salt.modules.nftables.delete_chain`(*table='filter', chain=None, family='ipv4'*)

New in version 2014.7.0.

Delete the chain from the specified table.

CLI Example:

```
salt '*' nftables.delete_chain filter input

salt '*' nftables.delete_chain filter foo

IPv6:
salt '*' nftables.delete_chain filter input family=ipv6

salt '*' nftables.delete_chain filter foo family=ipv6
```

`salt.modules.nftables.delete_table`(*table, family='ipv4'*)

New in version 2014.7.0.

Create new custom table.

CLI Example:

```
salt '*' nftables.delete_table filter

IPv6:
salt '*' nftables.delete_table filter family=ipv6
```

`salt.modules.nftables.flush`(*table='filter', chain='', family='ipv4'*)

Flush the chain in the specified table, flush all chains in the specified table if chain is not specified.

CLI Example:

```
salt '*' nftables.flush filter

salt '*' nftables.flush filter input

IPv6:
salt '*' nftables.flush filter input family=ipv6
```

`salt.modules.nftables.get_rule_handle`(*table='filter', chain=None, rule=None, family='ipv4'*)

Get the handle for a particular rule

**This function accepts a rule in a standard nftables command format**, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```
salt '*' nftables.get_rule_handle filter input \
    rule='input tcp dport 22 log accept'

IPv6:
salt '*' nftables.get_rule_handle filter input \
    rule='input tcp dport 22 log accept' \
    family=ipv6
```

`salt.modules.nftables.get_rules`(*family='ipv4'*)

Return a data structure of the current, in-memory rules

CLI Example:

```
salt '*' nftables.get_rules
salt '*' nftables.get_rules family=ipv6
```

`salt.modules.nftables.get_saved_rules`(*conf\_file=None, family='ipv4'*)  
Return a data structure of the rules in the conf file

CLI Example:

```
salt '*' nftables.get_saved_rules
```

`salt.modules.nftables.insert`(*table='filter', chain=None, position=None, rule=None, family='ipv4'*)  
Insert a rule into the specified table & chain, at the specified position.

If position is not specified, rule will be inserted in first position.

**This function accepts a rule in a standard nftables command format**, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Examples:

```
salt '*' nftables.insert filter input \
    rule='input tcp dport 22 log accept'

salt '*' nftables.insert filter input position=3 \
    rule='input tcp dport 22 log accept'

IPv6:
salt '*' nftables.insert filter input \
    rule='input tcp dport 22 log accept' \
    family=ipv6

salt '*' nftables.insert filter input position=3 \
    rule='input tcp dport 22 log accept' \
    family=ipv6
```

`salt.modules.nftables.new_chain`(*table='filter', chain=None, table\_type=None, hook=None, priority=None, family='ipv4'*)

New in version 2014.7.0.

Create new chain to the specified table.

CLI Example:

```
salt '*' nftables.new_chain filter input

salt '*' nftables.new_chain filter input \
    table_type=filter hook=input priority=0

salt '*' nftables.new_chain filter foo

IPv6:
salt '*' nftables.new_chain filter input family=ipv6

salt '*' nftables.new_chain filter input \
    table_type=filter hook=input priority=0 family=ipv6

salt '*' nftables.new_chain filter foo family=ipv6
```

`salt.modules.nftables.new_table` (*table*, *family='ipv4'*)

New in version 2014.7.0.

Create new custom table.

CLI Example:

```
salt '*' nftables.new_table filter

IPv6:
salt '*' nftables.new_table filter family=ipv6
```

`salt.modules.nftables.save` (*filename=None*, *family='ipv4'*)

Save the current in-memory rules to disk

CLI Example:

```
salt '*' nftables.save /etc/nftables
```

`salt.modules.nftables.version`()

Return version from nftables --version

CLI Example:

```
salt '*' nftables.version
```

### 14.7.255 salt.modules.nginx

Support for nginx

`salt.modules.nginx.build_info`()

Return server and build arguments

CLI Example:

```
salt '*' nginx.build_info
```

`salt.modules.nginx.configtest`()

test configuration and exit

CLI Example:

```
salt '*' nginx.configtest
```

`salt.modules.nginx.signal` (*signal=None*)

Signals nginx to start, reload, reopen or stop.

CLI Example:

```
salt '*' nginx.signal reload
```

`salt.modules.nginx.status` (*url='http://127.0.0.1/status'*)

Return the data from an Nginx status page as a dictionary. <http://wiki.nginx.org/HttpStubStatusModule>  
*url* The URL of the status page. Defaults to `'http://127.0.0.1/status'`

CLI Example:

```
salt '*' nginx.status
```

`salt.modules.nginx.version()`  
Return server version from nginx -v

CLI Example:

```
salt '*' nginx.version
```

### 14.7.256 salt.modules.nilrt\_ip module

The networking module for NI Linux Real-Time distro

`salt.modules.nilrt_ip.apply_network_settings(**settings)`  
Apply global network configuration.

CLI Example: .. code-block:: bash  
salt '\*' ip.apply\_network\_settings

`salt.modules.nilrt_ip.build_interface(iface, iface_type, enable, **settings)`  
Build an interface script for a network interface.

CLI Example: .. code-block:: bash  
salt '\*' ip.build\_interface eth0 eth <settings>

`salt.modules.nilrt_ip.build_network_settings(**settings)`  
Build the global network script.

CLI Example: .. code-block:: bash  
salt '\*' ip.build\_network\_settings <settings>

`salt.modules.nilrt_ip.disable(interface)`  
Disable the specified interface  
**Parameters** `interface` (*str*) -- interface label  
**Returns** True if the service was disabled, otherwise an exception will be thrown.  
**Return type** `bool`

CLI Example:

```
salt '*' ip.disable interface-label
```

`salt.modules.nilrt_ip.down(interface, iface_type=None)`  
Disable the specified interface  
**Parameters** `interface` (*str*) -- interface label  
**Returns** True if the service was disabled, otherwise an exception will be thrown.  
**Return type** `bool`

CLI Example:

```
salt '*' ip.down interface-label
```

`salt.modules.nilrt_ip.enable(interface)`  
Enable the specified interface  
**Parameters** `interface` (*str*) -- interface label  
**Returns** True if the service was enabled, otherwise an exception will be thrown.  
**Return type** `bool`

CLI Example:

```
salt '*' ip.enable interface-label
```

`salt.modules.nilrt_ip.get_interface(iface)`  
Returns details about given interface.

CLI Example:

```
salt '*' ip.get_interface eth0
```

`salt.modules.nilrt_ip.get_interfaces_details()`

Get details about all the interfaces on the minion

**Returns** information about all connmans interfaces

**Return type** dictionary

CLI Example:

```
salt '*' ip.get_interfaces_details
```

`salt.modules.nilrt_ip.get_network_settings()`

Return the contents of the global network script.

CLI Example: .. code-block:: bash

```
salt '*' ip.get_network_settings
```

`salt.modules.nilrt_ip.set_dhcp_linklocal_all(interface)`

Configure specified adapter to use DHCP with linklocal fallback

**Parameters** **interface** (*str*) -- interface label

**Returns** True if the settings were applied, otherwise an exception will be thrown.

**Return type** `bool`

CLI Example:

```
salt '*' ip.dhcp_linklocal_all interface-label
```

`salt.modules.nilrt_ip.set_static_all(interface, address, netmask, gateway, domains)`

Configure specified adapter to use ipv4 manual settings

**Parameters**

- **interface** (*str*) -- interface label
- **address** (*str*) -- ipv4 address
- **netmask** (*str*) -- ipv4 netmask
- **gateway** (*str*) -- ipv4 gateway
- **domains** (*str*) -- list of domains servers separated by spaces

**Returns** True if the settings were applied, otherwise an exception will be thrown.

**Return type** `bool`

CLI Example:

```
salt '*' ip.dhcp_linklocal_all interface-label address netmask gateway domains
```

`salt.modules.nilrt_ip.up(interface, iface_type=None)`

Enable the specified interface

**Parameters** **interface** (*str*) -- interface label

**Returns** True if the service was enabled, otherwise an exception will be thrown.

**Return type** `bool`

CLI Example:

```
salt '*' ip.up interface-label
```

## 14.7.257 salt.modules.nix

### Work with Nix packages

New in version 2017.7.0.

Does not require the machine to be Nixos, just have Nix installed and available to use for the user running this command. Their profile must be located in their home, under `$HOME/.nix-profile/`, and the nix store, unless specially set up, should be in `/nix`. To easily use this with multiple users or a root user, set up the nix-daemon.

This module exposes most of the common nix operations. Currently not meant to be run as a pkg module, but explicitly as `nix.*`.

For more information on nix, see the [nix documentation](#).

`salt.modules.nix.collect_garbage()`

Completely removed all currently 'uninstalled' packages in the nix store.

Tells the user how many store paths were removed and how much space was freed.

**Returns** How much space was freed and how many derivations were removed

**Return type** `str`

**Warning:** This is a destructive action on the nix store.

```
salt '*' nix.collect_garbage
```

`salt.modules.nix.install(*pkgs, **kwargs)`

Installs a single or multiple packages via nix

**Parameters**

- **pkgs** (`list(str)`) -- packages to update
- **attributes** (`bool`) -- Pass the list of packages or single package as attributes, not package names. default: False

**Returns** Installed packages. Example element: `gcc-3.3.2`

**Return type** `list(str)`

```
salt '*' nix.install package [package2 ...]
salt '*' nix.install attributes=True attr.name [attr.name2 ...]
```

`salt.modules.nix.list_pkgs(installed=True, attributes=True)`

Lists installed packages. Due to how nix works, it defaults to just doing a `nix-env -q`.

**Parameters**

- **installed** (`bool`) -- list only installed packages. This can be a very long list (12,000+ elements), so caution is advised. Default: True
- **attributes** (`bool`) -- show the attributes of the packages when listing all packages. Default: True

**Returns** Packages installed or available, along with their attributes.

**Return type** `list(list(str))`

```
salt '*' nix.list_pkgs
salt '*' nix.list_pkgs installed=False
```

`salt.modules.nix.uninstall(*pkgs)`

Erases a package from the current nix profile. Nix uninstalls work differently than other package managers, and the symlinks in the profile are removed, while the actual package remains. There is also a `nix.purge` function, to clear the package cache of unused packages.

**Parameters** **pkgs** (`list(str)`) -- List, single package to uninstall

**Returns** Packages that have been uninstalled

**Return type** `list(str)`

```
salt '*' nix.uninstall pkg1 [pkg2 ...]
```

```
salt.modules.nix.upgrade(*pkgs)
```

Runs an update operation on the specified packages, or all packages if none is specified.

**Parameters** `pkgs` (*list(str)*) -- List of packages to update

**Returns** The upgraded packages. Example element: `['libxslt-1.1.0', 'libxslt-1.1.10']`

**Return type** `list(tuple(str, str))`

```
salt '*' nix.update
salt '*' nix.update pkgs=one,two
```

### 14.7.258 salt.modules.nova

Module for handling OpenStack Nova calls

**depends**

- novaclient Python module

**configuration** This module is not usable until the user, password, tenant, and auth URL are specified either in a pillar or in the minion's config file. For example:

```
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
# Optional
keystone.region_name: 'RegionOne'
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

```
openstack1:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'

openstack2:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/'
```

With this configuration in place, any of the nova functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' nova.flavor_list profile=openstack1
```

To use `keystoneauth1` instead of `keystoneclient`, include the `use_keystoneauth` option in the pillar or minion config.

---

**Note:** this is required to use keystone v3 as for authentication.

---

```
keystone.user: admin
keystone.password: verybadpass
```

```
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v3/'
keystone.use_keystoneauth: true
keystone.verify: '/path/to/custom/certs/ca-bundle.crt'
```

Note: by default the nova module will attempt to verify its connection utilizing the system certificates. If you need to verify against another bundle of CA certificates or want to skip verification altogether you will need to specify the *verify* option. You can specify True or False to verify (or not) against system certificates, a path to a bundle or CA certs to check against, or None to allow keystoneauth to search for the certificates on its own.(defaults to True)

**salt.modules.nova.boot** (*name, flavor\_id=0, image\_id=0, profile=None, timeout=300*)

Boot (create) a new instance

**name** Name of the new instance (must be first)

**flavor\_id** Unique integer ID for the flavor

**image\_id** Unique integer ID for the image

**timeout** How long to wait, after creating the instance, for the provider to return information about it (default 300 seconds).

New in version 2014.1.0.

CLI Example:

```
salt '*' nova.boot myinstance flavor_id=4596 image_id=2
```

The *flavor\_id* and *image\_id* are obtained from *nova.flavor\_list* and *nova.image\_list*

```
salt '*' nova.flavor_list
salt '*' nova.image_list
```

**salt.modules.nova.delete** (*instance\_id, profile=None*)

Delete an instance

**instance\_id** ID of the instance to be deleted

CLI Example:

```
salt '*' nova.delete 1138
```

**salt.modules.nova.flavor\_create** (*name, flavor\_id=0, ram=0, disk=0, vcpus=1, profile=None*)

Add a flavor to nova (nova flavor-create). The following parameters are required:

**name** Name of the new flavor (must be first)

**flavor\_id** Unique integer ID for the new flavor

**ram** Memory size in MB

**disk** Disk size in GB

**vcpus** Number of vcpus

CLI Example:

```
salt '*' nova.flavor_create myflavor flavor_id=6 ram=4096 disk=10
↪vcpus=1
```

**salt.modules.nova.flavor\_delete** (*flavor\_id, profile=None*)

Delete a flavor from nova by id (nova flavor-delete)

CLI Example:

```
salt '*' nova.flavor_delete 7
```

**salt.modules.nova.flavor\_list** (*profile=None*)

Return a list of available flavors (nova flavor-list)

CLI Example:

```
salt '*' nova.flavor_list
```

`salt.modules.nova.image_list` (*name=None, profile=None*)

Return a list of available images (nova images-list + nova image-show) If a name is provided, only that image will be displayed.

CLI Examples:

```
salt '*' nova.image_list
salt '*' nova.image_list myimage
```

`salt.modules.nova.image_meta_delete` (*image\_id=None, name=None, keys=None, profile=None*)

Delete a key=value pair from the metadata for an image (nova image-meta set)

CLI Examples:

```
salt '*' nova.image_meta_delete 6f52b2ff-0b31-4d84-8fd1-af45b84824f6 keys=cheese
salt '*' nova.image_meta_delete name=myimage keys=salad,beans
```

`salt.modules.nova.image_meta_set` (*image\_id=None, name=None, profile=None, \*\*kwargs*)

Sets a key=value pair in the metadata for an image (nova image-meta set)

CLI Examples:

```
salt '*' nova.image_meta_set 6f52b2ff-0b31-4d84-8fd1-af45b84824f6 cheese=gruyere
salt '*' nova.image_meta_set name=myimage salad=pasta beans=baked
```

`salt.modules.nova.keypair_add` (*name, pubfile=None, pubkey=None, profile=None*)

Add a keypair to nova (nova keypair-add)

CLI Examples:

```
salt '*' nova.keypair_add mykey pubfile='/home/myuser/.ssh/id_rsa.pub'
salt '*' nova.keypair_add mykey pubkey='ssh-rsa <key> myuser@mybox'
```

`salt.modules.nova.keypair_delete` (*name, profile=None*)

Add a keypair to nova (nova keypair-delete)

CLI Example:

```
salt '*' nova.keypair_delete mykey'
```

`salt.modules.nova.keypair_list` (*profile=None*)

Return a list of available keypairs (nova keypair-list)

CLI Example:

```
salt '*' nova.keypair_list
```

`salt.modules.nova.list` (*profile=None*)

To maintain the feel of the nova command line, this function simply calls the `server_list` function.

CLI Example:

```
salt '*' nova.list
```

`salt.modules.nova.lock(instance_id, profile=None)`

Lock an instance

**instance\_id** ID of the instance to be locked

CLI Example:

```
salt '*' nova.lock 1138
```

`salt.modules.nova.resume(instance_id, profile=None)`

Resume an instance

**instance\_id** ID of the instance to be resumed

CLI Example:

```
salt '*' nova.resume 1138
```

`salt.modules.nova.secgroup_create(name, description, profile=None)`

Add a secgroup to nova (nova secgroup-create)

CLI Example:

```
salt '*' nova.secgroup_create mygroup 'This is my security group'
```

`salt.modules.nova.secgroup_delete(name, profile=None)`

Delete a secgroup to nova (nova secgroup-delete)

CLI Example:

```
salt '*' nova.secgroup_delete mygroup
```

`salt.modules.nova.secgroup_list(profile=None)`

Return a list of available security groups (nova items-list)

CLI Example:

```
salt '*' nova.secgroup_list
```

`salt.modules.nova.server_by_name(name, profile=None)`

Return information about a server

**name** Server Name

CLI Example:

```
salt '*' nova.server_by_name myserver profile=openstack
```

`salt.modules.nova.server_list(profile=None)`

Return list of active servers

CLI Example:

```
salt '*' nova.server_list
```

`salt.modules.nova.server_list_detailed(profile=None)`

Return detailed list of active servers

CLI Example:

```
salt '*' nova.server_list_detailed
```

`salt.modules.nova.server_show(server_id, profile=None)`

Return detailed information for an active server

CLI Example:

```
salt '*' nova.server_show <server_id>
```

`salt.modules.nova.show`(*server\_id*, *profile=None*)

To maintain the feel of the nova command line, this function simply calls the `server_show` function.

CLI Example:

```
salt '*' nova.show
```

`salt.modules.nova.suspend`(*instance\_id*, *profile=None*)

Suspend an instance

**instance\_id** ID of the instance to be suspended

CLI Example:

```
salt '*' nova.suspend 1138
```

`salt.modules.nova.volume_attach`(*name*, *server\_name*, *device='/dev/xvdb'*, *profile=None*, *timeout=300*)

Attach a block storage volume

**name** Name of the new volume to attach

**server\_name** Name of the server to attach to

**device** Name of the device on the server

**profile** Profile to build on

CLI Example:

```
salt '*' nova.volume_attach myblock slice.example.com profile=openstack
salt '*' nova.volume_attach myblock server.example.com device='/
dev/xvdb' profile=openstack
```

`salt.modules.nova.volume_create`(*name*, *size=100*, *snapshot=None*, *voltype=None*, *profile=None*)

Create a block storage volume

**name** Name of the new volume (must be first)

**size** Volume size

**snapshot** Block storage snapshot id

**voltype** Type of storage

**profile** Profile to build on

CLI Example:

```
salt '*' nova.volume_create myblock size=300 profile=openstack
```

`salt.modules.nova.volume_delete`(*name*, *profile=None*)

Destroy the volume

**name** Name of the volume

**profile** Profile to build on

CLI Example:

```
salt '*' nova.volume_delete myblock profile=openstack
```

`salt.modules.nova.volume_detach`(*name*, *profile=None*, *timeout=300*)

Attach a block storage volume

**name** Name of the new volume to attach

**server\_name** Name of the server to detach from

**profile** Profile to build on

CLI Example:

```
salt '*' nova.volume_detach myblock profile=openstack
```

`salt.modules.nova.volume_list`(*search\_opts=None, profile=None*)

List storage volumes

**search\_opts** Dictionary of search options

**profile** Profile to use

CLI Example:

```
salt '*' nova.volume_list search_opts={'display_name': "myblock"}
↪ profile=openstack
```

`salt.modules.nova.volume_show`(*name, profile=None*)

Create a block storage volume

**name** Name of the volume

**profile** Profile to use

CLI Example:

```
salt '*' nova.volume_show myblock profile=openstack
```

### 14.7.259 salt.modules.npm

Manage and query NPM packages.

`salt.modules.npm.cache_clean`(*path=None, runas=None, env=None, force=False*)

Clean cached NPM packages.

If no path for a specific package is provided the entire cache will be cleared.

**path** The cache subpath to delete, or None to clear the entire cache

**runas** The user to run NPM with

**env** Environment variables to set when invoking npm. Uses the same env format as the `cmd.run` execution function.

**force** Force cleaning of cache. Required for npm@5 and greater

New in version 2016.11.6.

CLI Example:

```
salt '*' npm.cache_clean force=True
```

`salt.modules.npm.cache_list`(*path=None, runas=None, env=None*)

List NPM cached packages.

If no path for a specific package is provided this will list all the cached packages.

**path** The cache subpath to list, or None to list the entire cache

**runas** The user to run NPM with

**env** Environment variables to set when invoking npm. Uses the same env format as the `cmd.run` execution function.

CLI Example:

```
salt '*' npm.cache_clean
```

`salt.modules.npm.cache_path`(*runas=None, env=None*)

List path of the NPM cache directory.

**runas** The user to run NPM with

**env** Environment variables to set when invoking npm. Uses the same env format as the `cmd.run` execution function.

CLI Example:

```
salt '*' npm.cache_path
```

**salt.modules.npm.install** (*pkg=None, pkgs=None, dir=None, runas=None, registry=None, env=None, dry\_run=False, silent=True*)

Install an NPM package.

If no directory is specified, the package will be installed globally. If no package is specified, the dependencies (from package.json) of the package in the given directory will be installed.

**pkg** A package name in any format accepted by NPM, including a version identifier

**pkgs** A list of package names in the same format as the name parameter

New in version 2014.7.0.

**dir** The target directory in which to install the package, or None for global installation

**runas** The user to run NPM with

**registry** The NPM registry to install the package from.

New in version 2014.7.0.

**env** Environment variables to set when invoking npm. Uses the same env format as the *cmd.run* execution function.

New in version 2014.7.0.

**silent** Whether or not to run NPM install with --silent flag.

New in version 2016.3.0.

**dry\_run** Whether or not to run NPM install with --dry-run flag.

New in version 2015.8.4.

**silent** Whether or not to run NPM install with --silent flag.

New in version 2015.8.5.

CLI Example:

```
salt '*' npm.install coffee-script
```

```
salt '*' npm.install coffee-script@1.0.1
```

**salt.modules.npm.list** (*pkg=None, dir=None, runas=None, env=None, depth=None*)

List installed NPM packages.

If no directory is specified, this will return the list of globally- installed packages.

**pkg** Limit package listing by name

**dir** The directory whose packages will be listed, or None for global installation

**runas** The user to run NPM with

New in version 2014.7.0.

**env** Environment variables to set when invoking npm. Uses the same env format as the *cmd.run* execution function.

New in version 2014.7.0.

**depth** Limit the depth of the packages listed

New in version 2016.11.6; 2017.7.0

CLI Example:

```
salt '*' npm.list
```

**salt.modules.npm.uninstall** (*pkg, dir=None, runas=None, env=None*)

Uninstall an NPM package.

If no directory is specified, the package will be uninstalled globally.

**pkg** A package name in any format accepted by NPM

**dir** The target directory from which to uninstall the package, or None for global installation

**runas** The user to run NPM with

**env** Environment variables to set when invoking npm. Uses the same env format as the `cmd.run` execution function.

New in version 2015.5.3.

CLI Example:

```
salt '*' npm.uninstall coffee-script
```

### 14.7.260 salt.modules.nspawn

Manage nspawn containers

New in version 2015.8.0.

`systemd-nspawn(1)` is a tool used to manage lightweight namespace containers. This execution module provides several functions to help manage these containers.

Minions running `systemd >= 219` will place new containers in `/var/lib/machines`, while those running `systemd < 219` will place them in `/var/lib/container`.

`salt.modules.nspawn.bootstrap_container` (*name*, *dist=None*, *version=None*)

Bootstrap a container from package servers, if *dist* is None the os the minion is running as will be created, otherwise the needed bootstrapping tools will need to be available on the host.

CLI Example:

```
salt myminion nspawn.bootstrap_container <name>
```

`salt.modules.nspawn.bootstrap_salt` (*name*, *config=None*, *approve\_key=True*, *install=True*, *pub\_key=None*, *priv\_key=None*, *bootstrap\_url=None*, *force\_install=False*, *unconditional\_install=False*, *bootstrap\_delay=None*, *bootstrap\_args=None*, *bootstrap\_shell=None*)

Bootstrap a container from package servers, if *dist* is None the os the minion is running as will be created, otherwise the needed bootstrapping tools will need to be available on the host.

CLI Example:

```
salt '*' nspawn.bootstrap_salt arch1
```

`salt.modules.nspawn.copy_to` (*name*, *\*args*, *\*\*kwargs*)

Copy a file from the host into a container

**name** Container name

**source** File to be copied to the container

**dest** Destination on the container. Must be an absolute path.

**overwrite** [False] Unless this option is set to True, then if a file exists at the location specified by the *dest* argument, an error will be raised.

**makedirs** : False

Create the parent directory on the container if it does not already exist.

CLI Example:

```
salt 'minion' nspawn.copy_to /tmp/foo /root/foo
```

`salt.modules.nspawn.disable(name, *args, **kwargs)`  
Set the named container to *not* be launched at boot

CLI Example:

```
salt myminion nspawn.enable <name>
```

`salt.modules.nspawn.enable(name, *args, **kwargs)`  
Set the named container to be launched at boot

CLI Example:

```
salt myminion nspawn.enable <name>
```

`salt.modules.nspawn.exists(name)`  
Returns true if the named container exists

CLI Example:

```
salt myminion nspawn.exists <name>
```

`salt.modules.nspawn.info(name, **kwargs)`  
Return info about a container

---

**Note:** The container must be running for `machinectl` to gather information about it. If the container is stopped, then this function will start it.

---

**start** [False] If True, then the container will be started to retrieve the info. A `Started` key will be in the return data if the container was started.

CLI Example:

```
salt myminion nspawn.info arch1
salt myminion nspawn.info arch1 force_start=False
```

`salt.modules.nspawn.list_all()`  
Lists all nspawn containers

CLI Example:

```
salt myminion nspawn.list_all
```

`salt.modules.nspawn.list_running()`  
Lists running nspawn containers

---

**Note:** `nspawn.list` also works to list running containers

---

CLI Example:

```
salt myminion nspawn.list_running
salt myminion nspawn.list
```

`salt.modules.nspawn.list_stopped()`  
Lists stopped nspawn containers

CLI Example:

```
salt myminion nspawn.list_stopped
```

`salt.modules.nspawn.pid`(*name*, \**args*, \*\**kwargs*)

Returns the PID of a container

**name** Container name

CLI Example:

```
salt myminion nspawn.pid arch1
```

`salt.modules.nspawn.poweroff`(*name*)

Issue a clean shutdown to the container. Equivalent to running `machinectl poweroff` on the named container.

For convenience, running `nspawn.stop` (as shown in the CLI examples below) is equivalent to running `nspawn.poweroff.`

---

**Note:** `machinectl poweroff` is only supported in `systemd >= 219`. On earlier `systemd` versions, running this function will simply issue a clean shutdown via `systemctl`.

---

CLI Examples:

```
salt myminion nspawn.poweroff arch1
salt myminion nspawn.stop arch1
```

`salt.modules.nspawn.pull_dkr`(*url*, *name*, *index*)

Execute a `machinectl pull-dkr` to download a docker image and add it to `/var/lib/machines` as a new container.

---

**Note:** Requires `systemd >= 219`

---

**url** URL from which to download the container

**name** Name for the new container

**index** URL of the Docker index server from which to pull (must be an `http://` or `https://` URL).

CLI Examples:

```
salt myminion nspawn.pull_dkr centos/centos6 cent6 index=https://get.docker.com
salt myminion nspawn.pull_docker centos/centos6 cent6 index=https://get.docker.com
```

`salt.modules.nspawn.pull_raw`(*url*, *name*, *verify=False*)

Execute a `machinectl pull-raw` to download a `.qcow2` or raw disk image, and add it to `/var/lib/machines` as a new container.

---

**Note:** Requires `systemd >= 219`

---

**url** URL from which to download the container

**name** Name for the new container

**verify** [False] Perform signature or checksum verification on the container. See the `machinectl(1)` man page (section titled "Image Transfer Commands") for more information on requirements for image verification. To perform signature verification, use `verify=signature`. For checksum verification, use `verify=checksum`. By default, no verification will be performed.

CLI Examples:

```
salt myminion nspawn.pull_raw http://ftp.halifax.rwth-aachen.de/fedora/linux/
↳ releases/21/Cloud/Images/x86_64/Fedora-Cloud-Base-20141203-21.x86_64.raw.xz
↳ fedora21
```

`salt.modules.nspawn.pull_tar` (*url*, *name*, *verify=False*)

Execute a `machinectl pull-raw` to download a .tar container image, and add it to `/var/lib/machines` as a new container.

---

**Note:** Requires `systemd >= 219`

---

**url** URL from which to download the container

**name** Name for the new container

**verify** [False] Perform signature or checksum verification on the container. See the `machinectl(1)` man page (section titled "Image Transfer Commands") for more information on requirements for image verification. To perform signature verification, use `verify=signature`. For checksum verification, use `verify=checksum`. By default, no verification will be performed.

CLI Examples:

```
salt myminion nspawn.pull_tar http://foo.domain.tld/containers/archlinux-2015.02.
↳ 01.tar.gz arch2
```

`salt.modules.nspawn.reboot` (*name*, *\*args*, *\*\*kwargs*)

Reboot the container by sending a SIGINT to its init process. Equivalent to running `machinectl reboot` on the named container.

For convenience, running `nspawn.restart` (as shown in the CLI examples below) is equivalent to running `nspawn.reboot`.

---

**Note:** `machinectl reboot` is only supported in `systemd >= 219`. On earlier `systemd` versions, running this function will instead restart the container via `systemctl`.

---

CLI Examples:

```
salt myminion nspawn.reboot arch1
salt myminion nspawn.restart arch1
```

`salt.modules.nspawn.remove` (*name*, *\*args*, *\*\*kwargs*)

Remove the named container

**Warning:** This function will remove all data associated with the container. It will not, however, remove the btrfs subvolumes created by pulling container images (`nspawn.pull_raw`, `nspawn.pull_tar`, `nspawn.pull_dkr`).

**stop** [False] If True, the container will be destroyed even if it is running/frozen.

CLI Examples:

```
salt '*' nspawn.remove foo
salt '*' nspawn.remove foo stop=True
```

`salt.modules.nspawn.retcode`(*name*, *cmd*, *no\_start=False*, *preserve\_state=True*, *stdin=None*, *python\_shell=True*, *output\_loglevel='debug'*, *use\_vt=False*, *ignore\_retcode=False*, *keep\_env=None*)

Run `cmd.retcode` within a container

**name** Name of the container in which to run the command

**cmd** Command to run

**no\_start** [False] If the container is not running, don't start it

**preserve\_state** [True] After running the command, return the container to its previous state

**stdin** [None] Standard input to be used for the command

**output\_loglevel** [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

**use\_vt** [False] Use SaltStack's `utils.vt` to stream output to console. Assumes `output=all`.

**keep\_env** [None] If not passed, only a sane default `PATH` environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.retcode mycontainer 'ip addr show'
```

`salt.modules.nspawn.run`(*name*, *cmd*, *no\_start=False*, *preserve\_state=True*, *stdin=None*, *python\_shell=True*, *output\_loglevel='debug'*, *use\_vt=False*, *ignore\_retcode=False*, *keep\_env=None*)

Run `cmd.run` within a container

**name** Name of the container in which to run the command

**cmd** Command to run

**no\_start** [False] If the container is not running, don't start it

**preserve\_state** [True] After running the command, return the container to its previous state

**stdin** [None] Standard input to be used for the command

**output\_loglevel** [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

**use\_vt** [False] Use SaltStack's `utils.vt` to stream output to console.

**keep\_env** [None] If not passed, only a sane default `PATH` environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run mycontainer 'ifconfig -a'
```

`salt.modules.nspawn.run_all`(*name*, *cmd*, *no\_start=False*, *preserve\_state=True*, *stdin=None*, *python\_shell=True*, *output\_loglevel='debug'*, *use\_vt=False*, *ignore\_retcode=False*, *keep\_env=None*)

Run `cmd.run_all` within a container

---

**Note:** While the command is run within the container, it is initiated from the host. Therefore, the PID in the return dict is from the host, not from the container.

---

**name** Name of the container in which to run the command

**cmd** Command to run

**no\_start** [False] If the container is not running, don't start it

**preserve\_state** [True] After running the command, return the container to its previous state

**stdin** [None] Standard input to be used for the command

**output\_loglevel** [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

**use\_vt** [False] Use SaltStack's `utils.vt` to stream output to console. Assumes `output=all`.

**keep\_env** [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run_all mycontainer 'ip addr show'
```

**salt.modules.nspawn.run\_stderr**(*name*, *cmd*, *no\_start=False*, *preserve\_state=True*, *stdin=None*, *python\_shell=True*, *output\_loglevel='debug'*, *use\_vt=False*, *ignore\_retcode=False*, *keep\_env=None*)

Run *cmd.run\_stderr* within a container

**name** Name of the container in which to run the command

**cmd** Command to run

**no\_start** [False] If the container is not running, don't start it

**preserve\_state** [True] After running the command, return the container to its previous state

**stdin** [None] Standard input to be used for the command

**output\_loglevel** [debug] Level at which to log the output from the command. Set to quiet to suppress logging.

**use\_vt** [False] Use SaltStack's *utils.vt* to stream output to console. Assumes *output=all*.

**keep\_env** [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run_stderr mycontainer 'ip addr show'
```

**salt.modules.nspawn.run\_stdout**(*name*, *cmd*, *no\_start=False*, *preserve\_state=True*, *stdin=None*, *python\_shell=True*, *output\_loglevel='debug'*, *use\_vt=False*, *ignore\_retcode=False*, *keep\_env=None*)

Run *cmd.run\_stdout* within a container

**name** Name of the container in which to run the command

**cmd** Command to run

**no\_start** [False] If the container is not running, don't start it

**preserve\_state** [True] After running the command, return the container to its previous state

**stdin** [None] Standard input to be used for the command

**output\_loglevel** [debug] Level at which to log the output from the command. Set to quiet to suppress logging.

**use\_vt** [False] Use SaltStack's *utils.vt* to stream output to console. Assumes *output=all*.

**keep\_env** [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run_stdout mycontainer 'ifconfig -a'
```

**salt.modules.nspawn.start**(*name*, *\*args*, *\*\*kwargs*)

Start the named container

CLI Example:

```
salt myminion nspawn.start <name>
```

**salt.modules.nspawn.state**(*name*, *\*args*, *\*\*kwargs*)

Return state of container (running or stopped)

CLI Example:

```
salt myminion nspawn.state <name>
```

`salt.modules.nspawn.terminate`(*name*)

Kill all processes in the container without issuing a clean shutdown. Equivalent to running `machinectl terminate` on the named container.

For convenience, running `nspawn.stop` and passing `kill=True` (as shown in the CLI examples below) is equivalent to running `nspawn.terminate`.

---

**Note:** `machinectl terminate` is only supported in `systemd >= 219`. On earlier `systemd` versions, running this function will simply issue a clean shutdown via `systemctl`.

---

CLI Examples:

```
salt myminion nspawn.terminate arch1
salt myminion nspawn.stop arch1 kill=True
```

### 14.7.261 salt.modules.nxos module

Execution module for Cisco NX OS Switches Proxy minions

New in version 2016.11.0.

For documentation on setting up the `nxos` proxy minion look in the documentation for [salt.proxy.nxos](#).

`salt.modules.nxos.cmd`(*command*, *\*args*, *\*\*kwargs*)

run commands from `__proxy__ salt.proxy.nxos`

**command** function from `salt.proxy.nxos` to run

**args** positional args to pass to `command` function

**kwargs** key word arguments to pass to `command` function

```
salt '*' nxos.cmd sendline 'show ver'
salt '*' nxos.cmd show_run
salt '*' nxos.cmd check_password username=admin password='$5$lkjsdfoi$blahblahblah
↳ encrypted=True
```

`salt.modules.nxos.system_info`()

Return system information for grains of the NX OS proxy minion

```
salt '*' nxos.system_info
```

### 14.7.262 salt.modules.omapi

This module interacts with an ISC DHCP Server via OMAPI. `server_ip` and `server_port` params may be set in the minion config or pillar:

```
omapi.server_ip: 127.0.0.1
omapi.server_port: 7991
```

**depends** `pypureomapi` Python module

`salt.modules.omapi.add_host`(*mac*, *name=None*, *ip=None*, *ddns=False*, *group=None*, *super-  
sede\_host=False*)

Add a host object for the given `mac`.

CLI Example:

```
salt dhcp-server omapi.add_host ab:ab:ab:ab:ab:ab name=host1
```

Add ddns-hostname and a fixed-ip statements:

```
salt dhcp-server omapi.add_host ab:ab:ab:ab:ab:ab name=host1 ip=10.1.1.1 ddns=true
```

`salt.modules.omapi.delete_host` (*mac=None, name=None*)  
Delete the host with the given mac or name.

CLI Examples:

```
salt dhcp-server omapi.delete_host name=host1
salt dhcp-server omapi.delete_host mac=ab:ab:ab:ab:ab:ab
```

### 14.7.263 salt.modules.openbsd\_sysctl

Module for viewing and modifying OpenBSD sysctl parameters

`salt.modules.openbsd_sysctl.assign` (*name, value*)  
Assign a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.assign net.inet.ip.forwarding 1
```

`salt.modules.openbsd_sysctl.get` (*name*)  
Return a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.get hw.physmem
```

`salt.modules.openbsd_sysctl.persist` (*name, value, config='/etc/sysctl.conf'*)  
Assign and persist a simple sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.persist net.inet.ip.forwarding 1
```

`salt.modules.openbsd_sysctl.show` (*config\_file=False*)  
Return a list of sysctl parameters for this minion

CLI Example:

```
salt '*' sysctl.show
```

### 14.7.264 salt.modules.openbsdpkg

Package support for OpenBSD

---

**Note:** The package repository is configured on each host using `/etc/pkg.conf`

---

Changed in version 2016.3.5: Package versions on OpenBSD are not normally specified explicitly; instead packages may be available in multiple *flavors*, and *branches* which are specified by the format of the package name. This module allows you to use the same formatting as `pkg_add(1)`, and will select the empty flavor and default branch by default. Examples:

```
- rsync
- vim--no_x11
- ruby%2.3
```

`salt.modules.openbsdpkg.install`(*name=None, pkgs=None, sources=None, \*\*kwargs*)

Install the passed package

Return a dict containing the new package names and versions:

```
{ '<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example, Install one package:

```
salt '*' pkg.install <package name>
```

CLI Example, Install more than one package:

```
salt '*' pkg.install pkgs='["<package name>", "<package name>"]'
```

CLI Example, Install more than one package from a alternate source (e.g. salt file-server, HTTP, FTP, local filesystem):

```
salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>"}]'
```

`salt.modules.openbsdpkg.latest_version`(*\*names, \*\*kwargs*)

The available version of the package in the repository

CLI Example:

```
salt '*' pkg.latest_version <package name>
```

`salt.modules.openbsdpkg.list_pkgs`(*versions\_as\_list=False, \*\*kwargs*)

List the packages currently installed as a dict:

```
{ '<package_name>': '<version>' }
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.openbsdpkg.purge`(*name=None, pkgs=None, \*\*kwargs*)

Package purges are not supported, this function is identical to `remove()`.

**name** The name of the package to be deleted.

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```

salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>, <package2>, <package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'

```

`salt.modules.openbsd_pkg.remove`(*name=None*, *pkgs=None*, *\*\*kwargs*)

Remove a single package with `pkg_delete`

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```

salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>, <package2>, <package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'

```

`salt.modules.openbsd_pkg.version`(*\*names*, *\*\*kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```

salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...

```

### 14.7.265 salt.modules.openbsdrctl

The `rcctl` service module for OpenBSD

`salt.modules.openbsdrctl.available`(*name*)

Return True if the named service is available.

CLI Example:

```

salt '*' service.available sshd

```

`salt.modules.openbsdrctl.disable`(*name*, *\*\*kwargs*)

Disable the named service to not start at boot.

CLI Example:

```

salt '*' service.disable <service name>

```

`salt.modules.openbsdrctl.disabled`(*name*)

Return True if the named service is disabled at boot, False otherwise.

CLI Example:

```

salt '*' service.disabled <service name>

```

`salt.modules.openbsdrctl.enable`(*name*, *\*\*kwargs*)

Enable the named service to start at boot.

**flags** [None] Set optional flags to run the service with.

service.flags can be used to change the default flags.

CLI Example:

```
salt '*' service.enable <service name>
salt '*' service.enable <service name> flags=<flags>
```

**salt.modules.openbsdrctl.enabled**(*name*, *\*\*kwargs*)

Return True if the named service is enabled at boot and the provided flags match the configured ones (if any).  
Return False otherwise.

**name** Service name

CLI Example:

```
salt '*' service.enabled <service name>
salt '*' service.enabled <service name> flags=<flags>
```

**salt.modules.openbsdrctl.get\_all**()

Return all installed services.

CLI Example:

```
salt '*' service.get_all
```

**salt.modules.openbsdrctl.get\_disabled**()

Return what services are available but not enabled to start at boot.

CLI Example:

```
salt '*' service.get_disabled
```

**salt.modules.openbsdrctl.get\_enabled**()

Return what services are set to run on boot.

CLI Example:

```
salt '*' service.get_enabled
```

**salt.modules.openbsdrctl.missing**(*name*)

The inverse of service.available. Return True if the named service is not available.

CLI Example:

```
salt '*' service.missing sshd
```

**salt.modules.openbsdrctl.reload**(*name*)

Reload the named service.

CLI Example:

```
salt '*' service.reload <service name>
```

**salt.modules.openbsdrctl.restart**(*name*)

Restart the named service.

CLI Example:

```
salt '*' service.restart <service name>
```

**salt.modules.openbsdrctl.start**(*name*)

Start the named service.

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.openbsdcctl.status`(*name*, *sig=None*)

Return the status for a service, returns a bool whether the service is running.

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.openbsdcctl.stop`(*name*)

Stop the named service.

CLI Example:

```
salt '*' service.stop <service name>
```

### 14.7.266 salt.modules.openbsdservice

The service module for OpenBSD

---

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `'service.start' is not available`), see [here](#).

---

`salt.modules.openbsdservice.available`(*name*)

New in version 2014.7.0.

Returns True if the specified service is available, otherwise returns False.

CLI Example:

```
salt '*' service.available sshd
```

`salt.modules.openbsdservice.disabled`(*name*)

New in version 2014.7.0.

Return True if the named service is disabled, false otherwise

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.openbsdservice.enabled`(*name*, *\*\*kwargs*)

New in version 2014.7.0.

Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.openbsdservice.get_all`()

New in version 2014.7.0.

Return all available boot services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.openbsdservice.get_disabled()`

New in version 2014.7.0.

Return a set of services that are installed but disabled

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.openbsdservice.get_enabled()`

New in version 2014.7.0.

Return a list of service that are enabled on boot

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.openbsdservice.missing(name)`

New in version 2014.7.0.

The inverse of `service.available`. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.openbsdservice.reload(name)`

New in version 2014.7.0.

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.openbsdservice.restart(name)`

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.openbsdservice.start(name)`

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.openbsdservice.status(name, sig=None)`

Return the status for a service, returns a bool whether the service is running.

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.openbsdservice.stop`(*name*)

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

### 14.7.267 salt.modules.openscap module

`salt.modules.openscap.xccdf`(*params*)

Run `oscap xccdf` commands on minions. It uses `cp.push_dir` to upload the generated files to the salt master in the master's minion files cachedir (defaults to `/var/cache/salt/master/minions/minion-id/files`)

It needs `file_recv` set to `True` in the master configuration file.

CLI Example:

```
salt '*' openscap.xccdf "eval --profile Default /usr/share/openscap/scap-
↳ yast2sec-xccdf.xml"
```

### 14.7.268 salt.modules.openstack\_config

Modify, retrieve, or delete values from OpenStack configuration files.

**maintainer** Jeffrey C. Ollie <jeff@ocjtech.us>

**maturity** new

**depends**

**platform** linux

`salt.modules.openstack_config.delete`(*filename*, *section*, *parameter*)

Delete a value from an OpenStack configuration file.

**filename** The full path to the configuration file

**section** The section from which to delete the parameter

**parameter** The parameter to delete

CLI Example:

```
salt-call openstack_config.delete /etc/keystone/keystone.conf sql connection
```

`salt.modules.openstack_config.get`(*filename*, *section*, *parameter*)

Get a value from an OpenStack configuration file.

**filename** The full path to the configuration file

**section** The section from which to search for the parameter

**parameter** The parameter to return

CLI Example:

```
salt-call openstack_config.get /etc/keystone/keystone.conf sql connection
```

`salt.modules.openstack_config.set`(*filename*, *section*, *parameter*, *value*)

Set a value in an OpenStack configuration file.

**filename** The full path to the configuration file

**section** The section in which the parameter will be set

**parameter** The parameter to change

**value** The value to set

CLI Example:

```
salt-call openstack_config.set /etc/keystone/keystone.conf sql connection foo
```

### 14.7.269 salt.modules.openstack\_mng module

Module for OpenStack Management

**codeauthor** Konrad Mosoń <mosonkonrad@gmail.com>

**maturity** new

**depends** openstack-utils

**platform** linux

**salt.modules.openstack\_mng.restart\_service**(*service\_name*, *minimum\_running\_time=None*)  
Restart OpenStack service immediately, or only if it's running longer than specified value

CLI Example:

```
salt '*' openstack_mng.restart_service neutron
salt '*' openstack_mng.restart_service neutron minimum_running_time=600
```

**salt.modules.openstack\_mng.start\_service**(*service\_name*)  
Start OpenStack service immediately

CLI Example:

```
salt '*' openstack_mng.start_service neutron
```

**salt.modules.openstack\_mng.stop\_service**(*service\_name*)  
Stop OpenStack service immediately

CLI Example:

```
salt '*' openstack_mng.stop_service neutron
```

### 14.7.270 salt.modules.openvswitch module

Support for Open vSwitch - module with basic Open vSwitch commands.

Suitable for setting up Openstack Neutron.

**codeauthor** Jiri Kotlin <jiri.kotlin@ultimum.io>

**salt.modules.openvswitch.bridge\_create**(*br*, *may\_exist=True*)  
Creates a new bridge.

**Parameters**

- **br** -- A string - bridge name
- **may\_exist** -- Bool, if False - attempting to create a bridge that exists returns False.

**Returns** True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.bridge_create br0
```

`salt.modules.openvswitch.bridge_delete(br, if_exists=True)`

Deletes bridge and all of its ports.

**Parameters**

- **br** -- A string - bridge name
- **if\_exists** -- Bool, if False - attempting to delete a bridge that does not exist returns False.

**Returns** True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.bridge_delete br0
```

`salt.modules.openvswitch.bridge_exists(br)`

Tests whether bridge exists as a real or fake bridge.

**Returns** True if Bridge exists, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.bridge_exists br0
```

`salt.modules.openvswitch.bridge_list()`

Lists all existing real and fake bridges.

**Returns** List of bridges (or empty list), False on failure.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.bridge_list
```

`salt.modules.openvswitch.interface_get_options(port)`

Port's interface's optional parameters.

**Parameters** **port** -- A string - port name.

**Returns** String containing optional parameters of port's interface, False on failure.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.interface_get_options tap0
```

`salt.modules.openvswitch.interface_get_type(port)`

Type of port's interface.

**Parameters** **port** -- A string - port name.

**Returns** String - type of interface or empty string, False on failure.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.interface_get_type tap0
```

`salt.modules.openvswitch.port_add(br, port, may_exist=False)`

Creates on bridge a new port named port.

**Returns** True on success, else False.

**Parameters**

- **br** -- A string - bridge name
- **port** -- A string - port name
- **may\_exist** -- Bool, if False - attempting to create a port that exists returns False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.port_add br0 8080
```

`salt.modules.openvswitch.port_create_gre(br, port, id, remote)`

Generic Routing Encapsulation - creates GRE tunnel between endpoints.

**Parameters**

- **br** -- A string - bridge name.
- **port** -- A string - port name.
- **id** -- An integer - unsigned 32-bit number, tunnel's key.
- **remote** -- A string - remote endpoint's IP address.

**Returns** True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.port_create_gre br0 gre1 5001 192.168.1.10
```

`salt.modules.openvswitch.port_create_vlan`(*br, port, id, internal=False*)

Isolate VM traffic using VLANs.

**Parameters**

- **br** -- A string - bridge name.
- **port** -- A string - port name.
- **id** -- An integer in the valid range 0 to 4095 (inclusive), name of VLAN.
- **internal** -- A boolean to create an internal interface if one does not exist.

**Returns** True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.port_create_vlan br0 tap0 100
```

`salt.modules.openvswitch.port_create_vxlan`(*br, port, id, remote, dst\_port=None*)

Virtual eXtensible Local Area Network - creates VXLAN tunnel between endpoints.

**Parameters**

- **br** -- A string - bridge name.
- **port** -- A string - port name.
- **id** -- An integer - unsigned 64-bit number, tunnel's key.
- **remote** -- A string - remote endpoint's IP address.
- **dst\_port** -- An integer - port to use when creating tunnelport in the switch.

**Returns** True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.port_create_vxlan br0 vx1 5001 192.168.1.10 8472
```

`salt.modules.openvswitch.port_get_tag`(*port*)

Lists tags of the port.

**Parameters** **port** -- A string - port name.

**Returns** List of tags (or empty list), False on failure.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.port_get_tag tap0
```

`salt.modules.openvswitch.port_list`(*br*)

Lists all of the ports within bridge.

**Parameters** **br** -- A string - bridge name.

**Returns** List of bridges (or empty list), False on failure.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.port_list br0
```

`salt.modules.openvswitch.port_remove`(*br, port, if\_exists=True*)

Deletes port.

**Parameters**

- **br** -- A string - bridge name (If bridge is None, port is removed from whatever bridge contains it)
- **port** -- A string - port name.
- **if\_exists** -- Bool, if False - attempting to delete a port that does not exist returns False. (Default True)

**Returns** True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.port_remove br0 8080
```

### 14.7.271 salt.modules.opkg module

Support for Opkg

---

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `'pkg.install' is not available`), see [here](#).

---

---

**Note:** For version comparison support on `opkg < 0.3.4`, the `opkg-utils` package must be installed.

---

`salt.modules.opkg.available_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.opkg.del_repo(alias)`

Delete a repo from `/etc/opkg/*.conf`

If the file does not contain any other repo configuration, the file itself will be deleted.

CLI Examples:

```
salt '*' pkg.del_repo alias
```

`salt.modules.opkg.file_dict(*packages)`

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of `_every_file` on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.opkg.file_list(*packages)`

List the files that belong to a package. Not specifying any packages will return a list of `_every_` file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.opkg.get_repo(alias)`

Display a repo from the `/etc/opkg/*.conf`

CLI Examples:

```
salt '*' pkg.get_repo alias
```

`salt.modules.opkg.hold(name=None, pkgs=None, sources=None, **kwargs)`

Set package in `'hold'` state, meaning it will not be upgraded.

**name** The name of the package, e.g., `'tmux'`

CLI Example:

```
salt '*' pkg.hold <package name>
```

**pkgs** A list of packages to hold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.hold pkgs=['foo', 'bar']
```

`salt.modules.opkg.info_installed(*names, **kwargs)`

Return the information of the named package(s), installed on the system.

New in version 2017.7.0.

**Parameters**

- **names** -- Names of the packages to get information about. If none are specified, will return information for all installed packages.
- **attr** -- Comma-separated package attributes. If no `'attr'` is specified, all available attributes returned.  
**Valid attributes are:** `arch`, `conffiles`, `conflicts`, `depends`, `description`, `filename`, `group`, `install_date_time_t`, `md5sum`, `packager`, `provides`, `recommends`, `replaces`, `size`, `source`, `suggests`, `url`, `version`

CLI example:

```
salt '*' pkg.info_installed
salt '*' pkg.info_installed attr=version,packager
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
salt '*' pkg.info_installed <package1> attr=version,packager
salt '*' pkg.info_installed <package1> <package2> <package3> ...
↳attr=version,packager
```

`salt.modules.opkg.install(name=None, refresh=False, pkgs=None, sources=None, reinstall=False, **kwargs)`

Install the passed package, add `refresh=True` to update the `opkg` database.

**name** The name of the package to be installed. Note that this parameter is ignored if either `'pkgs'` or `'sources'` is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the `'sources'` option.

CLI Example:

```
salt '*' pkg.install <package name>
```

**refresh** Whether or not to refresh the package database before installing.

**version** Install a specific version of the package, e.g. 1.2.3-0ubuntu0. Ignored if ``pkgs`` or ``sources`` is passed.

New in version 2017.7.0.

**reinstall** [False] Specifying `reinstall=True` will use `opkg install --force-reinstall` rather than simply `opkg install` for requested packages that are already installed.

If a version is specified with the requested package, then `opkg install --force-reinstall` will only be used if the installed version matches the requested version.

New in version 2017.7.0.

Multiple Package Installation Options:

**pkgs** A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3-0ubuntu0"}]'
```

**sources** A list of IPK packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package. Dependencies are automatically resolved and marked as auto-installed.

CLI Example:

```
salt '*' pkg.install sources=[{"foo": "salt://foo.deb"}, {"bar": "salt://bar.
↳deb"}]'
```

**install\_recommends** Whether to install the packages marked as recommended. Default is True.

**only\_upgrade** Only upgrade the packages (disallow downgrades), if they are already installed. Default is False.

New in version 2017.7.0.

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

`salt.modules.opkg.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.opkg.list_pkgs(versions_as_list=False, **kwargs)`

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

`salt.modules.opkg.list_repos()`

Lists all repos on `/etc/opkg/*.conf`

CLI Example:

```
salt '*' pkg.list_repos
```

`salt.modules.opkg.list_upgrades(refresh=True)`

List all available package upgrades.

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.opkg.mod_repo(alias, **kwargs)`

Modify one or more values for a repo. If the repo does not exist, it will be created, so long as uri is defined.

The following options are available to modify a repo definition:

**alias** alias by which opkg refers to the repo.

**uri** the URI to the repo.

**compressed** defines (True or False) if the index file is compressed

**enabled** enable or disable (True or False) repository but do not remove if disabled.

**refresh** enable or disable (True or False) auto-refresh of the repositories

CLI Examples:

```
salt '*' pkg.mod_repo alias uri=http://new/uri
salt '*' pkg.mod_repo alias enabled=False
```

`salt.modules.opkg.owner(*paths)`

Return the name of the package that owns the file. Multiple file paths can be passed. Like `pkg.version` `<salt.modules.opkg.version`, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Example:

```
salt '*' pkg.owner /usr/bin/apachectl salt '*' pkg.owner /usr/bin/apachectl /usr/bin/basename
```

`salt.modules.opkg.purge(name=None, pkgs=None, **kwargs)`

Package purges are not supported by opkg, this function is identical to `pkg.remove`.

**name** The name of the package to be deleted.

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>, <package2>, <package3>
salt '*' pkg.purge pkgs=['foo', 'bar']
```

`salt.modules.opkg.refresh_db()`

Updates the opkg database to latest packages based upon repositories

Returns a dict, with the keys being package databases and the values being the result of the update attempt. Values can be one of the following:

- True: Database updated successfully
- False: Problem updating database

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.opkg.remove` (*name=None, pkgs=None, \*\*kwargs*)

Remove packages using `opkg remove`.

**name** The name of the package to be deleted.

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs=['foo', 'bar']
```

`salt.modules.opkg.unhold` (*name=None, pkgs=None, sources=None, \*\*kwargs*)

Set package current in 'hold' state to install state, meaning it will be upgraded.

**name** The name of the package, e.g., 'tmux'

CLI Example:

```
salt '*' pkg.unhold <package name>
```

**pkgs** A list of packages to hold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.unhold pkgs=['foo', 'bar']
```

`salt.modules.opkg.upgrade` (*refresh=True*)

Upgrades all packages via `opkg upgrade`

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.opkg.upgrade_available` (*name*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.opkg.version` (*\*names, \*\*kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

`salt.modules.opkg.version_cmp`(*pkg1*, *pkg2*, *ignore\_epoch=False*)

Do a cmp-style comparison on two packages. Return -1 if *pkg1* < *pkg2*, 0 if *pkg1* == *pkg2*, and 1 if *pkg1* > *pkg2*. Return None if there was a problem making the comparison.

**ignore\_epoch** [False] Set to True to ignore the epoch when comparing versions

New in version 2016.3.4.

CLI Example:

```
salt '*' pkg.version_cmp '0.2.4-0' '0.2.4.1-0'
```

### 14.7.272 salt.modules.oracle

Oracle DataBase connection module

**maintainer** Vladimir Bormotov <bormotov@gmail.com>

**maturity** new

**depends** cx\_Oracle

**platform** all

**configuration** module provide connections for multiple Oracle DB instances.

#### OS Environment

```
ORACLE_HOME: path to oracle product
PATH: path to Oracle Client libs need to be in PATH
```

#### pillar

```
oracle.dbs: list of known based
oracle.dbs.<db>.uri: connection credentials in format:
    user/password@host[:port]/sid[ as {sysdba|sysoper}]
```

`salt.modules.oracle.client_version`()

Oracle Client Version

CLI Example:

```
salt '*' oracle.client_version
```

`salt.modules.oracle.run_query`(*db*, *query*)

Run SQL query and return result

CLI Example:

```
salt '*' oracle.run_query my_db "select * from my_table"
```

`salt.modules.oracle.show_dbs`(*\*dbs*)

Show databases configuration from pillar. Filter by *\*args*

CLI Example:

```
salt '*' oracle.show_dbs
salt '*' oracle.show_dbs my_db
```

`salt.modules.oracle.show_env()`  
 Show Environment used by Oracle Client

CLI Example:

```
salt '*' oracle.show_env
```

---

**Note:** at first `_connect()` NLS\_LANG will forced to ``.AL32UTF8'`

---

`salt.modules.oracle.show_pillar` (*item=None*)  
 Show Pillar segment oracle.\* and subitem with notation ``item:subitem''

CLI Example:

```
salt '*' oracle.show_pillar
salt '*' oracle.show_pillar dbs:my_db
```

`salt.modules.oracle.version` (*\*dbs*)  
 Server Version (select banner from v\$version)

CLI Example:

```
salt '*' oracle.version
salt '*' oracle.version my_db
```

### 14.7.273 salt.modules.osquery

Support for OSQuery - <https://osquery.io>.

New in version 2015.8.0.

`salt.modules.osquery.acpi_tables` (*attrs=None, where=None*)  
 Return acpi\_tables information from osquery

CLI Example:

```
salt '*' osquery.acpi_tables
```

`salt.modules.osquery.alf` (*attrs=None, where=None*)  
 Return alf information from osquery

CLI Example:

```
salt '*' osquery.alf
```

`salt.modules.osquery.alf_exceptions` (*attrs=None, where=None*)  
 Return alf\_exceptions information from osquery

CLI Example:

```
salt '*' osquery.alf_exceptions
```

`salt.modules.osquery.alf_explicit_auths` (*attrs=None, where=None*)  
 Return alf\_explicit\_auths information from osquery

CLI Example:

```
salt '*' osquery.alf_explicit_auths
```

`salt.modules.osquery.alf_services` (*attrs=None, where=None*)

Return `alf_services` information from `osquery`

CLI Example:

```
salt '*' osquery.alf_services
```

`salt.modules.osquery.apps` (*attrs=None, where=None*)

Return `apps` information from `osquery`

CLI Example:

```
salt '*' osquery.apps
```

`salt.modules.osquery.apt_sources` (*attrs=None, where=None*)

Return `apt_sources` information from `osquery`

CLI Example:

```
salt '*' osquery.apt_sources
```

`salt.modules.osquery.arp_cache` (*attrs=None, where=None*)

Return `arp_cache` information from `osquery`

CLI Example:

```
salt '*' osquery.arp_cache
```

`salt.modules.osquery.block_devices` (*attrs=None, where=None*)

Return `block_devices` information from `osquery`

CLI Example:

```
salt '*' osquery.block_devices
```

`salt.modules.osquery.certificates` (*attrs=None, where=None*)

Return `certificates` information from `osquery`

CLI Example:

```
salt '*' osquery.certificates
```

`salt.modules.osquery.chrome_extensions` (*attrs=None, where=None*)

Return `chrome_extensions` information from `osquery`

CLI Example:

```
salt '*' osquery.chrome_extensions
```

`salt.modules.osquery.cpuuid` (*attrs=None, where=None*)

Return `cpuuid` information from `osquery`

CLI Example:

```
salt '*' osquery.cpuuid
```

`salt.modules.osquery.crontab` (*attrs=None, where=None*)

Return crontab information from osquery

CLI Example:

```
salt '*' osquery.crontab
```

`salt.modules.osquery.deb_packages` (*attrs=None, where=None*)

Return deb\_packages information from osquery

CLI Example:

```
salt '*' osquery.deb_packages
```

`salt.modules.osquery.etc_hosts` (*attrs=None, where=None*)

Return etc\_hosts information from osquery

CLI Example:

```
salt '*' osquery.etc_hosts
```

`salt.modules.osquery.etc_services` (*attrs=None, where=None*)

Return etc\_services information from osquery

CLI Example:

```
salt '*' osquery.etc_services
```

`salt.modules.osquery.file` (*attrs=None, where=None*)

Return file information from osquery

CLI Example:

```
salt '*' osquery.file
```

`salt.modules.osquery.file_changes` (*attrs=None, where=None*)

Return file\_changes information from osquery

CLI Example:

```
salt '*' osquery.file_changes
```

`salt.modules.osquery.firefox_addons` (*attrs=None, where=None*)

Return firefox\_addons information from osquery

CLI Example:

```
salt '*' osquery.firefox_addons
```

`salt.modules.osquery.groups` (*attrs=None, where=None*)

Return groups information from osquery

CLI Example:

```
salt '*' osquery.groups
```

`salt.modules.osquery.hardware_events` (*attrs=None, where=None*)

Return hardware\_events information from osquery

CLI Example:

```
salt '*' osquery.hardware_events
```

`salt.modules.osquery.hash` (*attrs=None, where=None*)

Return hash information from osquery

CLI Example:

```
salt '*' osquery.hash
```

`salt.modules.osquery.homebrew_packages` (*attrs=None, where=None*)

Return homebrew\_packages information from osquery

CLI Example:

```
salt '*' osquery.homebrew_packages
```

`salt.modules.osquery.interface_addresses` (*attrs=None, where=None*)

Return interface\_addresses information from osquery

CLI Example:

```
salt '*' osquery.interface_addresses
```

`salt.modules.osquery.interface_details` (*attrs=None, where=None*)

Return interface\_details information from osquery

CLI Example:

```
salt '*' osquery.interface_details
```

`salt.modules.osquery.iokit_devicetree` (*attrs=None, where=None*)

Return iokit\_devicetree information from osquery

CLI Example:

```
salt '*' osquery.iokit_devicetree
```

`salt.modules.osquery.iokit_registry` (*attrs=None, where=None*)

Return iokit\_registry information from osquery

CLI Example:

```
salt '*' osquery.iokit_registry
```

`salt.modules.osquery.kernel_extensions` (*attrs=None, where=None*)

Return kernel\_extensions information from osquery

CLI Example:

```
salt '*' osquery.kernel_extensions
```

`salt.modules.osquery.kernel_info` (*attrs=None, where=None*)

Return kernel\_info information from osquery

CLI Example:

```
salt '*' osquery.kernel_info
```

`salt.modules.osquery.kernel_integrity` (*attrs=None, where=None*)

Return `kernel_integrity` information from `osquery`

CLI Example:

```
salt '*' osquery.kernel_integrity
```

`salt.modules.osquery.kernel_modules` (*attrs=None, where=None*)

Return `kernel_modules` information from `osquery`

CLI Example:

```
salt '*' osquery.kernel_modules
```

`salt.modules.osquery.keychain_items` (*attrs=None, where=None*)

Return `keychain_items` information from `osquery`

CLI Example:

```
salt '*' osquery.keychain_items
```

`salt.modules.osquery.last` (*attrs=None, where=None*)

Return `last` information from `osquery`

CLI Example:

```
salt '*' osquery.last
```

`salt.modules.osquery.launchd` (*attrs=None, where=None*)

Return `launchd` information from `osquery`

CLI Example:

```
salt '*' osquery.launchd
```

`salt.modules.osquery.listening_ports` (*attrs=None, where=None*)

Return `listening_ports` information from `osquery`

CLI Example:

```
salt '*' osquery.listening_ports
```

`salt.modules.osquery.logged_in_users` (*attrs=None, where=None*)

Return `logged_in_users` information from `osquery`

CLI Example:

```
salt '*' osquery.logged_in_users
```

`salt.modules.osquery.memory_map` (*attrs=None, where=None*)

Return `memory_map` information from `osquery`

CLI Example:

```
salt '*' osquery.memory_map
```

`salt.modules.osquery.mounts` (*attrs=None, where=None*)

Return `mounts` information from `osquery`

CLI Example:

```
salt '*' osquery.mounts
```

`salt.modules.osquery.nfs_shares` (*attrs=None, where=None*)

Return `nfs_shares` information from `osquery`

CLI Example:

```
salt '*' osquery.nfs_shares
```

`salt.modules.osquery.nvram` (*attrs=None, where=None*)

Return `nvram` information from `osquery`

CLI Example:

```
salt '*' osquery.nvram
```

`salt.modules.osquery.os_version` (*attrs=None, where=None*)

Return `os_version` information from `osquery`

CLI Example:

```
salt '*' osquery.os_version
```

`salt.modules.osquery.osquery_extensions` (*attrs=None, where=None*)

Return `osquery_extensions` information from `osquery`

CLI Example:

```
salt '*' osquery.osquery_extensions
```

`salt.modules.osquery.osquery_flags` (*attrs=None, where=None*)

Return `osquery_flags` information from `osquery`

CLI Example:

```
salt '*' osquery.osquery_flags
```

`salt.modules.osquery.osquery_info` (*attrs=None, where=None*)

Return `osquery_info` information from `osquery`

CLI Example:

```
salt '*' osquery.osquery_info
```

`salt.modules.osquery.osquery_registry` (*attrs=None, where=None*)

Return `osquery_registry` information from `osquery`

CLI Example:

```
salt '*' osquery.osquery_registry
```

`salt.modules.osquery.passwd_changes` (*attrs=None, where=None*)

Return `passwd_changes` information from `osquery`

CLI Example:

```
salt '*' osquery.passwd_changes
```

`salt.modules.osquery.pci_devices` (*attrs=None, where=None*)

Return pci\_devices information from osquery

CLI Example:

```
salt '*' osquery.pci_devices
```

`salt.modules.osquery.preferences` (*attrs=None, where=None*)

Return preferences information from osquery

CLI Example:

```
salt '*' osquery.preferences
```

`salt.modules.osquery.process_envs` (*attrs=None, where=None*)

Return process\_envs information from osquery

CLI Example:

```
salt '*' osquery.process_envs
```

`salt.modules.osquery.process_memory_map` (*attrs=None, where=None*)

Return process\_memory\_map information from osquery

CLI Example:

```
salt '*' osquery.process_memory_map
```

`salt.modules.osquery.process_open_files` (*attrs=None, where=None*)

Return process\_open\_files information from osquery

CLI Example:

```
salt '*' osquery.process_open_files
```

`salt.modules.osquery.process_open_sockets` (*attrs=None, where=None*)

Return process\_open\_sockets information from osquery

CLI Example:

```
salt '*' osquery.process_open_sockets
```

`salt.modules.osquery.processes` (*attrs=None, where=None*)

Return processes information from osquery

CLI Example:

```
salt '*' osquery.processes
```

`salt.modules.osquery.quarantine` (*attrs=None, where=None*)

Return quarantine information from osquery

CLI Example:

```
salt '*' osquery.quarantine
```

`salt.modules.osquery.query` (*sql=None*)

Return time information from osquery

CLI Example:

```
salt '*' osquery.query "select * from users;"
```

`salt.modules.osquery.routes` (*attrs=None, where=None*)

Return routes information from osquery

CLI Example:

```
salt '*' osquery.routes
```

`salt.modules.osquery.rpm_packages` (*attrs=None, where=None*)

Return cpuid information from osquery

CLI Example:

```
salt '*' osquery.rpm_packages
```

`salt.modules.osquery.safari_extensions` (*attrs=None, where=None*)

Return safari\_extensions information from osquery

CLI Example:

```
salt '*' osquery.safari_extensions
```

`salt.modules.osquery.shared_memory` (*attrs=None, where=None*)

Return shared\_memory information from osquery

CLI Example:

```
salt '*' osquery.shared_memory
```

`salt.modules.osquery.shell_history` (*attrs=None, where=None*)

Return shell\_history information from osquery

CLI Example:

```
salt '*' osquery.shell_history
```

`salt.modules.osquery.smbios_tables` (*attrs=None, where=None*)

Return smbios\_tables information from osquery

CLI Example:

```
salt '*' osquery.smbios_tables
```

`salt.modules.osquery.startup_items` (*attrs=None, where=None*)

Return startup\_items information from osquery

CLI Example:

```
salt '*' osquery.startup_items
```

`salt.modules.osquery.suid_bin` (*attrs=None, where=None*)

Return suid\_bin information from osquery

CLI Example:

```
salt '*' osquery.suid_bin
```

`salt.modules.osquery.system_controls` (*attrs=None, where=None*)

Return `system_controls` information from `osquery`

CLI Example:

```
salt '*' osquery.system_controls
```

`salt.modules.osquery.time` (*attrs=None*)

Return time information from `osquery`

CLI Example:

```
salt '*' osquery.time
```

`salt.modules.osquery.usb_devices` (*attrs=None, where=None*)

Return `usb_devices` information from `osquery`

CLI Example:

```
salt '*' osquery.usb_devices
```

`salt.modules.osquery.users` (*attrs=None, where=None*)

Return users information from `osquery`

CLI Example:

```
salt '*' osquery.users
```

`salt.modules.osquery.version` ()

Return version of `osquery`

CLI Example:

```
salt '*' osquery.version
```

`salt.modules.osquery.xattr_where_from` (*attrs=None, where=None*)

Return `xattr_where_from` information from `osquery`

CLI Example:

```
salt '*' osquery.xattr_where_from
```

`salt.modules.osquery.xprotect_entries` (*attrs=None, where=None*)

Return `xprotect_entries` information from `osquery`

CLI Example:

```
salt '*' osquery.xprotect_entries
```

`salt.modules.osquery.xprotect_reports` (*attrs=None, where=None*)

Return `xprotect_reports` information from `osquery`

CLI Example:

```
salt '*' osquery.xprotect_reports
```

### 14.7.274 salt.modules.pacman

A module to wrap `pacman` calls, since Arch is the best ([https://wiki.archlinux.org/index.php/Arch\\_is\\_the\\_best](https://wiki.archlinux.org/index.php/Arch_is_the_best))

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to ``pkg.install' is not available`), see [here](#).

---

`salt.modules.pacman.file_dict(*packages)`

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of `_every_file` on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.pacman.file_list(*packages)`

List the files that belong to a package. Not specifying any packages will return a list of `_every_file` on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.pacman.group_diff(name)`

New in version 2016.11.0.

Lists which of a group's packages are installed and which are not installed

Compatible with `yumpkg.group_diff` for easy support of `state.pkg.group_installed`

CLI Example:

```
salt '*' pkg.group_diff 'xorg'
```

`salt.modules.pacman.group_info(name)`

New in version 2016.11.0.

Lists all packages in the specified group

CLI Example:

```
salt '*' pkg.group_info 'xorg'
```

`salt.modules.pacman.group_list()`

New in version 2016.11.0.

Lists all groups known by pacman on this system

CLI Example:

```
salt '*' pkg.group_list
```

`salt.modules.pacman.install(name=None, refresh=False, sysupgrade=False, pkgs=None, sources=None, **kwargs)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd<=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any pacman commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage

of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Install (`pacman -S`) the specified packag(s). Add `refresh=True` to install with `-y`, add `sysupgrade=True` to install with `-u`.

**name** The name of the package to be installed. Note that this parameter is ignored if either `pkgs` or `sources` is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the `sources` option.

CLI Example:

```
salt '*' pkg.install <package name>
```

**refresh** Whether or not to refresh the package database before installing.

**sysupgrade** Whether or not to upgrade the system packages before installing.

Multiple Package Installation Options:

**pkgs** A list of packages to install from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version. As with the `version` parameter above, comparison operators can be used to target a specific version of a package.

CLI Examples:

```
salt '*' pkg.install pkgs=['foo', 'bar']
salt '*' pkg.install pkgs=['foo', {'bar': '1.2.3-4'}]
salt '*' pkg.install pkgs=['foo', {'bar': '<1.2.3-4'}]
```

**sources** A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources=[{"foo": "salt://foo.pkg.tar.xz"}, {"bar": "salt://bar.pkg.tar.xz"}]
```

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

`salt.modules.pacman.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.pacman.list_pkgs(versions_as_list=False, **kwargs)`

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.pacman.list_repo_pkgs(*args, **kwargs)`

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names.

This function can be helpful in discovering the version or repo to specify in a `pkg.installed` state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. If `byrepo` is set to `True`, then the return dictionary will contain repository names at the top level, and each repository will map packages to lists of version numbers. For example:

```
# With byrepo=False (default)
{
  'bash': ['4.4.005-2'],
  'nginx': ['1.10.2-2']
}
# With byrepo=True
{
  'core': {
    'bash': ['4.4.005-2']
  },
  'extra': {
    'nginx': ['1.10.2-2']
  }
}
```

**fromrepo** [None] Only include results from the specified repo(s). Multiple repos can be specified, comma-separated.

**byrepo** [False] When `True`, the return data for each package will be organized by repository.

**refresh** [False] When `True`, the package database will be refreshed (i.e. `pacman -Sy`) before checking for available versions.

CLI Examples:

```
salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
salt '*' pkg.list_repo_pkgs 'samba4*' fromrepo=base,updates
salt '*' pkg.list_repo_pkgs 'python2-*' byrepo=True
```

`salt.modules.pacman.list_upgrades(refresh=False, root=None, **kwargs)`

List all available package upgrades on this system

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.pacman.owner(*paths)`

New in version 2014.7.0.

Return the name of the package that owns the file. Multiple file paths can be passed. Like `pkg.version` <`salt.modules.yumpkg.version`, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Example:

```
salt '*' pkg.owner /usr/bin/apachectl salt '*' pkg.owner /usr/bin/apachectl /usr/bin/zsh
```

`salt.modules.pacman.purge(name=None, pkgs=None, **kwargs)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd<=205`, `systemd-run(1)` is now

used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any `pacman` commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Recursively remove a package and all dependencies which were installed with it, this will call a `pacman -Rsc`

**name** The name of the package to be deleted.

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs=['foo', 'bar']
```

`salt.modules.pacman.refresh_db` (*root=None*)

Just run a `pacman -Sy`, return a dict:

```
{'<database name>': Bool}
```

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.pacman.remove` (*name=None, pkgs=None, \*\*kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any `pacman` commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Remove packages with `pacman -R`.

**name** The name of the package to be deleted.

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs=['foo', 'bar']
```

`salt.modules.pacman.upgrade` (*refresh=False, root=None, \*\*kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any `pacman` commands spawned by Salt when the `salt-minion`

service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Run a full system upgrade, a `pacman -Syu`

**refresh** Whether or not to refresh the package database before installing.

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.pacman.upgrade_available`(*name*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.pacman.version`(*\*names*, *\*\*kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

### 14.7.275 salt.modules.pagerduty

Module for Firing Events via PagerDuty

New in version 2014.1.0.

**configuration** This module can be used by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:

```
my-pagerduty-account:
  pagerduty.api_key: F3Rbyjbve43rFFwF2214
  pagerduty.subdomain: mysubdomain
```

`salt.modules.pagerduty.create_event`(*service\_key=None*, *description=None*, *details=None*, *incident\_key=None*, *profile=None*)

Create an event in PagerDuty. Designed for use in states.

CLI Example:

```
salt myminion pagerduty.create_event <service_key> <description> <details>
  ↪profile=my-pagerduty-account
```

The following parameters are required:

**service\_key** This key can be found by using `pagerduty.list_services`.

**description** This is a short description of the event.

**details** This can be a more detailed description of the event.

**profile** This refers to the configuration profile to use to connect to the PagerDuty service.

`salt.modules.pagerduty.list_escalation_policies` (*profile=None, api\_key=None*)

This function is an alias of `list_policies`.

List escalation policies belonging to this account

CLI Example:

```
salt myminion pagerduty.list_policies my-pagerduty-account salt myminion pager-
duty.list_escalation_policies my-pagerduty-account
```

`salt.modules.pagerduty.list_incidents` (*profile=None, api\_key=None*)

List incidents belonging to this account

CLI Example:

```
salt myminion pagerduty.list_incidents my-pagerduty-account
```

`salt.modules.pagerduty.list_maintenance_windows` (*profile=None, api\_key=None*)

This function is an alias of `list_windows`.

List maintenance windows belonging to this account

CLI Example:

```
salt myminion pagerduty.list_windows my-pagerduty-account salt myminion pager-
duty.list_maintenance_windows my-pagerduty-account
```

`salt.modules.pagerduty.list_policies` (*profile=None, api\_key=None*)

List escalation policies belonging to this account

CLI Example:

```
salt myminion pagerduty.list_policies my-pagerduty-account salt myminion pager-
duty.list_escalation_policies my-pagerduty-account
```

`salt.modules.pagerduty.list_schedules` (*profile=None, api\_key=None*)

List schedules belonging to this account

CLI Example:

```
salt myminion pagerduty.list_schedules my-pagerduty-account
```

`salt.modules.pagerduty.list_services` (*profile=None, api\_key=None*)

List services belonging to this account

CLI Example:

```
salt myminion pagerduty.list_services my-pagerduty-account
```

`salt.modules.pagerduty.list_users` (*profile=None, api\_key=None*)

List users belonging to this account

CLI Example:

```
salt myminion pagerduty.list_users my-pagerduty-account
```

`salt.modules.pagerduty.list_windows` (*profile=None, api\_key=None*)

List maintenance windows belonging to this account

CLI Example:

```
salt myminion pagerduty.list_windows my-pagerduty-account salt myminion pager-
duty.list_maintenance_windows my-pagerduty-account
```

### 14.7.276 salt.modules.pagerduty\_util

Module for managing PagerDuty resource

**configuration** This module can be used by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The default configuration profile name is `'pagerduty'`.

For example:

```
pagerduty:
  pagerduty.api_key: F3Rbyjbve43rFWf2214
  pagerduty.subdomain: mysubdomain
```

For PagerDuty API details, see <https://developer.pagerduty.com/documentation/rest>

`salt.modules.pagerduty_util.create_or_update_resource` (*resource\_name*, *identifier\_fields*, *data*, *diff=None*, *profile='pagerduty'*, *subdomain=None*, *api\_key=None*)

create or update any pagerduty resource Helper method for present().

Determining if two resources are the same is different for different PD resource, so this method accepts a diff function. The diff function will be invoked as `diff(state_information, object_returned_from_pagerduty)`, and should return a dict of data to pass to the PagerDuty update API method, or None if no update is to be performed. If no diff method is provided, the default behavior is to scan the keys in the `state_information`, comparing the matching values in the `object_returned_from_pagerduty`, and update any values that differ.

### examples

```
create_or_update_resource(`user`, ["id";"name";"email"]) create_or_update_resource(`escalation_policies`,
["id";"name"], diff=my_diff_function)
```

`salt.modules.pagerduty_util.delete_resource` (*resource\_name*, *key*, *identifier\_fields*, *profile='pagerduty'*, *subdomain=None*, *api\_key=None*)

delete any pagerduty resource

Helper method for absent()

### example

```
delete_resource(`users`, key, ["id";"name";"email"]) # delete by id or name or email
```

`salt.modules.pagerduty_util.get_escalation_policies` (*profile='pagerduty'*, *subdomain=None*, *api\_key=None*)

List escalation\_policies belonging to this account

CLI Example:

```
salt myminion pagerduty.get_escalation_policies
```

`salt.modules.pagerduty_util.get_resource` (*resource\_name*, *key*, *identifier\_fields*, *profile='pagerduty'*, *subdomain=None*, *api\_key=None*)

Get any single pagerduty resource by key.

We allow flexible lookup by any of a list of `identifier_fields`. So, for example, you can look up users by email address or name by calling:

```
get_resource(`users`, key, ['name', `email'], ...)
```

This method is mainly used to translate state sls into pagerduty id's for dependent objects. For example, a pagerduty escalation policy contains one or more schedules, which must be passed by their pagerduty id. We look up the schedules by name (using this method), and then translate the names into id's.

This method is implemented by getting all objects of the resource type (cached into `__context__`), then brute force searching through the list and trying to match any of the `identifier_fields`. The `__context__` cache is purged after any create, update or delete to the resource.

```
salt.modules.pagerduty_util.get_schedules(profile='pagerduty', subdomain=None,
                                         api_key=None)
```

List schedules belonging to this account

CLI Example:

```
salt myminion pagerduty.get_schedules
```

```
salt.modules.pagerduty_util.get_services(profile='pagerduty', subdomain=None,
                                         api_key=None)
```

List services belonging to this account

CLI Example:

```
salt myminion pagerduty.get_services
```

```
salt.modules.pagerduty_util.get_users(profile='pagerduty', subdomain=None, api_key=None)
```

List users belonging to this account

CLI Example:

```
salt myminion pagerduty.get_users
```

```
salt.modules.pagerduty_util.resource_absent(resource, identifier_fields, profile='pagerduty', subdomain=None,
                                             api_key=None, **kwargs)
```

Generic `resource.absent` state method. Pagerduty state modules should be a thin wrapper over this method, with a custom diff function.

This method calls `delete_resource()` and formats the result as a salt state return value.

#### example

```
resource_absent(`users`, ["id","name","email"])
```

```
salt.modules.pagerduty_util.resource_present(resource, identifier_fields, diff=None,
                                             profile='pagerduty', subdomain=None,
                                             api_key=None, **kwargs)
```

Generic `resource.present` state method. Pagerduty state modules should be a thin wrapper over this method, with a custom diff function.

This method calls `create_or_update_resource()` and formats the result as a salt state return value.

#### example

```
resource_present(`users`, ["id","name","email"])
```

## 14.7.277 salt.modules.pam

Support for pam

```
salt.modules.pam.read_file(file_name)
```

This is just a test function, to make sure parsing works

CLI Example:

```
salt '*' pam.read_file /etc/pam.d/login
```

### 14.7.278 salt.modules.parallels module

Manage Parallels Desktop VMs with `prlctl` and `prlsrvctl`. Only some of the `prlctl` commands implemented so far. Of those that have been implemented, not all of the options may have been provided yet. For a complete reference, see the [Parallels Desktop Reference Guide](#).

What has not been implemented yet can be accessed through `parallels.prlctl` and `parallels.prlsrvctl` (note the preceding double dash `--` as necessary):

New in version 2016.3.0.

`salt.modules.parallels.clone` (*name*, *new\_name*, *linked=False*, *template=False*, *runas=None*)  
Clone a VM

New in version 2016.11.0.

#### Parameters

- **name** (*str*) -- Name/ID of VM to clone
- **new\_name** (*str*) -- Name of the new VM
- **linked** (*bool*) -- Create a linked virtual machine.
- **template** (*bool*) -- Create a virtual machine template instead of a real virtual machine.
- **runas** (*str*) -- The user that the `prlctl` command will be run as

Example:

```
salt '*' parallels.clone macvm macvm_new runas=macdev
salt '*' parallels.clone macvm macvm_tmpl template=True runas=macdev
```

`salt.modules.parallels.delete` (*name*, *runas=None*)  
Delete a VM

New in version 2016.11.0.

#### Parameters

- **name** (*str*) -- Name/ID of VM to clone
- **runas** (*str*) -- The user that the `prlctl` command will be run as

Example:

```
salt '*' parallels.exec macvm 'find /etc/paths.d' runas=macdev
```

`salt.modules.parallels.delete_snapshot` (*name*, *snap\_name*, *runas=None*, *all=False*)  
Delete a snapshot

---

**Note:** Deleting a snapshot from which other snapshots are dervied will not delete the derived snapshots

---

#### Parameters

- **name** (*str*) -- Name/ID of VM whose snapshot will be deleted
- **snap\_name** (*str*) -- Name/ID of snapshot to delete
- **runas** (*str*) -- The user that the `prlctl` command will be run as
- **all** (*bool*) -- Delete all snapshots having the name given

New in version 2016.11.0.

Example:

```
salt '*' parallels.delete_snapshot macvm 'unneeded snapshot' runas=macdev
salt '*' parallels.delete_snapshot macvm 'Snapshot for linked clone' all=True
↳runas=macdev
```

`salt.modules.parallels.exec`(*name, command, runas=None*)

Run a command on a VM

#### Parameters

- **name** (*str*) -- Name/ID of VM whose exec will be returned
- **command** (*str*) -- Command to run on the VM
- **runas** (*str*) -- The user that the prctl command will be run as

Example:

```
salt '*' parallels.exec macvm 'find /etc/paths.d' runas=macdev
```

`salt.modules.parallels.exists`(*name, runas=None*)

Query whether a VM exists

New in version 2016.11.0.

#### Parameters

- **name** (*str*) -- Name/ID of VM
- **runas** (*str*) -- The user that the prctl command will be run as

Example:

```
salt '*' parallels.exists macvm runas=macdev
```

`salt.modules.parallels.list_snapshots`(*name, snap\_name=None, tree=False, names=False, runas=None*)

List the snapshots

#### Parameters

- **name** (*str*) -- Name/ID of VM whose snapshots will be listed
- **snap\_id** (*str*) -- Name/ID of snapshot to display information about. If `tree=True` is also specified, display the snapshot subtree having this snapshot as the root snapshot
- **tree** (*bool*) -- List snapshots in tree format rather than tabular format
- **names** (*bool*) -- List snapshots as ID, name pairs
- **runas** (*str*) -- The user that the prctl command will be run as

Example:

```
salt '*' parallels.list_snapshots macvm runas=macdev
salt '*' parallels.list_snapshots macvm tree=True runas=macdev
salt '*' parallels.list_snapshots macvm snap_name=original runas=macdev
salt '*' parallels.list_snapshots macvm names=True runas=macdev
```

`salt.modules.parallels.list_vms`(*name=None, info=False, all=False, args=None, runas=None, template=False*)

List information about the VMs

#### Parameters

- **name** (*str*) -- Name/ID of VM to list  
Changed in version 2016.11.0: No longer implies `info=True`
- **info** (*str*) -- List extra information
- **all** (*bool*) -- List all non-template VMs
- **args** (*tuple*) -- Additional arguments given to `prctl list`
- **runas** (*str*) -- The user that the prctl command will be run as
- **template** (*bool*) -- List the available virtual machine templates. The real virtual machines will not be included in the output

New in version 2016.11.0.

Example:

```
salt '*' parallels.list_vms runas=macdev
salt '*' parallels.list_vms name=macvm info=True runas=macdev
salt '*' parallels.list_vms info=True runas=macdev
salt '*' parallels.list_vms '-o uuid,status' all=True runas=macdev
```

`salt.modules.parallels.prlctl`(*sub\_cmd*, *args=None*, *runas=None*)

Execute a prlctl command

Parameters

- **sub\_cmd** (*str*) -- prlctl subcommand to execute
- **args** (*str*) -- The arguments supplied to prlctl <sub\_cmd>
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.prlctl user list runas=macdev
salt '*' parallels.prlctl exec 'macvm uname' runas=macdev
salt -- '*' parallels.prlctl capture 'macvm --file macvm.display.png' runas=macdev
```

`salt.modules.parallels.prlsrvctl`(*sub\_cmd*, *args=None*, *runas=None*)

Execute a prlsrvctl command

New in version 2016.11.0.

Parameters

- **sub\_cmd** (*str*) -- prlsrvctl subcommand to execute
- **args** (*str*) -- The arguments supplied to prlsrvctl <sub\_cmd>
- **runas** (*str*) -- The user that the prlsrvctl command will be run as

Example:

```
salt '*' parallels.prlsrvctl info runas=macdev
salt '*' parallels.prlsrvctl usb list runas=macdev
salt -- '*' parallels.prlsrvctl set '--mem-limit auto' runas=macdev
```

`salt.modules.parallels.reset`(*name*, *runas=None*)

Reset a VM by performing a hard shutdown and then a restart

Parameters

- **name** (*str*) -- Name/ID of VM to reset
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.reset macvm runas=macdev
```

`salt.modules.parallels.restart`(*name*, *runas=None*)

Restart a VM by gracefully shutting it down and then restarting it

Parameters

- **name** (*str*) -- Name/ID of VM to restart
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.restart macvm runas=macdev
```

`salt.modules.parallels.revert_snapshot`(*name*, *snap\_name*, *runas=None*)

Revert a VM to a snapshot

Parameters

- **name** (*str*) -- Name/ID of VM to revert to a snapshot
- **snap\_name** (*str*) -- Name/ID of snapshot to revert to

- **runas** (*str*) -- The user that the prctl command will be run as

Example:

```
salt '*' parallels.revert_snapshot macvm base-with-updates runas=macdev
```

`salt.modules.parallels.snapshot` (*name*, *snap\_name=None*, *desc=None*, *runas=None*)

Create a snapshot

Parameters

- **name** (*str*) -- Name/ID of VM to take a snapshot of
- **snap\_name** (*str*) -- Name of snapshot
- **desc** (*str*) -- Description of snapshot
- **runas** (*str*) -- The user that the prctl command will be run as

Example:

```
salt '*' parallels.create_snapshot macvm snap_name=macvm-original runas=macdev
salt '*' parallels.create_snapshot macvm snap_name=macvm-updates desc='clean
↳install with updates' runas=macdev
```

`salt.modules.parallels.snapshot_id_to_name` (*name*, *snap\_id*, *strict=False*, *runas=None*)

Attempt to convert a snapshot ID to a snapshot name. If the snapshot has no name or if the ID is not found or invalid, an empty string will be returned

Parameters

- **name** (*str*) -- Name/ID of VM whose snapshots are inspected
- **snap\_id** (*str*) -- ID of the snapshot
- **strict** (*bool*) -- Raise an exception if a name cannot be found for the given `snap_id`
- **runas** (*str*) -- The user that the prctl command will be run as

Example data

```
ID: {a5b8999f-5d95-4aff-82de-e515b0101b66}
Name: original
Date: 2016-03-04 10:50:34
Current: yes
State: poweroff
Description: original state
```

CLI Example:

```
salt '*' parallels.snapshot_id_to_name macvm a5b8999f-5d95-4aff-82de-e515b0101b66
↳runas=macdev
```

`salt.modules.parallels.snapshot_name_to_id` (*name*, *snap\_name*, *strict=False*, *runas=None*)

Attempt to convert a snapshot name to a snapshot ID. If the name is not found an empty string is returned. If multiple snapshots share the same name, a list will be returned

Parameters

- **name** (*str*) -- Name/ID of VM whose snapshots are inspected
- **snap\_name** (*str*) -- Name of the snapshot
- **strict** (*bool*) -- Raise an exception if multiple snapshot IDs are found
- **runas** (*str*) -- The user that the prctl command will be run as

CLI Example:

```
salt '*' parallels.snapshot_id_to_name macvm original runas=macdev
```

`salt.modules.parallels.start` (*name*, *runas=None*)

Start a VM

Parameters

- **name** (*str*) -- Name/ID of VM to start
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.start macvm runas=macdev
```

**salt.modules.parallels.status** (*name, runas=None*)

Status of a VM

Parameters

- **name** (*str*) -- Name/ID of VM whose status will be returned
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.status macvm runas=macdev
```

**salt.modules.parallels.stop** (*name, kill=False, runas=None*)

Stop a VM

Parameters

- **name** (*str*) -- Name/ID of VM to stop
- **kill** (*bool*) -- Perform a hard shutdown
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.stop macvm runas=macdev
salt '*' parallels.stop macvm kill=True runas=macdev
```

### 14.7.279 salt.modules.parted

Module for managing partitions on POSIX-like systems.

**depends**

- parted, partprobe, lsblk (usually parted and util-linux packages)

Some functions may not be available, depending on your version of parted.

Check the manpage for parted(8) for more information, or the online docs at:

[http://www.gnu.org/software/parted/manual/html\\_chapter/parted\\_2.html](http://www.gnu.org/software/parted/manual/html_chapter/parted_2.html)

In light of parted not directly supporting partition IDs, some of this module has been written to utilize sfdisk instead. For further information, please reference the man page for sfdisk(8).

**salt.modules.parted.align\_check** (*device, part\_type, partition*)

Check if partition satisfies the alignment constraint of part\_type. Type must be ``minimal" or ``optimal".

CLI Example:

```
salt '*' partition.align_check /dev/sda minimal 1
```

**salt.modules.parted.check** (*device, minor*)

Checks if the file system on partition <minor> has any errors.

CLI Example:

```
salt '*' partition.check 1
```

`salt.modules.parted.cp`(*device, from\_minor, to\_minor*)

Copies the file system on the partition <from-minor> to partition <to-minor>, deleting the original contents of the destination partition.

CLI Example:

```
salt '*' partition.cp /dev/sda 2 3
```

`salt.modules.parted.exists`(*device=''*)

Check to see if the partition exists

CLI Example:

```
salt '*' partition.exists /dev/sdb1
```

`salt.modules.parted.get_block_device`()

Retrieve a list of disk devices

New in version 2014.7.0.

CLI Example:

```
salt '*' partition.get_block_device
```

`salt.modules.parted.get_id`(*device, minor*)

Prints the system ID for the partition. Some typical values are:

```
b: FAT32 (vfat)
7: HPFS/NTFS
82: Linux Swap
83: Linux
8e: Linux LVM
fd: Linux RAID Auto
```

CLI Example:

```
salt '*' partition.get_id /dev/sda 1
```

`salt.modules.parted.list`(*device, unit=None*)

Prints partition information of given <device>

CLI Examples:

```
salt '*' partition.list /dev/sda
salt '*' partition.list /dev/sda unit=s
salt '*' partition.list /dev/sda unit=kB
```

`salt.modules.parted.mkfs`(*device, fs\_type*)

Makes a file system <fs\_type> on partition <device>, destroying all data that resides on that partition. <fs\_type> must be one of ``ext2``, ``fat32``, ``fat16``, ``linux-swap`` or ``reiserfs`` (if libreriserfs is installed)

CLI Example:

```
salt '*' partition.mkfs /dev/sda2 fat32
```

`salt.modules.parted.mklabel`(*device, label\_type*)

Create a new disklabel (partition table) of label\_type.

Type should be one of ``aix``, ``amiga``, ``bsd``, ``dvh``, ``gpt``, ``loop``, ``mac``, ``msdos``, ``pc98``, or ``sun``.

CLI Example:

```
salt '*' partition.mklabel /dev/sda msdos
```

`salt.modules.parted.mkpart`(*device, part\_type, fs\_type=None, start=None, end=None*)

Make a `part_type` partition for filesystem `fs_type`, beginning at `start` and ending at `end` (by default in megabytes). `part_type` should be one of ```primary```, ```logical```, or ```extended```.

CLI Examples:

```
salt '*' partition.mkpart /dev/sda primary fs_type=fat32 start=0 end=639
salt '*' partition.mkpart /dev/sda primary start=0 end=639
```

`salt.modules.parted.mkpartfs`(*device, part\_type, fs\_type, start, end*)

Make a `<part_type>` partition with a new filesystem of `<fs_type>`, beginning at `<start>` and ending at `<end>` (by default in megabytes).

`<part_type>` should be one of ```primary```, ```logical```, or ```extended```. `<fs_type>` must be one of ```ext2```, ```fat32```, ```fat16```, ```linux-swap``` or ```reiserfs``` (if `libreiserfs` is installed)

CLI Example:

```
salt '*' partition.mkpartfs /dev/sda logical ext2 440 670
```

`salt.modules.parted.name`(*device, partition, name*)

Set the name of partition to `name`. This option works only on Mac, PC98, and GPT disklabels. The name can be placed in quotes, if necessary.

CLI Example:

```
salt '*' partition.name /dev/sda 1 'My Documents'
```

`salt.modules.parted.probe`(*\*devices*)

Ask the kernel to update its local partition data. When no args are specified all block devices are tried.

Caution: Generally only works on devices with no mounted partitions and may take a long time to return if specified devices are in use.

CLI Examples:

```
salt '*' partition.probe
salt '*' partition.probe /dev/sda
salt '*' partition.probe /dev/sda /dev/sdb
```

`salt.modules.parted.rescue`(*device, start, end*)

Rescue a lost partition that was located somewhere between `start` and `end`. If a partition is found, `parted` will ask if you want to create an entry for it in the partition table.

CLI Example:

```
salt '*' partition.rescue /dev/sda 0 8056
```

`salt.modules.parted.resize`(*device, minor, start, end*)

Resizes the partition with number `<minor>`.

The partition will start `<start>` from the beginning of the disk, and end `<end>` from the beginning of the disk. `resize` never changes the minor number. Extended partitions can be resized, so long as the new extended partition completely contains all logical partitions.

CLI Example:

```
salt '*' partition.resize /dev/sda 3 200 850
```

`salt.modules.parted.rm(device, minor)`

Removes the partition with number <minor>.

CLI Example:

```
salt '*' partition.rm /dev/sda 5
```

`salt.modules.parted.set(device, minor, flag, state)`

Changes a flag on the partition with number <minor>.

A flag can be either ``on`` or ``off`` (make sure to use proper quoting, see [YAML Idiosyncrasies](#)). Some or all of these flags will be available, depending on what disk label you are using.

**Valid flags are:** bios\_grub, legacy\_boot, boot, lba, root, swap, hidden, raid, LVM, PALO, PREP, DIAG

CLI Example:

```
salt '*' partition.set /dev/sda 1 boot "on"
```

`salt.modules.parted.set_id(device, minor, system_id)`

Sets the system ID for the partition. Some typical values are:

```
b: FAT32 (vfat)
7: HPFS/NTFS
82: Linux Swap
83: Linux
8e: Linux LVM
fd: Linux RAID Auto
```

CLI Example:

```
salt '*' partition.set_id /dev/sda 1 83
```

`salt.modules.parted.system_types()`

List the system types that are supported by the installed version of sfdisk

CLI Example:

```
salt '*' partition.system_types
```

`salt.modules.parted.toggle(device, partition, flag)`

Toggle the state of <flag> on <partition>. Valid flags are the same as the set command.

CLI Example:

```
salt '*' partition.toggle /dev/sda 1 boot
```

## 14.7.280 salt.modules.pcs module

### Configure a Pacemaker/Corosync cluster with PCS

Configure Pacemaker/Corosync clusters with the Pacemaker/Corosync configuration system (PCS)

**depends** pcs

New in version 2016.3.0.

`salt.modules.pcs.auth(nodes, pcsuser='hacluster', pcspasswd='hacluster', extra_args=None)`

Authorize nodes to the cluster

**nodes** a list of nodes which should be authorized to the cluster

**pcsuser** user for communication with PCS (default: hacluster)

**pcspasswd** password for pcsuser (default: hacluster)

**extra\_args** list of extra option for the `pcs cluster auth` command

CLI Example:

```
salt '*' pcs.auth nodes='[ node1.example.org node2.example.org ]' \  
                pcsuser='hacluster' \  
                pcspasswd='hoonetorg' \  
                extra_args=[ '--force' ]
```

`salt.modules.pcs.cib_create(cibfile, scope='configuration', extra_args=None)`

Create a CIB-file from the current CIB of the cluster

**cibfile** name/path of the file containing the CIB

**scope** specific section of the CIB (default: configuration)

**extra\_args** additional options for creating the CIB-file

CLI Example:

```
salt '*' pcs.cib_create cibfile='/tmp/VIP_apache_1.cib' \  
                      'scope=False'
```

`salt.modules.pcs.cib_push(cibfile, scope='configuration', extra_args=None)`

Push a CIB-file as the new CIB to the cluster

**cibfile** name/path of the file containing the CIB

**scope** specific section of the CIB (default: configuration)

**extra\_args** additional options for creating the CIB-file

CLI Example:

```
salt '*' pcs.cib_push cibfile='/tmp/VIP_apache_1.cib' \  
                      'scope=False'
```

`salt.modules.pcs.cluster_node_add(node, extra_args=None)`

Add a node to the pacemaker cluster via pcs command

**node** node that should be added

**extra\_args** list of extra option for the `pcs cluster node add` command

CLI Example:

```
salt '*' pcs.cluster_node_add node=node2.example.org'
```

`salt.modules.pcs.cluster_setup(nodes, pcsclustername='pcscluster', extra_args=None)`

Setup pacemaker cluster via pcs command

**nodes** a list of nodes which should be set up

**pcsclustername** Name of the Pacemaker cluster (default: pcscluster)

**extra\_args** list of extra option for the `pcs cluster setup` command

CLI Example:

```
salt '*' pcs.cluster_setup nodes='[ node1.example.org node2.example.org ]' \  
                          pcsclustername='pcscluster'
```

`salt.modules.pcs.config_show(cibfile=None)`

Show config of cluster

**cibfile** name/path of the file containing the CIB

CLI Example:

```
salt '*' pcs.config_show cibfile='/tmp/cib_for_galera'
```

`salt.modules.pcs.is_auth(nodes)`

Check if nodes are already authorized

**nodes** a list of nodes to be checked for authorization to the cluster

CLI Example:

```
salt '*' pcs.is_auth nodes='[node1.example.org node2.example.org]'
```

`salt.modules.pcs.item_create(item, item_id, item_type, create='create', extra_args=None, cibfile=None)`

Create an item via pcs command (mainly for use with the pcs state module)

**item** config, property, resource, constraint etc.

**item\_id** id of the item

**item\_type** item type

**create** create command (create or set f.e., default: create)

**extra\_args** additional options for the pcs command

**cibfile** use cibfile instead of the live CIB

`salt.modules.pcs.item_show(item, item_id=None, item_type=None, show='show', extra_args=None, cibfile=None)`

Show an item via pcs command (mainly for use with the pcs state module)

**item** config, property, resource, constraint etc.

**item\_id** id of the item

**item\_type** item type

**show** show command (probably None, default: show)

**extra\_args** additional options for the pcs command

**cibfile** use cibfile instead of the live CIB

`salt.modules.pcs.prop_set(prop, value, extra_args=None, cibfile=None)`

Set the value of a cluster property

**prop** name of the property

**value** value of the property prop

**extra\_args** additional options for the pcs property command

**cibfile** use cibfile instead of the live CIB

CLI Example:

```
salt '*' pcs.prop_set prop='no-quorum-policy' \
                    value='ignore' \
                    cibfile='/tmp/2_node_cluster.cib'
```

`salt.modules.pcs.prop_show(prop, extra_args=None, cibfile=None)`

Show the value of a cluster property

**prop** name of the property

**extra\_args** additional options for the pcs property command

**cibfile** use cibfile instead of the live CIB

CLI Example:

```
salt '*' pcs.prop_show cibfile='/tmp/2_node_cluster.cib' \
                    prop='no-quorum-policy' \
                    cibfile='/tmp/2_node_cluster.cib'
```

`salt.modules.pcs.resource_create(resource_id, resource_type, resource_options=None, cibfile=None)`

Create a resource via pcs command

**resource\_id** name for the resource

**resource\_type** resource type (f.e. ocf:heartbeat:IPaddr2 or VirtualIP)

**resource\_options** additional options for creating the resource

**cibfile** use cibfile instead of the live CIB for manipulation

CLI Example:

```
salt '*' pcs.resource_create resource_id='galera' \
                             resource_type='ocf:heartbeat:galera' \
                             resource_options="[ \
                                 'wsrep_cluster_address=gcomm://node1.example.org,node2.
→example.org,node3.example.org' \
                                 '--master' \
                             ]" \
                             cibfile='/tmp/cib_for_galera.cib'
```

**salt.modules.pcs.resource\_show**(*resource\_id*, *extra\_args=None*, *cibfile=None*)

Show a resource via pcs command

**resource\_id** name of the resource

**extra\_args** additional options for the pcs command

**cibfile** use cibfile instead of the live CIB

CLI Example:

```
salt '*' pcs.resource_show resource_id='galera' \
                             cibfile='/tmp/cib_for_galera.cib'
```

**salt.modules.pcs.stonith\_create**(*stonith\_id*, *stonith\_device\_type*, *stonith\_device\_options=None*, *cibfile=None*)

Create a stonith resource via pcs command

**stonith\_id** name for the stonith resource

**stonith\_device\_type** name of the stonith agent fence\_eps, fence\_xvm f.e.

**stonith\_device\_options** additional options for creating the stonith resource

**cibfile** use cibfile instead of the live CIB for manipulation

CLI Example:

```
salt '*' pcs.stonith_create stonith_id='eps_fence' \
                             stonith_device_type='fence_eps' \
                             stonith_device_options="[ \
                                 'pcmk_host_map=node1.example.org:01;node2.example.org:
→02', \
                                 'ipaddr=myepsdevice.example.org', \
                                 'action=reboot', \
                                 'power_wait=5', \
                                 'verbose=1', \
                                 'debug=/var/log/pcsd/eps_fence.log', \
                                 'login=hidden', \
                                 'passwd=hoonetorg' \
                             ]" \
                             cibfile='/tmp/cib_for_stonith.cib'
```

**salt.modules.pcs.stonith\_show**(*stonith\_id*, *extra\_args=None*, *cibfile=None*)

Show the value of a cluster stonith

**stonith\_id** name for the stonith resource

**extra\_args** additional options for the pcs stonith command

**cibfile** use cibfile instead of the live CIB

CLI Example:

```
salt '*' pcs.stonith_show stonith_id='eps_fence' \
                             cibfile='/tmp/2_node_cluster.cib'
```

## 14.7.281 salt.modules.pdbedit

Manage accounts in Samba's passdb using pdbedit

**maintainer** Jorge Schrauwen <sjorge@blackdot.be>

**maturity** new

**platform** posix

New in version 2017.7.0.

**salt.modules.pdbedit.create**(*login, password, password\_hashed=False, machine\_account=False*)

Create user account

**login** [string] login name

**password** [string] password

**password\_hashed** [boolean] set if password is a nt hash instead of plain text

**machine\_account** [boolean] set to create a machine trust account instead

CLI Example:

```
salt '*' pdbedit.create zoe 9764951149F84E770889011E1DC4A927 nthash
salt '*' pdbedit.create river 1sw4ll0w3d4bug
```

**salt.modules.pdbedit.delete**(*login*)

Delete user account

**login** [string] login name

CLI Example:

```
salt '*' pdbedit.delete wash
```

**salt.modules.pdbedit.generate\_nt\_hash**(*password*)

Generate a NT HASH

CLI Example:

```
salt '*' pdbedit.generate_nt_hash my_passwd
```

**salt.modules.pdbedit.get**(*login, hashes=False*)

Get user account details

**login** [string] login name

**hashes** [boolean] include NTHASH and LMHASH in verbose output

CLI Example:

```
salt '*' pdbedit.get kaylee
```

**salt.modules.pdbedit.list**(*verbose=True, hashes=False*)

List user accounts

**verbose** [boolean] return all information

**hashes** [boolean] include NT HASH and LM HASH in verbose output

CLI Example:

```
salt '*' pdbedit.list
```

**salt.modules.pdbedit.modify**(*login, password=None, password\_hashed=False, domain=None, profile=None, script=None, drive=None, homedir=None, full-name=None, account\_desc=None, account\_control=None, machine\_sid=None, user\_sid=None, reset\_login\_hours=False, reset\_bad\_password\_count=False*)

Modify user account

**login** [string] login name  
**password** [string] password  
**password\_hashed** [boolean] set if password is a nt hash instead of plain text  
**domain** [string] users domain  
**profile** [string] profile path  
**script** [string] logon script  
**drive** [string] home drive  
**homedir** [string] home directory  
**fullname** [string] full name  
**account\_desc** [string] account description  
**machine\_sid** [string] specify the machines new primary group SID or rid  
**user\_sid** [string] specify the users new primary group SID or rid  
**account\_control** [string] specify user account control properties

---

**Note:** Only the following can be set: - N: No password required - D: Account disabled - H: Home directory required - L: Automatic Locking - X: Password does not expire

---

**reset\_login\_hours** [boolean] reset the users allowed logon hours  
**reset\_bad\_password\_count** [boolean] reset the stored bad login counter

---

**Note:** if user is absent and password is provided, the user will be created

---

CLI Example:

```
salt '*' pdbedit.modify inara fullname='Inara Serra'  
salt '*' pdbedit.modify simon password=r1v3r  
salt '*' pdbedit.modify jane drive='V:' homedir='\\serenity\jane\profile'  
salt '*' pdbedit.modify mal account_control=NX
```

## 14.7.282 salt.modules.pecl

Manage PHP pecl extensions.

**salt.modules.pecl.install**(*pecls*, *defaults=False*, *force=False*, *preferred\_state='stable'*)

New in version 0.17.0.

Installs one or several pecl extensions.

**pecls** The pecl extensions to install.

**defaults** Use default answers for extensions such as pecl\_http which ask questions before installation. Without this option, the pecl.installed state will hang indefinitely when trying to install these extensions.

**force** Whether to force the installed version or not

CLI Example:

```
salt '*' pecl.install fuse
```

**salt.modules.pecl.list**(*channel=None*)

List installed pecl extensions.

CLI Example:

```
salt '*' pecl.list
```

**salt.modules.pecl.uninstall**(*pecls*)

Uninstall one or several pecl extensions.

**pecls** The pecl extensions to uninstall.  
CLI Example:

```
salt '*' pecl.uninstall fuse
```

**salt.modules.pecl.update** (*pecls*)  
Update one or several pecl extensions.  
**pecls** The pecl extensions to update.  
CLI Example:

```
salt '*' pecl.update fuse
```

### 14.7.283 salt.modules.philips\_hue module

Philips HUE lamps module for proxy.

New in version 2015.8.3.

### 14.7.284 salt.modules.pillar

Extract the pillar data for this minion

**salt.modules.pillar.ext** (*external, pillar=None*)  
Changed in version 2016.3.6,2016.11.3,2017.7.0: The supported `ext_pillar` types are now tunable using the `on_demand_ext_pillar` config option. Earlier releases used a hard-coded default.

Generate the pillar and apply an explicit external pillar

**external** A single `ext_pillar` to add to the `ext_pillar` configuration. This must be passed as a single section from the `ext_pillar` configuration (see CLI examples below). For more complicated `ext_pillar` configurations, it can be helpful to use the Python shell to load YAML configuration into a dictionary, and figure out

```
>>> import yaml
>>> ext_pillar = yaml.safe_load("""
... ext_pillar:
...   - git:
...     - issue38440 https://github.com/terminalmage/git_pillar:
...       - env: base
... """)
>>> ext_pillar
{'ext_pillar': [{'git': [{'mybranch https://github.com/myuser/myrepo': [{'env': 'base'}]}]}]}
>>> ext_pillar['ext_pillar'][0]
{'git': [{'mybranch https://github.com/myuser/myrepo': [{'env': 'base'}]}]}
```

In the above example, the value to pass would be `{'git': [{'mybranch https://github.com/myuser/myrepo': [{'env': 'base'}]}]}`. Note that this would need to be quoted when passing on the CLI (as in the CLI examples below).

**pillar** [None] If specified, allows for a dictionary of pillar data to be made available to pillar and `ext_pillar` rendering. These pillar variables will also override any variables of the same name in pillar or `ext_pillar`.

New in version 2015.5.0.

CLI Examples:

```
salt '*' pillar.ext '{libvirt: _}'
salt '*' pillar.ext '{"git": ['master https://github.com/myuser/myrepo']}'
salt '*' pillar.ext '{"git": ['mybranch https://github.com/myuser/myrepo': ['env
↪': 'base']]]}]}"
```

`salt.modules.pillar.fetch`(key, default=<type `exceptions.KeyError`>, merge=False, merge\_nested\_lists=None, delimiter=':', pillarenv=None, saltenv=None)

New in version 0.14.

Attempt to retrieve the named value from pillar, if the named value is not available return the passed default. The default return is an empty string except `__opts__[pillar_raise_on_missing]` is set to True, in which case a `KeyError` will be raised.

If the merge parameter is set to True, the default will be recursively merged into the returned pillar data.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in pillar looks like this:

```
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the apache key in the pkg dict this key can be passed:

```
pkg:apache
```

**merge** [False] If True, the retrieved values will be merged into the passed default. When the default and the retrieved value are both dictionaries, the dictionaries will be recursively merged.

New in version 2014.7.0.

Changed in version 2016.3.7,2016.11.4,2017.7.0: If the default and the retrieved value are not of the same type, then merging will be skipped and the retrieved value will be returned. Earlier releases raised an error in these cases.

**merge\_nested\_lists** If set to False, lists nested within the retrieved pillar dictionary will *overwrite* lists in default. If set to True, nested lists will be *merged* into lists in default. If unspecified (the default), this option is inherited from the `pillar_merge_lists` minion config option.

---

**Note:** This option is ignored when merge is set to False.

---

New in version 2016.11.6.

**delimiter** Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

New in version 2014.7.0.

**pillarenv** If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion's pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.0.

**saltenv** Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

New in version 2017.7.0.

CLI Example:

```
salt '*' pillar.get pkg:apache
salt '*' pillar.get abc::def|ghi delimiter='|'
```

`salt.modules.pillar.file_exists`(*path*, *saltenv=None*)

New in version 2016.3.0.

This is a master-only function. Calling from the minion is not supported.

Use the given path and search relative to the pillar environments to see if a file exists at that path.

If the `saltenv` argument is given, restrict search to that environment only.

Will only work with `pillar_roots`, not external pillars.

Returns True if the file is found, and False otherwise.

**path** The path to the file in question. Will be treated as a relative path

**saltenv** Optional argument to restrict the search to a specific saltenv

CLI Example:

```
salt '*' pillar.file_exists foo/bar.sls
```

`salt.modules.pillar.filter_by`(*lookup\_dict*, *pillar*, *merge=None*, *default='default'*, *base=None*)

New in version 2017.7.0.

Look up the given pillar in a given dictionary and return the result

#### Parameters

- **lookup\_dict** -- A dictionary, keyed by a pillar, containing a value or values relevant to systems matching that pillar. For example, a key could be a pillar for a role and the value could be the name of a package on that particular OS.

The dictionary key can be a globbing pattern. The function will return the corresponding `lookup_dict` value where the pillar value matches the pattern. For example:

```
# this will render 'got some salt' if ``role`` begins with 'salt'
salt '*' pillar.filter_by '{salt*: got some salt, default: salt
→is not here}' role
```

- **pillar** -- The name of a pillar to match with the system's pillar. For example, the value of the `role` pillar could be used to pull values from the `lookup_dict` dictionary.

The pillar value can be a list. The function will return the `lookup_dict` value for a first found item in the list matching one of the `lookup_dict` keys.

- **merge** -- A dictionary to merge with the results of the pillar selection from `lookup_dict`. This allows another dictionary to override the values in the `lookup_dict`.
- **default** -- default `lookup_dict`'s key used if the pillar does not exist or if the pillar value has no match on `lookup_dict`. If unspecified the value is `default`.
- **base** -- A `lookup_dict` key to use for a base dictionary. The pillar-selected `lookup_dict` is merged over this and then finally the `merge` dictionary is merged. This allows common values for each case to be collected in the base and overridden by the pillar selection dictionary and the merge dictionary. Default is unset.

CLI Example:

```
salt '*' pillar.filter_by '{web: Serve it up, db: I query, default: x_x}' role
```

```
salt.modules.pillar.get(key, default=<type `exceptions.KeyError`>, merge=False,
                       merge_nested_lists=None, delimiter=':', pillarenv=None, saltenv=None)
```

New in version 0.14.

Attempt to retrieve the named value from pillar, if the named value is not available return the passed default. The default return is an empty string except `__opts__['pillar_raise_on_missing']` is set to `True`, in which case a `KeyError` will be raised.

If the `merge` parameter is set to `True`, the default will be recursively merged into the returned pillar data.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in pillar looks like this:

```
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the `apache` key in the `pkg` dict this key can be passed:

```
pkg:apache
```

**merge** [`False`] If `True`, the retrieved values will be merged into the passed default. When the default and the retrieved value are both dictionaries, the dictionaries will be recursively merged.

New in version 2014.7.0.

Changed in version 2016.3.7,2016.11.4,2017.7.0: If the default and the retrieved value are not of the same type, then merging will be skipped and the retrieved value will be returned. Earlier releases raised an error in these cases.

**merge\_nested\_lists** If set to `False`, lists nested within the retrieved pillar dictionary will *overwrite* lists in default. If set to `True`, nested lists will be *merged* into lists in default. If unspecified (the default), this option is inherited from the `pillar_merge_lists` minion config option.

---

**Note:** This option is ignored when `merge` is set to `False`.

---

New in version 2016.11.6.

**delimiter** Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

New in version 2014.7.0.

**pillarenv** If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion's pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.0.

**saltenv** Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

New in version 2017.7.0.

CLI Example:

```
salt '*' pillar.get pkg:apache
salt '*' pillar.get abc::def|ghi delimiter='|'
```

`salt.modules.pillar.item(*args, **kwargs)`

New in version 0.16.2.

Return one or more pillar entries from the *in-memory pillar data*.

**delimiter** Delimiter used to traverse nested dictionaries.

---

**Note:** This is different from *pillar.get* in that no default value can be specified. *pillar.get* should probably still be used in most cases to retrieve nested pillar values, as it is a bit more flexible. One reason to use this function instead of *pillar.get* however is when it is desirable to retrieve the values of more than one key, since *pillar.get* can only retrieve one key at a time.

---

New in version 2015.8.0.

CLI Examples:

```
salt '*' pillar.item foo
salt '*' pillar.item foo:bar
salt '*' pillar.item foo bar baz
```

`salt.modules.pillar.items(*args, **kwargs)`

Calls the master for a fresh pillar and generates the pillar data on the fly

Contrast with *raw()* which returns the pillar data that is currently loaded into the minion.

**pillar** If specified, allows for a dictionary of pillar data to be made available to pillar and ext\_pillar rendering. these pillar variables will also override any variables of the same name in pillar or ext\_pillar.

New in version 2015.5.0.

**pillar\_enc** If specified, the data passed in the *pillar* argument will be passed through this renderer to decrypt it.

---

**Note:** This will decrypt on the minion side, so the specified renderer must be set up on the minion for this to work. Alternatively, pillar data can be decrypted master-side. For more information, see the *Pillar Encryption* documentation. Pillar data that is decrypted master-side, is not decrypted until the end of pillar compilation though, so minion-side decryption will be necessary if the encrypted pillar data must be made available in an decrypted state pillar/ext\_pillar rendering.

---

New in version 2017.7.0.

**pillarenv** Pass a specific pillar environment from which to compile pillar data. If not specified, then the minion's *pillarenv* option is not used, and if that also is not specified then all configured pillar environments will be merged into a single pillar dictionary and returned.

New in version 2016.11.2.

**saltenv** Included only for compatibility with *pillarenv\_from\_saltenv*, and is otherwise ignored.

CLI Example:

```
salt '*' pillar.items
```

`salt.modules.pillar.keys(key, delimiter=':')`

New in version 2015.8.0.

Attempt to retrieve a list of keys from the named value from the pillar.

The value can also represent a value in a nested dict using a ":" delimiter for the dict, similar to how *pillar.get* works.

**delimiter** Specify an alternate delimiter to use when traversing a nested dict

CLI Example:

```
salt '*' pillar.keys web:sites
```

`salt.modules.pillar.ls(*args)`

New in version 2015.8.0.

Calls the master for a fresh pillar, generates the pillar data on the fly (same as `items()`), but only shows the available main keys.

CLI Examples:

```
salt '*' pillar.ls
```

`salt.modules.pillar.obfuscate(*args)`

New in version 2015.8.0.

Same as `items()`, but replace pillar values with a simple type indication.

This is useful to avoid displaying sensitive information on console or flooding the console with long output, such as certificates. For many debug or control purposes, the stakes lie more in dispatching than in actual values.

In case the value is itself a collection type, obfuscation occurs within the value. For mapping types, keys are not obfuscated. Here are some examples:

- `'secret password'` becomes `'<str>'`
- `['secret',1]` becomes `['<str>','<int>']`
- `{'login': 'somelogin','pwd': 'secret'}` becomes `{'login': '<str>','pwd': '<str>'}`

CLI Examples:

```
salt '*' pillar.obfuscate
```

`salt.modules.pillar.raw(key=None)`

Return the raw pillar data that is currently loaded into the minion.

Contrast with `items()` which calls the master to fetch the most up-to-date Pillar.

CLI Example:

```
salt '*' pillar.raw
```

With the optional key argument, you can select a subtree of the pillar raw data.:

```
salt '*' pillar.raw key='roles'
```

### 14.7.285 salt.modules.pip

Install Python packages with pip to either the system or a virtualenv

#### Windows Support

New in version 2014.7.4.

Salt now uses a portable python. As a result the entire pip module is now functional on the salt installation itself. You can pip install dependencies for your custom modules. You can even upgrade salt itself using pip. For this to work properly, you must specify the Current Working Directory (cwd) and the Pip Binary (bin\_env) salt should use. The variable `pip_bin` can be either a virtualenv path or the path to the pip binary itself.

For example, the following command will list all software installed using pip to your current salt environment:

```
salt <minion> pip.list cwd='C:\salt\bin\Scripts' bin_env='C:\salt\bin\Scripts\pip.exe'
```

Specifying the `cwd` and `bin_env` options ensures you're modifying the salt environment. If these are omitted, it will default to the local installation of python. If python is not installed locally it will fail saying it couldn't find pip.

## State File Support

This functionality works in states as well. If you need to pip install colorama with a state, for example, the following will work:

```
install_colorama:
  pip.installed:
    - name: colorama
    - cwd: 'C:\salt\bin\scripts'
    - bin_env: 'C:\salt\bin\scripts\pip.exe'
    - upgrade: True
```

## Upgrading Salt using Pip

You can now update salt using pip to any version from the 2014.7 branch forward. Previous version require recompiling some of the dependencies which is painful in windows.

To do this you just use pip with git to update to the version you want and then restart the service. Here is a sample state file that upgrades salt to the head of the 2015.5 branch:

```
install_salt:
  pip.installed:
    - cwd: 'C:\salt\bin\scripts'
    - bin_env: 'C:\salt\bin\scripts\pip.exe'
    - editable: git+https://github.com/saltstack/salt@2015.5#egg=salt
    - upgrade: True

restart_service:
  service.running:
    - name: salt-minion
    - enable: True
    - watch:
      - pip: install_salt
```

**Note:** If you're having problems, you might try doubling the back slashes. For example, `cwd: `C:\salt\bin\scripts``. Sometimes python thinks the single back slash is an escape character.

`salt.modules.pip.freeze` (*bin\_env=None, user=None, cwd=None, use\_vt=False*)

Return a list of installed packages either globally or in the specified virtualenv

**bin\_env** path to pip bin or path to virtualenv. If doing an uninstall from the system python and want to use a specific pip bin (pip-2.7, pip-2.6, etc..) just specify the pip bin you want. If uninstalling from a virtualenv, just use the path to the virtualenv (/home/code/path/to/virtualenv/)

**user** The user under which to run pip

**cwd** Current working directory to run pip from

---

**Note:** If the version of pip available is older than 8.0.3, the list will not include the packages pip, wheel, setuptools, or distribute even if they are installed.

---

CLI Example:

```
salt '*' pip.freeze /home/code/path/to/virtualenv/
```

Changed in version 2016.11.2: The packages pip, wheel, setuptools, and distribute are included if the installed pip is new enough.

```
salt.modules.pip.install(pkgs=None, requirements=None, bin_env=None, use_wheel=False,
                        no_use_wheel=False, log=None, proxy=None, timeout=None,
                        editable=None, find_links=None, index_url=None, extra_index_url=None,
                        no_index=False, mirrors=None, build=None, target=None,
                        download=None, download_cache=None, source=None,
                        upgrade=False, force_reinstall=False, ignore_installed=False,
                        exists_action=None, no_deps=False, no_install=False, no_download=False,
                        global_options=None, install_options=None, user=None,
                        no_chown=False, cwd=None, pre_releases=False, cert=None,
                        allow_all_external=False, allow_external=None, allow_unverified=None,
                        process_dependency_links=False, saltenv='base', env_vars=None,
                        use_vt=False, trusted_host=None, no_cache_dir=False, cache_dir=None)
```

Install packages with pip

Install packages individually or from a pip requirements file. Install packages globally or to a virtualenv.

**pkgs** Comma separated list of packages to install

**requirements** Path to requirements

**bin\_env** Path to pip bin or path to virtualenv. If doing a system install, and want to use a specific pip bin (pip-2.7, pip-2.6, etc..) just specify the pip bin you want.

---

**Note:** If installing into a virtualenv, just use the path to the virtualenv (e.g. /home/code/path/to/virtualenv/)

---

**use\_wheel** Prefer wheel archives (requires pip>=1.4)

**no\_use\_wheel** Force to not use wheel archives (requires pip>=1.4)

**log** Log file where a complete (maximum verbosity) record will be kept

**proxy** Specify a proxy in the form `user:passwd@proxy.server:port`. Note that the `user:password@` is optional and required only if you are behind an authenticated proxy. If you provide `user@proxy.server:port` then you will be prompted for a password.

**timeout** Set the socket timeout (default 15 seconds)

**editable** install something editable (e.g. `git+https://github.com/worldcompany/djangoembed.git#egg=dja`)

**find\_links** URL to search for packages

**index\_url** Base URL of Python Package Index

**extra\_index\_url** Extra URLs of package indexes to use in addition to `index_url`

**no\_index** Ignore package index

**mirrors** Specific mirror URL(s) to query (automatically adds `--use-mirrors`)

**Warning:** This option has been deprecated and removed in pip version 7.0.0. Please use `index_url` and/or `extra_index_url` instead.

**build** Unpack packages into `build` dir

**target** Install packages into `target` dir

**download** Download packages into `download` instead of installing them

**download\_cache** | **cache\_dir** Cache downloaded packages in `download_cache` or `cache_dir` dir

**source** Check out `editable` packages into `source` dir

**upgrade** Upgrade all packages to the newest available version

**force\_reinstall** When upgrading, reinstall all packages even if they are already up-to-date.

**ignore\_installed** Ignore the installed packages (reinstalling instead)

**exists\_action** Default action when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup

**no\_deps** Ignore package dependencies

**no\_install** Download and unpack all packages, but don't actually install them

**no\_download** Don't download any packages, just install the ones already downloaded (completes an install run with `--no-install`)

**install\_options** Extra arguments to be supplied to the `setup.py` install command (e.g. like `--install-option='--install-scripts=/usr/local/bin'`). Use multiple `--install-option` options to pass multiple options to `setup.py` install. If you are using an option with a directory path, be sure to use absolute path.

**global\_options** Extra global options to be supplied to the `setup.py` call before the install command.

**user** The user under which to run pip

**no\_chown** When user is given, do not attempt to copy and chown a requirements file

**cwd** Current working directory to run pip from

**pre\_releases** Include pre-releases in the available versions

**cert** Provide a path to an alternate CA bundle

**allow\_all\_external** Allow the installation of all externally hosted files

**allow\_external** Allow the installation of externally hosted files (comma separated list)

**allow\_unverified** Allow the installation of insecure and unverifiable files (comma separated list)

**process\_dependency\_links** Enable the processing of dependency links

**env\_vars** Set environment variables that some builds will depend on. For example, a Python C-module may have a Makefile that needs `INCLUDE_PATH` set to pick up a header file while compiling. This must be in the form of a dictionary or a mapping.

Example:

```
salt '*' pip.install django_app env_vars="{ 'CUSTOM_PATH': '/opt/django_app' }"
```

**trusted\_host** Mark this host as trusted, even though it does not have valid or any HTTPS.

**use\_vt** Use VT terminal emulation (see output while installing)

**no\_cache\_dir** Disable the cache.

CLI Example:

```
salt '*' pip.install <package name>, <package2 name>
salt '*' pip.install requirements=/path/to/requirements.txt
salt '*' pip.install <package name> bin_env=/path/to/virtualenv
salt '*' pip.install <package name> bin_env=/path/to/pip_bin
```

Complicated CLI example:

```
salt '*' pip.install markdown,django editable=git+https://github.com/worldcompany/djangoembed.git#egg=djangoembed upgrade=True no_deps=True
```

`salt.modules.pip.list` (*prefix=None, bin\_env=None, user=None, cwd=None*)

Filter list of installed apps from `freeze` and check to see if `prefix` exists in the list of packages installed.

---

**Note:** If the version of pip available is older than 8.0.3, the packages `wheel`, `setuptools`, and `distribute` will not be reported by this function even if they are installed. Unlike `pip.freeze`, this function always reports the version of pip which is installed.

---

CLI Example:

```
salt '*' pip.list salt
```

Changed in version 2016.11.2: The packages wheel, setuptools, and distribute are included if the installed pip is new enough.

`salt.modules.pip.list_upgrades` (*bin\_env=None, user=None, cwd=None*)

Check whether or not an upgrade is available for all packages

CLI Example:

```
salt '*' pip.list_upgrades
```

`salt.modules.pip.uninstall` (*pkgs=None, requirements=None, bin\_env=None, log=None, proxy=None, timeout=None, user=None, no\_chown=False, cwd=None, saltenv='base', use\_vt=False*)

Uninstall packages with pip

Uninstall packages individually or from a pip requirements file. Uninstall packages globally or from a virtualenv.

**pkgs** comma separated list of packages to install

**requirements** path to requirements.

**bin\_env** path to pip bin or path to virtualenv. If doing an uninstall from the system python and want to use a specific pip bin (pip-2.7, pip-2.6, etc..) just specify the pip bin you want. If uninstalling from a virtualenv, just use the path to the virtualenv (/home/code/path/to/virtualenv/)

**log** Log file where a complete (maximum verbosity) record will be kept

**proxy** Specify a proxy in the form user:passwd@proxy.server:port. Note that the user:password@ is optional and required only if you are behind an authenticated proxy. If you provide user@proxy.server:port then you will be prompted for a password.

**timeout** Set the socket timeout (default 15 seconds)

**user** The user under which to run pip

**no\_chown** When user is given, do not attempt to copy and chown a requirements file (needed if the requirements file refers to other files via relative paths, as the copy-and-chown procedure does not account for such files)

**cwd** Current working directory to run pip from

**use\_vt** Use VT terminal emulation (see output while installing)

CLI Example:

```
salt '*' pip.uninstall <package name>,<package2 name>
salt '*' pip.uninstall requirements=/path/to/requirements.txt
salt '*' pip.uninstall <package name> bin_env=/path/to/virtualenv
salt '*' pip.uninstall <package name> bin_env=/path/to/pip_bin
```

`salt.modules.pip.upgrade` (*bin\_env=None, user=None, cwd=None, use\_vt=False*)

New in version 2015.5.0.

Upgrades outdated pip packages

Returns a dict containing the changes.

```
{`<package>`: {'old': `<old-version>`, `new`: `<new-version>`}}
```

CLI Example:

```
salt '*' pip.upgrade
```

`salt.modules.pip.upgrade_available` (*pkg, bin\_env=None, user=None, cwd=None*)

New in version 2015.5.0.

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pip.upgrade_available <package name>
```

`salt.modules.pip.version(bin_env=None)`

New in version 0.17.0.

Returns the version of pip. Use `bin_env` to specify the path to a virtualenv and get the version of pip in that virtualenv.

If unable to detect the pip version, returns None.

CLI Example:

```
salt '*' pip.version
```

### 14.7.286 salt.modules.pkg\_resource

Resources needed by pkg providers

`salt.modules.pkg_resource.add_pkg(pkgs, name, pkgver)`

Add a package to a dict of installed packages.

CLI Example:

```
salt '*' pkg_resource.add_pkg '{} bind 9
```

`salt.modules.pkg_resource.check_extra_requirements(pkgname, pkgver)`

Check if the installed package already has the given requirements. This function will return the result of `pkg.check_extra_requirements` if this function exists for the minion, otherwise it will return True.

CLI Example:

```
salt '*' pkg_resource.check_extra_requirements <pkgname> <extra_requirements>
```

`salt.modules.pkg_resource.pack_sources(sources, normalize=True)`

Accepts list of dicts (or a string representing a list of dicts) and packs the key/value pairs into a single dict.

'[{"foo": "salt://foo.rpm"}, {"bar": "salt://bar.rpm"}]' would become {"foo": "salt://foo.rpm", "bar": "salt://bar.rpm"}

**normalize** [True] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2015.8.0.

CLI Example:

```
salt '*' pkg_resource.pack_sources '[{"foo": "salt://foo.rpm"}, {"bar": "salt://
↪bar.rpm"}]'
```

`salt.modules.pkg_resource.parse_targets(name=None, pkgs=None, sources=None, saltenv='base', normalize=True, **kwargs)`

Parses the input to `pkg.install` and returns back the package(s) to be installed. Returns a list of packages, as well as a string noting whether the packages are to come from a repository or a binary package.

CLI Example:

```
salt '*' pkg_resource.parse_targets
```

`salt.modules.pkg_resource.sort_pkglist(pkgs)`

Accepts a dict obtained from `pkg.list_pkgs()` and sorts in place the list of versions for any packages that have multiple versions installed, so that two package lists can be compared to one another.

CLI Example:

```
salt '*' pkg_resource.sort_pkglist '["3.45", "2.13"]'
```

`salt.modules.pkg_resource.stringify(pkgs)`

Takes a dict of package name/version information and joins each list of installed versions into a string.

CLI Example:

```
salt '*' pkg_resource.stringify 'vim: 7.127'
```

`salt.modules.pkg_resource.version(*names, **kwargs)`

Common interface for obtaining the version of installed packages.

CLI Example:

```
salt '*' pkg_resource.version vim
salt '*' pkg_resource.version foo bar baz
salt '*' pkg_resource.version 'python*'
```

`salt.modules.pkg_resource.version_clean(verstr)`

Clean the version string removing extra data. This function will simply try to call `pkg.version_clean`.

CLI Example:

```
salt '*' pkg_resource.version_clean <version_string>
```

### 14.7.287 salt.modules.pkgin

Package support for pkgin based systems, inspired from `freebsd/pkg` module

---

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `'pkg.install' is not available`), see [here](#).

---

`salt.modules.pkgin.available_version(*names, **kwargs)`

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> ...
```

`salt.modules.pkgin.file_dict(*packages)`

List the files that belong to a package.

CLI Examples:

```
salt '*' pkg.file_dict nginx
salt '*' pkg.file_dict nginx varnish
```

`salt.modules.pkgin.file_list(package)`

List the files that belong to a package.

CLI Examples:

```
salt '*' pkg.file_list nginx
```

`salt.modules.pkgin.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)`

Install the passed package

**name** The name of the package to be installed.

**refresh** Whether or not to refresh the package database before installing.

**fromrepo** Specify a package repository to install from.

Multiple Package Installation Options:

**pkgs** A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo","bar"]'
```

**sources** A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources=[{"foo": "salt://foo.deb"}, {"bar": "salt://bar.
↳deb"}]
```

Return a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.install <package name>
```

`salt.modules.pkgin.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> ...
```

`salt.modules.pkgin.list_pkgs(versions_as_list=False, **kwargs)`

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.pkgin.purge` (*name=None, pkgs=None, \*\*kwargs*)

Package purges are not supported, this function is identical to `remove()`.

**name** The name of the package to be deleted.

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs=['foo', 'bar']
```

`salt.modules.pkgin.refresh_db` ()

Use pkg update to get latest pkg\_summary

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.pkgin.remove` (*name=None, pkgs=None, \*\*kwargs*)

**name** The name of the package to be deleted.

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs=['foo', 'bar']
```

`salt.modules.pkgin.search` (*pkg\_name*)

Searches for an exact match using `pkgin ^package$`

CLI Example:

```
salt '*' pkg.search 'mysql-server'
```

`salt.modules.pkgin.upgrade` ()

Run pkg upgrade, if pkgin used. Otherwise do nothing

Returns a dictionary containing the changes:

```
{<package>: {'old': '<old-version>',
             'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.pkgin.version` (*\*names, \*\*kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

### 14.7.288 salt.modules.pkgng

Support for pkgng, the new package manager for FreeBSD

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `pkg.install is not available`), see [here](#).

**Warning:** This module has been completely rewritten. Up to and including version 0.17.x, it was available as the pkgng module, (`pkgng.install`, `pkgng.delete`, etc.), but moving forward this module will no longer be available as pkgng, as it will behave like a normal Salt pkg provider. The documentation below should not be considered to apply to this module in versions  $\leq 0.17.x$ . If your minion is running a 0.17.x release or older, then the documentation for this module can be viewed using the `sys.doc` function:

```
salt bsdminion sys.doc pkgng
```

This module provides an interface to `pkg(8)`. It acts as the default package provider for FreeBSD 10 and newer. For FreeBSD hosts which have been upgraded to use pkgng, you will need to override the pkg provider by setting the `providers` parameter in your Minion config file, in order to use this module to manage packages, like so:

```
providers:
  pkg: pkgng
```

`salt.modules.pkgng.audit` (*jail=None, chroot=None, root=None*)

Audits installed packages against known vulnerabilities

CLI Example:

```
salt '*' pkg.audit
```

**jail** Audit packages within the specified jail

CLI Example:

```
salt '*' pkg.audit jail=<jail name or id>
```

**chroot** Audit packages within the specified chroot (ignored if `jail` is specified)

**root** Audit packages within the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.audit chroot=/path/to/chroot
```

`salt.modules.pkgng.autoremove` (*jail=None, chroot=None, root=None, dryrun=False*)

Delete packages which were automatically installed as dependencies and are not required anymore.

**dryrun** Dry-run mode. The list of changes to packages is always printed, but no changes are actually made.

CLI Example:

```
salt '*' pkg.autoremove
salt '*' pkg.autoremove jail=<jail name or id>
salt '*' pkg.autoremove dryrun=True
salt '*' pkg.autoremove jail=<jail name or id> dryrun=True
```

`salt.modules.pkgng.backup` (*file\_name*, *jail=None*, *chroot=None*, *root=None*)

Export installed packages into yaml+mtree file

CLI Example:

```
salt '*' pkg.backup /tmp/pkg
```

**jail** Backup packages from the specified jail. Note that this will run the command within the jail, and so the path to the backup file will be relative to the root of the jail

CLI Example:

```
salt '*' pkg.backup /tmp/pkg jail=<jail name or id>
```

**chroot** Backup packages from the specified chroot (ignored if `jail` is specified). Note that this will run the command within the chroot, and so the path to the backup file will be relative to the root of the chroot.

**root** Backup packages from the specified root (ignored if `jail` is specified). Note that this will run the command within the root, and so the path to the backup file will be relative to the root of the root.

CLI Example:

```
salt '*' pkg.backup /tmp/pkg chroot=/path/to/chroot
```

`salt.modules.pkgng.check` (*jail=None*, *chroot=None*, *root=None*, *depends=False*, *recompute=False*, *checksum=False*)

Sanity checks installed packages

**jail** Perform the sanity check in the specified jail

CLI Example:

```
salt '*' pkg.check jail=<jail name or id>
```

**chroot** Perform the sanity check in the specified chroot (ignored if `jail` is specified)

**root** Perform the sanity check in the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.check chroot=/path/to/chroot
```

Of the below, at least one must be set to `True`.

**depends** Check for and install missing dependencies.

CLI Example:

```
salt '*' pkg.check recompute=True
```

**recompute** Recompute sizes and checksums of installed packages.

CLI Example:

```
salt '*' pkg.check depends=True
```

**checksum** Find invalid checksums for installed packages.

CLI Example:

```
salt '*' pkg.check checksum=True
```

**salt.modules.pkgng.clean**(*jail=None, chroot=None, root=None*)

Cleans the local cache of fetched remote packages

CLI Example:

```
salt '*' pkg.clean
salt '*' pkg.clean jail=<jail name or id>
salt '*' pkg.clean chroot=/path/to/chroot
```

**salt.modules.pkgng.fetch**(*name, jail=None, chroot=None, root=None, fetch\_all=False, quiet=False, fromrepo=None, glob=True, regex=False, pcre=False, local=False, depends=False*)

Fetches remote packages

CLI Example:

```
salt '*' pkg.fetch <package name>
```

**jail** Fetch package in the specified jail

CLI Example:

```
salt '*' pkg.fetch <package name> jail=<jail name or id>
```

**chroot** Fetch package in the specified chroot (ignored if **jail** is specified)

**root** Fetch package in the specified root (ignored if **jail** is specified)

CLI Example:

```
salt '*' pkg.fetch <package name> chroot=/path/to/chroot
```

**fetch\_all** Fetch all packages.

CLI Example:

```
salt '*' pkg.fetch <package name> fetch_all=True
```

**quiet** Quiet mode. Show less output.

CLI Example:

```
salt '*' pkg.fetch <package name> quiet=True
```

**fromrepo** Fetches packages from the given repo if multiple repo support is enabled. See `pkg.conf(5)`.

CLI Example:

```
salt '*' pkg.fetch <package name> fromrepo=repo
```

**glob** Treat `pkg_name` as a shell glob pattern.

CLI Example:

```
salt '*' pkg.fetch <package name> glob=True
```

**regex** Treat `pkg_name` as a regular expression.

CLI Example:

```
salt '*' pkg.fetch <regular expression> regex=True
```

**pcre** Treat `pkg_name` as an extended regular expression.

CLI Example:

```
salt '*' pkg.fetch <extended regular expression> pcre=True
```

**local** Skip updating the repository catalogs with `pkg-update(8)`. Use the local cache only.

CLI Example:

```
salt '*' pkg.fetch <package name> local=True
```

**depends** Fetch the package and its dependencies as well.

CLI Example:

```
salt '*' pkg.fetch <package name> depends=True
```

`salt.modules.pkgng.install`(*name=None, fromrepo=None, pkgs=None, sources=None, jail=None, chroot=None, root=None, orphan=False, force=False, glob=False, local=False, dryrun=False, quiet=False, reinstall\_requires=False, regex=False, pcre=False, \*\*kwargs*)

Install package(s) from a repository

**name** The name of the package to install

CLI Example:

```
salt '*' pkg.install <package name>
```

**jail** Install the package into the specified jail

**chroot** Install the package into the specified chroot (ignored if `jail` is specified)

**root** Install the package into the specified root (ignored if `jail` is specified)

**orphan** Mark the installed package as orphan. Will be automatically removed if no other packages depend on them. For more information please refer to `pkg-autoremove(8)`.

CLI Example:

```
salt '*' pkg.install <package name> orphan=True
```

**force** Force the reinstallation of the package if already installed.

CLI Example:

```
salt '*' pkg.install <package name> force=True
```

**glob** Treat the package names as shell glob patterns.

CLI Example:

```
salt '*' pkg.install <package name> glob=True
```

**local** Do not update the repository catalogs with `pkg-update(8)`. A value of `True` here is equivalent to using the `-U` flag with `pkg install`.

CLI Example:

```
salt '*' pkg.install <package name> local=True
```

**dryrun** Dry-run mode. The list of changes to packages is always printed, but no changes are actually made.

CLI Example:

```
salt '*' pkg.install <package name> dryrun=True
```

**quiet** Force quiet output, except when dryrun is used, where pkg install will always show packages to be installed, upgraded or deleted.

CLI Example:

```
salt '*' pkg.install <package name> quiet=True
```

**reinstall\_requires** When used with force, reinstalls any packages that require the given package.

CLI Example:

```
salt '*' pkg.install <package name> reinstall_requires=True force=True
```

Changed in version 2014.7.0: `require` kwarg renamed to `reinstall_requires`

**fromrepo** In multi-repo mode, override the pkg.conf ordering and only attempt to download packages from the named repository.

CLI Example:

```
salt '*' pkg.install <package name> fromrepo=repo
```

**regex** Treat the package names as a regular expression

CLI Example:

```
salt '*' pkg.install <regular expression> regex=True
```

**pcre** Treat the package names as extended regular expressions.

CLI Example:

```
salt '*' pkg.install <extended regular expression> pcre=True
```

`salt.modules.pkgng.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> jail=<jail name or id>
salt '*' pkg.latest_version <package name> chroot=/path/to/chroot
```

`salt.modules.pkgng.list_pkgs(versions_as_list=False, jail=None, chroot=None, root=None, with_origin=False, **kwargs)`

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

**jail** List the packages in the specified jail

**chroot** List the packages in the specified chroot (ignored if jail is specified)

**root** List the packages in the specified root (ignored if jail is specified)

**with\_origin** [False] Return a nested dictionary containing both the origin name and version for each installed package.

New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs jail=<jail name or id>
salt '*' pkg.list_pkgs chroot=/path/to/chroot
```

`salt.modules.pkgng.parse_config`(*file\_name*='/usr/local/etc/pkg.conf')

Return dict of uncommented global variables.

CLI Example:

```
salt '*' pkg.parse_config
```

NOTE: not working properly right now

`salt.modules.pkgng.refresh_db`(*jail*=None, *chroot*=None, *root*=None, *force*=False)

Refresh PACKAGESITE contents

---

**Note:** This function can be accessed using `pkg.update` in addition to `pkg.refresh_db`, to more closely match the CLI usage of `pkg(8)`.

---

CLI Example:

```
salt '*' pkg.refresh_db
```

**jail** Refresh the pkg database within the specified jail

**chroot** Refresh the pkg database within the specified chroot (ignored if `jail` is specified)

**root** Refresh the pkg database within the specified root (ignored if `jail` is specified)

**force** Force a full download of the repository catalog without regard to the respective ages of the local and remote copies of the catalog.

CLI Example:

```
salt '*' pkg.refresh_db force=True
```

`salt.modules.pkgng.remove`(*name*=None, *pkgs*=None, *jail*=None, *chroot*=None, *root*=None, *all\_installed*=False, *force*=False, *glob*=False, *dryrun*=False, *recurse*=False, *regex*=False, *pcre*=False, *\*\*kwargs*)

Remove a package from the database and system

---

**Note:** This function can be accessed using `pkg.delete` in addition to `pkg.remove`, to more closely match the CLI usage of `pkg(8)`.

---

**name** The package to remove

CLI Example:

```
salt '*' pkg.remove <package name>
```

**jail** Delete the package from the specified jail

**chroot** Delete the package from the specified chroot (ignored if `jail` is specified)

**root** Delete the package from the specified root (ignored if `jail` is specified)

**all\_installed** Deletes all installed packages from the system and empties the database. USE WITH CAUTION!

CLI Example:

```
salt '*' pkg.remove all all_installed=True force=True
```

**force** Forces packages to be removed despite leaving unresolved dependencies.

CLI Example:

```
salt '*' pkg.remove <package name> force=True
```

**glob** Treat the package names as shell glob patterns.

CLI Example:

```
salt '*' pkg.remove <package name> glob=True
```

**dryrun** Dry run mode. The list of packages to delete is always printed, but no packages are actually deleted.

CLI Example:

```
salt '*' pkg.remove <package name> dryrun=True
```

**recurse** Delete all packages that require the listed package as well.

CLI Example:

```
salt '*' pkg.remove <package name> recurse=True
```

**regex** Treat the package names as regular expressions.

CLI Example:

```
salt '*' pkg.remove <regular expression> regex=True
```

**pcre** Treat the package names as extended regular expressions.

CLI Example:

```
salt '*' pkg.remove <extended regular expression> pcre=True
```

**salt.modules.pkgng.restore** (*file\_name, jail=None, chroot=None, root=None*)

Reads archive created by pkg backup -d and recreates the database.

CLI Example:

```
salt '*' pkg.restore /tmp/pkg
```

**jail** Restore database to the specified jail. Note that this will run the command within the jail, and so the path to the file from which the pkg database will be restored is relative to the root of the jail.

CLI Example:

```
salt '*' pkg.restore /tmp/pkg jail=<jail name or id>
```

**chroot** Restore database to the specified chroot (ignored if jail is specified). Note that this will run the command within the chroot, and so the path to the file from which the pkg database will be restored is relative to the root of the chroot.

**root** Restore database to the specified root (ignored if jail is specified). Note that this will run the command within the root, and so the path to the file from which the pkg database will be restored is relative to the root of the root.

CLI Example:

```
salt '*' pkg.restore /tmp/pkg chroot=/path/to/chroot
```

**salt.modules.pkgng.search** (*name, jail=None, chroot=None, root=None, exact=False, glob=False, regex=False, pcre=False, comment=False, desc=False, full=False, depends=False, size=False, quiet=False, origin=False, prefix=False*)

Searches in remote package repositories

CLI Example:

```
salt '*' pkg.search pattern
```

**jail** Perform the search using the `pkg.conf(5)` from the specified jail

CLI Example:

```
salt '*' pkg.search pattern jail=<jail name or id>
```

**chroot** Perform the search using the `pkg.conf(5)` from the specified chroot (ignored if `jail` is specified)

**root** Perform the search using the `pkg.conf(5)` from the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.search pattern chroot=/path/to/chroot
```

**exact** Treat pattern as exact pattern.

CLI Example:

```
salt '*' pkg.search pattern exact=True
```

**glob** Treat pattern as a shell glob pattern.

CLI Example:

```
salt '*' pkg.search pattern glob=True
```

**regex** Treat pattern as a regular expression.

CLI Example:

```
salt '*' pkg.search pattern regex=True
```

**pcre** Treat pattern as an extended regular expression.

CLI Example:

```
salt '*' pkg.search pattern pcre=True
```

**comment** Search for pattern in the package comment one-line description.

CLI Example:

```
salt '*' pkg.search pattern comment=True
```

**desc** Search for pattern in the package description.

CLI Example:

```
salt '*' pkg.search pattern desc=True
```

**full** Displays full information about the matching packages.

CLI Example:

```
salt '*' pkg.search pattern full=True
```

**depends** Displays the dependencies of pattern.

CLI Example:

```
salt '*' pkg.search pattern depends=True
```

**size** Displays the size of the package

CLI Example:

```
salt '*' pkg.search pattern size=True
```

**quiet** Be quiet. Prints only the requested information without displaying many hints.

CLI Example:

```
salt '*' pkg.search pattern quiet=True
```

**origin** Displays pattern origin.

CLI Example:

```
salt '*' pkg.search pattern origin=True
```

**prefix** Displays the installation prefix for each package matching pattern.

CLI Example:

```
salt '*' pkg.search pattern prefix=True
```

**salt.modules.pkgng.stats** (*local=False, remote=False, jail=None, chroot=None, root=None*)

Return pkgng stats.

CLI Example:

```
salt '*' pkg.stats
```

**local** Display stats only for the local package database.

CLI Example:

```
salt '*' pkg.stats local=True
```

**remote** Display stats only for the remote package database(s).

CLI Example:

```
salt '*' pkg.stats remote=True
```

**jail** Retrieve stats from the specified jail.

CLI Example:

```
salt '*' pkg.stats jail=<jail name or id>
salt '*' pkg.stats jail=<jail name or id> local=True
salt '*' pkg.stats jail=<jail name or id> remote=True
```

**chroot** Retrieve stats from the specified chroot (ignored if `jail` is specified).

**root** Retrieve stats from the specified root (ignored if `jail` is specified).

CLI Example:

```
salt '*' pkg.stats chroot=/path/to/chroot
salt '*' pkg.stats chroot=/path/to/chroot local=True
salt '*' pkg.stats chroot=/path/to/chroot remote=True
```

**salt.modules.pkgng.update\_package\_site** (*new\_url*)

Updates remote package repo URL, `PACKAGESITE` var to be exact.

Must use `http://`, `ftp://`, or `https://` protocol

CLI Example:

```
salt '*' pkg.update_package_site http://127.0.0.1/
```

`salt.modules.pkgng.updating`(*name*, *jail=None*, *chroot=None*, *root=None*, *filedate=None*, *filename=None*)

` Displays UPDATING entries of software packages

CLI Example:

```
salt '*' pkg.updating foo
```

**jail** Perform the action in the specified jail

CLI Example:

```
salt '*' pkg.updating foo jail=<jail name or id>
```

**chroot** Perform the action in the specified chroot (ignored if `jail` is specified)

**root** Perform the action in the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.updating foo chroot=/path/to/chroot
```

**filedate** Only entries newer than date are shown. Use a YYYYMMDD date format.

CLI Example:

```
salt '*' pkg.updating foo filedate=20130101
```

**filename** Defines an alternative location of the UPDATING file.

CLI Example:

```
salt '*' pkg.updating foo filename=/tmp/UPDATING
```

`salt.modules.pkgng.upgrade`(*\*names*, *\*\*kwargs*)

Upgrade named or all packages (run a `pkg upgrade`). If `<package name>` is omitted, the operation is executed on all packages.

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',  
              'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade <package name>
```

**jail** Audit packages within the specified jail

CLI Example:

```
salt '*' pkg.upgrade <package name> jail=<jail name or id>
```

**chroot** Audit packages within the specified chroot (ignored if `jail` is specified)

**root** Audit packages within the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.upgrade <package name> chroot=/path/to/chroot
```

Any of the below options can also be used with `jail` or `chroot`.

**force** Force reinstalling/upgrading the whole set of packages.

CLI Example:

```
salt '*' pkg.upgrade <package name> force=True
```

**local** Do not update the repository catalogs with `pkg-update(8)`. A value of `True` here is equivalent to using the `-U` flag with `pkg upgrade`.

CLI Example:

```
salt '*' pkg.upgrade <package name> local=True
```

**dryrun** Dry-run mode: show what packages have updates available, but do not perform any upgrades. Repository catalogs will be updated as usual unless the `local` option is also given.

CLI Example:

```
salt '*' pkg.upgrade <package name> dryrun=True
```

`salt.modules.pkgng.version(*names, **kwargs)`

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

---

**Note:** This function can be accessed using `pkg.info` in addition to `pkg.version`, to more closely match the CLI usage of `pkg(8)`.

---

**jail** Get package version information for the specified jail

**chroot** Get package version information for the specified chroot (ignored if `jail` is specified)

**root** Get package version information for the specified root (ignored if `jail` is specified)

**with\_origin** [False] Return a nested dictionary containing both the origin name and version for each specified package.

New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package name> jail=<jail name or id>
salt '*' pkg.version <package1> <package2> <package3> ...
```

`salt.modules.pkgng.version_cmp(pkg1, pkg2, ignore_epoch=False)`

Do a `cmp`-style comparison on two packages. Return `-1` if `pkg1 < pkg2`, `0` if `pkg1 == pkg2`, and `1` if `pkg1 > pkg2`. Return `None` if there was a problem making the comparison.

CLI Example:

```
salt '*' pkg.version_cmp '2.1.11' '2.1.12'
```

`salt.modules.pkgng.which(path, jail=None, chroot=None, root=None, origin=False, quiet=False)`

Displays which package installed a specific file

CLI Example:

```
salt '*' pkg.which <file name>
```

**jail** Perform the check in the specified jail

CLI Example:

```
salt '*' pkg.which <file name> jail=<jail name or id>
```

**chroot** Perform the check in the specified chroot (ignored if jail is specified)

**root** Perform the check in the specified root (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.which <file name> chroot=/path/to/chroot
```

**origin** Shows the origin of the package instead of name-version.

CLI Example:

```
salt '*' pkg.which <file name> origin=True
```

**quiet** Quiet output.

CLI Example:

```
salt '*' pkg.which <file name> quiet=True
```

## 14.7.289 salt.modules.pkgutil

Pkgutil support for Solaris

---

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to ``pkg.install' is not available`), see [here](#).

---

`salt.modules.pkgutil.install`(*name=None, refresh=False, version=None, pkgs=None, \*\*kwargs*)  
Install packages using the pkgutil tool.

CLI Example:

```
salt '*' pkg.install <package_name>
salt '*' pkg.install SMClgcc346
```

Multiple Package Installation Options:

**pkgs** A list of packages to install from OpenCSW. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs=['"foo", "bar"']
salt '*' pkg.install pkgs=['"foo", {"bar": "1.2.3"}']
```

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

`salt.modules.pkgutil.latest_version`(\*names, \*\*kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkgutil.latest_version CSWpython
salt '*' pkgutil.latest_version <package1> <package2> <package3> ...
```

`salt.modules.pkgutil.list_pkgs` (*versions\_as\_list=False, \*\*kwargs*)  
List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

`salt.modules.pkgutil.list_upgrades` (*refresh=True, \*\*kwargs*)  
List all available package upgrades on this system

CLI Example:

```
salt '*' pkgutil.list_upgrades
```

`salt.modules.pkgutil.purge` (*name=None, pkgs=None, \*\*kwargs*)  
Package purges are not supported, this function is identical to `remove()`.

**name** The name of the package to be deleted.

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>, <package2>, <package3>
salt '*' pkg.purge pkgs=['"foo"', '"bar"']
```

`salt.modules.pkgutil.refresh_db`()  
Updates the pkgutil repo database (pkgutil -U)

CLI Example:

```
salt '*' pkgutil.refresh_db
```

`salt.modules.pkgutil.remove` (*name=None, pkgs=None, \*\*kwargs*)  
Remove a package and all its dependencies which are not in use by other packages.

**name** The name of the package to be deleted.

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>, <package2>, <package3>
salt '*' pkg.remove pkgs=['"foo"', '"bar"']
```

`salt.modules.pkgutil.upgrade` (*refresh=True*)  
Upgrade all of the packages to the latest available version.

Returns a dict containing the changes:

```
{'<package>': {'old': '<old-version>',  
              'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkgutil.upgrade
```

`salt.modules.pkgutil.upgrade_available(name)`  
Check if there is an upgrade available for a certain package

CLI Example:

```
salt '*' pkgutil.upgrade_available CSWpython
```

`salt.modules.pkgutil.version(*names, **kwargs)`  
Returns a version if the package is installed, else returns an empty string

CLI Example:

```
salt '*' pkgutil.version CSWpython
```

### 14.7.290 salt.modules.portage\_config

Configure portage (5)

`salt.modules.portage_config.append_to_package_conf(conf, atom=',', flags=None, string=',', overwrite=False)`  
Append a string or a list of flags for a given package or DEPEND atom to a given configuration file.

CLI Example:

```
salt '*' portage_config.append_to_package_conf use string="app-admin/salt ldap -  
↳ libvirt"  
salt '*' portage_config.append_to_package_conf use atom="> = app-admin/salt-0.14.1  
↳" flags="['ldap', '-libvirt']"
```

`salt.modules.portage_config.append_use_flags(atom, uses=None, overwrite=False)`  
Append a list of use flags for a given package or DEPEND atom

CLI Example:

```
salt '*' portage_config.append_use_flags "app-admin/salt[ldap, -libvirt]"  
salt '*' portage_config.append_use_flags ">=app-admin/salt-0.14.1" "['ldap', '-  
↳ libvirt']"
```

`salt.modules.portage_config.enforce_nice_config()`  
Enforce a nice tree structure for /etc/portage/package.\* configuration files.

**See also:**

[`salt.modules.ebuild.ex\_mod\_init\(\)`](#) for information on automatically running this when pkg is used.

CLI Example:

```
salt '*' portage_config.enforce_nice_config
```

`salt.modules.portage_config.filter_flags`(*use, use\_expand\_hidden, usemasked, useforced*)  
New in version 2015.8.0.

Filter function to remove hidden or otherwise not normally visible USE flags from a list.

@type use: list @param use: the USE flag list to be filtered. @type use\_expand\_hidden: list @param use\_expand\_hidden: list of flags hidden. @type usemasked: list @param usemasked: list of masked USE flags. @type useforced: list @param useforced: the forced USE flags. @rtype: list @return the filtered USE flags.

`salt.modules.portage_config.get_all_cpv_use`(*cp*)  
New in version 2015.8.0.

Uses portage to determine final USE flags and settings for an emerge.

@type cp: string @param cp: eg cat/pkg @rtype: lists @return use, use\_expand\_hidden, usemask, useforce

`salt.modules.portage_config.get_cleared_flags`(*cp*)  
New in version 2015.8.0.

Uses portage for compare use flags which is used for installing package and use flags which now exist int /etc/portage/package.use/

@type cp: string @param cp: eg cat/pkg @rtype: tuple @rparam: tuple with two lists - list of used flags and list of flags which will be used

`salt.modules.portage_config.get_flags_from_package_conf`(*conf, atom*)

Get flags for a given package or DEPEND atom. Warning: This only works if the configuration files tree is in the correct format (the one enforced by `enforce_nice_config`)

CLI Example:

```
salt '*' portage_config.get_flags_from_package_conf license salt
```

`salt.modules.portage_config.get_installed_use`(*cp, use='USE'*)  
New in version 2015.8.0.

Gets the installed USE flags from the VARDB.

@type cp: string @param cp: cat/pkg @type use: string @param use: 1 of ["USE", ``PKGUSE"] @rtype list @returns [] or the list of IUSE flags

`salt.modules.portage_config.get_iuse`(*cp*)  
New in version 2015.8.0.

Gets the current IUSE flags from the tree.

@type cpv: string @param cpv: cat/pkg @rtype list @returns [] or the list of IUSE flags

`salt.modules.portage_config.get_missing_flags`(*conf, atom, flags*)  
Find out which of the given flags are currently not set. CLI Example:

```
salt '*' portage_config.get_missing_flags use salt "['ldap', '-libvirt', 'openssl ↵']"
```

`salt.modules.portage_config.has_flag`(*conf, atom, flag*)

Verify if the given package or DEPEND atom has the given flag. Warning: This only works if the configuration files tree is in the correct format (the one enforced by `enforce_nice_config`)

CLI Example:

```
salt '*' portage_config.has_flag license salt Apache-2.0
```

`salt.modules.portage_config.has_use(atom, use)`

Verify if the given package or DEPEND atom has the given use flag. Warning: This only works if the configuration files tree is in the correct format (the one enforced by `enforce_nice_config`)

CLI Example:

```
salt '*' portage_config.has_use salt libvirt
```

`salt.modules.portage_config.is_changed_uses(cp)`

New in version 2015.8.0.

Uses portage for determine if the use flags of installed package is compatible with use flags in portage configs.

@type cp: string @param cp: eg cat/pkg

`salt.modules.portage_config.is_present(conf, atom)`

Tell if a given package or DEPEND atom is present in the configuration files tree. Warning: This only works if the configuration files tree is in the correct format (the one enforced by `enforce_nice_config`)

CLI Example:

```
salt '*' portage_config.is_present unmask salt
```

### 14.7.291 salt.modules.postfix

Support for Postfix

This module is currently little more than a config file viewer and editor. It is able to read the master.cf file (which is one style) and files in the style of main.cf (which is a different style, that is used in multiple postfix configuration files).

The design of this module is such that when files are edited, a minimum of changes are made to them. Each file should look as if it has been edited by hand; order, comments and whitespace are all preserved.

`salt.modules.postfix.delete(queue_id)`

Delete message(s) from the mail queue

CLI Example:

```
salt '*' postfix.delete 5C33CA0DEA
```

```
salt '*' postfix.delete ALL
```

`salt.modules.postfix.hold(queue_id)`

Put message(s) on hold from the mail queue

CLI Example:

```
salt '*' postfix.hold 5C33CA0DEA
```

```
salt '*' postfix.hold ALL
```

`salt.modules.postfix.requeue(queue_id)`

Requeue message(s) in the mail queue

CLI Example:

```
salt '*' postfix.requeue 5C33CA0DEA
```

```
salt '*' postfix.requeue ALL
```

`salt.modules.postfix.set_main(key, value, path='/etc/postfix/main.cf')`

Set a single config value in the main.cf file. If the value does not already exist, it will be appended to the end.

CLI Example:

```
salt <minion> postfix.set_main mailq_path /usr/bin/mailq
```

`salt.modules.postfix.set_master(service, conn_type, private='y', unpriv='y', chroot='y', wakeup='n', maxproc='100', command='', write_conf=True, path='/etc/postfix/master.cf')`

Set a single config value in the master.cf file. If the value does not already exist, it will be appended to the end.

Because of shell parsing issues, ``-`` cannot be set as a value, as is normal in the master.cf file; either ``y``, ``n`` or a number should be used when calling this function from the command line. If the value used matches the default, it will internally be converted to a ``-``. Calling this function from the Python API is not affected by this limitation

The settings and their default values, in order, are: `service` (required), `conn_type` (required), `private` (y), `unpriv` (y), `chroot` (y), `wakeup` (n), `maxproc` (100), `command` (required).

By default, this function will write out the changes to the master.cf file, and then returns the full contents of the file. By setting the `write_conf` option to `False`, it will skip writing the file.

CLI Example:

```
salt <minion> postfix.set_master smtp inet n y n n 100 smtpd
```

`salt.modules.postfix.show_main(path='/etc/postfix/main.cf')`

Return a dict of active config values. This does not include comments, spacing or order. Bear in mind that order is functionally important in the main.cf file, since keys can be referred to as variables. This means that the data returned from this function should not be used for direct modification of the main.cf file; other functions are available for that.

CLI Examples:

```
salt <minion> postfix.show_main salt <minion> postfix.show_main path=/path/to/main.cf
```

`salt.modules.postfix.show_master(path='/etc/postfix/master.cf')`

Return a dict of active config values. This does not include comments, spacing or order.

The data returned from this function should not be used for direct modification of the main.cf file; other functions are available for that.

CLI Examples:

```
salt <minion> postfix.show_master salt <minion> postfix.show_master path=/path/to/master.cf
```

`salt.modules.postfix.show_queue()`

Show contents of the mail queue

CLI Example:

```
salt '*' postfix.show_queue
```

`salt.modules.postfix.unhold(queue_id)`

Set held message(s) in the mail queue to unheld

CLI Example:

```
salt '*' postfix.unhold 5C33CA0DEA
```

```
salt '*' postfix.unhold ALL
```

## 14.7.292 salt.modules.postgres

Module to provide Postgres compatibility to salt.

**configuration** In order to connect to Postgres, certain configuration is required in `/etc/salt/minion` on the relevant minions. Some sample configs might look like:

```
postgres.host: 'localhost'
postgres.port: '5432'
postgres.user: 'postgres' -> db user
postgres.pass: ''
postgres.maintenance_db: 'postgres'
```

The default for the `maintenance_db` is `'postgres'` and in most cases it can be left at the default setting. This data can also be passed into pillar. Options passed into `opts` will overwrite options passed into pillar

**note** This module uses MD5 hashing which may not be compliant with certain security audits.

**note** When installing postgres from the official postgres repos, on certain linux distributions, either the `psql` or the `initdb` binary is *not* automatically placed on the path. Add a configuration to the location of the postgres bin's path to the relevant minion for this module:

```
postgres.bins_dir: '/usr/pgsql-9.5/bin/'
```

`salt.modules.postgres.available_extensions` (*user=None, host=None, port=None, maintenance\_db=None, password=None, runas=None*)

List available postgresql extensions

CLI Example:

```
salt '*' postgres.available_extensions
```

`salt.modules.postgres.create_extension` (*name, if\_not\_exists=None, schema=None, ext\_version=None, from\_version=None, user=None, host=None, port=None, maintenance\_db=None, password=None, runas=None*)

Install a postgresql extension

CLI Example:

```
salt '*' postgres.create_extension 'adminpack'
```

`salt.modules.postgres.create_metadata` (*name, ext\_version=None, schema=None, user=None, host=None, port=None, maintenance\_db=None, password=None, runas=None*)

Get lifecycle information about an extension

CLI Example:

```
salt '*' postgres.create_metadata adminpack
```

`salt.modules.postgres.datadir_exists` (*name*)

New in version 2016.3.0.

Checks if postgres data directory has been initialized

CLI Example:

```
salt '*' postgres.datadir_exists '/var/lib/pgsql/data'
```

**name** Name of the directory to check

`salt.modules.postgres.datadir_init`(*name*, *auth*='password', *user*=None, *password*=None, *encoding*='UTF8', *locale*=None, *runas*=None)

New in version 2016.3.0.

Initializes a postgres data directory

CLI Example:

```
salt '*' postgres.datadir_init '/var/lib/pgsql/data'
```

**name** The name of the directory to initialize

**auth** The default authentication method for local connections

**password** The password to set for the postgres user

**user** The database superuser name

**encoding** The default encoding for new databases

**locale** The default locale for new databases

**runas** The system user the operation should be performed on behalf of

`salt.modules.postgres.db_alter`(*name*, *user*=None, *host*=None, *port*=None, *maintenance\_db*=None, *password*=None, *tablespace*=None, *owner*=None, *owner\_recurse*=False, *runas*=None)

Change tablespace or/and owner of database.

CLI Example:

```
salt '*' postgres.db_alter dbname owner=otheruser
```

`salt.modules.postgres.db_create`(*name*, *user*=None, *host*=None, *port*=None, *maintenance\_db*=None, *password*=None, *tablespace*=None, *encoding*=None, *lc\_collate*=None, *lc\_ctype*=None, *owner*=None, *template*=None, *runas*=None)

Adds a databases to the Postgres server.

CLI Example:

```
salt '*' postgres.db_create 'dbname'
```

```
salt '*' postgres.db_create 'dbname' template=template_postgis
```

`salt.modules.postgres.db_exists`(*name*, *user*=None, *host*=None, *port*=None, *maintenance\_db*=None, *password*=None, *runas*=None)

Checks if a database exists on the Postgres server.

CLI Example:

```
salt '*' postgres.db_exists 'dbname'
```

`salt.modules.postgres.db_list`(*user*=None, *host*=None, *port*=None, *maintenance\_db*=None, *password*=None, *runas*=None)

Return dictionary with information about databases of a Postgres server.

CLI Example:

```
salt '*' postgres.db_list
```

`salt.modules.postgres.db_remove`(*name*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *runas=None*)

Removes a databases from the Postgres server.

CLI Example:

```
salt '*' postgres.db_remove 'dbname'
```

`salt.modules.postgres.drop_extension`(*name*, *if\_exists=None*, *restrict=None*, *cascade=None*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *runas=None*)

Drop an installed postgresql extension

CLI Example:

```
salt '*' postgres.drop_extension 'adminpack'
```

`salt.modules.postgres.get_available_extension`(*name*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *runas=None*)

Get info about an available postgresql extension

CLI Example:

```
salt '*' postgres.get_available_extension plpgsql
```

`salt.modules.postgres.get_installed_extension`(*name*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *runas=None*)

Get info about an installed postgresql extension

CLI Example:

```
salt '*' postgres.get_installed_extension plpgsql
```

`salt.modules.postgres.group_create`(*groupname*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *createdb=None*, *createuser=None*, *createroles=None*, *encrypted=None*, *login=None*, *inherit=None*, *superuser=None*, *replication=None*, *rolepassword=None*, *groups=None*, *runas=None*)

Creates a Postgres group. A group in postgres is similar to a user, but cannot login.

CLI Example:

```
salt '*' postgres.group_create 'groupname' user='user' \
    host='hostname' port='port' password='password' \
    rolepassword='rolepassword'
```

`salt.modules.postgres.group_remove`(*groupname*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *runas=None*)

Removes a group from the Postgres server.

CLI Example:

```
salt '*' postgres.group_remove 'groupname'
```

`salt.modules.postgres.group_update`(*groupname*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *createdb=None*, *createroles=None*, *createuser=None*, *encrypted=None*, *inherit=None*, *login=None*, *superuser=None*, *replication=None*, *rolepassword=None*, *groups=None*, *runas=None*)

Updates a postgres group

CLI Examples:

```
salt '*' postgres.group_update 'username' user='user' \
    host='hostname' port='port' password='password' \
    rolepassword='rolepassword'
```

`salt.modules.postgres.has_privileges`(*name*, *object\_name*, *object\_type*, *privileges=None*, *grant\_option=None*, *prepend='public'*, *maintenance\_db=None*, *user=None*, *host=None*, *port=None*, *password=None*, *runas=None*)

New in version 2016.3.0.

Check if a role has the specified privileges on an object

CLI Example:

```
salt '*' postgres.has_privileges user_name table_name table \
    SELECT,INSERT maintenance_db=db_name
```

**name** Name of the role whose privileges should be checked on *object\_type*

**object\_name** Name of the object on which the check is to be performed

**object\_type** The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

**privileges** Comma separated list of privileges to check, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

**grant\_option** If *grant\_option* is set to True, the grant option check is performed

**prepend** Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

**maintenance\_db** The database to connect to

**user** database username if different from config or default

**password** user password if any password for a specified user  
**host** Database host if different from config or default  
**port** Database port if different from config or default  
**runas** System user all operations should be performed on behalf of

`salt.modules.postgres.installed_extensions` (*user=None, host=None, port=None, maintenance\_db=None, password=None, runas=None*)

List installed postgresql extensions

CLI Example:

```
salt '*' postgres.installed_extensions
```

`salt.modules.postgres.is_available_extension` (*name, user=None, host=None, port=None, maintenance\_db=None, password=None, runas=None*)

Test if a specific extension is available

CLI Example:

```
salt '*' postgres.is_available_extension
```

`salt.modules.postgres.is_installed_extension` (*name, user=None, host=None, port=None, maintenance\_db=None, password=None, runas=None*)

Test if a specific extension is installed

CLI Example:

```
salt '*' postgres.is_installed_extension
```

`salt.modules.postgres.language_create` (*name, maintenance\_db, user=None, host=None, port=None, password=None, runas=None*)

New in version 2016.3.0.

Installs a language into a database

CLI Example:

```
salt '*' postgres.language_create plpgsql dbname
```

**name** Language to install  
**maintenance\_db** The database to install the language in  
**user** database username if different from config or default  
**password** user password if any password for a specified user  
**host** Database host if different from config or default  
**port** Database port if different from config or default  
**runas** System user all operations should be performed on behalf of

`salt.modules.postgres.language_exists` (*name, maintenance\_db, user=None, host=None, port=None, password=None, runas=None*)

New in version 2016.3.0.

Checks if language exists in a database.

CLI Example:

```
salt '*' postgres.language_exists plpgsql dbname
```

**name** Language to check for

**maintenance\_db** The database to check in  
**user** database username if different from config or default  
**password** user password if any password for a specified user  
**host** Database host if different from config or default  
**port** Database port if different from config or default  
**runas** System user all operations should be performed on behalf of

`salt.modules.postgres.language_list`(*maintenance\_db*, *user=None*, *host=None*, *port=None*,  
*password=None*, *runas=None*)

New in version 2016.3.0.

Return a list of languages in a database.

CLI Example:

```
salt '*' postgres.language_list dbname
```

**maintenance\_db** The database to check  
**user** database username if different from config or default  
**password** user password if any password for a specified user  
**host** Database host if different from config or default  
**port** Database port if different from config or default  
**runas** System user all operations should be performed on behalf of

`salt.modules.postgres.language_remove`(*name*, *maintenance\_db*, *user=None*, *host=None*,  
*port=None*, *password=None*, *runas=None*)

New in version 2016.3.0.

Removes a language from a database

CLI Example:

```
salt '*' postgres.language_remove plpgsql dbname
```

**name** Language to remove  
**maintenance\_db** The database to install the language in  
**user** database username if different from config or default  
**password** user password if any password for a specified user  
**host** Database host if different from config or default  
**port** Database port if different from config or default  
**runas** System user all operations should be performed on behalf of

`salt.modules.postgres.owner_to`(*dbname*, *ownername*, *user=None*, *host=None*, *port=None*, *password=None*,  
*runas=None*)

Set the owner of all schemas, functions, tables, views and sequences to the given username.

CLI Example:

```
salt '*' postgres.owner_to 'dbname' 'username'
```

`salt.modules.postgres.privileges_grant`(*name*, *object\_name*, *object\_type*, *privileges=None*,  
*grant\_option=None*, *prepend='public'*, *maintenance\_db=None*, *user=None*, *host=None*, *port=None*,  
*password=None*, *runas=None*)

New in version 2016.3.0.

Grant privileges on a postgres object

CLI Example:

```
salt '*' postgres.privileges_grant user_name table_name table \
SELECT,UPDATE maintenance_db=db_name
```

**name** Name of the role to which privileges should be granted

**object\_name** Name of the object on which the grant is to be performed

**object\_type** The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

**privileges** Comma separated list of privileges to grant, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

**grant\_option** If grant\_option is set to True, the recipient of the privilege can in turn grant it to others

**prepend** Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

**maintenance\_db** The database to connect to

**user** database username if different from config or default

**password** user password if any password for a specified user

**host** Database host if different from config or default

**port** Database port if different from config or default

**runas** System user all operations should be performed on behalf of

```
salt.modules.postgres.privileges_list(name, object_type, prepend='public',
                                     maintenance_db=None, user=None, host=None, port=None,
                                     password=None, runas=None)
```

New in version 2016.3.0.

Return a list of privileges for the specified object.

CLI Example:

```
salt '*' postgres.privileges_list table_name table maintenance_db=db_name
```

**name** Name of the object for which the permissions should be returned

**object\_type** The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language

- database
- group
- function

**prepend** Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

**maintenance\_db** The database to connect to

**user** database username if different from config or default

**password** user password if any password for a specified user

**host** Database host if different from config or default

**port** Database port if different from config or default

**runas** System user all operations should be performed on behalf of

```
salt.modules.postgres.privileges_revoke(name, object_name, object_type, privileges=None,
                                       prepend='public', maintenance_db=None,
                                       user=None, host=None, port=None, password=None,
                                       runas=None)
```

New in version 2016.3.0.

Revoke privileges on a postgres object

CLI Example:

```
salt '*' postgres.privileges_revoke user_name table_name table \
SELECT,UPDATE maintenance_db=db_name
```

**name** Name of the role whose privileges should be revoked

**object\_name** Name of the object on which the revoke is to be performed

**object\_type** The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

**privileges** Comma separated list of privileges to revoke, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

**maintenance\_db** The database to connect to

**user** database username if different from config or default

**password** user password if any password for a specified user

**host** Database host if different from config or default

**port** Database port if different from config or default

**runas** System user all operations should be performed on behalf of

`salt.modules.postgres.psycopg_query`(*query*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *runas=None*, *write=False*)

Run an SQL-Query and return the results as a list. This command only supports SELECT statements. This limitation can be worked around with a query like this:

```
WITH updated AS (UPDATE pg_authid SET rolconnlimit = 2000 WHERE rolname = 'rolename' RETURNING rolconnlimit) SELECT * FROM updated;
```

**query** The query string.

**user** Database username, if different from config or default.

**host** Database host, if different from config or default.

**port** Database port, if different from the config or default.

**maintenance\_db** The database to run the query against.

**password** User password, if different from the config or default.

**runas** User to run the command as.

**write** Mark query as READ WRITE transaction.

CLI Example:

```
salt '*' postgres.psycopg_query 'select * from pg_stat_activity'
```

`salt.modules.postgres.role_get`(*name*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *runas=None*, *return\_password=False*)

Return a dict with information about users of a Postgres server.

Set `return_password` to `True` to get password hash in the result.

CLI Example:

```
salt '*' postgres.role_get postgres
```

`salt.modules.postgres.schema_create`(*dbname*, *name*, *owner=None*, *user=None*, *db\_user=None*, *db\_password=None*, *db\_host=None*, *db\_port=None*)

Creates a Postgres schema.

CLI Example:

```
salt '*' postgres.schema_create dbname name owner='owner' \
    user='user' \
    db_user='user' db_password='password'
    db_host='hostname' db_port='port'
```

`salt.modules.postgres.schema_exists`(*dbname*, *name*, *db\_user=None*, *db\_password=None*, *db\_host=None*, *db\_port=None*)

Checks if a schema exists on the Postgres server.

CLI Example:

```
salt '*' postgres.schema_exists dbname schemaname
```

**dbname** Database name we query on

**name** Schema name we look for

**db\_user** database username if different from config or default

**db\_password** user password if any password for a specified user

**db\_host** Database host if different from config or default

**db\_port** Database port if different from config or default

`salt.modules.postgres.schema_get`(*dbname*, *name*, *db\_user=None*, *db\_password=None*, *db\_host=None*, *db\_port=None*)

Return a dict with information about schemas in a database.

CLI Example:

```
salt '*' postgres.schema_get dbname name
```

**dbname** Database name we query on  
**name** Schema name we look for  
**db\_user** database username if different from config or default  
**db\_password** user password if any password for a specified user  
**db\_host** Database host if different from config or default  
**db\_port** Database port if different from config or default

`salt.modules.postgres.schema_list`(*dbname*, *db\_user=None*, *db\_password=None*, *db\_host=None*,  
*db\_port=None*)

Return a dict with information about schemas in a Postgres database.

CLI Example:

```
salt '*' postgres.schema_list dbname
```

**dbname** Database name we query on  
**db\_user** database username if different from config or default  
**db\_password** user password if any password for a specified user  
**db\_host** Database host if different from config or default  
**db\_port** Database port if different from config or default

`salt.modules.postgres.schema_remove`(*dbname*, *name*, *user=None*, *db\_user=None*,  
*db\_password=None*, *db\_host=None*, *db\_port=None*)

Removes a schema from the Postgres server.

CLI Example:

```
salt '*' postgres.schema_remove dbname schemaname
```

**dbname** Database name we work on  
**schemaname** The schema's name we'll remove  
**user** System user all operations should be performed on behalf of  
**db\_user** database username if different from config or default  
**db\_password** user password if any password for a specified user  
**db\_host** Database host if different from config or default  
**db\_port** Database port if different from config or default

`salt.modules.postgres.tablespace_alter`(*name*, *user=None*, *host=None*, *port=None*, *mainte-*  
*nance\_db=None*, *password=None*, *new\_name=None*,  
*new\_owner=None*, *set\_option=None*, *re-*  
*set\_option=None*, *runas=None*)

Change tablespace name, owner, or options.

CLI Example:

```
salt '*' postgres.tablespace_alter tsname new_owner=otheruser
salt '*' postgres.tablespace_alter index_space new_name=fast_raid
salt '*' postgres.tablespace_alter test set_option="{ 'seq_page_cost': '1.1' }"
salt '*' postgres.tablespace_alter tsname reset_option=seq_page_cost
```

New in version 2015.8.0.

`salt.modules.postgres.tablespace_create`(*name*, *location*, *options=None*, *owner=None*,  
*user=None*, *host=None*, *port=None*, *mainte-*  
*nance\_db=None*, *password=None*, *runas=None*)

Adds a tablespace to the Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_create tablespacename '/path/datadir'
```

New in version 2015.8.0.

`salt.modules.postgres.tablespace_exists`(*name*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *runas=None*)  
Checks if a tablespace exists on the Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_exists 'dbname'
```

New in version 2015.8.0.

`salt.modules.postgres.tablespace_list`(*user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *runas=None*)  
Return dictionary with information about tablespaces of a Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_list
```

New in version 2015.8.0.

`salt.modules.postgres.tablespace_remove`(*name*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *runas=None*)  
Removes a tablespace from the Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_remove tsname
```

New in version 2015.8.0.

`salt.modules.postgres.user_create`(*username*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *createdb=None*, *createuser=None*, *createroles=None*, *inherit=None*, *login=None*, *connlimit=None*, *encrypted=None*, *superuser=None*, *replication=None*, *rolepassword=None*, *groups=None*, *runas=None*)  
Creates a Postgres user.

CLI Examples:

```
salt '*' postgres.user_create 'username' user='user' \  
    host='hostname' port='port' password='password' \  
    rolepassword='rolepassword'
```

`salt.modules.postgres.user_exists`(*name*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *runas=None*)  
Checks if a user exists on the Postgres server.

CLI Example:

```
salt '*' postgres.user_exists 'username'
```

`salt.modules.postgres.user_list`(*user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *runas=None*, *return\_password=False*)  
Return a dict with information about users of a Postgres server.

Set `return_password` to `True` to get password hash in the result.

CLI Example:

```
salt '*' postgres.user_list
```

`salt.modules.postgres.user_remove`(*username*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *runas=None*)

Removes a user from the Postgres server.

CLI Example:

```
salt '*' postgres.user_remove 'username'
```

`salt.modules.postgres.user_update`(*username*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *createdb=None*, *createuser=None*, *createroles=None*, *encrypted=None*, *superuser=None*, *inherit=None*, *login=None*, *connlimit=None*, *replication=None*, *rolepassword=None*, *groups=None*, *runas=None*)

Updates a Postgres user.

CLI Examples:

```
salt '*' postgres.user_update 'username' user='user' \
    host='hostname' port='port' password='password' \
    rolepassword='rolepassword'
```

`salt.modules.postgres.version`(*user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *runas=None*)

Return the version of a Postgres server.

CLI Example:

```
salt '*' postgres.version
```

### 14.7.293 salt.modules.poudriere

Support for poudriere

`salt.modules.poudriere.bulk_build`(*jail*, *pkg\_file*, *keep=False*)

Run bulk build on poudriere server.

Return number of pkg builds, failures, and errors, on error dump to CLI

CLI Example:

```
salt -N buildbox_group poudriere.bulk_build 90amd64 /root/pkg_list
```

`salt.modules.poudriere.create_jail`(*name*, *arch*, *version='9.0-RELEASE'*)

Creates a new poudriere jail if one does not exist

*NOTE* creating a new jail will take some time the master is not hanging

CLI Example:

```
salt '*' poudriere.create_jail 90amd64 amd64
```

`salt.modules.poudriere.create_ports_tree`()

Not working need to run portfetch non interactive

`salt.modules.poudriere.delete_jail(name)`

Deletes poudriere jail with *name*

CLI Example:

```
salt '*' poudriere.delete_jail 90amd64
```

`salt.modules.poudriere.is_jail(name)`

Return True if jail exists False if not

CLI Example:

```
salt '*' poudriere.is_jail <jail name>
```

`salt.modules.poudriere.list_jails()`

Return a list of current jails managed by poudriere

CLI Example:

```
salt '*' poudriere.list_jails
```

`salt.modules.poudriere.list_ports()`

Return a list of current port trees managed by poudriere

CLI Example:

```
salt '*' poudriere.list_ports
```

`salt.modules.poudriere.make_pkgng_aware(jname)`

Make jail *jname* pkgng aware

CLI Example:

```
salt '*' poudriere.make_pkgng_aware <jail name>
```

`salt.modules.poudriere.parse_config(config_file=None)`

Returns a dict of poudriere main configuration definitions

CLI Example:

```
salt '*' poudriere.parse_config
```

`salt.modules.poudriere.update_jail(name)`

Run freebsd-update on *name* poudriere jail

CLI Example:

```
salt '*' poudriere.update_jail freebsd:10:x86:64
```

`salt.modules.poudriere.update_ports_tree(ports_tree)`

Updates the ports tree, either the default or the *ports\_tree* specified

CLI Example:

```
salt '*' poudriere.update_ports_tree staging
```

`salt.modules.poudriere.version()`

Return poudriere version

CLI Example:

```
salt '*' poudriere.version
```

### 14.7.294 salt.modules.powerpath

powerpath support.

Assumes RedHat

**salt.modules.powerpath.add\_license**(*key*)  
Add a license

**salt.modules.powerpath.list\_licenses**()  
returns a list of applied powerpath license keys

**salt.modules.powerpath.remove\_license**(*key*)  
Remove a license

### 14.7.295 salt.modules.proxy module

This module allows you to manage proxy settings

```
salt '*' network.get_http_proxy
```

**salt.modules.proxy.get\_ftp\_proxy**(*network\_service='Ethernet'*)  
Returns the current ftp proxy settings  
**network\_service** The network service to apply the changes to, this only necessary on macOS  
CLI Example:

```
salt '*' proxy.get_ftp_proxy Ethernet
```

**salt.modules.proxy.get\_http\_proxy**(*network\_service='Ethernet'*)  
Returns the current http proxy settings  
**network\_service** The network service to apply the changes to, this only necessary on macOS  
CLI Example:

```
salt '*' proxy.get_http_proxy Ethernet
```

**salt.modules.proxy.get\_https\_proxy**(*network\_service='Ethernet'*)  
Returns the current https proxy settings  
**network\_service** The network service to apply the changes to, this only necessary on macOS  
CLI Example:

```
salt '*' proxy.get_https_proxy Ethernet
```

**salt.modules.proxy.get\_proxy\_bypass**(*network\_service='Ethernet'*)  
Returns the current domains that can bypass the proxy  
**network\_service** The network service to get the bypass domains from, this is only necessary on macOS  
CLI Example:

```
salt '*' proxy.get_proxy_bypass
```

**salt.modules.proxy.get\_proxy\_win**()  
Gets all of the proxy settings in one call, only available on Windows  
CLI Example:

```
salt '*' proxy.get_proxy_win
```

`salt.modules.proxy.set_ftp_proxy(server, port, user=None, password=None, network_service='Ethernet', bypass_hosts=None)`

Sets the ftp proxy settings

**server** The proxy server to use

**port** The port used by the proxy server

**user** The username to use for the proxy server if required

**password** The password to use if required by the server

**network\_service** The network service to apply the changes to, this only necessary on macOS

**bypass\_hosts** The hosts that are allowed to by pass the proxy. Only used on Windows for other OS's use `set_proxy_bypass` to edit the bypass hosts.

CLI Example:

```
salt '*' proxy.set_ftp_proxy example.com 1080 user=proxy_user password=proxy_pass
↳network_service=Ethernet
```

`salt.modules.proxy.set_http_proxy(server, port, user=None, password=None, network_service='Ethernet', bypass_hosts=None)`

Sets the http proxy settings. Note: On Windows this will override any other proxy settings you have, the preferred method of updating proxies on windows is using `set_proxy`.

**server** The proxy server to use

**port** The port used by the proxy server

**user** The username to use for the proxy server if required

**password** The password to use if required by the server

**network\_service** The network service to apply the changes to, this only necessary on macOS

**bypass\_hosts** The hosts that are allowed to by pass the proxy. Only used on Windows for other OS's use `set_proxy_bypass` to edit the bypass hosts.

CLI Example:

```
salt '*' proxy.set_http_proxy example.com 1080 user=proxy_user password=proxy_
↳pass network_service=Ethernet
```

`salt.modules.proxy.set_https_proxy(server, port, user=None, password=None, network_service='Ethernet', bypass_hosts=None)`

Sets the https proxy settings. Note: On Windows this will override any other proxy settings you have, the preferred method of updating proxies on windows is using `set_proxy`.

**server** The proxy server to use

**port** The port used by the proxy server

**user** The username to use for the proxy server if required

**password** The password to use if required by the server

**network\_service** The network service to apply the changes to, this only necessary on macOS

**bypass\_hosts** The hosts that are allowed to by pass the proxy. Only used on Windows for other OS's use `set_proxy_bypass` to edit the bypass hosts.

CLI Example:

```
salt '*' proxy.set_https_proxy example.com 1080 user=proxy_user password=proxy_
↳pass network_service=Ethernet
```

`salt.modules.proxy.set_proxy_bypass(domains, network_service='Ethernet')`

Sets the domains that can bypass the proxy

**domains** An array of domains allowed to bypass the proxy

**network\_service** The network service to apply the changes to, this only necessary on macOS

CLI Example:

```
salt '*' proxy.set_proxy_bypass "['127.0.0.1', 'localhost']"
```

`salt.modules.proxy.set_proxy_win` (*server*, *port*, *types=None*, *bypass\_hosts=None*)

Sets the http proxy settings, only works with Windows.

**server** The proxy server to use

**password** The password to use if required by the server

**types** The types of proxy connections should be setup with this server. Valid types are http and https.

**bypass\_hosts** The hosts that are allowed to by pass the proxy.

CLI Example:

```
salt '*' proxy.set_http_proxy example.com 1080 types="['http', 'https']"
```

### 14.7.296 salt.modules.ps

A salt interface to psutil, a system and process library. See <http://code.google.com/p/psutil>.

**depends**

- psutil Python module, version 0.3.0 or later
- python-utmp package (optional)

`salt.modules.ps.boot_time` (*time\_format=None*)

Return the boot time in number of seconds since the epoch began.

CLI Example:

**time\_format** Optionally specify a `strftime` format string. Use `time_format='%c'` to get a nicely-formatted locale specific date and time (i.e. Fri May 2 19:08:32 2014).

New in version 2014.1.4.

```
salt '*' ps.boot_time
```

`salt.modules.ps.cpu_percent` (*interval=0.1*, *per\_cpu=False*)

Return the percent of time the CPU is busy.

**interval** the number of seconds to sample CPU usage over

**per\_cpu** if True return an array of CPU percent busy for each CPU, otherwise aggregate all percents into one number

CLI Example:

```
salt '*' ps.cpu_percent
```

`salt.modules.ps.cpu_times` (*per\_cpu=False*)

Return the percent of time the CPU spends in each state, e.g. user, system, idle, nice, iowait, irq, softirq.

**per\_cpu** if True return an array of percents for each CPU, otherwise aggregate all percents into one number

CLI Example:

```
salt '*' ps.cpu_times
```

`salt.modules.ps.disk_io_counters` (*device=None*)

Return disk I/O statistics.

CLI Example:

```
salt '*' ps.disk_io_counters
```

```
salt '*' ps.disk_io_counters device=sda1
```

`salt.modules.ps.disk_partition_usage` (*all=False*)

Return a list of disk partitions plus the mount point, filesystem and usage statistics.

CLI Example:

```
salt '*' ps.disk_partition_usage
```

`salt.modules.ps.disk_partitions` (*all=False*)

Return a list of disk partitions and their device, mount point, and filesystem type.

**all** if set to False, only return local, physical partitions (hard disk, USB, CD/DVD partitions). If True, return all filesystems.

CLI Example:

```
salt '*' ps.disk_partitions
```

`salt.modules.ps.disk_usage` (*path*)

Given a path, return a dict listing the total available space as well as the free space, and used space.

CLI Example:

```
salt '*' ps.disk_usage /home
```

`salt.modules.ps.get_pid_list` ()

Return a list of process ids (PIDs) for all running processes.

CLI Example:

```
salt '*' ps.get_pid_list
```

`salt.modules.ps.get_users` ()

Return logged-in users.

CLI Example:

```
salt '*' ps.get_users
```

`salt.modules.ps.kill_pid` (*pid, signal=15*)

Kill a process by PID.

```
salt 'minion' ps.kill_pid pid [signal=signal_number]
```

**pid** PID of process to kill.

**signal** Signal to send to the process. See manpage entry for kill for possible values. Default: 15 (SIGTERM).

**Example:**

Send SIGKILL to process with PID 2000:

```
salt 'minion' ps.kill_pid 2000 signal=9
```

`salt.modules.ps.lsof` (*name*)

Retrieve the lsof information of the given process name.

CLI Example:

```
salt '*' ps.lsof apache2
```

`salt.modules.ps.netstat` (*name*)

Retrieve the netstat information of the given process name.

CLI Example:

```
salt '*' ps.netstat apache2
```

`salt.modules.ps.network_io_counters` (*interface=None*)  
Return network I/O statistics.

CLI Example:

```
salt '*' ps.network_io_counters
salt '*' ps.network_io_counters interface=eth0
```

`salt.modules.ps.num_cpus`()  
Return the number of CPUs.

CLI Example:

```
salt '*' ps.num_cpus
```

`salt.modules.ps.pgrep` (*pattern, user=None, full=False*)  
Return the pids for processes matching a pattern.

If `full` is true, the full command line is searched for a match, otherwise only the name of the command is searched.

```
salt '*' ps.pgrep pattern [user=username] [full=(true|false)]
```

**pattern** Pattern to search for in the process list.

**user** Limit matches to the given username. Default: All users.

**full** A boolean value indicating whether only the name of the command or the full command line should be matched against the pattern.

#### Examples:

Find all httpd processes on all `www` minions:

```
salt 'www.*' ps.pgrep httpd
```

Find all bash processes owned by user `tom`:

```
salt '*' ps.pgrep bash user=tom
```

`salt.modules.ps.pkill` (*pattern, user=None, signal=15, full=False*)  
Kill processes matching a pattern.

```
salt '*' ps.pkill pattern [user=username] [signal=signal_number] \
[full=(true|false)]
```

**pattern** Pattern to search for in the process list.

**user** Limit matches to the given username. Default: All users.

**signal** Signal to send to the process(es). See manpage entry for kill for possible values. Default: 15 (SIGTERM).

**full** A boolean value indicating whether only the name of the command or the full command line should be matched against the pattern.

#### Examples:

Send SIGHUP to all httpd processes on all `www` minions:

```
salt 'www.*' ps.pkill httpd signal=1
```

Send SIGKILL to all bash processes owned by user `tom`:

```
salt '*' ps.pkill bash signal=9 user=tom
```

`salt.modules.ps.proc_info`(*pid*, *attrs=None*)

Return a dictionary of information for a process id (PID).

CLI Example:

```
salt '*' ps.proc_info 2322
salt '*' ps.proc_info 2322 attrs='["pid", "name"]'
```

**pid** PID of process to query.

**attrs** Optional list of desired process attributes. The list of possible attributes can be found here: <http://pythonhosted.org/psutil/#psutil.Process>

`salt.modules.ps.psaux`(*name*)

Retrieve information corresponding to a ``ps aux`` filtered with the given pattern. It could be just a name or a regular expression (using python search from ``re`` module).

CLI Example:

```
salt '*' ps.psaux www-data.+apache2
```

`salt.modules.ps.ss`(*name*)

Retrieve the ss information of the given process name.

CLI Example:

```
salt '*' ps.ss apache2
```

New in version 2016.11.6.

`salt.modules.ps.swap_memory`()

New in version 2014.7.0.

Return a dict that describes swap memory statistics.

---

**Note:** This function is only available in psutil version 0.6.0 and above.

---

CLI Example:

```
salt '*' ps.swap_memory
```

`salt.modules.ps.top`(*num\_processes=5*, *interval=3*)

Return a list of top CPU consuming processes during the interval. *num\_processes* = return the top N CPU consuming processes *interval* = the number of seconds to sample CPU usage over

CLI Examples:

```
salt '*' ps.top
salt '*' ps.top 5 10
```

`salt.modules.ps.total_physical_memory`()

Return the total number of bytes of physical memory.

CLI Example:

```
salt '*' ps.total_physical_memory
```

`salt.modules.ps.virtual_memory()`

New in version 2014.7.0.

Return a dict that describes statistics about system memory usage.

---

**Note:** This function is only available in psutil version 0.6.0 and above.

---

CLI Example:

```
salt '*' ps.virtual_memory
```

### 14.7.297 salt.modules.publish

Publish a command from a minion to a target

`salt.modules.publish.full_data(tgt, fun, arg=None, tgt_type='glob', returner='', timeout=5, expr_form=None)`

Return the full data about the publication, this is invoked in the same way as the publish function

CLI Example:

```
salt system.example.com publish.full_data '*' cmd.run 'ls -la /tmp'
```

---

#### Attention

If you need to pass a value to a function argument and that value contains an equal sign, you **must** include the argument name. For example:

```
salt '*' publish.full_data test.kwarg arg='cheese=spam'
```

---

`salt.modules.publish.publish(tgt, fun, arg=None, tgt_type='glob', returner='', timeout=5, via_master=None, expr_form=None)`

Publish a command from the minion out to other minions.

Publications need to be enabled on the Salt master and the minion needs to have permission to publish the command. The Salt master will also prevent a recursive publication loop, this means that a minion cannot command another minion to command another minion as that would create an infinite command loop.

The `tgt_type` argument is used to pass a target other than a glob into the execution, the available options are:

- glob
- pcre
- grain
- grain\_pcre
- pillar
- pillar\_pcre
- ipcidr
- range
- compound

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Note that for pillar matches must be exact, both in the pillar matcher and the compound matcher. No globbing is supported.

The arguments sent to the minion `publish` function are separated with commas. This means that for a minion executing a command with multiple args it will look like this:

```
salt system.example.com publish.publish '*' user.add 'foo,1020,1020'
salt system.example.com publish.publish 'os:Fedora' network.interfaces ' grain
```

CLI Example:

```
salt system.example.com publish.publish '*' cmd.run 'ls -la /tmp'
```

---

### Attention

If you need to pass a value to a function argument and that value contains an equal sign, you **must** include the argument name. For example:

```
salt '*' publish.publish test.kwarg arg='cheese=spam'
```

Multiple keyword arguments should be passed as a list.

```
salt '*' publish.publish test.kwarg arg="['cheese=spam', 'spam=cheese']"
```

---

When running via `salt-call`, the `via_master` flag may be set to specific which master the publication should be sent to. Only one master may be specified. If unset, the publication will be sent only to the first master in minion configuration.

`salt.modules.publish.runner` (*fun, arg=None, timeout=5*)

Execute a runner on the master and return the data from the runner function

CLI Example:

```
salt publish.runner manage.down
```

## 14.7.298 salt.modules.puppet

Execute puppet routines

`salt.modules.puppet.disable` (*message=None*)

New in version 2014.7.0.

Disable the puppet agent

**message** New in version 2015.5.2.

Disable message to send to puppet

CLI Example:

```
salt '*' puppet.disable
salt '*' puppet.disable 'Disabled, contact XYZ before enabling'
```

`salt.modules.puppet.enable` ()

New in version 2014.7.0.

Enable the puppet agent

CLI Example:

```
salt '*' puppet.enable
```

`salt.modules.puppet.fact`(*name*, *puppet=False*)

Run facter for a specific fact

CLI Example:

```
salt '*' puppet.fact kernel
```

`salt.modules.puppet.facts`(*puppet=False*)

Run facter and return the results

CLI Example:

```
salt '*' puppet.facts
```

`salt.modules.puppet.noop`(*\*args*, *\*\*kwargs*)

Execute a puppet noop run and return a dict with the stderr, stdout, return code, etc. Usage is the same as for puppet.run.

CLI Example:

```
salt '*' puppet.noop
salt '*' puppet.noop tags=basefiles::edit,apache::server
salt '*' puppet.noop debug
salt '*' puppet.noop apply /a/b/manifest.pp modulepath=/a/b/modules
↳tags=basefiles::edit,apache::server
```

`salt.modules.puppet.plugin_sync`()

Runs a plugin sync between the puppet master and agent

CLI Example:

```
salt '*' puppet.plugin_sync
```

`salt.modules.puppet.run`(*\*args*, *\*\*kwargs*)

Execute a puppet run and return a dict with the stderr, stdout, return code, etc. The first positional argument given is checked as a subcommand. Following positional arguments should be ordered with arguments required by the subcommand first, followed by non-keyword arguments. Tags are specified by a tag keyword and comma separated list of values. -- [http://docs.puppetlabs.com/puppet/latest/reference/lang\\_tags.html](http://docs.puppetlabs.com/puppet/latest/reference/lang_tags.html)

CLI Examples:

```
salt '*' puppet.run
salt '*' puppet.run tags=basefiles::edit,apache::server
salt '*' puppet.run agent onetime no-daemonize no-usecacheonfailure no-splay
↳ignorecache
salt '*' puppet.run debug
salt '*' puppet.run apply /a/b/manifest.pp modulepath=/a/b/modules tags=basefiles:
↳:edit,apache::server
```

`salt.modules.puppet.status`()

New in version 2014.7.0.

Display puppet agent status

CLI Example:

```
salt '*' puppet.status
```

`salt.modules.puppet.summary()`

New in version 2014.7.0.

Show a summary of the last puppet agent run

CLI Example:

```
salt '*' puppet.summary
```

### 14.7.299 salt.modules.pushbullet module

Module for sending messages to Pushbullet (<https://www.pushbullet.com>)

New in version 2015.8.0.

Requires an `api_key` in `/etc/salt/minion`:

For example:

```
pushbullet:
  device: "Chrome"
  title: "Example push message"
  body: "Message body."
```

`salt.modules.pushbullet.push_note(device=None, title=None, body=None)`

Pushing a text note.

Parameters

- **device** -- Pushbullet target device
- **title** -- Note title
- **body** -- Note body

Returns Boolean if message was sent successfully.

CLI Example:

```
salt "*" pushbullet.push_note device="Chrome" title="Example title" body="Example
↳body."
```

### 14.7.300 salt.modules.pushover\_notify

Module for sending messages to Pushover (<https://www.pushover.net>)

New in version 2016.3.0.

**configuration** This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
pushover:
  token: abAHuZyCLtdH8P4zhmFZmgUHUsv1ei8
```

`salt.modules.pushover_notify.post_message(user=None, device=None, message=None, title=None, priority=None, expire=None, retry=None, sound=None, api_version=1, token=None)`

Send a message to a Pushover user or group.

**Parameters**

- **user** -- The user or group to send to, must be key of user or group not email address.
- **message** -- The message to send to the PushOver user or group.
- **title** -- Specify who the message is from.
- **priority** -- The priority of the message, defaults to 0.
- **expire** -- The message should expire after N number of seconds.
- **retry** -- The number of times the message should be retried.
- **sound** -- The sound to associate with the message.
- **api\_version** -- The PushOver API version, if not specified in the configuration.
- **token** -- The PushOver token, if not specified in the configuration.

**Returns** Boolean if message was sent successfully.

CLI Example:

```
salt '*' pushover.post_message user='xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx' title=
↳'Message from Salt' message='Build is done'

salt '*' pushover.post_message user='xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx' title=
↳'Message from Salt' message='Build is done' priority='2' expire='720' retry='5'
```

**14.7.301 salt.modules.pw\_group**

Manage groups on FreeBSD

---

**Important:** If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to `'group.info' is not available`), see [here](#).

---

`salt.modules.pw_group.add`(*name*, *gid=None*, *\*\*kwargs*)

Add the specified group

CLI Example:

```
salt '*' group.add foo 3456
```

`salt.modules.pw_group.adduser`(*name*, *username*)

Add a user in the group.

CLI Example:

```
salt '*' group.adduser foo bar
```

Verifies if a valid username `'bar'` as a member of an existing group `'foo'`, if not then adds it.

`salt.modules.pw_group.chgid`(*name*, *gid*)

Change the gid for a named group

CLI Example:

```
salt '*' group.chgid foo 4376
```

`salt.modules.pw_group.delete`(*name*)

Remove the named group

CLI Example:

```
salt '*' group.delete foo
```

`salt.modules.pw_group.deluser`(*name, username*)

Remove a user from the group.

CLI Example:

```
salt '*' group.deluser foo bar
```

Removes a member user `bar` from a group `foo`. If group is not present then returns True.

`salt.modules.pw_group.getent`(*refresh=False*)

Return info on all groups

CLI Example:

```
salt '*' group.getent
```

`salt.modules.pw_group.info`(*name*)

Return information about a group

CLI Example:

```
salt '*' group.info foo
```

`salt.modules.pw_group.members`(*name, members\_list*)

Replaces members of the group with a provided list.

New in version 2015.5.4.

CLI Example:

```
salt '*' group.members foo `user1,user2,user3,...`
```

Replaces a membership list for a local group `foo`. foo:x:1234:user1,user2,user3,...

### 14.7.302 salt.modules.pw\_user

Manage users with the pw command

---

**Important:** If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to ``user.info` is not available`), see [here](#).

---

`salt.modules.pw_user.add`(*name, uid=None, gid=None, groups=None, home=None, shell=None, unique=True, fullname='`, roomnumber='`, workphone='`, homephone='`, createhome=True, loginclass=None, \*\*kwargs*)

Add a user to the minion

CLI Example:

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

`salt.modules.pw_user.chfullname`(*name, fullname*)

Change the user's Full Name

CLI Example:

```
salt '*' user.chfullname foo "Foo Bar"
```

`salt.modules.pw_user.chgid`(*name, gid*)

Change the default group of the user

CLI Example:

```
salt '*' user.chgid foo 4376
```

`salt.modules.pw_user.chgroups` (*name, groups, append=False*)

Change the groups to which a user belongs

**name** Username to modify

**groups** List of groups to set for the user. Can be passed as a comma-separated list or a Python list.

**append** [False] Set to True to append these groups to the user's existing list of groups. Otherwise, the specified groups will replace any existing groups for the user.

CLI Example:

```
salt '*' user.chgroups foo wheel,root True
```

`salt.modules.pw_user.chhome` (*name, home, persist=False*)

Set a new home directory for an existing user

**name** Username to modify

**home** New home directory to set

**persist** [False] Set to True to prevent configuration files in the new home directory from being overwritten by the files from the skeleton directory.

CLI Example:

```
salt '*' user.chhome foo /home/users/foo True
```

`salt.modules.pw_user.chhomephone` (*name, homephone*)

Change the user's Home Phone

CLI Example:

```
salt '*' user.chhomephone foo "7735551234"
```

`salt.modules.pw_user.chloginclass` (*name, loginclass, root=None*)

Change the default login class of the user

New in version 2016.3.5.

CLI Example:

```
salt '*' user.chloginclass foo staff
```

`salt.modules.pw_user.chroomnumber` (*name, roomnumber*)

Change the user's Room Number

CLI Example:

```
salt '*' user.chroomnumber foo 123
```

`salt.modules.pw_user.chshell` (*name, shell*)

Change the default shell of the user

CLI Example:

```
salt '*' user.chshell foo /bin/zsh
```

`salt.modules.pw_user.chuid` (*name, uid*)

Change the uid for a named user

CLI Example:

```
salt '*' user.chuid foo 4376
```

`salt.modules.pw_user.chworkphone` (*name*, *workphone*)

Change the user's Work Phone

CLI Example:

```
salt '*' user.chworkphone foo "7735550123"
```

`salt.modules.pw_user.delete` (*name*, *remove=False*, *force=False*)

Remove a user from the minion

CLI Example:

```
salt '*' user.delete name remove=True force=True
```

`salt.modules.pw_user.get_loginclass` (*name*)

Get the login class of the user

New in version 2016.3.0.

CLI Example:

```
salt '*' user.get_loginclass foo
```

`salt.modules.pw_user.getent` (*refresh=False*)

Return the list of all info for all users

CLI Example:

```
salt '*' user.getent
```

`salt.modules.pw_user.info` (*name*)

Return user information

CLI Example:

```
salt '*' user.info root
```

`salt.modules.pw_user.list_groups` (*name*)

Return a list of groups the named user belongs to

CLI Example:

```
salt '*' user.list_groups foo
```

`salt.modules.pw_user.list_users` ()

Return a list of all users

CLI Example:

```
salt '*' user.list_users
```

`salt.modules.pw_user.rename` (*name*, *new\_name*)

Change the username for a named user

CLI Example:

```
salt '*' user.rename name new_name
```

### 14.7.303 salt.modules.pyenv

Manage python installations with pyenv.

---

**Note:** Git needs to be installed and available via PATH if pyenv is to be installed automatically by the module.

---

New in version v2014.04.

**salt.modules.pyenv.default**(*python=None, runas=None*)

Returns or sets the currently defined default python.

**python=None** The version to set as the default. Should match one of the versions listed by [pyenv.versions](#). Leave blank to return the current default.

CLI Example:

```
salt '*' pyenv.default
salt '*' pyenv.default 2.0.0-p0
```

**salt.modules.pyenv.do**(*cmdline=None, runas=None*)

Execute a python command with pyenv's shims from the user or the system.

CLI Example:

```
salt '*' pyenv.do 'gem list bundler'
salt '*' pyenv.do 'gem list bundler' deploy
```

**salt.modules.pyenv.do\_with\_python**(*python, cmdline, runas=None*)

Execute a python command with pyenv's shims using a specific python version.

CLI Example:

```
salt '*' pyenv.do_with_python 2.0.0-p0 'gem list bundler'
salt '*' pyenv.do_with_python 2.0.0-p0 'gem list bundler' deploy
```

**salt.modules.pyenv.install**(*runas=None, path=None*)

Install pyenv systemwide

CLI Example:

```
salt '*' pyenv.install
```

**salt.modules.pyenv.install\_python**(*python, runas=None*)

Install a python implementation.

**python** The version of python to install, should match one of the versions listed by [pyenv.list](#)

CLI Example:

```
salt '*' pyenv.install_python 2.0.0-p0
```

**salt.modules.pyenv.is\_installed**(*runas=None*)

Check if pyenv is installed.

CLI Example:

```
salt '*' pyenv.is_installed
```

**salt.modules.pyenv.list**(*runas=None*)

List the installable versions of python.

CLI Example:

```
salt '*' pyenv.list
```

`salt.modules.pyenv.rehash` (*runas=None*)  
Run pyenv rehash to update the installed shims.

CLI Example:

```
salt '*' pyenv.rehash
```

`salt.modules.pyenv.uninstall_python` (*python, runas=None*)  
Uninstall a python implementation.  
**python** The version of python to uninstall. Should match one of the versions listed by `pyenv.versions`  
CLI Example:

```
salt '*' pyenv.uninstall_python 2.0.0-p0
```

`salt.modules.pyenv.update` (*runas=None, path=None*)  
Updates the current versions of pyenv and python-Build

CLI Example:

```
salt '*' pyenv.update
```

`salt.modules.pyenv.versions` (*runas=None*)  
List the installed versions of python.

CLI Example:

```
salt '*' pyenv.versions
```

### 14.7.304 salt.modules.qemu\_img

#### Qemu-img Command Wrapper

The qemu img command is wrapped for specific functions

**depends** qemu-img

`salt.modules.qemu_img.convert` (*orig, dest, fmt*)  
Convert an existing disk image to another format using qemu-img

CLI Example:

```
salt '*' qemu_img.convert /path/to/original.img /path/to/new.img qcow2
```

`salt.modules.qemu_img.make_image` (*location, size, fmt*)  
Create a blank virtual machine image file of the specified size in megabytes. The image can be created in any format supported by qemu

CLI Example:

```
salt '*' qemu_img.make_image /tmp/image.qcow 2048 qcow2  
salt '*' qemu_img.make_image /tmp/image.raw 10240 raw
```

### 14.7.305 salt.modules.qemu\_nbd

#### Qemu Command Wrapper

The qemu system comes with powerful tools, such as qemu-img and qemu-nbd which are used here to build up kvm images.

`salt.modules.qemu_nbd.clear(mnt)`

Pass in the mnt dict returned from `nbd_mount` to unmount and disconnect the image from nbd. If all of the partitions are unmounted return an empty dict, otherwise return a dict containing the still mounted partitions

CLI Example:

```
salt '*' qemu_nbd.clear '{"mnt/foo": "/dev/nbd0p1"}'
```

`salt.modules.qemu_nbd.connect(image)`

Activate nbd for an image file.

CLI Example:

```
salt '*' qemu_nbd.connect /tmp/image.raw
```

`salt.modules.qemu_nbd.init(image, root=None)`

Mount the named image via qemu-nbd and return the mounted roots

CLI Example:

```
salt '*' qemu_nbd.init /srv/image.qcow2
```

`salt.modules.qemu_nbd.mount(nbd, root=None)`

Pass in the nbd connection device location, mount all partitions and return a dict of mount points

CLI Example:

```
salt '*' qemu_nbd.mount /dev/nbd0
```

### 14.7.306 salt.modules.quota

Module for managing quotas on POSIX-like systems.

`salt.modules.quota.get_mode(device)`

Report whether the quota system for this device is on or off

CLI Example:

```
salt '*' quota.get_mode
```

`salt.modules.quota.off(device)`

Turns off the quota system

CLI Example:

```
salt '*' quota.off
```

`salt.modules.quota.on(device)`

Turns on the quota system

CLI Example:

```
salt '*' quota.on
```

`salt.modules.quota.report`(*mount*)

Report on quotas for a specific volume

CLI Example:

```
salt '*' quota.report /media/data
```

`salt.modules.quota.set`(*device*, *\*\*kwargs*)

Calls out to setquota, for a specific user or group

CLI Example:

```
salt '*' quota.set /media/data user=larry block-soft-limit=1048576
salt '*' quota.set /media/data group=painters file-hard-limit=1000
```

`salt.modules.quota.stats`()

Runs the quotastats command, and returns the parsed output

CLI Example:

```
salt '*' quota.stats
```

`salt.modules.quota.warn`()

Runs the warnquota command, to send warning emails to users who are over their quota limit.

CLI Example:

```
salt '*' quota.warn
```

### 14.7.307 salt.modules.rabbitmq

Module to provide RabbitMQ compatibility to Salt. Todo: A lot, need to add cluster support, logging, and minion configuration data.

`salt.modules.rabbitmq.add_user`(*name*, *password=None*, *runas=None*)

Add a rabbitMQ user via rabbitmqctl user\_add <user> <password>

CLI Example:

```
salt '*' rabbitmq.add_user rabbit_user password
```

`salt.modules.rabbitmq.add_vhost`(*vhost*, *runas=None*)

Adds a vhost via rabbitmqctl add\_vhost.

CLI Example:

```
salt '*' rabbitmq add_vhost '<vhost_name>'
```

`salt.modules.rabbitmq.change_password`(*name*, *password*, *runas=None*)

Changes a user's password.

CLI Example:

```
salt '*' rabbitmq.change_password rabbit_user password
```

`salt.modules.rabbitmq.check_password`(*name*, *password*, *runas=None*)

New in version 2016.3.0.

Checks if a user's password is valid.

CLI Example:

```
salt '*' rabbitmq.check_password rabbit_user password
```

`salt.modules.rabbitmq.clear_password`(*name*, *runas=None*)

Removes a user's password.

CLI Example:

```
salt '*' rabbitmq.clear_password rabbit_user
```

`salt.modules.rabbitmq.cluster_status`(*runas=None*)

return rabbitmq cluster\_status

CLI Example:

```
salt '*' rabbitmq.cluster_status
```

`salt.modules.rabbitmq.delete_policy`(*vhost*, *name*, *runas=None*)

Delete a policy based on rabbitmqctl clear\_policy.

Reference: <http://www.rabbitmq.com/ha.html>

CLI Example:

```
salt '*' rabbitmq.delete_policy / HA'
```

`salt.modules.rabbitmq.delete_user`(*name*, *runas=None*)

Deletes a user via rabbitmqctl delete\_user.

CLI Example:

```
salt '*' rabbitmq.delete_user rabbit_user
```

`salt.modules.rabbitmq.delete_vhost`(*vhost*, *runas=None*)

Deletes a vhost rabbitmqctl delete\_vhost.

CLI Example:

```
salt '*' rabbitmq.delete_vhost '<vhost_name>'
```

`salt.modules.rabbitmq.disable_plugin`(*name*, *runas=None*)

Disable a RabbitMQ plugin via the rabbitmq-plugins command.

CLI Example:

```
salt '*' rabbitmq.disable_plugin foo
```

`salt.modules.rabbitmq.enable_plugin`(*name*, *runas=None*)

Enable a RabbitMQ plugin via the rabbitmq-plugins command.

CLI Example:

```
salt '*' rabbitmq.enable_plugin foo
```

`salt.modules.rabbitmq.force_reset` (*runas=None*)

Forcefully Return a RabbitMQ node to its virgin state

CLI Example:

```
salt '*' rabbitmq.force_reset
```

`salt.modules.rabbitmq.join_cluster` (*host, user='rabbit', ram\_node=None, runas=None*)

Join a rabbit cluster

CLI Example:

```
salt '*' rabbitmq.join_cluster 'rabbit.example.com' 'rabbit'
```

`salt.modules.rabbitmq.list_available_plugins` (*runas=None*)

Returns a list of the names of all available plugins (enabled and disabled).

CLI Example:

```
salt '*' rabbitmq.list_available_plugins
```

`salt.modules.rabbitmq.list_enabled_plugins` (*runas=None*)

Returns a list of the names of the enabled plugins.

CLI Example:

```
salt '*' rabbitmq.list_enabled_plugins
```

`salt.modules.rabbitmq.list_permissions` (*vhost, runas=None*)

Lists permissions for vhost via `rabbitmqctl list_permissions`

CLI Example:

```
salt '*' rabbitmq.list_permissions '/myvhost'
```

`salt.modules.rabbitmq.list_policies` (*vhost='/', runas=None*)

Return a dictionary of policies nested by vhost and name based on the data returned from `rabbitmqctl list_policies`.

Reference: <http://www.rabbitmq.com/ha.html>

CLI Example:

```
salt '*' rabbitmq.list_policies'
```

`salt.modules.rabbitmq.list_queues` (*runas=None, \*args*)

Returns queue details of the / virtual host

CLI Example:

```
salt '*' rabbitmq.list_queues messages consumers
```

`salt.modules.rabbitmq.list_queues_vhost` (*vhost, runas=None, \*args*)

Returns queue details of specified virtual host. This command will consider first parameter as the vhost name and rest will be treated as queueinfoitem. For getting details on vhost /, use `list_queues` instead).

CLI Example:

```
salt '*' rabbitmq.list_queues messages consumers
```

`salt.modules.rabbitmq.list_user_permissions`(*name*, *runas=None*)

List permissions for a user via rabbitmqctl list\_user\_permissions

CLI Example:

```
salt '*' rabbitmq.list_user_permissions 'user'.
```

`salt.modules.rabbitmq.list_users`(*runas=None*)

Return a list of users based off of rabbitmqctl user\_list.

CLI Example:

```
salt '*' rabbitmq.list_users
```

`salt.modules.rabbitmq.list_vhosts`(*runas=None*)

Return a list of vhost based on rabbitmqctl list\_vhosts.

CLI Example:

```
salt '*' rabbitmq.list_vhosts
```

`salt.modules.rabbitmq.plugin_is_enabled`(*name*, *runas=None*)

Return whether the plugin is enabled.

CLI Example:

```
salt '*' rabbitmq.plugin_is_enabled rabbitmq_plugin_name
```

`salt.modules.rabbitmq.policy_exists`(*vhost*, *name*, *runas=None*)

Return whether the policy exists based on rabbitmqctl list\_policies.

Reference: <http://www.rabbitmq.com/ha.html>

CLI Example:

```
salt '*' rabbitmq.policy_exists / HA
```

`salt.modules.rabbitmq.reset`(*runas=None*)

Return a RabbitMQ node to its virgin state

CLI Example:

```
salt '*' rabbitmq.reset
```

`salt.modules.rabbitmq.set_permissions`(*vhost*, *user*, *conf='\*'*, *write='\*'*, *read='\*'*, *runas=None*)

Sets permissions for vhost via rabbitmqctl set\_permissions

CLI Example:

```
salt '*' rabbitmq.set_permissions 'myvhost' 'myuser'
```

`salt.modules.rabbitmq.set_policy`(*vhost*, *name*, *pattern*, *definition*, *priority=None*, *runas=None*)

Set a policy based on rabbitmqctl set\_policy.

Reference: <http://www.rabbitmq.com/ha.html>

CLI Example:

```
salt '*' rabbitmq.set_policy / HA '.*' '{"ha-mode":"all"}'
```

`salt.modules.rabbitmq.set_user_tags`(*name, tags, runas=None*)

Add user tags via rabbitmqctl set\_user\_tags

CLI Example:

```
salt '*' rabbitmq.set_user_tags 'myadmin' 'administrator'
```

`salt.modules.rabbitmq.start_app`(*runas=None*)

Start the RabbitMQ application.

CLI Example:

```
salt '*' rabbitmq.start_app
```

`salt.modules.rabbitmq.status`(*runas=None*)

return rabbitmq status

CLI Example:

```
salt '*' rabbitmq.status
```

`salt.modules.rabbitmq.stop_app`(*runas=None*)

Stops the RabbitMQ application, leaving the Erlang node running.

CLI Example:

```
salt '*' rabbitmq.stop_app
```

`salt.modules.rabbitmq.user_exists`(*name, runas=None*)

Return whether the user exists based on rabbitmqctl list\_users.

CLI Example:

```
salt '*' rabbitmq.user_exists rabbit_user
```

`salt.modules.rabbitmq.vhost_exists`(*name, runas=None*)

Return whether the vhost exists based on rabbitmqctl list\_vhosts.

CLI Example:

```
salt '*' rabbitmq.vhost_exists rabbit_host
```

### 14.7.308 salt.modules.raet\_publish

Publish a command from a minion to a target

`salt.modules.raet_publish.full_data`(*tgt, fun, arg=None, tgt\_type='glob', returner='', timeout=5, expr\_form=None*)

Return the full data about the publication, this is invoked in the same way as the publish function

CLI Example:

```
salt system.example.com publish.full_data '*' cmd.run 'ls -la /tmp'
```

---

#### Attention

If you need to pass a value to a function argument and that value contains an equal sign, you **must** include the argument name. For example:

```
salt '*' publish.full_data test.kwarg arg='cheese=spam'
```

`salt.modules.raet_publish.publish`(*tgt, fun, arg=None, tgt\_type='glob', returner='', timeout=5, expr\_form=None*)

Publish a command from the minion out to other minions.

Publications need to be enabled on the Salt master and the minion needs to have permission to publish the command. The Salt master will also prevent a recursive publication loop, this means that a minion cannot command another minion to command another minion as that would create an infinite command loop.

The `tgt_type` argument is used to pass a target other than a glob into the execution, the available options are:

- glob
- pcre
- grain
- grain\_pcre
- pillar
- pillar\_pcre
- ipcidr
- range
- compound

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

The arguments sent to the minion publish function are separated with commas. This means that for a minion executing a command with multiple args it will look like this:

```
salt system.example.com publish.publish '*' user.add 'foo,1020,1020'
salt system.example.com publish.publish 'os:Fedora' network.interfaces '' grain
```

CLI Example:

```
salt system.example.com publish.publish '*' cmd.run 'ls -la /tmp'
```

### Attention

If you need to pass a value to a function argument and that value contains an equal sign, you **must** include the argument name. For example:

```
salt '*' publish.publish test.kwarg arg='cheese=spam'
```

`salt.modules.raet_publish.runner`(*fun, arg=None, timeout=5*)

Execute a runner on the master and return the data from the runner function

CLI Example:

```
salt publish.runner manage.down
```

## 14.7.309 salt.modules.rallydev

Support for RallyDev

New in version 2015.8.0.

Requires a username and a password in `/etc/salt/minion`:

`salt.modules.rallydev.list_items(name)`

List items of a particular type

CLI Examples:

```
salt myminion rallydev.list_<item name>s
salt myminion rallydev.list_users
salt myminion rallydev.list_artifacts
```

`salt.modules.rallydev.list_users()`

List the users

CLI Example:

```
salt myminion rallydev.list_users
```

`salt.modules.rallydev.query_item(name, query_string, order='Rank')`

Query a type of record for one or more items. Requires a valid query string. See <https://rally1.rallydev.com/slm/doc/webservice/introduction.jsp> for information on query syntax.

CLI Example:

```
salt myminion rallydev.query_<item name> <query string> [<order>]
salt myminion rallydev.query_task '(Name contains github)'
salt myminion rallydev.query_task '(Name contains reactor)' Rank
```

`salt.modules.rallydev.query_user(query_string, order='UserName')`

Update a user

CLI Example:

```
salt myminion rallydev.query_user '(Name contains Jo)'
```

`salt.modules.rallydev.show_artifact(id_)`

Show an artifact

CLI Example:

```
salt myminion rallydev.show_artifact <artifact id>
```

`salt.modules.rallydev.show_item(name, id_)`

Show an item

CLI Example:

```
salt myminion rallydev.show_<item name> <item id>
```

`salt.modules.rallydev.show_user(id_)`

Show a user

CLI Example:

```
salt myminion rallydev.show_user <user id>
```

`salt.modules.rallydev.update_item(name, id_, field=None, value=None, postdata=None)`

Update an item. Either a field and a value, or a chunk of POST data, may be used, but not both.

CLI Example:

```
salt myminion rallydev.update_<item name> <item id> field=<field> value=<value>
salt myminion rallydev.update_<item name> <item id> postdata=<post data>
```

`salt.modules.rallydev.update_user` (*id\_*, *field*, *value*)

Update a user

CLI Example:

```
salt myminion rallydev.update_user <user id> <field> <new value>
```

### 14.7.310 salt.modules.random\_org

Module for retrieving random information from Random.org

New in version 2015.5.0.

**configuration** This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
random_org:
  api_key: 7be1402d-5719-5bd3-a306-3def9f135da5
  api_version: 1
```

`salt.modules.random_org.generateBlobs` (*api\_key=None*, *api\_version=None*, *\*\*kwargs*)

List all Slack users.

**Parameters**

- **api\_key** -- The Random.org api key.
- **api\_version** -- The Random.org api version.
- **format** -- Specifies the format in which the blobs will be returned. Values allowed are base64 and hex.

**Returns** The user list.

CLI Example:

```
salt '*' get_integers number=5 min=1 max=6
salt '*' get_integers number=5 min=1 max=6
```

`salt.modules.random_org.generateDecimalFractions` (*api\_key=None*, *api\_version=None*, *\*\*kwargs*)

Generates true random decimal fractions

**Parameters**

- **api\_key** -- The Random.org api key.
- **api\_version** -- The Random.org api version.
- **number** -- How many random decimal fractions you need. Must be within the [1,1e4] range.
- **decimalPlaces** -- The number of decimal places to use. Must be within the [1,20] range.
- **replacement** -- Specifies whether the random numbers should be picked with replacement. The default (true) will cause the numbers to be picked with replacement, i.e., the resulting numbers may contain duplicate values (like a series of dice rolls). If you want the numbers picked to be unique (like raffle tickets drawn from a container), set this value to false.

**Returns** A list of decimal fraction

CLI Example:

```
salt '*' random_org.generateDecimalFractions number=10 decimalPlaces=4

salt '*' random_org.generateDecimalFractions number=10 decimalPlaces=4
↳ replacement=True
```

`salt.modules.random_org.generateGaussians` (*api\_key=None, api\_version=None, \*\*kwargs*)

This method generates true random numbers from a Gaussian distribution (also known as a normal distribution).

Parameters

- **api\_key** -- The Random.org api key.
- **api\_version** -- The Random.org api version.
- **number** -- How many random numbers you need. Must be within the [1,1e4] range.
- **mean** -- The distribution's mean. Must be within the [-1e6,1e6] range.
- **standardDeviation** -- The distribution's standard deviation. Must be within the [-1e6,1e6] range.
- **significantDigits** -- The number of significant digits to use. Must be within the [2,20] range.

Returns The user list.

CLI Example:

```
salt '*' random_org.generateGaussians number=10 mean=0.0 standardDeviation=1.0
↳ significantDigits=8
```

`salt.modules.random_org.generateIntegers` (*api\_key=None, api\_version=None, \*\*kwargs*)

Generate random integers

Parameters

- **api\_key** -- The Random.org api key.
- **api\_version** -- The Random.org api version.
- **number** -- The number of integers to generate
- **minimum** -- The lower boundary for the range from which the random numbers will be picked. Must be within the [-1e9,1e9] range.
- **maximum** -- The upper boundary for the range from which the random numbers will be picked. Must be within the [-1e9,1e9] range.
- **replacement** -- Specifies whether the random numbers should be picked with replacement. The default (true) will cause the numbers to be picked with replacement, i.e., the resulting numbers may contain duplicate values (like a series of dice rolls). If you want the numbers picked to be unique (like raffle tickets drawn from a container), set this value to false.
- **base** -- Specifies the base that will be used to display the numbers. Values allowed are 2, 8, 10 and 16. This affects the JSON types and formatting of the resulting data as discussed below.

Returns A list of integers.

CLI Example:

```
salt '*' random_org.generateIntegers number=5 minimum=1 maximum=6

salt '*' random_org.generateIntegers number=5 minimum=2 maximum=255 base=2
```

`salt.modules.random_org.generateStrings` (*api\_key=None, api\_version=None, \*\*kwargs*)

Generate random strings.

Parameters

- **api\_key** -- The Random.org api key.
- **api\_version** -- The Random.org api version.

- **number** -- The number of strings to generate.
- **length** -- The length of each string. Must be within the [1,20] range. All strings will be of the same length
- **characters** -- A string that contains the set of characters that are allowed to occur in the random strings. The maximum number of characters is 80.
- **replacement** -- Specifies whether the random strings should be picked with replacement. The default (true) will cause the strings to be picked with replacement, i.e., the resulting list of strings may contain duplicates (like a series of dice rolls). If you want the strings to be unique (like raffle tickets drawn from a container), set this value to false.

**Returns** A list of strings.

CLI Example:

```
salt '*' random_org.generateStrings number=5 length=8 characters=
↳ 'abcdefghijklmnopqrstuvwxy'

salt '*' random_org.generateStrings number=10 length=16 characters
↳ 'abcdefghijklmnopqrstuvwxy'
```

`salt.modules.random_org.generateUUIDs` (*api\_key=None, api\_version=None, \*\*kwargs*)

Generate a list of random UUIDs

**Parameters**

- **api\_key** -- The Random.org api key.
- **api\_version** -- The Random.org api version.
- **number** -- How many random UUIDs you need. Must be within the [1,1e3] range.

**Returns** A list of UUIDs

CLI Example:

```
salt '*' random_org.generateUUIDs number=5
```

`salt.modules.random_org.getUsage` (*api\_key=None, api\_version=None*)

Show current usages statistics

**Parameters**

- **api\_key** -- The Random.org api key.
- **api\_version** -- The Random.org api version.

**Returns** The current usage statistics.

CLI Example:

```
salt '*' random_org.getUsage

salt '*' random_org.getUsage api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15 api_
↳ version=1
```

### 14.7.311 salt.modules.rbac\_solaris

Module for Solaris' Role-Based Access Control

`salt.modules.rbac_solaris.auth_add` (*user, auth*)

Add authorization to user

**user** [string] username

**auth** [string] authorization name

CLI Example:

```
salt '*' rbac.auth_add martine solaris.zone.manage
salt '*' rbac.auth_add martine solaris.zone.manage,solaris.mail.mailq
```

`salt.modules.rbac_solaris.auth_get(user, computed=True)`

List authorization for user

**user** [string] username

**computed** [boolean] merge results from *auths* command into data from *user\_attr*

CLI Example:

```
salt '*' rbac.auth_get leo
```

`salt.modules.rbac_solaris.auth_list()`

List all available authorization

CLI Example:

```
salt '*' rbac.auth_list
```

`salt.modules.rbac_solaris.auth_rm(user, auth)`

Remove authorization from user

**user** [string] username

**auth** [string] authorization name

CLI Example:

```
salt '*' rbac.auth_rm jorge solaris.zone.manage
salt '*' rbac.auth_rm jorge solaris.zone.manage,solaris.mail.mailq
```

`salt.modules.rbac_solaris.profile_add(user, profile)`

Add profile to user

**user** [string] username

**profile** [string] profile name

CLI Example:

```
salt '*' rbac.profile_add martine 'Primary Administrator'
salt '*' rbac.profile_add martine 'User Management,User Security'
```

`salt.modules.rbac_solaris.profile_get(user, default_hidden=True)`

List profiles for user

**user** [string] username

**default\_hidden** [boolean] hide default profiles

CLI Example:

```
salt '*' rbac.profile_get leo
salt '*' rbac.profile_get leo default_hidden=False
```

`salt.modules.rbac_solaris.profile_list(default_only=False)`

List all available profiles

**default\_only** [boolean] return only default profile

CLI Example:

```
salt '*' rbac.profile_list
```

`salt.modules.rbac_solaris.profile_rm(user, profile)`

Remove profile from user

**user** [string] username

**profile** [string] profile name

CLI Example:

```
salt '*' rbac.profile_rm jorge 'Primary Administrator'
salt '*' rbac.profile_rm jorge 'User Management,User Security'
```

`salt.modules.rbac_solaris.role_add(user, role)`

Add role to user

**user** [string] username

**role** [string] role name

CLI Example:

```
salt '*' rbac.role_add martine netcfg
salt '*' rbac.role_add martine netcfg,zfssnap
```

`salt.modules.rbac_solaris.role_get(user)`

List roles for user

**user** [string] username

CLI Example:

```
salt '*' rbac.role_get leo
```

`salt.modules.rbac_solaris.role_list()`

List all available roles

CLI Example:

```
salt '*' rbac.role_list
```

`salt.modules.rbac_solaris.role_rm(user, role)`

Remove role from user

**user** [string] username

**role** [string] role name

CLI Example:

```
salt '*' rbac.role_rm jorge netcfg
salt '*' rbac.role_rm jorge netcfg,zfssnap
```

### 14.7.312 salt.modules.rbenv

Manage ruby installations with rbenv. rbenv is supported on Linux and macOS. rbenv doesn't work on Windows (and isn't really necessary on Windows as there is no system Ruby on Windows). On Windows, the RubyInstaller and/or Pik are both good alternatives to work with multiple versions of Ruby on the same box.

<http://misheska.com/blog/2013/06/15/using-rbenv-to-manage-multiple-versions-of-ruby/>

New in version 0.16.0.

`salt.modules.rbenv.default(ruby=None, runas=None)`

Returns or sets the currently defined default ruby

**ruby** The version to set as the default. Should match one of the versions listed by `rbenv.versions`. Leave blank to return the current default.

CLI Example:

```
salt '*' rbenv.default
salt '*' rbenv.default 2.0.0-p0
```

`salt.modules.rbenv.do(cmdline, runas=None, env=None)`

Execute a ruby command with rbenv's shims from the user or the system

CLI Example:

```
salt '*' rbenv.do 'gem list bundler'
salt '*' rbenv.do 'gem list bundler' deploy
```

`salt.modules.rbenv.do_with_ruby` (*ruby, cmdline, runas=None*)

Execute a ruby command with rbenv's shims using a specific ruby version

CLI Example:

```
salt '*' rbenv.do_with_ruby 2.0.0-p0 'gem list bundler'
salt '*' rbenv.do_with_ruby 2.0.0-p0 'gem list bundler' runas=deploy
```

`salt.modules.rbenv.install` (*runas=None, path=None*)

Install rbenv systemwide

CLI Example:

```
salt '*' rbenv.install
```

`salt.modules.rbenv.install_ruby` (*ruby, runas=None*)

Install a ruby implementation.

**ruby** The version of Ruby to install, should match one of the versions listed by `rbenv.list`

**runas** The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

Additional environment variables can be configured in pillar / grains / master:

```
rbenv:
  build_env: 'CONFIGURE_OPTS="--no-tcmalloc" CFLAGS="-fno-tree-dce"'
```

CLI Example:

```
salt '*' rbenv.install_ruby 2.0.0-p0
```

`salt.modules.rbenv.is_installed` (*runas=None*)

Check if rbenv is installed

CLI Example:

```
salt '*' rbenv.is_installed
```

`salt.modules.rbenv.list` (*runas=None*)

List the installable versions of ruby

**runas** The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rbenv.list
```

`salt.modules.rbenv.rehash` (*runas=None*)

Run rbenv rehash to update the installed shims

**runas** The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rbenv.rehash
```

`salt.modules.rbenv.uninstall_ruby`(*ruby*, *runas=None*)

Uninstall a ruby implementation.

**ruby** The version of ruby to uninstall. Should match one of the versions listed by `rbenv.versions`.

**runas** The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rbenv.uninstall_ruby 2.0.0-p0
```

`salt.modules.rbenv.update`(*runas=None*, *path=None*)

Updates the current versions of rbenv and ruby-build

**runas** The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rbenv.update
```

`salt.modules.rbenv.versions`(*runas=None*)

List the installed versions of ruby

CLI Example:

```
salt '*' rbenv.versions
```

### 14.7.313 salt.modules.rdp

Manage RDP Service on Windows servers

`salt.modules.rdp.disable`()

Disable RDP the service on the server

CLI Example:

```
salt '*' rdp.disable
```

`salt.modules.rdp.disconnect_session`(*session\_id*)

Disconnect a session.

New in version 2016.11.0.

**Parameters** **session\_id** -- The numeric Id of the session.

**Returns** A boolean representing whether the disconnect succeeded.

CLI Example:

```
salt '*' rdp.disconnect_session session_id
```

```
salt '*' rdp.disconnect_session 99
```

`salt.modules.rdp.enable`()

Enable RDP the service on the server

CLI Example:

```
salt '*' rdp.enable
```

`salt.modules.rdp.get_session`(*session\_id*)

Get information about a session.

New in version 2016.11.0.

**Parameters** **session\_id** -- The numeric Id of the session.

**Returns** A dictionary of session information.

CLI Example:

```
salt '*' rdp.get_session session_id
salt '*' rdp.get_session 99
```

**salt.modules.rdp.list\_sessions**(*logged\_in\_users\_only=False*)

List information about the sessions.

New in version 2016.11.0.

**Parameters** **logged\_in\_users\_only** -- If True, only return sessions with users logged in.

**Returns** A list containing dictionaries of session information.

CLI Example:

```
salt '*' rdp.list_sessions
```

**salt.modules.rdp.logoff\_session**(*session\_id*)

Initiate the logoff of a session.

New in version 2016.11.0.

**Parameters** **session\_id** -- The numeric Id of the session.

**Returns** A boolean representing whether the logoff succeeded.

CLI Example:

```
salt '*' rdp.logoff_session session_id
salt '*' rdp.logoff_session 99
```

**salt.modules.rdp.status**()

Show if rdp is enabled on the server

CLI Example:

```
salt '*' rdp.status
```

### 14.7.314 salt.modules.redis

Module to provide redis functionality to Salt

New in version 2014.7.0.

**configuration** This module requires the redis python module and uses the following defaults which may be overridden in the minion configuration:

```
redis.host: 'localhost'
redis.port: 6379
redis.db: 0
redis.password: None
```

**salt.modules.redismod.bgrewriteaof**(*host=None, port=None, db=None, password=None*)

Asynchronously rewrite the append-only file

CLI Example:

```
salt '*' redis.bgrewriteaof
```

`salt.modules.redismod.bgsave` (*host=None, port=None, db=None, password=None*)

Asynchronously save the dataset to disk

CLI Example:

```
salt '*' redis.bgsave
```

`salt.modules.redismod.config_get` (*pattern='\*', host=None, port=None, db=None, password=None*)

Get redis server configuration values

CLI Example:

```
salt '*' redis.config_get
salt '*' redis.config_get port
```

`salt.modules.redismod.config_set` (*name, value, host=None, port=None, db=None, password=None*)

Set redis server configuration values

CLI Example:

```
salt '*' redis.config_set masterauth luv_kittens
```

`salt.modules.redismod.dbsize` (*host=None, port=None, db=None, password=None*)

Return the number of keys in the selected database

CLI Example:

```
salt '*' redis.dbsize
```

`salt.modules.redismod.delete` (*\*keys, \*\*connection\_args*)

Deletes the keys from redis, returns number of keys deleted

CLI Example:

```
salt '*' redis.delete foo
```

`salt.modules.redismod.exists` (*key, host=None, port=None, db=None, password=None*)

Return true if the key exists in redis

CLI Example:

```
salt '*' redis.exists foo
```

`salt.modules.redismod.expire` (*key, seconds, host=None, port=None, db=None, password=None*)

Set a keys time to live in seconds

CLI Example:

```
salt '*' redis.expire foo 300
```

`salt.modules.redismod.expireat` (*key, timestamp, host=None, port=None, db=None, password=None*)

Set a keys expire at given UNIX time

CLI Example:

```
salt '*' redis.expireat foo 1400000000
```

`salt.modules.redismod.flushall` (*host=None, port=None, db=None, password=None*)  
Remove all keys from all databases

CLI Example:

```
salt '*' redis.flushall
```

`salt.modules.redismod.flushdb` (*host=None, port=None, db=None, password=None*)  
Remove all keys from the selected database

CLI Example:

```
salt '*' redis.flushdb
```

`salt.modules.redismod.get_key` (*key, host=None, port=None, db=None, password=None*)  
Get redis key value

CLI Example:

```
salt '*' redis.get_key foo
```

`salt.modules.redismod.get_master_ip` (*host=None, port=None, password=None*)  
Get host information about slave

CLI Example:

```
salt '*' redis.get_master_ip
```

`salt.modules.redismod.hdel` (*key, \*fields, \*\*options*)  
Delete one of more hash fields.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hdel foo_hash bar_field1 bar_field2
```

`salt.modules.redismod.hexists` (*key, field, host=None, port=None, db=None, password=None*)  
Determine if a hash fields exists.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hexists foo_hash bar_field
```

`salt.modules.redismod.hget` (*key, field, host=None, port=None, db=None, password=None*)  
Get specific field value from a redis hash, returns dict

CLI Example:

```
salt '*' redis.hget foo_hash bar_field
```

`salt.modules.redismod.hgetall` (*key, host=None, port=None, db=None, password=None*)  
Get all fields and values from a redis hash, returns dict

CLI Example:

```
salt '*' redis.hgetall foo_hash
```

`salt.modules.redismod.hincrby`(*key, field, increment=1, host=None, port=None, db=None, password=None*)

Increment the integer value of a hash field by the given number.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hincrby foo_hash bar_field 5
```

`salt.modules.redismod.hincrbyfloat`(*key, field, increment=1.0, host=None, port=None, db=None, password=None*)

Increment the float value of a hash field by the given number.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hincrbyfloat foo_hash bar_field 5.17
```

`salt.modules.redismod.hlen`(*key, host=None, port=None, db=None, password=None*)

Returns number of fields of a hash.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hlen foo_hash
```

`salt.modules.redismod.hmget`(*key, \*fields, \*\*options*)

Returns the values of all the given hash fields.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hmget foo_hash bar_field1 bar_field2
```

`salt.modules.redismod.hmset`(*key, \*\*fieldsvals*)

Sets multiple hash fields to multiple values.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hmset foo_hash bar_field1=bar_value1 bar_field2=bar_value2
```

`salt.modules.redismod.hscan`(*key, cursor=0, match=None, count=None, host=None, port=None, db=None, password=None*)

Incrementally iterate hash fields and associated values.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hscan foo_hash match='field_prefix_*' count=1
```

`salt.modules.redismod.hset`(*key, field, value, host=None, port=None, db=None, password=None*)

Set the value of a hash field.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hset foo_hash bar_field bar_value
```

`salt.modules.redismod.hsetnx` (*key, field, value, host=None, port=None, db=None, password=None*)

Set the value of a hash field only if the field does not exist.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hsetnx foo_hash bar_field bar_value
```

`salt.modules.redismod.hvals` (*key, host=None, port=None, db=None, password=None*)

Return all the values in a hash.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hvals foo_hash bar_field1 bar_value1
```

`salt.modules.redismod.info` (*host=None, port=None, db=None, password=None*)

Get information and statistics about the server

CLI Example:

```
salt '*' redis.info
```

`salt.modules.redismod.key_type` (*key, host=None, port=None, db=None, password=None*)

Get redis key type

CLI Example:

```
salt '*' redis.type foo
```

`salt.modules.redismod.keys` (*pattern='\*', host=None, port=None, db=None, password=None*)

Get redis keys, supports glob style patterns

CLI Example:

```
salt '*' redis.keys
salt '*' redis.keys test*
```

`salt.modules.redismod.lastsave` (*host=None, port=None, db=None, password=None*)

Get the UNIX time in seconds of the last successful save to disk

CLI Example:

```
salt '*' redis.lastsave
```

`salt.modules.redismod.llen` (*key, host=None, port=None, db=None, password=None*)

Get the length of a list in Redis

CLI Example:

```
salt '*' redis.llen foo_list
```

`salt.modules.redismod.lrange` (*key, start, stop, host=None, port=None, db=None, password=None*)

Get a range of values from a list in Redis

CLI Example:

```
salt '*' redis.lrange foo_list 0 10
```

`salt.modules.redismod.ping` (*host=None, port=None, db=None, password=None*)

Ping the server, returns False on connection errors

CLI Example:

```
salt '*' redis.ping
```

`salt.modules.redismod.save` (*host=None, port=None, db=None, password=None*)

Synchronously save the dataset to disk

CLI Example:

```
salt '*' redis.save
```

`salt.modules.redismod.sentinel_get_master_ip` (*master, host=None, port=None, password=None*)

Get ip for sentinel master

CLI Example:

```
salt '*' redis.sentinel_get_master_ip 'mymaster'
```

`salt.modules.redismod.set_key` (*key, value, host=None, port=None, db=None, password=None*)

Set redis key value

CLI Example:

```
salt '*' redis.set_key foo bar
```

`salt.modules.redismod.shutdown` (*host=None, port=None, db=None, password=None*)

Synchronously save the dataset to disk and then shut down the server

CLI Example:

```
salt '*' redis.shutdown
```

`salt.modules.redismod.slaveof` (*master\_host=None, master\_port=None, host=None, port=None, db=None, password=None*)

Make the server a slave of another instance, or promote it as master

CLI Example:

```
# Become slave of redis-n01.example.com:6379
salt '*' redis.slaveof redis-n01.example.com 6379
salt '*' redis.slaveof redis-n01.example.com
# Become master
salt '*' redis.slaveof
```

`salt.modules.redismod.smembers` (*key, host=None, port=None, db=None, password=None*)

Get members in a Redis set

CLI Example:

```
salt '*' redis.smembers foo_set
```

`salt.modules.redismod.time` (*host=None, port=None, db=None, password=None*)

Return the current server UNIX time in seconds

CLI Example:

```
salt '*' redis.time
```

`salt.modules.redismod.zcard`(*key, host=None, port=None, db=None, password=None*)

Get the length of a sorted set in Redis

CLI Example:

```
salt '*' redis.zcard foo_sorted
```

`salt.modules.redismod.zrange`(*key, start, stop, host=None, port=None, db=None, password=None*)

Get a range of values from a sorted set in Redis by index

CLI Example:

```
salt '*' redis.zrange foo_sorted 0 10
```

### 14.7.315 salt.modules.reg

#### Manage the Windows registry

##### Hives

Hives are the main sections of the registry and all begin with the word HKEY. - HKEY\_LOCAL\_MACHINE - HKEY\_CURRENT\_USER - HKEY\_USER

##### Keys

Keys are the folders in the registry. Keys can have many nested subkeys. Keys can have a value assigned to them under the (Default)

##### Values or Entries

Values/Entries are name/data pairs. There can be many values in a key. The (Default) value corresponds to the Key, the rest are their own value pairs.

##### depends

- winreg Python module

`class salt.modules.reg.Registry`

Delay `'_winreg'` usage until this module is used

`salt.modules.reg.broadcast_change()`

Refresh the windows environment.

Returns (bool): True if successful, otherwise False

CLI Example:

```
salt '*' reg.broadcast_change
```

`salt.modules.reg.delete_key_recursive` (*hive, key, use\_32bit\_registry=False*)

New in version 2015.5.4.

Delete a registry key to include all subkeys.

**Parameters**

- **hive** -- The name of the hive. Can be one of the following
  - HKEY\_LOCAL\_MACHINE or HKLM
  - HKEY\_CURRENT\_USER or HKCU
  - HKEY\_USER or HKU
- **key** -- The key to remove (looks like a path)
- **use\_32bit\_registry** (*bool*) -- Deletes the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.

**Returns** A dictionary listing the keys that deleted successfully as well as those that failed to delete.

**Return type** *dict*

The following example will remove `salt` and all its subkeys from the `SOFTWARE` key in `HKEY_LOCAL_MACHINE`:

CLI Example:

```
salt '*' reg.delete_key_recursive HKLM SOFTWARE\salt
```

`salt.modules.reg.delete_value` (*hive, key, vname=None, use\_32bit\_registry=False*)

Delete a registry value entry or the default value for a key.

**Parameters**

- **hive** (*str*) -- The name of the hive. Can be one of the following
  - HKEY\_LOCAL\_MACHINE or HKLM
  - HKEY\_CURRENT\_USER or HKCU
  - HKEY\_USER or HKU
- **key** (*str*) -- The key (looks like a path) to the value name.
- **vname** (*str*) -- The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be deleted.
- **use\_32bit\_registry** (*bool*) -- Deletes the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.

**Returns** Returns True if successful, False if not

**Return type** *bool*

CLI Example:

```
salt '*' reg.delete_value HKEY_CURRENT_USER 'SOFTWARE\Salt' 'version'
```

`salt.modules.reg.list_keys` (*hive, key=None, use\_32bit\_registry=False*)

Enumerates the subkeys in a registry key or hive.

**Parameters**

- **hive** (*str*) -- The name of the hive. Can be one of the following
  - HKEY\_LOCAL\_MACHINE or HKLM
  - HKEY\_CURRENT\_USER or HKCU
  - HKEY\_USER or HKU
- **key** (*str*) -- The key (looks like a path) to the value name. If a key is not passed, the keys under the hive will be returned.
- **use\_32bit\_registry** (*bool*) -- Accesses the 32bit portion of the registry on 64 bit installations. On 32bit machines this is ignored.

**Returns** A list of keys/subkeys under the hive or key.

**Return type** *list*

CLI Example:

```
salt '*' reg.list_keys HKLM 'SOFTWARE'
```

`salt.modules.reg.list_values`(*hive*, *key=None*, *use\_32bit\_registry=False*, *include\_default=True*)

Enumerates the values in a registry key or hive.

**Parameters**

- **hive** (*str*) -- The name of the hive. Can be one of the following
  - HKEY\_LOCAL\_MACHINE or HKLM
  - HKEY\_CURRENT\_USER or HKCU
  - HKEY\_USER or HKU
- **key** (*str*) -- The key (looks like a path) to the value name. If a key is not passed, the values under the hive will be returned.
- **use\_32bit\_registry** (*bool*) -- Accesses the 32bit portion of the registry on 64 bit installations. On 32bit machines this is ignored.
- **include\_default** (*bool*) -- Toggle whether to include the '(Default)' value.

**Returns** A list of values under the hive or key.

**Return type** *list*

CLI Example:

```
salt '*' reg.list_values HKLM 'SYSTEM\CurrentControlSet\Services\Tcpip'
```

`salt.modules.reg.read_value`(*hive*, *key*, *vname=None*, *use\_32bit\_registry=False*)

Reads a registry value entry or the default value for a key.

**Parameters**

- **hive** (*str*) -- The name of the hive. Can be one of the following
  - HKEY\_LOCAL\_MACHINE or HKLM
  - HKEY\_CURRENT\_USER or HKCU
  - HKEY\_USER or HKU
- **key** (*str*) -- The key (looks like a path) to the value name.
- **vname** (*str*) -- The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be returned
- **use\_32bit\_registry** (*bool*) -- Accesses the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.

**Returns** A dictionary containing the passed settings as well as the `value_data` if successful. If unsuccessful, sets `success` to `False`.

**Return type** *dict*

If `vname` is not passed:

- Returns the first unnamed value (Default) as a string.
- Returns none if first unnamed value is empty.
- Returns `False` if key not found.

CLI Example:

```
salt '*' reg.read_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'version'
```

`salt.modules.reg.set_value`(*hive*, *key*, *vname=None*, *vdata=None*, *vtype=u'REG\_SZ'*, *use\_32bit\_registry=False*, *volatile=False*)

Sets a registry value entry or the default value for a key.

**Parameters**

- **hive** (*str*) -- The name of the hive. Can be one of the following
  - HKEY\_LOCAL\_MACHINE or HKLM
  - HKEY\_CURRENT\_USER or HKCU
  - HKEY\_USER or HKU
- **key** (*str*) -- The key (looks like a path) to the value name.
- **vname** (*str*) -- The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be set.

- **vdata** (*object*) -- The value data to be set. What the type of this parameter should be is determined by the value of the vtype parameter. The correspondence is as follows:  
 REG\_BINARY binary data (i.e. str in python version < 3 and bytes in version >=3)  
 REG\_DWORD int  
 REG\_EXPAND\_SZ str  
 REG\_MULTI\_SZ list of objects of type str  
 REG\_SZ str
- **vtype** (*str*) -- The value type. The possible values of the vtype parameter are indicated above in the description of the vdata parameter.
- **use\_32bit\_registry** (*bool*) -- Sets the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.
- **volatile** (*bool*) -- When this parameter has a value of True, the registry key will be made volatile (i.e. it will not persist beyond a system reset or shutdown). This parameter only has an effect when a key is being created and at no other time.

**Returns** Returns True if successful, False if not

**Return type** bool

CLI Example:

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'version' '2015.5.2'
```

This function is strict about the type of vdata. For instance the the next example will fail because vtype has a value of REG\_SZ and vdata has a type of int (as opposed to str as expected).

CLI Example:

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'version' '2015.5.2' \
vtype=REG_SZ vdata=0
```

However, this next example where vdata is properly quoted should succeed.

CLI Example:

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'version' '2015.5.2' \
vtype=REG_SZ vdata="'0'"
```

An example of using vtype REG\_BINARY is as follows:

CLI Example:

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'version' '2015.5.2' \
vtype=REG_BINARY vdata='!!binary d2hhdCdzIHRoZSBwb2ludA=='
```

An example of using vtype REG\_LIST is as follows:

CLI Example:

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'version' '2015.5.2' \
vtype=REG_LIST vdata='[a,b,c]'
```

### 14.7.316 salt.modules.rest\_package

Package support for the REST example

`salt.modules.rest_package.version(*names, **kwargs)`

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

### 14.7.317 salt.modules.rest\_sample\_utils module

Utility functions for the rest\_sample

`salt.modules.rest_sample_utils.fix_outage()`  
``Fix" the outage

CLI Example:

```
salt 'rest-sample-proxy' rest_sample.fix_outage
```

`salt.modules.rest_sample_utils.get_test_string()`  
Helper function to test cross-calling to the `__proxy__` dunder.

CLI Example:

```
salt 'rest-sample-proxy' rest_sample.get_test_string
```

### 14.7.318 salt.modules.rest\_service

Provide the service module for the proxy-minion REST sample

`salt.modules.rest_service.enabled(name, sig=None)`  
Only the 'redbull' service is 'enabled' in the test

New in version 2015.8.1.

`salt.modules.rest_service.get_all()`  
Return a list of all available services

New in version 2015.8.0.

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.rest_service.list()`  
Return a list of all available services.

CLI Example:

```
salt '*' service.list
```

`salt.modules.rest_service.restart(name, sig=None)`  
Restart the specified service with rest\_sample

New in version 2015.8.0.

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.rest_service.running`(*name*, *sig=None*)  
Return whether this service is running.

New in version 2015.8.0.

`salt.modules.rest_service.start`(*name*, *sig=None*)  
Start the specified service on the rest\_sample

New in version 2015.8.0.

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.rest_service.status`(*name*, *sig=None*)  
Return the status for a service via rest\_sample, returns a bool whether the service is running.

New in version 2015.8.0.

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.rest_service.stop`(*name*, *sig=None*)  
Stop the specified service on the rest\_sample

New in version 2015.8.0.

CLI Example:

```
salt '*' service.stop <service name>
```

### 14.7.319 salt.modules.restartcheck module

checkrestart functionality for Debian and Red Hat Based systems

Identifies services (processes) that are linked against deleted files (for example after downloading an updated binary of a shared library).

Based on checkrestart script from debian-goodies (written by Matt Zimmerman for the Debian GNU/Linux distribution, <https://packages.debian.org/debian-goodies>) and psdel by Sam Morris.

**codeauthor** Jiri Kotlin <jiri.kotlin@ultimum.io>

`salt.modules.restartcheck.restartcheck`(*ignorelist=None*, *blacklist=None*, *excludepid=None*, *verbose=True*)

Analyzes files opened by running processes and seeks for packages which need to be restarted.

**Parameters**

- **ignorelist** -- string or list of packages to be ignored
- **blacklist** -- string or list of file paths to be ignored
- **excludepid** -- string or list of process IDs to be ignored
- **verbose** -- boolean, enables extensive output

**Returns** True if no packages for restart found. False on failure. String with checkrestart output if some package seems to need to be restarted.

New in version 2015.8.3.

CLI Example: .. code-block:: bash

```
salt '*' restartcheck.restartcheck
```

### 14.7.320 salt.modules.ret

Module to integrate with the returner system and retrieve data sent to a salt returner

`salt.modules.ret.get_fun(returner, fun)`

Return info about last time fun was called on each minion

CLI Example:

```
salt '*' ret.get_fun mysql network.interfaces
```

`salt.modules.ret.get_jid(returner, jid)`

Return the information for a specified job id

CLI Example:

```
salt '*' ret.get_jid redis 20421104181954700505
```

`salt.modules.ret.get_jids(returner)`

Return a list of all job ids

CLI Example:

```
salt '*' ret.get_jids mysql
```

`salt.modules.ret.get_minions(returner)`

Return a list of all minions

CLI Example:

```
salt '*' ret.get_minions mysql
```

### 14.7.321 salt.modules.rh\_ip

The networking module for RHEL/Fedora based distros

`salt.modules.rh_ip.apply_network_settings(**settings)`

Apply global network configuration.

CLI Example:

```
salt '*' ip.apply_network_settings
```

`salt.modules.rh_ip.build_bond(iface, **settings)`

Create a bond script in /etc/modprobe.d with the passed settings and load the bonding kernel module.

CLI Example:

```
salt '*' ip.build_bond bond0 mode=balance-alb
```

`salt.modules.rh_ip.build_interface(iface, iface_type, enabled, **settings)`

Build an interface script for a network interface.

CLI Example:

```
salt '*' ip.build_interface eth0 eth <settings>
```

`salt.modules.rh_ip.build_network_settings(**settings)`  
Build the global network script.

CLI Example:

```
salt '*' ip.build_network_settings <settings>
```

`salt.modules.rh_ip.build_routes(iface, **settings)`  
Build a route script for a network interface.

CLI Example:

```
salt '*' ip.build_routes eth0 <settings>
```

`salt.modules.rh_ip.down(iface, iface_type)`  
Shutdown a network interface

CLI Example:

```
salt '*' ip.down eth0
```

`salt.modules.rh_ip.get_bond(iface)`  
Return the content of a bond script

CLI Example:

```
salt '*' ip.get_bond bond0
```

`salt.modules.rh_ip.get_interface(iface)`  
Return the contents of an interface script

CLI Example:

```
salt '*' ip.get_interface eth0
```

`salt.modules.rh_ip.get_network_settings()`  
Return the contents of the global network script.

CLI Example:

```
salt '*' ip.get_network_settings
```

`salt.modules.rh_ip.get_routes(iface)`  
Return the contents of the interface routes script.

CLI Example:

```
salt '*' ip.get_routes eth0
```

`salt.modules.rh_ip.up(iface, iface_type)`  
Start up a network interface

CLI Example:

```
salt '*' ip.up eth0
```

### 14.7.322 salt.modules.rh\_service

Service support for RHEL-based systems, including support for both upstart and sysvinit

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `service.start` is not available), see [here](#).

---

`salt.modules.rh_service.available(name, limit='')`

Return True if the named service is available. Use the `limit` param to restrict results to services of that type.

CLI Examples:

```
salt '*' service.available sshd
salt '*' service.available sshd limit=upstart
salt '*' service.available sshd limit=sysvinit
```

`salt.modules.rh_service.delete(name, **kwargs)`

Delete the named service

New in version 2016.3.

CLI Example:

```
salt '*' service.delete <service name>
```

`salt.modules.rh_service.disable(name, **kwargs)`

Disable the named service to start at boot

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.rh_service.disabled(name)`

Check to see if the named service is disabled to start on boot

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.rh_service.enable(name, **kwargs)`

Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.rh_service.enabled(name, **kwargs)`

Check to see if the named service is enabled to start on boot

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.rh_service.get_all(limit='')`

Return all installed services. Use the `limit` param to restrict results to services of that type.

CLI Example:

```
salt '*' service.get_all
salt '*' service.get_all limit=upstart
salt '*' service.get_all limit=sysvinit
```

`salt.modules.rh_service.get_disabled(limit='')`

Return the disabled services. Use the `limit` param to restrict results to services of that type.

CLI Example:

```

salt '*' service.get_disabled
salt '*' service.get_disabled limit=upstart
salt '*' service.get_disabled limit=sysvinit

```

`salt.modules.rh_service.get_enabled(limit='')`

Return the enabled services. Use the `limit` param to restrict results to services of that type.

CLI Examples:

```

salt '*' service.get_enabled
salt '*' service.get_enabled limit=upstart
salt '*' service.get_enabled limit=sysvinit

```

`salt.modules.rh_service.missing(name, limit='')`

The inverse of `service.available`. Return True if the named service is not available. Use the `limit` param to restrict results to services of that type.

CLI Examples:

```

salt '*' service.missing sshd
salt '*' service.missing sshd limit=upstart
salt '*' service.missing sshd limit=sysvinit

```

`salt.modules.rh_service.reload(name)`

Reload the named service

CLI Example:

```

salt '*' service.reload <service name>

```

`salt.modules.rh_service.restart(name)`

Restart the named service

CLI Example:

```

salt '*' service.restart <service name>

```

`salt.modules.rh_service.start(name)`

Start the specified service

CLI Example:

```

salt '*' service.start <service name>

```

`salt.modules.rh_service.status(name, sig=None)`

Return the status for a service, returns a bool whether the service is running.

CLI Example:

```

salt '*' service.status <service name>

```

`salt.modules.rh_service.stop(name)`

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

### 14.7.323 salt.modules.riak

Riak Salt Module

**salt.modules.riak.cluster\_commit()**

Commit Cluster Changes

Changed in version 2015.8.0.

CLI Example:

```
salt '*' riak.cluster_commit
```

**salt.modules.riak.cluster\_join(*username, hostname*)**

Join a Riak cluster

Changed in version 2015.8.0.

CLI Example:

```
salt '*' riak.cluster_join <user> <host>
```

*username* - The riak username to join the cluster *hostname* - The riak hostname you are connecting to

**salt.modules.riak.cluster\_leave(*username, hostname*)**

Leave a Riak cluster

New in version 2015.8.0.

CLI Example:

```
salt '*' riak.cluster_leave <username> <host>
```

*username* - The riak username to join the cluster *hostname* - The riak hostname you are connecting to

**salt.modules.riak.cluster\_plan()**

Review Cluster Plan

Changed in version 2015.8.0.

CLI Example:

```
salt '*' riak.cluster_plan
```

**salt.modules.riak.member\_status()**

Get cluster member status

Changed in version 2015.8.0.

CLI Example:

```
salt '*' riak.member_status
```

**salt.modules.riak.services()**

List available services on a node

New in version 2015.8.0.

CLI Example:

```
salt '*' riak.services
```

`salt.modules.riak.start()`

Start Riak

CLI Example:

```
salt '*' riak.start
```

`salt.modules.riak.status()`

Current node status

New in version 2015.8.0.

CLI Example:

```
salt '*' riak.status
```

`salt.modules.riak.stop()`

Stop Riak

Changed in version 2015.8.0.

CLI Example:

```
salt '*' riak.stop
```

`salt.modules.riak.test()`

Runs a test of a few standard Riak operations

New in version 2015.8.0.

CLI Example:

```
salt '*' riak.test
```

### 14.7.324 salt.modules.rpm

Support for rpm

`salt.modules.rpm.bin_pkg_info(path, saltenv='base')`

New in version 2015.8.0.

Parses RPM metadata and returns a dictionary of information about the package (name, version, etc.).

**path** Path to the file. Can either be an absolute path to a file on the minion, or a salt fileserver URL (e.g. `salt://path/to/file.rpm`). If a salt fileserver URL is passed, the file will be cached to the minion so that it can be examined.

**saltenv** [base] Salt fileserver environment from which to retrieve the package. Ignored if `path` is a local file path on the minion.

CLI Example:

```
salt '*' lowpkg.bin_pkg_info /root/salt-2015.5.1-2.el7.noarch.rpm
salt '*' lowpkg.bin_pkg_info salt://salt-2015.5.1-2.el7.noarch.rpm
```

`salt.modules.rpm.checksum(*paths)`

Return if the signature of a RPM file is valid.

CLI Example:

```
salt '*' lowpkg.checksum /path/to/package1.rpm
salt '*' lowpkg.checksum /path/to/package1.rpm /path/to/package2.rpm
```

`salt.modules.rpm.diff(package, path)`

Return a formatted diff between current file and original in a package. NOTE: this function includes all files (configuration and not), but does not work on binary content.

**Parameters**

- **package** -- The name of the package
- **path** -- Full path to the installed file

**Returns** Difference or empty string. For binary files only a notification.

CLI example:

```
salt '*' lowpkg.diff apache2 /etc/apache2/httpd.conf
```

`salt.modules.rpm.file_dict(*packages)`

List the files that belong to a package, sorted by group. Not specifying any packages will return a list of `_every_file` on the system's rpm database (not generally recommended).

CLI Examples:

```
salt '*' lowpkg.file_dict httpd
salt '*' lowpkg.file_dict httpd postfix
salt '*' lowpkg.file_dict
```

`salt.modules.rpm.file_list(*packages)`

List the files that belong to a package. Not specifying any packages will return a list of `_every_file` on the system's rpm database (not generally recommended).

CLI Examples:

```
salt '*' lowpkg.file_list httpd
salt '*' lowpkg.file_list httpd postfix
salt '*' lowpkg.file_list
```

`salt.modules.rpm.info(*packages, **attr)`

Return a detailed package(s) summary information. If no packages specified, all packages will be returned.

**Parameters**

- **packages** --
- **attr** -- Comma-separated package attributes. If no `attr` is specified, all available attributes returned.

**Valid attributes are:** version, vendor, release, build\_date, build\_date\_time\_t, install\_date, install\_date\_time\_t, build\_host, group, source\_rpm, arch, epoch, size, license, signature, packager, url, summary, description.

**Returns**

CLI example:

```
salt '*' lowpkg.info apache2 bash
salt '*' lowpkg.info apache2 bash attr=version
salt '*' lowpkg.info apache2 bash attr=version,build_date_iso,size
```

`salt.modules.rpm.list_pkgs(*packages)`

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' lowpkg.list_pkgs
```

`salt.modules.rpm.modified(*packages, **flags)`

List the modified files that belong to a package. Not specifying any packages will return a list of `_all_` modified files on the system's RPM database.

New in version 2015.5.0.

CLI examples:

```
salt '*' lowpkg.modified httpd
salt '*' lowpkg.modified httpd postfix
salt '*' lowpkg.modified
```

`salt.modules.rpm.owner(*paths)`

Return the name of the package that owns the file. Multiple file paths can be passed. If a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Examples:

```
salt '*' lowpkg.owner /usr/bin/apachectl
salt '*' lowpkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf
```

`salt.modules.rpm.verify(*packages, **kwargs)`

Runs an `rpm -Va` on a system, and returns the results in a dict

Files with an attribute of `config`, `doc`, `ghost`, `license` or `readme` in the package header can be ignored using the `ignore_types` keyword argument

CLI Example:

```
salt '*' lowpkg.verify
salt '*' lowpkg.verify httpd
salt '*' lowpkg.verify httpd postfix
salt '*' lowpkg.verify httpd postfix ignore_types=['config','doc']
```

`salt.modules.rpm.version_cmp(ver1, ver2, ignore_epoch=False)`

New in version 2015.8.9.

Do a `cmp`-style comparison on two packages. Return `-1` if `ver1 < ver2`, `0` if `ver1 == ver2`, and `1` if `ver1 > ver2`. Return `None` if there was a problem making the comparison.

`ignore_epoch` [False] Set to `True` to ignore the epoch when comparing versions

New in version 2015.8.10,2016.3.2.

CLI Example:

```
salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002'
```

## 14.7.325 salt.modules.rpmbuild

RPM Package builder system

New in version 2015.8.0.

This system allows for all of the components to build rpms safely in chrooted environments. This also provides a function to generate yum repositories

This module implements the pkgbuild interface

`salt.modules.rpmbuild.build` (*runas*, *tgt*, *dest\_dir*, *spec*, *sources*, *deps*, *env*, *template*, *saltenv*='base', *log\_dir*='/var/log/salt/pkgbuild')

Given the package destination directory, the spec file source and package sources, use mock to safely build the rpm defined in the spec file

CLI Example:

```
salt '*' pkgbuild.build mock epel-7-x86_64 /var/www/html https://raw.
↳githubusercontent.com/saltstack/libnacl/master/pkg/rpm/python-libnacl.spec
↳https://pypi.python.org/packages/source/l/libnacl/libnacl-1.3.5.tar.gz
```

This example command should build the libnacl package for rhel 7 using user mock and place it in /var/www/html/ on the minion

`salt.modules.rpmbuild.make_repo` (*reporidir*, *keyid*=None, *env*=None, *use\_passphrase*=False, *gnupghome*='/etc/salt/gpgkeys', *runas*='root', *timeout*=15.0)

Make a package repository and optionally sign packages present

Given the repodir, create a yum repository out of the rpms therein and optionally sign it and packages present, the name is directory to turn into a repo. This state is best used with onchanges linked to your package building states.

**reporidir** The directory to find packages that will be in the repository.

**keyid** Changed in version 2016.3.0.

Optional Key ID to use in signing packages and repository. Utilizes Public and Private keys associated with keyid which have been loaded into the minion's Pillar data.

For example, contents from a Pillar data file with named Public and Private keys as follows:

```
gpg_pkg_priv_key: |
-----BEGIN PGP PRIVATE KEY BLOCK-----
Version: GnuPG v1

lQ0+BFciIfQBCADAPctzx7I5Rl32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b
w82PCE8Y1jF/9Uk2m3RKVWp3YcLlc7Ap3gj6V04ysvVz28UbnhPxsIk0lf2cq8qc
.
.
Ebe+8JCQTWqSXPRtzXmy/b5WXDeM79CkLWvuGpXFor76D+ECMRPv/rawukEcNptn
R50mgHqvdyEn04pWbn8JzQ09YX/Us0SMHBVzLC8eIi5ZIopzalvX
=JvW8
-----END PGP PRIVATE KEY BLOCK-----

gpg_pkg_priv_keyname: gpg_pkg_key.pem

gpg_pkg_pub_key: |
-----BEGIN PGP PUBLIC KEY BLOCK-----
Version: GnuPG v1

mQENBFciIfQBCADAPctzx7I5Rl32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b
w82PCE8Y1jF/9Uk2m3RKVWp3YcLlc7Ap3gj6V04ysvVz28UbnhPxsIk0lf2cq8qc
.
.

inNqW9c=
```

```
=s1CX
-----END PGP PUBLIC KEY BLOCK-----

gpg_pkg_pub_keyname: gpg_pkg_key.pub
```

**env** Changed in version 2016.3.0.

A dictionary of environment variables to be utilized in creating the repository.

---

**Note:** This parameter is not used for making yum repositories.

---

**use\_passphrase** [False] New in version 2016.3.0.

Use a passphrase with the signing key presented in `keyid`. Passphrase is received from Pillar data which could be passed on the command line with `pillar` parameter. For example:

```
pillar='{ "gpg_passphrase" : "my_passphrase" }'
```

**gnupghome** [/etc/salt/gpgkeys] New in version 2016.3.0.

Location where GPG related files are stored, used with `keyid`.

**runas** [root] New in version 2016.3.0.

User to create the repository as, and optionally sign packages.

---

**Note:** Ensure the user has correct permissions to any files and directories which are to be utilized.

---

**timeout** [15.0] New in version 2016.3.4.

Timeout in seconds to wait for the prompt for inputting the passphrase.

CLI Example:

```
salt '*' pkgbuild.make_repo /var/www/html/
```

`salt.modules.rpmbuild.make_src_pkg`(*dest\_dir*, *spec*, *sources*, *env=None*, *template=None*, *saltenv='base'*)

Create a source rpm from the given spec file and sources

CLI Example:

```
salt '*' pkgbuild.make_src_pkg /var/www/html/ https://raw.githubusercontent.com/
↳ saltstack/libnacl/master/pkg/rpm/python-libnacl.spec https://pypi.python.org/
↳ packages/source/l/libnacl/libnacl-1.3.5.tar.gz
```

This example command should build the libnacl SOURCE package and place it in `/var/www/html/` on the minion

Changed in version 2017.7.0.

---

**Note:** using SHA256 as digest and minimum level dist el6

---

### 14.7.326 salt.modules.rsync

Wrapper for rsync

New in version 2014.1.0.

This data can also be passed into *pillar*. Options passed into *opts* will overwrite options passed into *pillar*.

`salt.modules.rsync.config` (*conf\_path*='/etc/rsyncd.conf')

Changed in version 2016.3.0: Return data now contains just the contents of the `rsyncd.conf` as a string, instead of a dictionary as returned from `cmd.run_all`.

Returns the contents of the `rsync` config file

**conf\_path** [/etc/rsyncd.conf] Path to the config file

CLI Example:

```
salt '*' rsync.config
```

`salt.modules.rsync.rsync` (*src*, *dst*, *delete=False*, *force=False*, *update=False*, *passwordfile=None*, *exclude=None*, *excludefrom=None*, *dryrun=False*, *rsh=None*)

Changed in version 2016.3.0: Return data now contains just the output of the `rsync` command, instead of a dictionary as returned from `cmd.run_all`.

Rsync files from *src* to *dst*

CLI Example:

```
salt '*' rsync.rsync {src} {dst} {delete=True} {update=True} {passwordfile=/etc/
↳pass.crt} {exclude=xx} {rsh}
salt '*' rsync.rsync {src} {dst} {delete=True} {excludefrom=/xx.ini} {rsh}
```

`salt.modules.rsync.version`()

Changed in version 2016.3.0: Return data now contains just the version number as a string, instead of a dictionary as returned from `cmd.run_all`.

Returns `rsync` version

CLI Example:

```
salt '*' rsync.version
```

### 14.7.327 salt.modules.runit

runit service module (<http://smarden.org/runit>)

This module is compatible with the *service* states, so it can be used to maintain services using the provider argument:

```
myservice:
  service:
    - running
    - provider: runit
```

Provides virtual *service* module on systems using `runit` as `init`.

Service management rules (`sv` command):

service \$n is ENABLED if file `SERVICE_DIR/$n/run` exists service \$n is AVAILABLE if ENABLED or if file `AVAIL_SVR_DIR/$n/run` exists service \$n is DISABLED if AVAILABLE but not ENABLED

`SERVICE_DIR/$n` is normally a symlink to a `AVAIL_SVR_DIR/$n` folder

Service auto-start/stop mechanism:

`sv` (auto)starts/stops service as soon as `SERVICE_DIR/<service>` is created/deleted, both on service creation or a boot time.

autostart feature is disabled if file `SERVICE_DIR/<n>/down` exists. This does not affect the current's service status (if already running) nor manual service management.

Service's alias:

Service `sva` is an alias of service `svc` when `AVAIL_SVR_DIR/sva` symlinks to folder `AVAIL_SVR_DIR/svc`. `svc` can't be enabled if it is already enabled through an alias already enabled, since `sv` files are stored in folder `SERVICE_DIR/svc/`.

XBPS package management uses a service's alias to provides service alternative(s), such as `chrony` and `openntpd` both aliased to `ntpd`.

`salt.modules.runit.add_svc_avail_path(path)`

Add a path that may contain available services. Return `True` if added (or already present), `False` on error.  
**path** directory to add to `AVAIL_SVR_DIRS`

`salt.modules.runit.available(name)`

Returns `True` if the specified service is available, otherwise returns `False`.

**name** the service's name

CLI Example:

```
salt '*' runit.available <service name>
```

`salt.modules.runit.disable(name, stop=False, **kwargs)`

Don't start service name at boot Returns `True` if operation is successful

**name** the service's name

**stop** if `True`, also stops the service

CLI Example:

```
salt '*' service.disable <name> [stop=True]
```

`salt.modules.runit.disabled(name)`

Return `True` if the named service is disabled, `False` otherwise

**name** the service's name

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.runit.enable(name, start=False, **kwargs)`

Start service name at boot. Returns `True` if operation is successful

**name** the service's name

**start**

**False** [Do not start the service once enabled. Default mode.] (consistent with other service management)

**True** : also start the service at the same time (default `sv` mode)

CLI Example:

```
salt '*' service.enable <name> [start=True]
```

`salt.modules.runit.enabled(name)`

Return `True` if the named service is enabled, `False` otherwise

**name** the service's name

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.runit.full_restart(name)`

Calls `runit.restart()`

**name** the service's name

CLI Example:

```
salt '*' runit.full_restart <service name>
```

**salt.modules.runit.get\_all()**

Return a list of all available services

CLI Example:

```
salt '*' runit.get_all
```

**salt.modules.runit.get\_disabled()**

Return a list of all disabled services

CLI Example:

```
salt '*' service.get_disabled
```

**salt.modules.runit.get\_enabled()**

Return a list of all enabled services

CLI Example:

```
salt '*' service.get_enabled
```

**salt.modules.runit.get\_svc\_alias()**

Returns the list of service's name that are aliased and their alias path(s)

**salt.modules.runit.get\_svc\_avail\_path()**

Return list of paths that may contain available services

**salt.modules.runit.get\_svc\_broken\_path(*name='\*'*)**

Return list of broken path(s) in SERVICE\_DIR that match name

A path is broken if it is a broken symlink or can not be a runit service

**name** a glob for service name. default is `\*`

CLI Example:

```
salt '*' runit.get_svc_broken_path <service name>
```

**salt.modules.runit.missing(*name*)**

The inverse of `runit.available`. Returns True if the specified service is not available, otherwise returns False.

**name** the service's name

CLI Example:

```
salt '*' runit.missing <service name>
```

**salt.modules.runit.reload(*name*)**

Reload service

**name** the service's name

CLI Example:

```
salt '*' runit.reload <service name>
```

**salt.modules.runit.remove(*name*)**

Remove the service <name> from system. Returns True if operation is successful. The service will be also stopped.

**name** the service's name

CLI Example:

```
salt '*' service.remove <name>
```

`salt.modules.runit.restart(name)`

Restart service

**name** the service's name

CLI Example:

```
salt '*' runit.restart <service name>
```

`salt.modules.runit.show(name)`

Show properties of one or more units/jobs or the manager

**name** the service's name

CLI Example:

```
salt '*' service.show <service name>
```

`salt.modules.runit.start(name)`

Start service

**name** the service's name

CLI Example:

```
salt '*' runit.start <service name>
```

`salt.modules.runit.status(name, sig=None)`

Return True if service is running

**name** the service's name

**sig** signature to identify with ps

CLI Example:

```
salt '*' runit.status <service name>
```

`salt.modules.runit.status_autostart(name)`

Return True if service <name> is autostarted by sv (file \$service\_folder/down does not exist) NB: return False if the service is not enabled.

**name** the service's name

CLI Example:

```
salt '*' runit.status_autostart <service name>
```

`salt.modules.runit.stop(name)`

Stop service

**name** the service's name

CLI Example:

```
salt '*' runit.stop <service name>
```

### 14.7.328 salt.modules.rvm

Manage ruby installations and gemsets with RVM, the Ruby Version Manager.

`salt.modules.rvm.do(ruby, command, runas=None, cwd=None)`

Execute a command in an RVM controlled environment.

**ruby** Which ruby to use

**command** The rvm command to execute

**runas** The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

**cwd** The directory from which to run the rvm command. Defaults to the user's home directory.

CLI Example:

```
salt '*' rvm.do 2.0.0 <command>
```

`salt.modules.rvm.gemset_copy` (*source, destination, runas=None*)

Copy all gems from one gemset to another.

**source** The name of the gemset to copy, complete with ruby version

**destination** The destination gemset

**runas** The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_copy foobar bazquo
```

`salt.modules.rvm.gemset_create` (*ruby, gemset, runas=None*)

Creates a gemset.

**ruby** The ruby version for which to create the gemset

**gemset** The name of the gemset to create

**runas** The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_create 2.0.0 foobar
```

`salt.modules.rvm.gemset_delete` (*ruby, gemset, runas=None*)

Delete a gemset

**ruby** The ruby version to which the gemset belongs

**gemset** The gemset to delete

**runas** The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_delete 2.0.0 foobar
```

`salt.modules.rvm.gemset_empty` (*ruby, gemset, runas=None*)

Remove all gems from a gemset.

**ruby** The ruby version to which the gemset belongs

**gemset** The gemset to empty

**runas** The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_empty 2.0.0 foobar
```

`salt.modules.rvm.gemset_list` (*ruby='default', runas=None*)

List all gemsets for the given ruby.

**ruby** [default] The ruby version for which to list the gemsets

**runas** The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_list
```

`salt.modules.rvm.gemset_list_all`(*runas=None*)

List all gemsets for all installed rubies.

Note that you must have set a default ruby before this can work.

**runas** The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_list_all
```

`salt.modules.rvm.get`(*version='stable', runas=None*)

Update RVM

**version** [stable] Which version of RVM to install, (e.g. stable or head)

CLI Example:

```
salt '*' rvm.get
```

`salt.modules.rvm.install`(*runas=None*)

Install RVM system-wide

**runas** The user under which to run the rvm installer script. If not specified, then it be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.install
```

`salt.modules.rvm.install_ruby`(*ruby, runas=None*)

Install a ruby implementation.

**ruby** The version of ruby to install

**runas** The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.install_ruby 1.9.3-p385
```

`salt.modules.rvm.is_installed`(*runas=None*)

Check if RVM is installed.

CLI Example:

```
salt '*' rvm.is_installed
```

`salt.modules.rvm.list`(*runas=None*)

List all rvm-installed rubies

**runas** The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.list
```

`salt.modules.rvm.reinstall_ruby`(*ruby, runas=None*)

Reinstall a ruby implementation

**ruby** The version of ruby to reinstall

**runas** The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.reinstall_ruby 1.9.3-p385
```

`salt.modules.rvm.rubygems` (*ruby, version, runas=None*)

Installs a specific rubygems version in the given ruby

**ruby** The ruby for which to install rubygems

**version** The version of rubygems to install, or `remove' to use the version that ships with 1.9

**runas** The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.rubygems 2.0.0 1.8.24
```

`salt.modules.rvm.set_default` (*ruby, runas=None*)

Set the default ruby

**ruby** The version of ruby to make the default

**runas** The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.set_default 2.0.0
```

`salt.modules.rvm.wrapper` (*ruby\_string, wrapper\_prefix, runas=None, \*binaries*)

Install RVM wrapper scripts

**ruby\_string** Ruby/gemset to install wrappers for

**wrapper\_prefix** What to prepend to the name of the generated wrapper binaries

**runas** The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

**binaries** [None] The names of the binaries to create wrappers for. When nothing is given, wrappers for ruby, gem, rake, irb, rdoc, ri and testrb are generated.

CLI Example:

```
salt '*' rvm.wrapper <ruby_string> <wrapper_prefix>
```

### 14.7.329 salt.modules.s3

Connection module for Amazon S3

**configuration** This module accepts explicit s3 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
s3.keyid: GKTADJGHEIQSXMKKRBJ08H
s3.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
```

(Note: this is literally the pillar key `s3.keyid' or the config option `s3.keyid', not ``s3:n keyid: blah".)

A `service_url` may also be specified in the configuration:

```
s3.service_url: s3.amazonaws.com
```

A `role_arn` may also be specified in the configuration:

```
s3.role_arn: arn:aws:iam::111111111111:role/my-role-to-assume
```

If a `service_url` is not specified, the default is `s3.amazonaws.com`. This may appear in various documentation as an `endpoint`. A comprehensive list for Amazon S3 may be found at:

```
http://docs.aws.amazon.com/general/latest/gr/rande.html#s3_region
```

The `service_url` will form the basis for the final endpoint that is used to query the service.

Path style can be enabled:

```
s3.path_style: True
```

This can be useful if you need to use salt with a proxy for an s3 compatible storage

You can use either `https` protocol or `http` protocol:

```
s3.https_enable: True
```

SSL verification may also be turned off in the configuration:

```
s3.verify_ssl: False
```

This is required if using S3 bucket names that contain a period, as these will not match Amazon's S3 wildcard certificates. Certificate verification is enabled by default.

AWS region may be specified in the configuration:

```
s3.location: eu-central-1
```

Default is `us-east-1`.

This module should be usable to query other S3-like services, such as Eucalyptus.

**depends** requests

```
salt.modules.s3.delete(bucket, path=None, action=None, key=None, keyid=None, service_url=None,
                       verify_ssl=None, kms_keyid=None, location=None, role_arn=None,
                       path_style=None, https_enable=None)
```

Delete a bucket, or delete an object from a bucket.

CLI Example to delete a bucket:

```
salt myminion s3.delete mybucket
```

CLI Example to delete an object from a bucket:

```
salt myminion s3.delete mybucket remoteobject
```

```
salt.modules.s3.get(bucket='', path='', return_bin=False, action=None, local_file=None, key=None,
                   keyid=None, service_url=None, verify_ssl=None, kms_keyid=None, location=None,
                   role_arn=None, path_style=None, https_enable=None)
```

List the contents of a bucket, or return an object from a bucket. Set `return_bin` to `True` in order to retrieve an object wholesale. Otherwise, Salt will attempt to parse an XML response.

CLI Example to list buckets:

```
salt myminion s3.get
```

CLI Example to list the contents of a bucket:

```
salt myminion s3.get mybucket
```

CLI Example to return the binary contents of an object:

```
salt myminion s3.get mybucket myfile.png return_bin=True
```

CLI Example to save the binary contents of an object to a local file:

```
salt myminion s3.get mybucket myfile.png local_file=/tmp/myfile.png
```

It is also possible to perform an action on a bucket. Currently, S3 supports the following actions:

```
acl
cors
lifecycle
policy
location
logging
notification
tagging
versions
requestPayment
versioning
website
```

To perform an action on a bucket:

```
salt myminion s3.get mybucket myfile.png action=acl
```

```
salt.modules.s3.head(bucket, path='', key=None, keyid=None, service_url=None, verify_ssl=None,
                    kms_keyid=None, location=None, role_arn=None, path_style=None,
                    https_enable=None)
```

Return the metadata for a bucket, or an object in a bucket.

CLI Examples:

```
salt myminion s3.head mybucket
salt myminion s3.head mybucket myfile.png
```

```
salt.modules.s3.put(bucket, path=None, return_bin=False, action=None, local_file=None, key=None,
                   keyid=None, service_url=None, verify_ssl=None, kms_keyid=None, location=None,
                   role_arn=None, path_style=None, https_enable=None)
```

Create a new bucket, or upload an object to a bucket.

CLI Example to create a bucket:

```
salt myminion s3.put mybucket
```

CLI Example to upload an object to a bucket:

```
salt myminion s3.put mybucket remotepath local_file=/path/to/file
```

### 14.7.330 salt.modules.s6 module

s6 service module

This module is compatible with the *service* states, so it can be used to maintain services using the provider argument:

```
myservice:
  service:
    - running
    - provider: s6
```

Note that the `enabled` argument is not available with this provider.

**codeauthor** :email:`Marek Skrobacki <skrobul@skrobul.com>`

**salt.modules.s6.available**(*name*)

Returns True if the specified service is available, otherwise returns False.

CLI Example:

```
salt '*' s6.available foo
```

**salt.modules.s6.full\_restart**(*name*)

Calls `s6.restart()` function

CLI Example:

```
salt '*' s6.full_restart <service name>
```

**salt.modules.s6.get\_all**()

Return a list of all available services

CLI Example:

```
salt '*' s6.get_all
```

**salt.modules.s6.missing**(*name*)

The inverse of `s6.available`. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```
salt '*' s6.missing foo
```

**salt.modules.s6.reload**(*name*)

Send a HUP to service via `s6`

CLI Example:

```
salt '*' s6.reload <service name>
```

**salt.modules.s6.restart**(*name*)

Restart service via `s6`. This will stop/start service

CLI Example:

```
salt '*' s6.restart <service name>
```

**salt.modules.s6.start**(*name*)

Starts service via `s6`

CLI Example:

```
salt '*' s6.start <service name>
```

`salt.modules.s6.status`(*name*, *sig=None*)  
Return the status for a service via s6, return pid if running

CLI Example:

```
salt '*' s6.status <service name>
```

`salt.modules.s6.stop`(*name*)  
Stops service via s6

CLI Example:

```
salt '*' s6.stop <service name>
```

`salt.modules.s6.term`(*name*)  
Send a TERM to service via s6

CLI Example:

```
salt '*' s6.term <service name>
```

### 14.7.331 salt.modules.salt\_proxy module

Salt proxy module

New in version 2015.8.3.

Module to deploy and manage salt-proxy processes on a minion.

`salt.modules.salt_proxy.configure_proxy`(*proxyname*, *start=True*)  
Create the salt proxy file and start the proxy process if required

Parameters

- **proxyname** -- Name to be used for this proxy (should match entries in pillar)
- **start** -- Boolean indicating if the process should be started default = True

CLI Example:

```
salt deviceminion salt_proxy.configure_proxy p8000
```

`salt.modules.salt_proxy.is_running`(*proxyname*)  
Check if the salt-proxy process associated with this proxy (name) is running.

Returns True if the process is running False otherwise

Parameters **proxyname** -- String name of the proxy (p8000 for example)

CLI Example:

```
salt deviceminion salt_proxy.is_running p8000
```

### 14.7.332 salt.modules.saltcloudmod

Control a salt cloud system

`salt.modules.saltcloudmod.create`(*name*, *profile*)  
Create the named vm

CLI Example:

```
salt <minion-id> saltcloud.create webserver rackspace_centos_512
```

### 14.7.333 salt.modules.saltutil

The Saltutil module is used to manage the state of the salt minion itself. It is used to manage minion modules as well as automate updates to the salt minion.

#### depends

- esky Python module for update functionality

#### salt.modules.saltutil.clear\_cache()

Forcibly removes all caches on a minion.

New in version 2014.7.0.

WARNING: The safest way to clear a minion cache is by first stopping the minion and then deleting the cache files before restarting it.

CLI Example:

```
salt '*' saltutil.clear_cache
```

#### salt.modules.saltutil.cmd(*tgt, fun, arg=(), timeout=None, tgt\_type='glob', ret='`, karg=None, ssh=False, \*\*kwargs*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Assuming this minion is a master, execute a salt command

CLI Example:

```
salt '*' saltutil.cmd
```

#### salt.modules.saltutil.cmd\_iter(*tgt, fun, arg=(), timeout=None, tgt\_type='glob', ret='`, karg=None, ssh=False, \*\*kwargs*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Assuming this minion is a master, execute a salt command

CLI Example:

```
salt '*' saltutil.cmd_iter
```

#### salt.modules.saltutil.find\_cached\_job(*jid*)

Return the data for a specific cached job id. Note this only works if `cache_jobs` has previously been set to True on the minion.

CLI Example:

```
salt '*' saltutil.find_cached_job <job id>
```

#### salt.modules.saltutil.find\_job(*jid*)

Return the data for a specific job id that is currently running.

**jid** The job id to search for and return data.

CLI Example:

```
salt '*' saltutil.find_job <job id>
```

Note that the `find_job` function only returns job information when the job is still running. If the job is currently running, the output looks something like this:

```
# salt my-minion saltutil.find_job 20160503150049487736
my-minion:
-----
  arg:
    - 30
  fun:
    test.sleep
  jid:
    20160503150049487736
  pid:
    9601
  ret:
  tgt:
    my-minion
  tgt_type:
    glob
  user:
    root
```

If the job has already completed, the job cannot be found and therefore the function returns an empty dictionary, which looks like this on the CLI:

```
# salt my-minion saltutil.find_job 20160503150049487736
my-minion:
-----
```

#### `salt.modules.saltutil.is_running(fun)`

If the named function is running return the data associated with it/them. The argument can be a glob

CLI Example:

```
salt '*' saltutil.is_running state.highstate
```

#### `salt.modules.saltutil.kill_all_jobs()`

Sends a kill signal (SIGKILL 9) to all currently running jobs

CLI Example:

```
salt '*' saltutil.kill_all_jobs
```

#### `salt.modules.saltutil.kill_job(jid)`

Sends a kill signal (SIGKILL 9) to the named salt job's process

CLI Example:

```
salt '*' saltutil.kill_job <job id>
```

#### `salt.modules.saltutil.list_extmods()`

New in version 2017.7.0.

List Salt modules which have been synced externally

CLI Examples:

```
salt '*' saltutil.list_extmods
```

`salt.modules.saltutil.mmodule(saltenv, fun, *args, **kwargs)`  
 Loads minion modules from an environment so that they can be used in pillars for that environment

CLI Example:

```
salt '*' saltutil.mmodule base test.ping
```

`salt.modules.saltutil.refresh_beacons()`  
 Signal the minion to refresh the beacons.

CLI Example:

```
salt '*' saltutil.refresh_beacons
```

`salt.modules.saltutil.refresh_grains(**kwargs)`  
 New in version 2016.3.6,2016.11.4,2017.7.0.

Refresh the minion's grains without syncing custom grains modules from `salt://_grains`.

---

**Note:** The available execution modules will be reloaded as part of this process, as grains can affect which modules are available.

---

`refresh_pillar` [True] Set to False to keep pillar data from being refreshed.

CLI Examples:

```
salt '*' saltutil.refresh_grains
```

`salt.modules.saltutil.refresh_modules(async=True)`  
 Signal the minion to refresh the module and grain data

The default is to refresh module asynchronously. To block until the module refresh is complete, set the ``async`` flag to False.

CLI Example:

```
salt '*' saltutil.refresh_modules
```

`salt.modules.saltutil.refresh_pillar()`  
 Signal the minion to refresh the pillar data.

CLI Example:

```
salt '*' saltutil.refresh_pillar
```

`salt.modules.saltutil.regen_keys()`  
 Used to regenerate the minion keys.

CLI Example:

```
salt '*' saltutil.regen_keys
```

`salt.modules.saltutil.revoke_auth(preserve_minion_cache=False)`

The minion sends a request to the master to revoke its own key. Note that the minion session will be revoked and the minion may not be able to return the result of this command back to the master.

If the ``preserve_minion_cache`` flag is set to True, the master cache for this minion will not be removed.

CLI Example:

```
salt '*' saltutil.revoke_auth
```

`salt.modules.saltutil.runner`(*name*, *arg=None*, *kwarg=None*, *full\_return=False*, *saltenv='base'*, *jid=None*, *\*\*kwargs*)

Execute a runner function. This function must be run on the master, either by targeting a minion running on a master or by using salt-call on a master.

New in version 2014.7.0.

**name** The name of the function to run

**kwargs** Any keyword arguments to pass to the runner function

CLI Example:

In this example, assume that *master\_minion* is a minion running on a master.

```
salt master_minion saltutil.runner jobs.list_jobs
salt master_minion saltutil.runner test.arg arg="['baz']" kwarg={'foo': 'bar'}
```

`salt.modules.saltutil.running`()

Return the data on all running salt processes on the minion

CLI Example:

```
salt '*' saltutil.running
```

`salt.modules.saltutil.signal_job`(*jid*, *sig*)

Sends a signal to the named salt job's process

CLI Example:

```
salt '*' saltutil.signal_job <job id> 15
```

`salt.modules.saltutil.sync_all`(*saltenv=None*, *refresh=True*, *extmod\_whitelist=None*, *extmod\_blacklist=None*)

Changed in version 2015.8.11,2016.3.2: On masterless minions, pillar modules are now synced, and refreshed when *refresh* is set to *True*.

Sync down all of the dynamic modules from the file server for a specific environment. This function synchronizes custom modules, states, beacons, grains, returners, output modules, renderers, and utils.

**refresh** [True] Also refresh the execution modules and recompile pillar data available to the minion. This refresh will be performed even if no new dynamic modules are synced. Set to *False* to prevent this refresh.

---

**Important:** If this function is executed using a `module.run` state, the SLS file will not have access to newly synced execution modules unless a *refresh* argument is added to the state, like so:

```
load_my_custom_module:
  module.run:
    - name: saltutil.sync_all
    - refresh: True
```

See [here](#) for a more detailed explanation of why this is necessary.

---

**extmod\_whitelist** [None] dictionary of modules to sync based on type

**extmod\_blacklist** [None] dictionary of modules to blacklist based on type

CLI Examples:

```

salt '*' saltutil.sync_all
salt '*' saltutil.sync_all saltenv=dev
salt '*' saltutil.sync_all saltenv=base,dev
salt '*' saltutil.sync_all extmod_whitelist={'modules': ['custom_module']}

```

`salt.modules.saltutil.sync_beacons`(*saltenv=None*, *refresh=True*, *extmod\_whitelist=None*, *extmod\_blacklist=None*)

New in version 2015.5.1.

Sync beacons from `salt://_beacons` to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for beacons to sync. If no top files are found, then the base environment will be synced.

**refresh** [True] If True, refresh the available beacons on the minion. This refresh will be performed even if no new beacons are synced. Set to False to prevent this refresh.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```

salt '*' saltutil.sync_beacons
salt '*' saltutil.sync_beacons saltenv=dev
salt '*' saltutil.sync_beacons saltenv=base,dev

```

`salt.modules.saltutil.sync_clouds`(*saltenv=None*, *refresh=True*, *extmod\_whitelist=None*, *extmod\_blacklist=None*)

New in version 2017.7.0.

Sync utility modules from `salt://_cloud` to the minion

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new utility modules are synced. Set to False to prevent this refresh.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```

salt '*' saltutil.sync_clouds
salt '*' saltutil.sync_clouds saltenv=dev
salt '*' saltutil.sync_clouds saltenv=base,dev

```

`salt.modules.saltutil.sync_engines`(*saltenv=None*, *refresh=False*, *extmod\_whitelist=None*, *extmod\_blacklist=None*)

New in version 2016.3.0.

Sync engine modules from `salt://_engines` to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for engines to sync. If no top files are found, then the base environment will be synced.

**refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new engine modules are synced. Set to False to prevent this refresh.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_engines
salt '*' saltutil.sync_engines saltenv=base,dev
```

`salt.modules.saltutil.sync_grains` (*saltenv=None*, *refresh=True*, *extmod\_whitelist=None*,  
*extmod\_blacklist=None*)

New in version 0.10.0.

Sync grains modules from `salt://_grains` to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for grains modules to sync. If no top files are found, then the base environment will be synced.

**refresh** [True] If True, refresh the available execution modules and recompile pillar data for the minion. This refresh will be performed even if no new grains modules are synced. Set to False to prevent this refresh.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_grains
salt '*' saltutil.sync_grains saltenv=dev
salt '*' saltutil.sync_grains saltenv=base,dev
```

`salt.modules.saltutil.sync_log_handlers` (*saltenv=None*, *refresh=True*,  
*extmod\_whitelist=None*, *extmod\_blacklist=None*)

New in version 2015.8.0.

Sync log handlers from `salt://_log_handlers` to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for log handlers to sync. If no top files are found, then the base environment will be synced.

**refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new log handlers are synced. Set to False to prevent this refresh.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_log_handlers
salt '*' saltutil.sync_log_handlers saltenv=dev
salt '*' saltutil.sync_log_handlers saltenv=base,dev
```

`salt.modules.saltutil.sync_modules` (*saltenv=None*, *refresh=True*, *extmod\_whitelist=None*,  
*extmod\_blacklist=None*)

New in version 0.10.0.

Sync execution modules from `salt://_modules` to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for execution modules to sync. If no top files are found, then the base environment will be synced.

**refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new execution modules are synced. Set to False to prevent this refresh.

**Important:** If this function is executed using a `module.run` state, the SLS file will not have access to newly synced execution modules unless a `refresh` argument is added to the state, like so:

```
load_my_custom_module:
  module.run:
    - name: saltutil.sync_modules
    - refresh: True
```

See [here](#) for a more detailed explanation of why this is necessary.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt '*' saltutil.sync_modules
salt '*' saltutil.sync_modules saltenv=dev
salt '*' saltutil.sync_modules saltenv=base,dev
```

**salt.modules.saltutil.sync\_output** (*saltenv=None, refresh=True, extmod\_whitelist=None, extmod\_blacklist=None*)

Sync outputters from `salt://_output` to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for outputters to sync. If no top files are found, then the base environment will be synced.

**refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new outputters are synced. Set to False to prevent this refresh.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_output
salt '*' saltutil.sync_output saltenv=dev
salt '*' saltutil.sync_output saltenv=base,dev
```

**salt.modules.saltutil.sync\_outputters** (*saltenv=None, refresh=True, extmod\_whitelist=None, extmod\_blacklist=None*)

This function is an alias of `sync_output`.

Sync outputters from `salt://_output` to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for outputters to sync. If no top files are found, then the base environment will be synced.

**refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new outputters are synced. Set to False to prevent this refresh.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_output
salt '*' saltutil.sync_output saltenv=dev
salt '*' saltutil.sync_output saltenv=base,dev
```

`salt.modules.saltutil.sync_pillar` (*saltenv=None*, *refresh=True*, *extmod\_whitelist=None*,  
*extmod\_blacklist=None*)

New in version 2015.8.11,2016.3.2.

Sync pillar modules from the `salt://_pillar` directory on the Salt fileserver. This function is environment-aware, pass the desired environment to grab the contents of the `_pillar` directory from that environment. The default environment, if none is specified, is `base`.

**refresh** [True] Also refresh the execution modules available to the minion, and refresh pillar data.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

---

**Note:** This function will raise an error if executed on a traditional (i.e. not masterless) minion

---

CLI Examples:

```
salt '*' saltutil.sync_pillar
salt '*' saltutil.sync_pillar saltenv=dev
```

`salt.modules.saltutil.sync_proxymodules` (*saltenv=None*, *refresh=False*,  
*extmod\_whitelist=None*, *extmod\_blacklist=None*)

New in version 2015.8.2.

Sync proxy modules from `salt://_proxy` to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for proxy modules to sync. If no top files are found, then the base environment will be synced.

**refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new proxy modules are synced. Set to `False` to prevent this refresh.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_proxymodules
salt '*' saltutil.sync_proxymodules saltenv=dev
salt '*' saltutil.sync_proxymodules saltenv=base,dev
```

`salt.modules.saltutil.sync_renderers` (*saltenv=None*, *refresh=True*, *extmod\_whitelist=None*,  
*extmod\_blacklist=None*)

New in version 0.10.0.

Sync renderers from `salt://_renderers` to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for renderers to sync. If no top files are found, then the base environment will be synced.

**refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new renderers are synced. Set to `False` to prevent this refresh. Set to `False` to prevent this refresh.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_renderers
salt '*' saltutil.sync_renderers saltenv=dev
salt '*' saltutil.sync_renderers saltenv=base,dev
```

---

```
salt.modules.saltutil.sync_returners(saltenv=None, refresh=True, extmod_whitelist=None,
                                     extmod_blacklist=None)
```

New in version 0.10.0.

Sync beacons from `salt://_returners` to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for returners to sync. If no top files are found, then the base environment will be synced.

**refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new returners are synced. Set to False to prevent this refresh.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_returners
salt '*' saltutil.sync_returners saltenv=dev
```

```
salt.modules.saltutil.sync_sdb(saltenv=None, extmod_whitelist=None, extmod_blacklist=None)
```

New in version 2015.5.8,2015.8.3.

Sync sdb modules from `salt://_sdb` to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for sdb modules to sync.

If no top files are found, then the base environment will be synced.

**refresh** [False] This argument has no affect and is included for consistency with the other sync functions.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt '*' saltutil.sync_sdb
salt '*' saltutil.sync_sdb saltenv=dev
salt '*' saltutil.sync_sdb saltenv=base,dev
```

```
salt.modules.saltutil.sync_states(saltenv=None, refresh=True, extmod_whitelist=None,
                                   extmod_blacklist=None)
```

New in version 0.10.0.

Sync state modules from `salt://_states` to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for state modules to sync.

If no top files are found, then the base environment will be synced.

**refresh** [True] If True, refresh the available states on the minion. This refresh will be performed even if no new state modules are synced. Set to False to prevent this refresh.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_states
salt '*' saltutil.sync_states saltenv=dev
salt '*' saltutil.sync_states saltenv=base,dev
```

`salt.modules.saltutil.sync_utils` (*saltenv=None*, *refresh=True*, *extmod\_whitelist=None*,  
*extmod\_blacklist=None*)

New in version 2014.7.0.

Sync utility modules from `salt://_utils` to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for utility modules to sync. If no top files are found, then the base environment will be synced.

**refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new utility modules are synced. Set to False to prevent this refresh.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_utils
salt '*' saltutil.sync_utils saltenv=dev
salt '*' saltutil.sync_utils saltenv=base,dev
```

`salt.modules.saltutil.term_all_jobs`()

Sends a termination signal (SIGTERM 15) to all currently running jobs

CLI Example:

```
salt '*' saltutil.term_all_jobs
```

`salt.modules.saltutil.term_job`(*jid*)

Sends a termination signal (SIGTERM 15) to the named salt job's process

CLI Example:

```
salt '*' saltutil.term_job <job id>
```

`salt.modules.saltutil.update`(*version=None*)

Update the salt minion from the URL defined in `opts['update_url']` SaltStack, Inc provides the latest builds here: `update_url: https://repo.saltstack.com/windows/`

Be aware that as of 2014-8-11 there's a bug in esky such that only the latest version available in the `update_url` can be downloaded and installed.

This feature requires the minion to be running a `bdist_esky` build.

The version number is optional and will default to the most recent version available at `opts['update_url']`.

Returns details about the transaction upon completion.

CLI Examples:

```
salt '*' saltutil.update
salt '*' saltutil.update 0.10.3
```

`salt.modules.saltutil.wheel`(*name*, *\*args*, *\*\*kwargs*)

Execute a wheel module and function. This function must be run against a minion that is local to the master.

New in version 2014.7.0.

**name** The name of the function to run

**args** Any positional arguments to pass to the wheel function. A common example of this would be the `match` arg needed for key functions.

New in version v2015.8.11.

**kwargs** Any keyword arguments to pass to the wheel function

CLI Example:

```
salt my-local-minion saltutil.wheel key.accept jerry
salt my-local-minion saltutil.wheel minions.connected
```

**Note:** Since this function must be run against a minion that is running locally on the master in order to get accurate returns, if this function is run against minions that are not local to the master, ``empty`` returns are expected. The remote minion does not have access to wheel functions and their return data.

### 14.7.334 salt.modules.schedule

Module for managing the Salt schedule on a minion

New in version 2014.7.0.

**salt.modules.schedule.add**(*name*, **\*\*kwargs**)

Add a job to the schedule

CLI Example:

```
salt '*' schedule.add job1 function='test.ping' seconds=3600
# If function have some arguments, use job_args
salt '*' schedule.add job2 function='cmd.run' job_args="['date >> /tmp/date.log']
↪" seconds=60
```

**salt.modules.schedule.build\_schedule\_item**(*name*, **\*\*kwargs**)

Build a schedule job

CLI Example:

```
salt '*' schedule.build_schedule_item job1 function='test.ping' seconds=3600
```

**salt.modules.schedule.copy**(*name*, *target*, **\*\*kwargs**)

Copy scheduled job to another minion or minions.

CLI Example:

```
salt '*' schedule.copy jobname target
```

**salt.modules.schedule.delete**(*name*, **\*\*kwargs**)

Delete a job from the minion's schedule

CLI Example:

```
salt '*' schedule.delete job1
```

**salt.modules.schedule.disable**(**\*\*kwargs**)

Disable all scheduled jobs on the minion

CLI Example:

```
salt '*' schedule.disable
```

**salt.modules.schedule.disable\_job**(*name*, **\*\*kwargs**)

Disable a job in the minion's schedule

CLI Example:

```
salt '*' schedule.disable_job job1
```

`salt.modules.schedule.enable(**kwargs)`  
Enable all scheduled jobs on the minion

CLI Example:

```
salt '*' schedule.enable
```

`salt.modules.schedule.enable_job(name, **kwargs)`  
Enable a job in the minion's schedule

CLI Example:

```
salt '*' schedule.enable_job job1
```

`salt.modules.schedule.is_enabled(name)`  
List a Job only if its enabled

New in version 2015.5.3.

CLI Example:

```
salt '*' schedule.is_enabled name=job_name
```

`salt.modules.schedule.list(show_all=False, show_disabled=True, where=None, return_yaml=True)`  
List the jobs currently scheduled on the minion

CLI Example:

```
salt '*' schedule.list

# Show all jobs including hidden internal jobs
salt '*' schedule.list show_all=True

# Hide disabled jobs from list of jobs
salt '*' schedule.list show_disabled=False
```

`salt.modules.schedule.modify(name, **kwargs)`  
Modify an existing job in the schedule

CLI Example:

```
salt '*' schedule.modify job1 function='test.ping' seconds=3600
```

`salt.modules.schedule.move(name, target, **kwargs)`  
Move scheduled job to another minion or minions.

CLI Example:

```
salt '*' schedule.move jobname target
```

`salt.modules.schedule.purge(**kwargs)`  
Purge all the jobs currently scheduled on the minion

CLI Example:

```
salt '*' schedule.purge
```

`salt.modules.schedule.reload()`  
Reload saved scheduled jobs on the minion

CLI Example:

```
salt '*' schedule.reload
```

`salt.modules.schedule.run_job(name, force=False)`  
Run a scheduled job on the minion immediately

CLI Example:

```
salt '*' schedule.run_job job1
salt '*' schedule.run_job job1 force=True
Force the job to run even if it is disabled.
```

`salt.modules.schedule.save(**kwargs)`  
Save all scheduled jobs on the minion

CLI Example:

```
salt '*' schedule.save
```

### 14.7.335 salt.modules.scsi

SCSI administration module

`salt.modules.scsi.ls(get_size=True)`  
List SCSI devices, with details

CLI Examples:

```
salt '*' scsi.ls
salt '*' scsi.ls get_size=False
```

`get_size` [True] Get the size information for scsi devices. This option should be set to False for older OS distributions (RHEL6 and older) due to lack of support for the `-s` option in `lsscsi`.

New in version 2015.5.10.

`salt.modules.scsi.rescan_all(host)`  
List scsi devices

CLI Example:

```
salt '*' scsi.rescan_all 0
```

### 14.7.336 salt.modules.sdb

Module for Manipulating Data via the Salt DB API

`salt.modules.sdb.delete(uri)`  
Delete a value from a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://` or the value is not successfully deleted, return `False`.

CLI Example:

```
salt '*' sdb.delete sdb://mymemcached/foo
```

`salt.modules.sdb.get(uri)`

Get a value from a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://`, then it will be returned as-is.

CLI Example:

```
salt '*' sdb.get sdb://mymemcached/foo
```

`salt.modules.sdb.get_or_set_hash(uri, length=8, chars='abcdefghijklmnopqrstuvwxyz0123456789!@#$$%^&*(-_+=)')`

Perform a one-time generation of a hash and write it to sdb. If that value has already been set return the value instead.

This is useful for generating passwords or keys that are specific to multiple minions that need to be stored somewhere centrally.

State Example:

```
some_mysql_user:
  mysql_user:
    - present
    - host: localhost
    - password: '{{ salt["sdb.get_or_set_hash"]('some_mysql_user_pass') }}'
```

CLI Example:

```
salt '*' sdb.get_or_set_hash 'SECRET_KEY' 50
```

**Warning:** This function could return strings which may contain characters which are reserved as directives by the YAML parser, such as strings beginning with `%`. To avoid issues when using the output of this function in an SLS file containing YAML+Jinja, surround the call with single quotes.

`salt.modules.sdb.set(uri, value)`

Set a value in a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://` or the value is not successfully set, return `False`.

CLI Example:

```
salt '*' sdb.set sdb://mymemcached/foo bar
```

### 14.7.337 salt.modules.seed

Virtual machine image management tools

`salt.modules.seed.apply(path, id_=None, config=None, approve_key=True, install=True, prep_install=False, pub_key=None, priv_key=None, mount_point=None)`

Seed a location (disk image, directory, or block device) with the minion config, approve the minion's key, and/or install salt-minion.

CLI Example:

```
salt 'minion' seed.apply path id [config=config_data] \
    [gen_key=(true|false)] [approve_key=(true|false)] \
    [install=(true|false)]
```

**path** Full path to the directory, device, or disk image on the target minion's file system.

**id** Minion id with which to seed the path.

**config** Minion configuration options. By default, the `master` option is set to the target host's `master`.

**approve\_key** Request a pre-approval of the generated minion key. Requires that the salt-master be configured to either auto-accept all keys or expect a signing request from the target host. Default: true.

**install** Install salt-minion, if absent. Default: true.

**prep\_install** Prepare the bootstrap script, but don't run it. Default: false

```
salt.modules.seed.mkconfig(config=None, tmp=None, id_=None, approve_key=True, pub_key=None,
                           priv_key=None)
```

Generate keys and config and put them in a tmp directory.

**pub\_key** absolute path or file content of an optional preseeded salt key

**priv\_key** absolute path or file content of an optional preseeded salt key

CLI Example:

```
salt 'minion' seed.mkconfig [config=config_data] [tmp=tmp_dir] \
    [id_=minion_id] [approve_key=(true|false)]
```

```
salt.modules.seed.prep_bootstrap(mpt)
```

Update and get the random script to a random place

CLI Example:

```
salt '*' seed.prep_bootstrap /tmp
```

### 14.7.338 salt.modules.selinux

Execute calls on selinux

**Note:** This module requires the `semanage`, `setsebool`, and `semodule` commands to be available on the minion. On RHEL-based distributions, ensure that the `policycoreutils` and `policycoreutils-python` packages are installed. If not on a Fedora or RHEL-based distribution, consult the selinux documentation for your distribution to ensure that the proper packages are installed.

```
salt.modules.selinux.fcontext_add_or_delete_policy(action, name, filetype=None,
                                                    sel_type=None, sel_user=None,
                                                    sel_level=None)
```

New in version 2017.7.0.

Sets or deletes the SELinux policy for a given filespec and other optional parameters.

Returns the result of the call to `semanage`.

Note that you don't have to remove an entry before setting a new one for a given filespec and filetype, as adding one with `semanage` automatically overwrites a previously configured SELinux context.

**name** filespec of the file or directory. Regex syntax is allowed.

**file\_type** The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also `man semanage-fcontext`. Defaults to `a` (all files).

**sel\_type** SELinux context type. There are many.

**sel\_user** SELinux user. Use `semanage login -l` to determine which ones are available to you.

**sel\_level** The MLS range of the SELinux context.

CLI Example:

```
salt '*' selinux.fcontext_add_or_delete_policy add my-policy
```

`salt.modules.selinux.fcontext_apply_policy`(*name*, *recursive=False*)

New in version 2017.7.0.

Applies SELinux policies to filespec using *restorecon [-R] filespec*. Returns dict with changes if succesful, the output of the restorecon command otherwise.

**name** filespec of the file or directory. Regex syntax is allowed.

**recursive** Recursively apply SELinux policies.

CLI Example:

```
salt '*' selinux.fcontext_apply_policy my-policy
```

`salt.modules.selinux.fcontext_get_policy`(*name*, *filetype=None*, *sel\_type=None*,  
*sel\_user=None*, *sel\_level=None*)

New in version 2017.7.0.

Returns the current entry in the SELinux policy list as a dictionary. Returns None if no exact match was found.

Returned keys are:

- filespec (the name supplied and matched)
- filetype (the descriptive name of the filetype supplied)
- sel\_user, sel\_role, sel\_type, sel\_level (the selinux context)

For a more in-depth explanation of the selinux context, go to [https://access.redhat.com/documentation/en-US/Red\\_Hat\\_Enterprise\\_Linux/6/html/Security-Enhanced\\_Linux/chap-Security-Enhanced\\_Linux-SELinux\\_Contexts.html](https://access.redhat.com/documentation/en-US/Red_Hat_Enterprise_Linux/6/html/Security-Enhanced_Linux/chap-Security-Enhanced_Linux-SELinux_Contexts.html)

**name** filespec of the file or directory. Regex syntax is allowed.

**filetype** The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also *man semanage-fcontext*. Defaults to `a' (all files).

CLI Example:

```
salt '*' selinux.fcontext_get_policy my-policy
```

`salt.modules.selinux.fcontext_policy_is_applied`(*name*, *recursive=False*)

New in version 2017.7.0.

Returns an empty string if the SELinux policy for a given filespec is applied, returns string with differences in policy and actual situation otherwise.

**name** filespec of the file or directory. Regex syntax is allowed.

CLI Example:

```
salt '*' selinux.fcontext_policy_is_applied my-policy
```

`salt.modules.selinux.filetype_id_to_string`(*filetype='a'*)

New in version 2017.7.0.

Translates SELinux filetype single-letter representation to a more human-readable version (which is also used in *semanage fcontext -l*).

`salt.modules.selinux.getconfig`()

Return the selinux mode from the config file

CLI Example:

```
salt '*' selinux.getconfig
```

`salt.modules.selinux.getenforce()`

Return the mode selinux is running in

CLI Example:

```
salt '*' selinux.getenforce
```

`salt.modules.selinux.getsebool(boolean)`

Return the information on a specific selinux boolean

CLI Example:

```
salt '*' selinux.getsebool virt_use_usb
```

`salt.modules.selinux.getsemod(module)`

Return the information on a specific selinux module

CLI Example:

```
salt '*' selinux.getsemod mysql
```

New in version 2016.3.0.

`salt.modules.selinux.install_semod(module_path)`

Install custom SELinux module from file

CLI Example:

```
salt '*' selinux.install_semod [salt://]path/to/module.pp
```

New in version 2016.11.6.

`salt.modules.selinux.list_sebool()`

Return a structure listing all of the selinux booleans on the system and what state they are in

CLI Example:

```
salt '*' selinux.list_sebool
```

`salt.modules.selinux.list_semod()`

Return a structure listing all of the selinux modules on the system and what state they are in

CLI Example:

```
salt '*' selinux.list_semod
```

New in version 2016.3.0.

`salt.modules.selinux.remove_semod(module)`

Remove SELinux module

CLI Example:

```
salt '*' selinux.remove_semod module_name
```

New in version 2016.11.6.

`salt.modules.selinux.selinux_fs_path(*args, **kwargs)`

Return the location of the SELinux VFS directory

CLI Example:

```
salt '*' selinux.selinux_fs_path
```

`salt.modules.selinux.setenforce(mode)`

Set the SELinux enforcing mode

CLI Example:

```
salt '*' selinux.setenforce enforcing
```

`salt.modules.selinux.setsebool(boolean, value, persist=False)`

Set the value for a boolean

CLI Example:

```
salt '*' selinux.setsebool virt_use_usb off
```

`salt.modules.selinux.setsebools(pairs, persist=False)`

Set the value of multiple booleans

CLI Example:

```
salt '*' selinux.setsebools '{virt_use_usb: on, squid_use_tproxy: off}'
```

`salt.modules.selinux.setsemod(module, state)`

Enable or disable an SELinux module.

CLI Example:

```
salt '*' selinux.setsemod nagios Enabled
```

New in version 2016.3.0.

### 14.7.339 salt.modules.sensehat

Module for controlling the LED matrix or reading environment data on the SenseHat of a Raspberry Pi.

**maintainer** Benedikt Werner <1benediktwerner@gmail.com>, Joachim Werner <joe@suse.com>

**maturity** new

**depends** sense\_hat Python module

You can specify the rotation of the Pi in a pillar. This is useful if it is used upside down or sideways to correct the orientation of the image being shown.

Example:

```
sensehat:  
  rotation: 90
```

`salt.modules.sensehat.clear(color=None)`

Sets the LED matrix to a single color or turns all LEDs off.

CLI Example:

```
salt 'raspberrypi' sensehat.clear  
salt 'raspberrypi' sensehat.clear '[255, 0, 0]'
```

`salt.modules.sensehat.get_humidity()`

Get the percentage of relative humidity from the humidity sensor.

`salt.modules.sensehat.get_pixel(x, y)`

Returns the color of a single pixel on the LED matrix.

**x** The x coordinate of the pixel. Ranges from 0 on the left to 7 on the right.

**y** The y coordinate of the pixel. Ranges from 0 at the top to 7 at the bottom.

---

**Note:** Please read the note for `get_pixels`

---

`salt.modules.sensehat.get_pixels()`

Returns a list of 64 smaller lists of `[R, G, B]` pixels representing the currently displayed image on the LED matrix.

---

**Note:** When using `set_pixels` the pixel values can sometimes change when you read them again using `get_pixels`. This is because we specify each pixel element as 8 bit numbers (0 to 255) but when they're passed into the Linux frame buffer for the LED matrix the numbers are bit shifted down to fit into RGB 565. 5 bits for red, 6 bits for green and 5 bits for blue. The loss of binary precision when performing this conversion (3 bits lost for red, 2 for green and 3 for blue) accounts for the discrepancies you see.

The `get_pixels` method provides an accurate representation of how the pixels end up in frame buffer memory after you have called `set_pixels`.

---

`salt.modules.sensehat.get_pressure()`

Gets the current pressure in Millibars from the pressure sensor.

`salt.modules.sensehat.get_temperature()`

Gets the temperature in degrees Celsius from the humidity sensor. Equivalent to calling `get_temperature_from_humidity`.

If you get strange results try using `'get_temperature_from_pressure'`.

`salt.modules.sensehat.get_temperature_from_humidity()`

Gets the temperature in degrees Celsius from the humidity sensor.

`salt.modules.sensehat.get_temperature_from_pressure()`

Gets the temperature in degrees Celsius from the pressure sensor.

`salt.modules.sensehat.low_light(low_light=True)`

Sets the LED matrix to low light mode. Useful in a dark environment.

CLI Example:

```
salt 'raspberrypi' sensehat.low_light
salt 'raspberrypi' sensehat.low_light False
```

`salt.modules.sensehat.set_pixel(x, y, color)`

Sets the a single pixel on the LED matrix to a specified color.

**x** The x coordinate of the pixel. Ranges from 0 on the left to 7 on the right.

**y** The y coordinate of the pixel. Ranges from 0 at the top to 7 at the bottom.

**color** The new color of the pixel as a list of `[R, G, B]` values.

CLI Example:

```
salt 'raspberrypi' sensehat.set_pixel 0 0 '[255, 0, 0]'
```

`salt.modules.sensehat.set_pixels(pixels)`

Sets the entire LED matrix based on a list of 64 pixel values

**pixels** A list of 64 color values `[R, G, B]`.

`salt.modules.sensehat.show_image`(*image*)

Displays a 8 x 8 image on the LED matrix.

**image** The path to the image to display. The image must be 8 x 8 pixels in size.

CLI Example:

```
salt 'raspberrry' sensehat.show_image /tmp/my_image.png
```

`salt.modules.sensehat.show_letter`(*letter*, *text\_color=None*, *back\_color=None*)

Displays a single letter on the LED matrix.

**letter** The letter to display

**text\_color** The color in which the letter is shown. Defaults to `[255, 255, 255]` (white).

**back\_color** The background color of the display. Defaults to `[0, 0, 0]` (black).

CLI Example:

```
salt 'raspberrry' sensehat.show_letter 0
salt 'raspberrry' sensehat.show_letter X '[255, 0, 0]'
salt 'raspberrry' sensehat.show_letter B '[0, 0, 255]' '[255, 255, 0]'
```

`salt.modules.sensehat.show_message`(*message*, *msg\_type=None*, *text\_color=None*, *back\_color=None*, *scroll\_speed=None*)

Displays a message on the LED matrix.

**message** The message to display

**msg\_type** The type of the message. Changes the appearance of the message.

Available types are:

```
error:      red text
warning:    orange text
success:    green text
info:       blue text
```

**scroll\_speed** The speed at which the message moves over the LED matrix. This value represents the time paused for between shifting the text to the left by one column of pixels. Defaults to `0.1`.

**text\_color** The color in which the message is shown. Defaults to `[255, 255, 255]` (white).

**back\_color** The background color of the display. Defaults to `[0, 0, 0]` (black).

CLI Example:

```
salt 'raspberrry' sensehat.show_message 'Status ok'
salt 'raspberrry' sensehat.show_message 'Something went wrong' error
salt 'raspberrry' sensehat.show_message 'Red' text_color='[255, 0, 0]'
salt 'raspberrry' sensehat.show_message 'Hello world' None '[0, 0, 255]' '[255,
↪255, 0]' 0.2
```

### 14.7.340 salt.modules.sensors

Read lm-sensors

New in version 2014.1.3.

`salt.modules.sensors.sense`(*chip*, *fahrenheit=False*)

Gather lm-sensors data from a given chip

To determine the chip to query, use the `sensors` command and see the leading line in the block.

Example:

```
/usr/bin/sensors
```

coretemp-isa-0000 Adapter: ISA adapter Physical id 0: +56.0°C (high = +87.0°C, crit = +105.0°C) Core 0: +52.0°C (high = +87.0°C, crit = +105.0°C) Core 1: +50.0°C (high = +87.0°C, crit = +105.0°C) Core 2: +56.0°C (high = +87.0°C, crit = +105.0°C) Core 3: +53.0°C (high = +87.0°C, crit = +105.0°C)

Given the above, the chip is `coretemp-isa-0000`.

### 14.7.341 salt.modules.serverdensity\_device

#### Wrapper around Server Density API

New in version 2014.7.0.

`salt.modules.serverdensity_device.create(name, **params)`  
Function to create device in Server Density. For more info, see the [API docs](#).

CLI Example:

```
salt '*' serverdensity_device.create lama
salt '*' serverdensity_device.create rich_lama group=lama_band installedRAM=32768
```

`salt.modules.serverdensity_device.delete(device_id)`  
Delete a device from Server Density. For more information, see the [API docs](#).

CLI Example:

```
salt '*' serverdensity_device.delete 51f7eafcdba4bb235e000ae4
```

`salt.modules.serverdensity_device.get_sd_auth(val, sd_auth_pillar_name='serverdensity')`  
Returns requested Server Density authentication value from pillar.

CLI Example:

```
salt '*' serverdensity_device.get_sd_auth <val>
```

`salt.modules.serverdensity_device.install_agent(agent_key, agent_version=1)`  
Function downloads Server Density installation agent, and installs sd-agent with agent\_key. Optionally the agent\_version would select the series to use (defaults on the v1 one).

CLI Example:

```
salt '*' serverdensity_device.install_agent c2bbdd6689ff46282bdaa07555641498
salt '*' serverdensity_device.install_agent c2bbdd6689ff46282bdaa07555641498 2
```

`salt.modules.serverdensity_device.ls(**params)`

List devices in Server Density

Results will be filtered by any params passed to this function. For more information, see the [API docs on listing and searching](#).

CLI Example:

```
salt '*' serverdensity_device.ls
salt '*' serverdensity_device.ls name=lama
salt '*' serverdensity_device.ls name=lama group=lama_band installedRAM=32768
```

`salt.modules.serverdensity_device.update(device_id, **params)`  
Updates device information in Server Density. For more information see the [API docs](#).

CLI Example:

```

salt '*' serverdensity_device.update 51f7eafcdba4bb235e000ae4 name=lama
↳group=lama_band
salt '*' serverdensity_device.update 51f7eafcdba4bb235e000ae4 name=better_lama
↳group=rock_lamas swapSpace=512

```

### 14.7.342 salt.modules.service

service is a virtual module that is fulfilled by one of the following modules:

Execution Module	Used for
<i>debian_service</i>	Debian Wheezy and earlier
<i>freebsd_service</i>	FreeBSD-based OSes using service(8)
<i>gentoo_service</i>	Gentoo Linux using sysvinit and rc-update(8)
<i>launchctl</i>	Mac OS hosts using launchctl(1)
<i>netbsd_service</i>	NetBSD-based OSes
<i>openbsd_service</i>	OpenBSD-based OSes
<i>rh_service</i>	RedHat-based distros and derivatives using service(8) and chkconfig(8). Supports both pure sysvinit and mixed sysvinit/upstart systems.
<i>service</i>	Fallback which simply wraps sysvinit scripts
<i>smf</i>	Solaris-based OSes which use SMF
<i>systemd</i>	Linux distros which use systemd
<i>upstart</i>	Ubuntu-based distros using upstart
<i>win_service</i>	Windows

If Salt's OS detection does not identify a different virtual service module, the minion will fall back to using this basic module, which simply wraps sysvinit scripts.

**salt.modules.service.available**(*name*)

Returns True if the specified service is available, otherwise returns False.

CLI Example:

```
salt '*' service.available sshd
```

**salt.modules.service.get\_all**()

Return a list of all available services

CLI Example:

```
salt '*' service.get_all
```

**salt.modules.service.missing**(*name*)

The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.service.reload(name)`

Refreshes config files by calling service reload. Does not perform a full restart.

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.service.restart(name)`

Restart the specified service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.service.run(name, action)`

Run the specified service with an action.

New in version 2015.8.1.

**name** Service name.

**action** Action name (like start, stop, reload, restart).

CLI Example:

```
salt '*' service.run apache2 reload
salt '*' service.run postgresql initdb
```

`salt.modules.service.start(name)`

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.service.status(name, sig=None)`

Return the status for a service, returns the PID or an empty string if the service is running or not, pass a signature to use to find the service via ps

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

`salt.modules.service.stop(name)`

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

### 14.7.343 salt.modules.servicenow module

Module for execution of ServiceNow CI (configuration items)

New in version 2016.11.0.

**depends** servicenow\_rest python module

**configuration** Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the `servicenow` key by default, if defined.

For example:

```
servicenow:
  instance_name: ''
  username: ''
  password: ''
```

`salt.modules.servicenow.delete_record(table, sys_id)`

Delete an existing record

**Parameters**

- **table** (str) -- The table name, e.g. sys\_user
- **sys\_id** (str) -- The unique ID of the record

CLI Example:

```
salt myminion servicenow.delete_record sys_computer 2134566
```

`salt.modules.servicenow.non_structured_query(table, query=None, **kwargs)`

Run a non-structured (not a dict) query on a servicenow table. See [http://wiki.servicenow.com/index.php?title=Encoded\\_Query\\_Strings#gsc.tab=0](http://wiki.servicenow.com/index.php?title=Encoded_Query_Strings#gsc.tab=0) for help on constructing a non-structured query string.

**Parameters**

- **table** (str) -- The table name, e.g. sys\_user
- **query** (str) -- The query to run (or use keyword arguments to filter data)

CLI Example:

```
salt myminion servicenow.non_structured_query sys_computer 'role=web'
salt myminion servicenow.non_structured_query sys_computer role=web type=computer
```

`salt.modules.servicenow.set_change_request_state(change_id, state='approved')`

Set the approval state of a change request/record

**Parameters**

- **change\_id** (str) -- The ID of the change request, e.g. CHG123545
- **state** (str) -- The target state, e.g. approved

CLI Example:

```
salt myminion servicenow.set_change_request_state CHG000123 declined
salt myminion servicenow.set_change_request_state CHG000123 approved
```

`salt.modules.servicenow.update_record_field(table, sys_id, field, value)`

Update the value of a record's field in a servicenow table

**Parameters**

- **table** (str) -- The table name, e.g. sys\_user
- **sys\_id** (str) -- The unique ID of the record
- **field** (str) -- The new value
- **value** (str) -- The new value

CLI Example:

```
salt myminion servicenow.update_record_field sys_user 2348234 first_name jimmy
```

### 14.7.344 salt.modules.shadow

shadow is a virtual module that is fulfilled by one of the following modules:

Execution Module	Used for
<i>shadow</i>	Linux
<i>bsd_shadow</i>	FreeBSD, OpenBSD, NetBSD
<i>solaris_shadow</i>	Solaris-based OSes
<i>win_shadow</i>	Windows

Manage the shadow file on Linux systems

---

**Important:** If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to `'shadow.info' is not available`), see [here](#).

---

`salt.modules.shadow.default_hash()`

Returns the default hash used for unset passwords

CLI Example:

```
salt '*' shadow.default_hash
```

`salt.modules.shadow.del_password(name)`

New in version 2014.7.0.

Delete the password from name user

CLI Example:

```
salt '*' shadow.del_password username
```

`salt.modules.shadow.gen_password(password, crypt_salt=None, algorithm='sha512')`

New in version 2014.7.0.

Generate hashed password

---

**Note:** When called this function is called directly via remote-execution, the password argument may be displayed in the system's process list. This may be a security risk on certain systems.

---

**password** Plaintext password to be hashed.

**crypt\_salt** Cryptographic salt. If not given, a random 8-character salt will be generated.

**algorithm** The following hash algorithms are supported:

- md5
- blowfish (not in mainline glibc, only available in distros that add it)
- sha256
- sha512 (default)

CLI Example:

```
salt '*' shadow.gen_password 'I_am_password'
salt '*' shadow.gen_password 'I_am_password' crypt_salt='I_am_salt'
↪algorithm=sha256
```

`salt.modules.shadow.info(name)`

Return information for the specified user

CLI Example:

```
salt '*' shadow.info root
```

`salt.modules.shadow.lock_password(name)`

New in version 2016.11.0.

Lock the password from name user

CLI Example:

```
salt '*' shadow.lock_password username
```

`salt.modules.shadow.set_date(name, date)`

Sets the value for the date the password was last changed to days since the epoch (January 1, 1970). See man change.

CLI Example:

```
salt '*' shadow.set_date username 0
```

`salt.modules.shadow.set_expire(name, expire)`

Changed in version 2014.7.0.

Sets the value for the date the account expires as days since the epoch (January 1, 1970). Using a value of -1 will clear expiration. See man change.

CLI Example:

```
salt '*' shadow.set_expire username -1
```

`salt.modules.shadow.set_inactdays(name, inactdays)`

Set the number of days of inactivity after a password has expired before the account is locked. See man change.

CLI Example:

```
salt '*' shadow.set_inactdays username 7
```

`salt.modules.shadow.set_maxdays(name, maxdays)`

Set the maximum number of days during which a password is valid. See man change.

CLI Example:

```
salt '*' shadow.set_maxdays username 90
```

`salt.modules.shadow.set_mindays(name, mindays)`

Set the minimum number of days between password changes. See man change.

CLI Example:

```
salt '*' shadow.set_mindays username 7
```

`salt.modules.shadow.set_password(name, password, use_usermod=False)`

Set the password for a named user. The password must be a properly defined hash. The password hash can be generated with this command:

```
python -c "import crypt; print crypt.crypt('password','\${6}\$SALTsalt')"
```

SALTsalt is the 8-character cryptographic salt. Valid characters in the salt are ., /, and any alphanumeric character.

Keep in mind that the \$7 represents a sha512 hash, if your OS is using a different hashing algorithm this needs to be changed accordingly

CLI Example:

```
salt '*' shadow.set_password root '$1$UYCIxa628.9qXjpQCjM4a..'
```

`salt.modules.shadow.set_warndays`(*name*, *warndays*)

Set the number of days of warning before a password change is required. See man chage.

CLI Example:

```
salt '*' shadow.set_warndays username 7
```

`salt.modules.shadow.unlock_password`(*name*)

New in version 2016.11.0.

Unlock the password from name user

CLI Example:

```
salt '*' shadow.unlock_password username
```

### 14.7.345 salt.modules.slack\_notify

Module for sending messages to Slack

New in version 2015.5.0.

**configuration** This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
slack:
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.modules.slack_notify.call_hook`(*message*, *attachment=None*, *color='good'*, *short=False*, *identifier=None*, *channel=None*, *username=None*, *icon\_emoji=None*)

Send message to Slack incoming webhook.

**Parameters**

- **message** -- The topic of message.
- **attachment** -- The message to send to the Slacke WebHook.
- **color** -- The color of border of left side
- **short** -- An optional flag indicating whether the value is short enough to be displayed side-by-side with other values.
- **identifier** -- The identifier of WebHook.
- **channel** -- The channel to use instead of the WebHook default.
- **username** -- Username to use instead of WebHook default.
- **icon\_emoji** -- Icon to use instead of WebHook default.

**Returns** Boolean if message was sent successfully.

CLI Example:

```
salt '*' slack.post_hook message='Hello, from SaltStack'
```

`salt.modules.slack_notify.find_room`(*name*, *api\_key=None*)

Find a room by name and return it.

**Parameters**

- **name** -- The room name.

- **api\_key** -- The Slack admin api key.

**Returns** The room object.

CLI Example:

```
salt '*' slack.find_room name="random"

salt '*' slack.find_room name="random" api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.modules.slack_notify.find_user`(*name*, *api\_key=None*)

Find a user by name and return it.

**Parameters**

- **name** -- The user name.
- **api\_key** -- The Slack admin api key.

**Returns** The user object.

CLI Example:

```
salt '*' slack.find_user name="ThomasHatch"

salt '*' slack.find_user name="ThomasHatch" api_
↪key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.modules.slack_notify.list_rooms`(*api\_key=None*)

List all Slack rooms.

**Parameters** **api\_key** -- The Slack admin api key.

**Returns** The room list.

CLI Example:

```
salt '*' slack.list_rooms

salt '*' slack.list_rooms api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.modules.slack_notify.list_users`(*api\_key=None*)

List all Slack users.

**Parameters** **api\_key** -- The Slack admin api key.

**Returns** The user list.

CLI Example:

```
salt '*' slack.list_users

salt '*' slack.list_users api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.modules.slack_notify.post_message`(*channel*, *message*, *from\_name*, *api\_key=None*, *icon=None*)

Send a message to a Slack channel.

**Parameters**

- **channel** -- The channel name, either will work.
- **message** -- The message to send to the Slack channel.
- **from\_name** -- Specify who the message is from.
- **api\_key** -- The Slack api key, if not specified in the configuration.
- **icon** -- URL to an image to use as the icon for this message

**Returns** Boolean if message was sent successfully.

CLI Example:

```
salt '*' slack.post_message channel="Development Room" message="Build is done"
↪from_name="Build Server"
```

## 14.7.346 salt.modules.slsutil

Utility functions for use with or in SLS files

`salt.modules.slsutil.merge(obj_a, obj_b, strategy='smart', renderer='yaml', merge_lists=False)`

Merge a data structure into another by choosing a merge strategy

Strategies:

- aggregate
- list
- overwrite
- recurse
- smart

CLI Example:

```
salt '*' slsutil.merge '{foo: Foo}' '{bar: Bar}'
```

`salt.modules.slsutil.renderer(path=None, string=None, default_renderer='jinja|yaml', **kwargs)`

Parse a string or file through Salt's renderer system

This is an open-ended function and can be used for a variety of tasks. It makes use of Salt's ``renderer pipes'' system to run a string or file through a pipe of any of the loaded renderer modules.

Parameters

- **path** -- The path to a file on the filesystem.
- **string** -- An inline string to be used as the file to send through the renderer system. Note, not all renderer modules can work with strings; the `py' renderer requires a file, for example.
- **default\_renderer** -- The renderer pipe to send the file through; this is overridden by a ``she-bang'' at the top of the file.
- **kwargs** -- Keyword args to pass to Salt's `compile_template()` function.

Keep in mind the goal of each renderer when choosing a render-pipe; for example, the Jinja renderer processes a text file and produces a string, however the YAML renderer processes a text file and produces a data structure.

One possible use is to allow writing ``map files'', as are commonly seen in Salt formulas, but without tying the renderer of the map file to the renderer used in the other sls files. In other words, a map file could use the Python renderer and still be included and used by an sls file that uses the default `jinja|yaml' renderer.

For example, the two following map files produce identical results but one is written using the normal `jinja|yaml' and the other is using `py':

```
#!jinja|yaml
{% set apache = salt.grains.filter_by({
    ..normal jinja map file here...
}), merge=salt.pillar.get('apache:lookup')) %}
{{ apache | yaml() }}
```

```
#!py
def run():
    apache = __salt__.grains.filter_by({
        ..normal map here but as a python dict...
    }, merge=__salt__.pillar.get('apache:lookup'))
    return apache
```

Regardless of which of the above map files is used, it can be accessed from any other sls file by calling this function. The following is a usage example in Jinja:

```
{% set apache = salt.slsutil.renderer('map.sls') %}
```

CLI Example:

```
salt '*' slsutil.renderer /path/to/file
salt '*' slsutil.renderer /path/to/file.jinja 'jinja'
salt '*' slsutil.renderer /path/to/file.sls 'jinja|yaml'
salt '*' slsutil.renderer string='Inline template! {{ saltenv }}'
salt '*' slsutil.renderer string='Hello, {{ name }}.' name='world'
```

`salt.modules.slsutil.update`(*dest, upd, recursive\_update=True, merge\_lists=False*)

Merge upd recursively into dest

If `merge_lists=True`, will aggregate list object types instead of replacing. This behavior is only activated when `recursive_update=True`.

CLI Example:

```
salt '*' slsutil.update '{foo: Foo}' '{bar: Bar}'
```

#### 14.7.347 salt.modules.smartos\_imgadm

Module for running imgadm command on SmartOS

`salt.modules.smartos_imgadm.avail`(*search=None, verbose=False*)

Return a list of available images

**search** [string] search keyword

**verbose** [boolean (False)] toggle verbose output

CLI Example:

```
salt '*' imgadm.avail [percona]
salt '*' imgadm.avail verbose=True
```

`salt.modules.smartos_imgadm.delete`(*uuid*)

Remove an installed image

**uuid** [string] Specifies uuid to import

CLI Example:

```
salt '*' imgadm.delete e42f8c84-bbea-11e2-b920-078fab2aab1f
```

`salt.modules.smartos_imgadm.get`(*uuid*)

Return info on an installed image

**uuid** [string] uuid of image

CLI Example:

```
salt '*' imgadm.get e42f8c84-bbea-11e2-b920-078fab2aab1f
```

`salt.modules.smartos_imgadm.import`(*uuid, verbose=False*)

Import an image from the repository

**uuid** [string] uuid to import

**verbose** [boolean (False)] toggle verbose output

CLI Example:

```
salt '*' imgadm.import e42f8c84-bbea-11e2-b920-078fab2aab1f [verbose=True]
```

`salt.modules.smartos_imgadm.list(verbose=False)`

Return a list of installed images  
**verbose** [boolean (False)] toggle verbose output  
 CLI Example:

```
salt '*' imgadm.list [verbose=True]
```

`salt.modules.smartos_imgadm.show(uuid)`

Show manifest of a given image  
**uuid** [string] uuid of image  
 CLI Example:

```
salt '*' imgadm.show e42f8c84-bbea-11e2-b920-078fab2aab1f
```

`salt.modules.smartos_imgadm.update(uuid='')`

Gather info on unknown image(s) (locally installed)  
**uuid** [string] optional uuid of image  
 CLI Example:

```
salt '*' imgadm.update [uuid]
```

`salt.modules.smartos_imgadm.vacuum(verbose=False)`

Remove unused images  
**verbose** [boolean (False)] toggle verbose output  
 CLI Example:

```
salt '*' imgadm.vacuum [verbose=True]
```

`salt.modules.smartos_imgadm.version()`

Return imgadm version  
 CLI Example:

```
salt '*' imgadm.version
```

### 14.7.348 salt.modules.smartos\_nictagadm module

Module for running nictagadm command on SmartOS :maintainer: Jorge Schrauwen <[sjorge@blackdot.be](mailto:sjorge@blackdot.be)> :maturity: new :depends: nictagadm binary, dladm binary :platform: smartos

..versionadded:: 2016.11.0

`salt.modules.smartos_nictagadm.add(name, mac, mtu=1500)`

Add a new nictag  
**name** [string] name of new nictag  
**mac** [string] mac of parent interface or `etherstub` to create a ether stub  
**mtu** [int] MTU  
 CLI Example:

```
salt '*' nictagadm.add storage etherstub
salt '*' nictagadm.add trunk 'DE:AD:00:00:BE:EF' 9000
```

`salt.modules.smartos_nictagadm.delete(name, force=False)`

Delete nictag  
**name** [string] nictag to delete  
**force** [boolean] force delete even if vms attached

CLI Example:

```
salt '*' nictagadm.exists admin
```

`salt.modules.smartos_nictagadm.exists(*nictag, **kwargs)`

Check if nictags exists

**nictag** [string] one or more nictags to check

**verbose** [boolean] return list of nictags

CLI Example:

```
salt '*' nictagadm.exists admin
```

`salt.modules.smartos_nictagadm.list(include_etherstubs=True)`

List all nictags

**include\_etherstubs** [boolean] toggle include of etherstubs

CLI Example:

```
salt '*' nictagadm.list
```

`salt.modules.smartos_nictagadm.update(name, mac=None, mtu=None)`

Update a nictag

**name** [string] name of nictag

**mac** [string] optional new mac for nictag

**mtu** [int] optional new MTU for nictag

CLI Example:

```
salt '*' nictagadm.update trunk mtu=9000
```

`salt.modules.smartos_nictagadm.vms(nictag)`

List all vms connect to nictag

**nictag** [string] name of nictag

CLI Example:

```
salt '*' nictagadm.vms admin
```

### 14.7.349 salt.modules.smartos\_virt

virst compatibility module for managing VMs on SmartOS

`salt.modules.smartos_virt.get_macs(domain)`

Return a list off MAC addresses from the named VM

CLI Example:

```
salt '*' virt.get_macs <domain>
```

`salt.modules.smartos_virt.init(**kwargs)`

Initialize a new VM

CLI Example:

```
salt '*' virt.init image_uuid='...' alias='...' [...]
```

`salt.modules.smartos_virt.list_active_vms()`

Return a list of uuids for active virtual machine on the minion

CLI Example:

```
salt '*' virt.list_active_vms
```

`salt.modules.smartos_virt.list_domains()`

Return a list of virtual machine names on the minion

CLI Example:

```
salt '*' virt.list_domains
```

`salt.modules.smartos_virt.list_inactive_vms()`

Return a list of uids for inactive virtual machine on the minion

CLI Example:

```
salt '*' virt.list_inactive_vms
```

`salt.modules.smartos_virt.reboot(domain)`

Reboot a domain via ACPI request

CLI Example:

```
salt '*' virt.reboot <domain>
```

`salt.modules.smartos_virt.setmem(domain, memory)`

Change the amount of memory allocated to VM. <memory> is to be specified in MB.

Note for KVM : this would require a restart of the VM.

CLI Example:

```
salt '*' virt.setmem <domain> 512
```

`salt.modules.smartos_virt.shutdown(domain)`

Send a soft shutdown signal to the named vm

CLI Example:

```
salt '*' virt.shutdown <domain>
```

`salt.modules.smartos_virt.start(domain)`

Start a defined domain

CLI Example:

```
salt '*' virt.start <domain>
```

`salt.modules.smartos_virt.stop(domain)`

Hard power down the virtual machine, this is equivalent to powering off the hardware.

CLI Example:

```
salt '*' virt.destroy <domain>
```

`salt.modules.smartos_virt.vm_info(domain)`

Return a dict with information about the specified VM on this CN

CLI Example:

```
salt '*' virt.vm_info <domain>
```

`salt.modules.smartos_virt.virt.vm_virt_type(domain)`

Return VM virtualization type : OS or KVM

CLI Example:

```
salt '*' virt.vm_virt_type <domain>
```

### 14.7.350 salt.modules.smartos\_vmadm

Module for running vmadm command on SmartOS

`salt.modules.smartos_vmadm.create(from_file=None, **kwargs)`

Create a new vm

**from\_file** [string] json file to create the vm from -- if present, all other options will be ignored

**kwargs** [string|int|...] options to set for the vm

CLI Example:

```
salt '*' vmadm.create from_file=/tmp/new_vm.json
salt '*' vmadm.create image_uuid='...' alias='...' nics='[{"nic_tag": "admin",
→ "ip": "198.51.100.123", ...}, {...}]' [...]
```

`salt.modules.smartos_vmadm.create_snapshot(vm, name, key='uuid')`

Create snapshot of a vm

**vm** [string] vm to be targeted

**name** [string]

**snapshot name** The snapname must be 64 characters or less and must only contain alphanumeric characters and characters in the set `[-_:%]` to comply with ZFS restrictions.

**key** [string [uuid|alias|hostname]] value type of `vm` parameter

CLI Example:

```
salt '*' vmadm.create_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543 baseline
salt '*' vmadm.create_snapshot nacl baseline key=alias
```

`salt.modules.smartos_vmadm.delete(vm, key='uuid')`

Delete a vm

**vm** [string] vm to be deleted

**key** [string [uuid|alias|hostname]] value type of `vm` parameter

CLI Example:

```
salt '*' vmadm.delete 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.delete nacl key=alias
```

`salt.modules.smartos_vmadm.delete_snapshot(vm, name, key='uuid')`

Delete snapshot of a vm

**vm** [string] vm to be targeted

**name** [string]

**snapshot name** The snapname must be 64 characters or less and must only contain alphanumeric characters and characters in the set `[-_:%]` to comply with ZFS restrictions.

**key** [string [uuid|alias|hostname]] value type of `vm` parameter

CLI Example:

```
salt '*' vmadm.delete_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543 baseline
salt '*' vmadm.delete_snapshot nacl baseline key=alias
```

`salt.modules.smartos_vmadm.get(vm, key='uuid')`

Output the JSON object describing a VM

**vm** [string] vm to be targeted  
**key** [string [uuid|alias|hostname]] value type of `vm` parameter  
 CLI Example:

```
salt '*' vmadm.get 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.get nacl key=alias
```

**salt.modules.smartos\_vmadm.info**(*vm, info\_type='all', key='uuid'*)

Lookup info on running kvm  
**vm** [string] vm to be targeted  
**info\_type** [string [all|block|blockstats|chardev|cpus|kvm|pci|spice|version|vnc]] info type to return  
**key** [string [uuid|alias|hostname]] value type of `vm` parameter  
 CLI Example:

```
salt '*' vmadm.info 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.info 186da9ab-7392-4f55-91a5-b8f1fe770543 vnc
salt '*' vmadm.info nacl key=alias
salt '*' vmadm.info nacl vnc key=alias
```

**salt.modules.smartos\_vmadm.list**(*search=None, sort=None, order='uuid, type, ram, state, alias', keyed=True*)

Return a list of VMs  
**search** [string] vmadm filter property  
**sort** [string] vmadm sort (-s) property  
**order** [string] vmadm order (-o) property -- Default: uuid,type,ram,state,alias  
**keyed** [boolean]  
     **specified if the output should be an array (False) or dict (True)** For a dict the key is the first item from the order parameter. Note: If key is not unique last vm wins.  
 CLI Example:

```
salt '*' vmadm.list
salt '*' vmadm.list order=alias,ram,cpu_cap sort=-ram,-cpu_cap
salt '*' vmadm.list search='type=KVM'
```

**salt.modules.smartos\_vmadm.lookup**(*search=None, order=None, one=False*)

Return a list of VMs using lookup  
**search** [string] vmadm filter property  
**order** [string] vmadm order (-o) property -- Default: uuid,type,ram,state,alias  
**one** [boolean] return only one result (vmadm's -1)  
 CLI Example:

```
salt '*' vmadm.lookup search='state=running'
salt '*' vmadm.lookup search='state=running' order=uuid,alias,hostname
salt '*' vmadm.lookup search='alias=nacl' one=True
```

**salt.modules.smartos\_vmadm.reboot**(*vm, force=False, key='uuid'*)

Reboot a vm  
**vm** [string] vm to be rebooted  
**force** [boolean] force reboot of vm if true  
**key** [string [uuid|alias|hostname]] value type of `vm` parameter  
 CLI Example:

```
salt '*' vmadm.reboot 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.reboot 186da9ab-7392-4f55-91a5-b8f1fe770543 True
salt '*' vmadm.reboot vm=nacl key=alias
salt '*' vmadm.reboot vm=nina.example.org key=hostname
```

`salt.modules.smartos_vmadm.receive(uuid, source)`

Receive a vm from a directory

**uuid** [string] uuid of vm to be received

**source** [string] source directory

CLI Example:

```
salt '*' vmadm.receive 186da9ab-7392-4f55-91a5-b8f1fe770543 /opt/backups
```

`salt.modules.smartos_vmadm.reprovision(vm, image, key='uuid')`

Reprovision a vm

**vm** [string] vm to be reprovisioned

**image** [string] uuid of new image

**key** [string [uuid|alias|hostname]] value type of `vm` parameter

CLI Example:

```
salt '*' vmadm.reprovision 186da9ab-7392-4f55-91a5-b8f1fe770543 c02a2044-c1bd-
↪11e4-bd8c-dfc1db8b0182
salt '*' vmadm.reprovision nacl c02a2044-c1bd-11e4-bd8c-dfc1db8b0182 key=alias
```

`salt.modules.smartos_vmadm.rollback_snapshot(vm, name, key='uuid')`

Rollback snapshot of a vm

**vm** [string] vm to be targeted

**name** [string]

**snapshot name** The snapname must be 64 characters or less and must only contain alphanumeric characters and characters in the set `[-_.:%]` to comply with ZFS restrictions.

**key** [string [uuid|alias|hostname]] value type of `vm` parameter

CLI Example:

```
salt '*' vmadm.rollback_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543 baseline
salt '*' vmadm.rollback_snapshot nacl baseline key=alias
```

`salt.modules.smartos_vmadm.send(vm, target, key='uuid')`

Send a vm to a directory

**vm** [string] vm to be sent

**target** [string] target directory

**key** [string [uuid|alias|hostname]] value type of `vm` parameter

CLI Example:

```
salt '*' vmadm.send 186da9ab-7392-4f55-91a5-b8f1fe770543 /opt/backups
salt '*' vmadm.send vm=nacl target=/opt/backups key=alias
```

`salt.modules.smartos_vmadm.start(vm, options=None, key='uuid')`

Start a vm

**vm** [string] vm to be started

**options** [string] optional additional options

**key** [string [uuid|alias|hostname]] value type of `vm` parameter

CLI Example:

```
salt '*' vmadm.start 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.start 186da9ab-7392-4f55-91a5-b8f1fe770543 'order=c,once=d cdrom=
↪path/to/image.iso,ide'
salt '*' vmadm.start vm=nacl key=alias
salt '*' vmadm.start vm=nina.example.org key=hostname
```

`salt.modules.smartos_vmadm.stop(vm, force=False, key='uuid')`

Stop a vm

**vm** [string] vm to be stopped  
**force** [boolean] force stop of vm if true  
**key** [string [uuid|alias|hostname]] value type of `vm` parameter  
 CLI Example:

```
salt '*' vmadm.stop 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.stop 186da9ab-7392-4f55-91a5-b8f1fe770543 True
salt '*' vmadm.stop vm=nacl key=alias
salt '*' vmadm.stop vm=nina.example.org key=hostname
```

`salt.modules.smartos_vmadm.sysrq`(*vm, action='nmi', key='uuid'*)

Send non-maskable interrupt to vm or capture a screenshot

**vm** [string] vm to be targeted  
**action** [string] nmi or screenshot -- Default: nmi  
**key** [string [uuid|alias|hostname]] value type of `vm` parameter  
 CLI Example:

```
salt '*' vmadm.sysrq 186da9ab-7392-4f55-91a5-b8f1fe770543 nmi
salt '*' vmadm.sysrq 186da9ab-7392-4f55-91a5-b8f1fe770543 screenshot
salt '*' vmadm.sysrq nacl nmi key=alias
```

`salt.modules.smartos_vmadm.update`(*vm, from\_file=None, key='uuid', \*\*kwargs*)

Update a new vm

**vm** [string] vm to be updated  
**from\_file** [string] json file to update the vm with -- if present, all other options will be ignored  
**key** [string [uuid|alias|hostname]] value type of `vm` parameter  
**kwargs** [string|int|...] options to update for the vm  
 CLI Example:

```
salt '*' vmadm.update vm=186da9ab-7392-4f55-91a5-b8f1fe770543 from_file=/tmp/new_
↳vm.json
salt '*' vmadm.update vm=nacl key=alias from_file=/tmp/new_vm.json
salt '*' vmadm.update vm=186da9ab-7392-4f55-91a5-b8f1fe770543 max_physical_
↳memory=1024
```

### 14.7.351 salt.modules.smbios

Interface to SMBIOS/DMI

(Parsing through dmidecode)

#### External References

[Desktop Management Interface \(DMI\)](#)

[System Management BIOS](#)

[DMidecode](#)

`salt.modules.smbios.get`(*string, clean=True*)

Get an individual DMI string from SMBIOS info

**string**

The string to fetch. DMidecode supports:

- bios-vendor
- bios-version

- bios-release-date
- system-manufacturer
- system-product-name
- system-version
- system-serial-number
- system-uuid
- baseboard-manufacturer
- baseboard-product-name
- baseboard-version
- baseboard-serial-number
- baseboard-asset-tag
- chassis-manufacturer
- chassis-type
- chassis-version
- chassis-serial-number
- chassis-asset-tag
- processor-family
- processor-manufacturer
- processor-version
- processor-frequency

**clean**

Don't return well-known false information  
(invalid UUID's, serial 000000000's, etcetera)

Defaults to True

CLI Example:

```
salt '*' smbios.get system-uuid clean=False
```

`salt.modules.smbios.records` (*rec\_type=None, fields=None, clean=True*)

Return DMI records from SMBIOS

**type** Return only records of type(s) The SMBIOS specification defines the following DMI types:

Type	Information
0	BIOS
1	System
2	Baseboard
3	Chassis
4	Processor
5	Memory Controller
6	Memory Module
7	Cache
8	Port Connector
9	System Slots
10	On Board Devices
11	OEM Strings
12	System Configuration Options
13	BIOS Language
14	Group Associations
15	System Event Log
16	Physical Memory Array
17	Memory Device
18	32-bit Memory Error
Continued on next page	

Table 14.8 -- continued from previous page

Type	Information
19	Memory Array Mapped Address
20	Memory Device Mapped Address
21	Built-in Pointing Device
22	Portable Battery
23	System Reset
24	Hardware Security
25	System Power Controls
26	Voltage Probe
27	Cooling Device
28	Temperature Probe
29	Electrical Current Probe
30	Out-of-band Remote Access
31	Boot Integrity Services
32	System Boot
33	64-bit Memory Error
34	Management Device
35	Management Device Component
36	Management Device Threshold Data
37	Memory Channel
38	IPMI Device
39	Power Supply
40	Additional Information
41	Onboard Devices Extended Information
42	Management Controller Host Interface

**clean**

Don't return well-known false information  
(invalid UUID's, serial 000000000's, etcetera)

Defaults to True

CLI Example:

```
salt '*' smbios.records clean=False
salt '*' smbios.records 14
salt '*' smbios.records 4 core_count,thread_count,current_speed
```

**14.7.352 salt.modules.smf**

Service support for Solaris 10 and 11, should work with other systems that use SMF also. (e.g. SmartOS)

---

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `'service.start' is not available`), see [here](#).

---

`salt.modules.smf.available`(*name*)

Returns True if the specified service is available, otherwise returns False.

We look up the name with the `svcs` command to get back the FMRI This allows users to use simpler service names

CLI Example:

```
salt '*' service.available net-snmp
```

`salt.modules.smf.disable(name, **kwargs)`

Disable the named service to start at boot

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.smf.disabled(name)`

Check to see if the named service is disabled to start on boot

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.smf.enable(name, **kwargs)`

Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.smf.enabled(name, **kwargs)`

Check to see if the named service is enabled to start on boot

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.smf.get_all()`

Return all installed services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.smf.get_disabled()`

Return the disabled services

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.smf.get_enabled()`

Return the enabled services

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.smf.get_running()`

Return the running services

CLI Example:

```
salt '*' service.get_running
```

`salt.modules.smf.get_stopped()`

Return the stopped services

CLI Example:

```
salt '*' service.get_stopped
```

`salt.modules.smf.missing(name)`

The inverse of `service.available`. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```
salt '*' service.missing net-snmp
```

`salt.modules.smf.reload(name)`

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.smf.restart(name)`

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.smf.start(name)`

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.smf.status(name, sig=None)`

Return the status for a service, returns a bool whether the service is running.

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.smf.stop(name)`

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

### 14.7.353 salt.modules.smtp

Module for Sending Messages via SMTP

New in version 2014.7.0.

**depends**

- smtplib python module

**configuration** This module can be used by either passing a jid and password directly to `send_message`, or by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:

```
my-smtp-login:
  smtp.server: smtp.domain.com
  smtp.tls: True
  smtp.sender: admin@domain.com
  smtp.username: myuser
  smtp.password: verybadpass
```

The resourcename refers to the resource that is using this account. It is user-definable, and optional. The following configurations are both valid:

```
my-smtp-login:
  smtp.server: smtp.domain.com
  smtp.tls: True
  smtp.sender: admin@domain.com
  smtp.username: myuser
  smtp.password: verybadpass

another-smtp-login:
  smtp.server: smtp.domain.com
  smtp.tls: True
  smtp.sender: admin@domain.com
  smtp.username: myuser
  smtp.password: verybadpass
```

`salt.modules.smtp.send_msg(recipient, message, subject='Message from Salt', sender=None, server=None, use_ssl='True', username=None, password=None, profile=None)`

Send a message to an SMTP recipient. Designed for use in states.

CLI Examples:

```
smtp.send_msg 'admin@example.com' 'This is a salt module test'           profile=
↳ 'my-smtp-account'
smtp.send_msg 'admin@example.com' 'This is a salt module test'           ✘
↳ username='myuser' password='verybadpass' sender='admin@example.com'  ✘
↳ server='smtp.domain.com'
```

### 14.7.354 salt.modules.solaris\_fmadm

Module for running `fmadm` and `fmdump` on Solaris

**maintainer** Jorge Schrauwen <[sjorge@blackdot.be](mailto:sjorge@blackdot.be)>

**maturity** new

**platform** solaris,illumos

New in version 2016.3.0.

`salt.modules.solaris_fmadm.acquit(fmri)`

Acquit resource or acquit case

**fmri**: string fmri or uuid

CLI Example:

```
salt '*' fmadm.acquit fmri | uuid
```

`salt.modules.solaris_fmadm.config()`

Display fault manager configuration

CLI Example:

```
salt '*' fmadm.config
```

`salt.modules.solaris_fmadm.faulty()`

Display list of faulty resources

CLI Example:

```
salt '*' fmadm.faulty
```

`salt.modules.solaris_fmadm.flush(fmri)`

Flush cached state for resource

**fmri:** string fmri

CLI Example:

```
salt '*' fmadm.flush fmri
```

`salt.modules.solaris_fmadm.healthy()`

Return whether fmadm is reporting faults

CLI Example:

```
salt '*' fmadm.healthy
```

`salt.modules.solaris_fmadm.list(after=None, before=None)`

Display fault management logs

**after** [string] filter events after time, see man fmdump for format

**before** [string] filter events before time, see man fmdump for format

CLI Example:

```
salt '*' fmadm.list
```

`salt.modules.solaris_fmadm.load(path)`

Load specified fault manager module

**path:** string path of fault manager module

CLI Example:

```
salt '*' fmadm.load /module/path
```

`salt.modules.solaris_fmadm.repaired(fmri)`

Notify fault manager that resource has been repaired

**fmri:** string fmri

CLI Example:

```
salt '*' fmadm.repaired fmri
```

`salt.modules.solaris_fmadm.replaced(fmri)`

Notify fault manager that resource has been replaced

**fmri:** string fmri

CLI Example:

```
salt '*' fmadm.repaired fmri
```

`salt.modules.solaris_fmadm.reset`(*module*, *serd=None*)

Reset module or sub-component

**module:** **string** module to unload

**serd** [string] serd sub module

CLI Example:

```
salt '*' fmadm.reset software-response
```

`salt.modules.solaris_fmadm.show`(*uuid*)

Display log details

**uuid:** **string** uuid of fault

CLI Example:

```
salt '*' fmadm.show 11b4070f-4358-62fa-9e1e-998f485977e1
```

`salt.modules.solaris_fmadm.unload`(*module*)

Unload specified fault manager module

**module:** **string** module to unload

CLI Example:

```
salt '*' fmadm.unload software-response
```

## 14.7.355 salt.modules.solaris\_group

Manage groups on Solaris

---

**Important:** If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to `'group.info' is not available`), see [here](#).

---

`salt.modules.solaris_group.add`(*name*, *gid=None*, **\*\*kwargs**)

Add the specified group

CLI Example:

```
salt '*' group.add foo 3456
```

`salt.modules.solaris_group.chgid`(*name*, *gid*)

Change the gid for a named group

CLI Example:

```
salt '*' group.chgid foo 4376
```

`salt.modules.solaris_group.delete`(*name*)

Remove the named group

CLI Example:

```
salt '*' group.delete foo
```

`salt.modules.solaris_group.getent` (*refresh=False*)

Return info on all groups

CLI Example:

```
salt '*' group.getent
```

`salt.modules.solaris_group.info` (*name*)

Return information about a group

CLI Example:

```
salt '*' group.info foo
```

### 14.7.356 salt.modules.solaris\_shadow

Manage the password database on Solaris systems

---

**Important:** If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to `'shadow.info' is not available`), see [here](#).

---

`salt.modules.solaris_shadow.default_hash` ()

Returns the default hash used for unset passwords

CLI Example:

```
salt '*' shadow.default_hash
```

`salt.modules.solaris_shadow.del_password` (*name*)

New in version 2015.8.8.

Delete the password from name user

CLI Example:

```
salt '*' shadow.del_password username
```

`salt.modules.solaris_shadow.gen_password` (*password, crypt\_salt=None, algorithm='sha512'*)

New in version 2015.8.8.

Generate hashed password

---

**Note:** When called this function is called directly via remote-execution, the password argument may be displayed in the system's process list. This may be a security risk on certain systems.

---

**password** Plaintext password to be hashed.

**crypt\_salt** Cryptographic salt. If not given, a random 8-character salt will be generated.

**algorithm** The following hash algorithms are supported:

- md5
- blowfish (not in mainline glibc, only available in distros that add it)
- sha256
- sha512 (default)

CLI Example:

```
salt '*' shadow.gen_password 'I_am_password'  
salt '*' shadow.gen_password 'I_am_password' crypt_salt='I_am_salt'  
↪algorithm=sha256
```

`salt.modules.solaris_shadow.info(name)`

Return information for the specified user

CLI Example:

```
salt '*' shadow.info root
```

`salt.modules.solaris_shadow.set_maxdays(name, maxdays)`

Set the maximum number of days during which a password is valid. See man passwd.

CLI Example:

```
salt '*' shadow.set_maxdays username 90
```

`salt.modules.solaris_shadow.set_mindays(name, mindays)`

Set the minimum number of days between password changes. See man passwd.

CLI Example:

```
salt '*' shadow.set_mindays username 7
```

`salt.modules.solaris_shadow.set_password(name, password)`

Set the password for a named user. The password must be a properly defined hash, the password hash can be generated with this command: `openssl passwd -1 <plaintext password>`

CLI Example:

```
salt '*' shadow.set_password root $1$UYCIxa628.9qXjpQCjM4a..
```

`salt.modules.solaris_shadow.set_warndays(name, warndays)`

Set the number of days of warning before a password change is required. See man passwd.

CLI Example:

```
salt '*' shadow.set_warndays username 7
```

### 14.7.357 salt.modules.solaris\_system

Support for reboot, shutdown, etc

This module is assumes we are using solaris-like shutdown

New in version 2016.3.0.

`salt.modules.solaris_system.halt()`

Halt a running system

CLI Example:

```
salt '*' system.halt
```

`salt.modules.solaris_system.init(state)`

Change the system runlevel on sysV compatible systems

CLI Example:

`state` [string] Init state

```
salt '*' system.init 3
```

`salt.modules.solaris_system.poweroff()`

Poweroff a running system

CLI Example:

```
salt '*' system.poweroff
```

`salt.modules.solaris_system.reboot(delay=0, message=None)`

Reboot the system

`delay` [int] Optional wait time in seconds before the system will be rebooted.

`message` [string] Optional message to broadcast before rebooting.

CLI Example:

```
salt '*' system.reboot
salt '*' system.reboot 60 "=== system upgraded ==="
```

`salt.modules.solaris_system.shutdown(delay=0, message=None)`

Shutdown a running system

`delay` [int] Optional wait time in seconds before the system will be shutdown.

`message` [string] Optional message to broadcast before rebooting.

CLI Example:

```
salt '*' system.shutdown
salt '*' system.shutdown 60 "=== disk replacement ==="
```

### 14.7.358 salt.modules.solaris\_user

Manage users with the useradd command

---

**Important:** If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to ``user.info' is not available`), see [here](#).

---

`salt.modules.solaris_user.add(name, uid=None, gid=None, groups=None, home=None, shell=None, unique=True, fullname='', roomnumber='', workphone='', homophone='', createhome=True, **kwargs)`

Add a user to the minion

CLI Example:

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

`salt.modules.solaris_user.chfullname(name, fullname)`

Change the user's Full Name

CLI Example:

```
salt '*' user.chfullname foo "Foo Bar"
```

`salt.modules.solaris_user.chgid(name, gid)`

Change the default group of the user

CLI Example:

```
salt '*' user.chgid foo 4376
```

`salt.modules.solaris_user.chgroups` (*name, groups, append=False*)

Change the groups to which a user belongs

**name** Username to modify

**groups** List of groups to set for the user. Can be passed as a comma-separated list or a Python list.

**append** [False] Set to True to append these groups to the user's existing list of groups. Otherwise, the specified groups will replace any existing groups for the user.

CLI Example:

```
salt '*' user.chgroups foo wheel,root True
```

`salt.modules.solaris_user.chhome` (*name, home, persist=False*)

Set a new home directory for an existing user

**name** Username to modify

**home** New home directory to set

**persist** [False] Set to True to prevent configuration files in the new home directory from being overwritten by the files from the skeleton directory.

CLI Example:

```
salt '*' user.chhome foo /home/users/foo True
```

`salt.modules.solaris_user.chhomephone` (*name, homephone*)

Change the user's Home Phone

CLI Example:

```
salt '*' user.chhomephone foo "7735551234"
```

`salt.modules.solaris_user.chroomnumber` (*name, roomnumber*)

Change the user's Room Number

CLI Example:

```
salt '*' user.chroomnumber foo 123
```

`salt.modules.solaris_user.chshell` (*name, shell*)

Change the default shell of the user

CLI Example:

```
salt '*' user.chshell foo /bin/zsh
```

`salt.modules.solaris_user.chuid` (*name, uid*)

Change the uid for a named user

CLI Example:

```
salt '*' user.chuid foo 4376
```

`salt.modules.solaris_user.chworkphone` (*name, workphone*)

Change the user's Work Phone

CLI Example:

```
salt '*' user.chworkphone foo "7735550123"
```

`salt.modules.solaris_user.delete`(*name*, *remove=False*, *force=False*)

Remove a user from the minion

CLI Example:

```
salt '*' user.delete name remove=True force=True
```

`salt.modules.solaris_user.getent`(*refresh=False*)

Return the list of all info for all users

CLI Example:

```
salt '*' user.getent
```

`salt.modules.solaris_user.info`(*name*)

Return user information

CLI Example:

```
salt '*' user.info root
```

`salt.modules.solaris_user.list_groups`(*name*)

Return a list of groups the named user belongs to

CLI Example:

```
salt '*' user.list_groups foo
```

`salt.modules.solaris_user.list_users`()

Return a list of all users CLI Example: .. code-block:: bash

```
salt '*' user.list_users
```

`salt.modules.solaris_user.rename`(*name*, *new\_name*)

Change the username for a named user

CLI Example:

```
salt '*' user.rename name new_name
```

### 14.7.359 salt.modules.solarisips

IPS pkg support for Solaris

---

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `'pkg.install' is not available`), see [here](#).

---

This module provides support for Solaris 11 new package management - IPS (Image Packaging System). This is the default pkg module for Solaris 11 (and later).

If you want to use also other packaging module (e.g. pkgutil) together with IPS, you need to override the pkg provider in sls for each package:

```
mypackage:
  pkg.installed:
    - provider: pkgutil
```

Or you can override it globally by setting the *providers* parameter in your Minion config file like this:

```
providers:
  pkg: pkgutil
```

Or you can override it globally by setting the *providers* parameter in your Minion config file like this:

```
providers:
  pkg: pkgutil
```

`salt.modules.solarisips.available_version(name, **kwargs)`

This function is an alias of `latest_version`.

The available version of the package in the repository. In case of multiple matches, it returns list of all matched packages. Accepts full or partial FMRI. Please use `pkg.latest_version` as `pkg.available_version` is being deprecated.

CLI Example:

```
salt '*' pkg.latest_version pkg://solaris/entire
```

`salt.modules.solarisips.get_fmri(name, **kwargs)`

Returns FMRI from partial name. Returns empty string (``) if not found. In case of multiple match, the function returns list of all matched packages.

CLI Example:

```
salt '*' pkg.get_fmri bash
```

`salt.modules.solarisips.install(name=None, refresh=False, pkgs=None, version=None, test=False, **kwargs)`

Install the named package using the IPS `pkg` command. Accepts full or partial FMRI.

Returns a dict containing the new package names and versions:

```
{'package': {'old': 'old-version',
              'new': 'new-version'}}
```

Multiple Package Installation Options:

**pkgs** A list of packages to install. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install vim
salt '*' pkg.install pkg://solaris/editor/vim
salt '*' pkg.install pkg://solaris/editor/vim refresh=True
salt '*' pkg.install pkgs=['foo', 'bar']
```

`salt.modules.solarisips.is_installed(name, **kwargs)`

Returns True if the package is installed. Otherwise returns False. Name can be full or partial FMRI. In case of multiple match from partial FMRI name, it returns True.

CLI Example:

```
salt '*' pkg.is_installed bash
```

`salt.modules.solarisips.latest_version(name, **kwargs)`

The available version of the package in the repository. In case of multiple matches, it returns list of all matched packages. Accepts full or partial FMRI. Please use `pkg.latest_version` as `pkg.available_version` is being deprecated.

CLI Example:

```
salt '*' pkg.latest_version pkg://solaris/entire
```

`salt.modules.solarisips.list_pkgs`(*versions\_as\_list=False, \*\*kwargs*)

List the currently installed packages as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.solarisips.list_upgrades`(*refresh=True, \*\*kwargs*)

Lists all packages available for update.

When run in global zone, it reports only upgradable packages for the global zone.

When run in non-global zone, it can report more upgradable packages than `pkg update -vn`, because `pkg update` hides packages that require newer version of `pkg://solaris/entire` (which means that they can be upgraded only from the global zone). If `pkg://solaris/entire` is found in the list of upgrades, then the global zone should be updated to get all possible updates. Use `refresh=True` to refresh the package database.

**refresh** [True] Runs a full package database refresh before listing. Set to False to disable running the refresh.

Changed in version 2017.7.0.

In previous versions of Salt, `refresh` defaulted to False. This was changed to default to True in the 2017.7.0 release to make the behavior more consistent with the other package modules, which all default to True.

CLI Example:

```
salt '*' pkg.list_upgrades
salt '*' pkg.list_upgrades refresh=False
```

`salt.modules.solarisips.normalize_name`(*name, \*\*kwargs*)

Internal function. Normalizes pkg name to full FMRI before running `pkg.install`. In case of multiple matches or no match, it returns the name without modifications.

CLI Example:

```
salt '*' pkg.normalize_name vim
```

`salt.modules.solarisips.purge`(*name, \*\*kwargs*)

Remove specified package. Accepts full or partial FMRI.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.purge <package name>
```

`salt.modules.solarisips.refresh_db`(*full=False*)

Updates the remote repos database.

**full** : False

Set to True to force a refresh of the pkg DB from all publishers, regardless of the last refresh time.

CLI Example:

```
salt '*' pkg.refresh_db
salt '*' pkg.refresh_db full=True
```

`salt.modules.solarisips.remove`(*name=None, pkgs=None, \*\*kwargs*)

Remove specified package. Accepts full or partial FMRI. In case of multiple match, the command fails and won't modify the OS.

**name** The name of the package to be deleted.

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove tcsh
salt '*' pkg.remove pkg://solaris/shell/tcsh
salt '*' pkg.remove pkgs=['"foo", "bar"]'
```

`salt.modules.solarisips.search`(*name, versions\_as\_list=False, \*\*kwargs*)

Searches the repository for given pkg name. The name can be full or partial FMRI. All matches are printed. Globs are also supported.

CLI Example:

```
salt '*' pkg.search bash
```

`salt.modules.solarisips.upgrade`(*refresh=False, \*\*kwargs*)

Upgrade all packages to the latest possible version. When run in global zone, it updates also all non-global zones. In non-global zones upgrade is limited by dependency constraints linked to the version of `pkg://solaris/entire`.

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

When there is a failure, an explanation is also included in the error message, based on the return code of the `pkg update` command.

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.solarisips.upgrade_available`(*name*)

Check if there is an upgrade available for a certain package. Accepts full or partial FMRI. Returns all matches found.

CLI Example:

```
salt '*' pkg.upgrade_available apache-22
```

`salt.modules.solarisips.version`(*\*names, \*\*kwargs*)

Common interface for obtaining the version of installed packages. Accepts full or partial FMRI. If called using `pkg_resource`, full FMRI is required.

CLI Example:

```
salt '*' pkg.version vim
salt '*' pkg.version foo bar baz
salt '*' pkg_resource.version pkg://solaris/entire
```

### 14.7.360 salt.modules.solarispkg

Package support for Solaris

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to ``pkg.install' is not available`), see [here](#).

`salt.modules.solarispkg.install` (*name=None, sources=None, saltenv='base', \*\*kwargs*)

Install the passed package. Can install packages from the following sources:

- Locally (package already exists on the minion)
- HTTP/HTTPS server
- FTP server
- Salt master

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
                'new': '<new-version>'}}
```

CLI Examples:

```
# Installing a data stream pkg that already exists on the minion

salt '*' pkg.install sources='[{"<pkg name>": "/dir/on/minion/<pkg filename>"}]'
salt '*' pkg.install sources='[{"SMClgcc346": "/var/spool/pkg/gcc-3.4.6-sol10-
↳sparc-local.pkg"}]'
```

```
# Installing a data stream pkg that exists on the salt master

salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>"}]'
salt '*' pkg.install sources='[{"SMClgcc346": "salt://pkgs/gcc-3.4.6-sol10-sparc-
↳local.pkg"}]'
```

CLI Example:

```
# Installing a data stream pkg that exists on a HTTP server
salt '*' pkg.install sources='[{"<pkg name>": "http://packages.server.com/<pkg
↳filename>"}]'
```

```
salt '*' pkg.install sources='[{"SMClgcc346": "http://packages.server.com/gcc-3.4.
↳6-sol10-sparc-local.pkg"}]'
```

If working with solaris zones and you want to install a package only in the global zone you can pass ``current_zone_only=True'` to salt to have the package only installed in the global zone. (Behind the scenes this is passing ``-G'` to the `pkgadd` command.) Solaris default when installing a package in the global zone is to install it in all zones. This overrides that and installs the package only in the global.

CLI Example:

```
# Installing a data stream package only in the global zone:
salt 'global_zone' pkg.install sources='[{"SMClgcc346": "/var/spool/pkg/gcc-3.4.6-
↳sol10-sparc-local.pkg"}]' current_zone_only=True
```

By default salt automatically provides an adminfile, to automate package installation, with these options set:

```
email=
instance=quit
partial=nocheck
runlevel=nocheck
idepend=nocheck
rdepend=nocheck
space=nocheck
setuid=nocheck
conflict=nocheck
action=nocheck
basedir=default
```

You can override any of these options in two ways. First you can optionally pass any of the options as a kwarg to the module/state to override the default value or you can optionally pass the `admin\_source` option providing your own adminfile to the minions.

Note: You can find all of the possible options to provide to the adminfile by reading the admin man page:

```
man -s 4 admin
```

CLI Example:

```
# Overriding the 'instance' adminfile option when calling the module directly
salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>"}]'
↳instance="overwrite"
```

SLS Example:

```
# Overriding the 'instance' adminfile option when used in a state

SMClgcc346:
  pkg.installed:
    - sources:
      - SMClgcc346: salt://srv/salt/pkgs/gcc-3.4.6-sol10-sparc-local.pkg
    - instance: overwrite
```

---

**Note:** The ID declaration is ignored, as the package name is read from the sources parameter.

---

CLI Example:

```
# Providing your own adminfile when calling the module directly

salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>"}]'
↳admin_source='salt://pkgs/<adminfile filename>'

# Providing your own adminfile when using states

<pkg name>:
  pkg.installed:
    - sources:
      - <pkg name>: salt://pkgs/<pkg filename>
    - admin_source: salt://pkgs/<adminfile filename>
```

---

**Note:** The ID declaration is ignored, as the package name is read from the `sources` parameter.

---

`salt.modules.solarispkg.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

NOTE: As package repositories are not presently supported for Solaris pkgadd, this function will always return an empty string for a given package.

`salt.modules.solarispkg.list_pkgs(versions_as_list=False, **kwargs)`

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.solarispkg.purge(name=None, pkgs=None, **kwargs)`

Package purges are not supported, this function is identical to `remove()`.

**name** The name of the package to be deleted

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>, <package2>, <package3>
salt '*' pkg.purge pkgs=['foo', 'bar']
```

`salt.modules.solarispkg.remove(name=None, pkgs=None, saltenv='base', **kwargs)`

Remove packages with `pkgrm`

**name** The name of the package to be deleted

By default salt automatically provides an adminfile, to automate package removal, with these options set:

```
email=
instance=quit
partial=nocheck
runlevel=nocheck
idepend=nocheck
rdepend=nocheck
space=nocheck
setuid=nocheck
conflict=nocheck
action=nocheck
basedir=default
```

You can override any of these options in two ways. First you can optionally pass any of the options as a kwarg to the module/state to override the default value or you can optionally pass the ``admin_source'` option providing your own adminfile to the minions.

Note: You can find all of the possible options to provide to the adminfile by reading the admin man page:

```
man -s 4 admin
```

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove SUNWgit
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs=['"foo"', "bar"]'
```

`salt.modules.solarispkg.upgrade_available(name)`

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.solarispkg.version(*names, **kwargs)`

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

### 14.7.361 salt.modules.solr

Apache Solr Salt Module

Author: Jed Glazner Version: 0.2.1 Modified: 12/09/2011

This module uses HTTP requests to talk to the apache solr request handlers to gather information and report errors. Because of this the minion doesn't necessarily need to reside on the actual slave. However if you want to use the signal function the minion must reside on the physical solr host.

This module supports multi-core and standard setups. Certain methods are master/slave specific. Make sure you set the solr.type. If you have questions or want a feature request please ask.

#### Coming Features in 0.3

1. Add command for checking for replication failures on slaves
2. Improve match\_index\_versions since it's pointless on busy solr masters
3. Add additional local fs checks for backups to make sure they succeeded

### Override these in the minion config

**solr.cores** A list of core names e.g. ['core1','core2']. An empty list indicates non-multicore setup.

**solr.baseurl** The root level URL to access solr via HTTP

**solr.request\_timeout** The number of seconds before timing out an HTTP/HTTPS/FTP request. If nothing is specified then the python global timeout setting is used.

**solr.type** Possible values are `master` or `slave`

**solr.backup\_path** The path to store your backups. If you are using cores and you can specify to append the core name to the path in the backup method.

**solr.num\_backups** For versions of solr >= 3.5. Indicates the number of backups to keep. This option is ignored if your version is less.

**solr.init\_script** The full path to your init script with start/stop options

**solr.dih.options** A list of options to pass to the DIH.

### Required Options for DIH

**clean** [False] Clear the index before importing

**commit** [True] Commit the documents to the index upon completion

**optimize** [True] Optimize the index after commit is complete

**verbose** [True] Get verbose output

**salt.modules.solr.abort\_import** (*handler, host=None, core\_name=None, verbose=False*)

MASTER ONLY Aborts an existing import command to the specified handler. This command can only be run if the minion is configured with solr.type=master

**handler** [str] The name of the data import handler.

**host** [str (None)] The solr host to query. `__opts__['host']` is default.

**core** [str (None)] The core the handler belongs to.

**verbose** [boolean (False)] Run the command with verbose output.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.abort_import dataimport None music {'clean':True}
```

**salt.modules.solr.backup** (*host=None, core\_name=None, append\_core\_to\_path=False*)

Tell solr make a backup. This method can be mis-leading since it uses the backup API. If an error happens during the backup you are not notified. The status: `OK` in the response simply means that solr received the request successfully.

**host** [str (None)] The solr host to query. `__opts__['host']` is default.

**core\_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

**append\_core\_to\_path** [boolean (False)] If True add the name of the core to the backup path. Assumes that minion backup path is not None.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.backup music
```

`salt.modules.solr.core_status` (*host=None, core\_name=None*)  
 MULTI-CORE HOSTS ONLY Get the status for a given core or all cores if no core is specified  
**host** [str (None)] The solr host to query. `__opts__['host']` is default.  
**core\_name** [str] The name of the core to reload  
 Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.core_status None music
```

`salt.modules.solr.delta_import` (*handler, host=None, core\_name=None, options=None, extra=None*)  
 Submits an import command to the specified handler using specified options. This command can only be run if the minion is configured with `solr.type=master`  
**handler** [str] The name of the data import handler.  
**host** [str (None)] The solr host to query. `__opts__['host']` is default.  
**core** [str (None)] The core the handler belongs to.  
**options** [dict (`__opts__`)] A list of options such as `clean`, `optimize commit`, `verbose`, and `pause_replication`.  
 leave blank to use `__opts__` defaults. options will be merged with `__opts__`  
**extra** [dict ({})] Extra name value pairs to pass to the handler. e.g. ["name=value"]  
 Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.delta_import dataimport None music {'clean':True}
```

`salt.modules.solr.full_import` (*handler, host=None, core\_name=None, options=None, extra=None*)  
 MASTER ONLY Submits an import command to the specified handler using specified options. This command can only be run if the minion is configured with `solr.type=master`  
**handler** [str] The name of the data import handler.  
**host** [str (None)] The solr host to query. `__opts__['host']` is default.  
**core** [str (None)] The core the handler belongs to.  
**options** [dict (`__opts__`)] A list of options such as `clean`, `optimize commit`, `verbose`, and `pause_replication`.  
 leave blank to use `__opts__` defaults. options will be merged with `__opts__`  
**extra** [dict ({})] Extra name value pairs to pass to the handler. e.g. ["name=value"]  
 Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.full_import dataimport None music {'clean':True}
```

`salt.modules.solr.import_status` (*handler, host=None, core\_name=None, verbose=False*)  
 Submits an import command to the specified handler using specified options. This command can only be run if the minion is configured with `solr.type: `master``  
**handler** [str] The name of the data import handler.

**host** [str (None)] The solr host to query. `__opts__['host']` is default.  
**core** [str (None)] The core the handler belongs to.  
**verbose** [boolean (False)] Specifies verbose output  
 Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.import_status dataimport None music False
```

`salt.modules.solr.is_replication_enabled`(*host=None, core\_name=None*)

SLAVE CALL Check for errors, and determine if a slave is replicating or not.

**host** [str (None)] The solr host to query. `__opts__['host']` is default.  
**core\_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.  
 Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.is_replication_enabled music
```

`salt.modules.solr.lucene_version`(*core\_name=None*)

Gets the lucene version that solr is using. If you are running a multi-core setup you should specify a core name since all the cores run under the same servlet container, they will all have the same version.

**core\_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.  
 Return: dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.lucene_version
```

`salt.modules.solr.match_index_versions`(*host=None, core\_name=None*)

SLAVE CALL Verifies that the master and the slave versions are in sync by comparing the index version. If you are constantly pushing updates the index the master and slave versions will seldom match. A solution to this is pause indexing every so often to allow the slave to replicate and then call this method before allowing indexing to resume.

**host** [str (None)] The solr host to query. `__opts__['host']` is default.  
**core\_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.  
 Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.match_index_versions music
```

`salt.modules.solr.optimize`(*host=None, core\_name=None*)

Search queries fast, but it is a very expensive operation. The ideal process is to run this with a master/slave configuration. Then you can optimize the master, and push the optimized index to the slaves. If you are

running a single solr instance, or if you are going to run this on a slave be aware than search performance will be horrible while this command is being run. Additionally it can take a LONG time to run and your HTTP request may timeout. If that happens adjust your timeout settings.

**host** [str (None)] The solr host to query. `__opts__['host']` is default.

**core\_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.optimize music
```

`salt.modules.solr.ping`(*host=None, core\_name=None*)

Does a health check on solr, makes sure solr can talk to the indexes.

**host** [str (None)] The solr host to query. `__opts__['host']` is default.

**core\_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.ping music
```

`salt.modules.solr.reload_core`(*host=None, core\_name=None*)

MULTI-CORE HOSTS ONLY Load a new core from the same configuration as an existing registered core. While the ``new`` core is initializing, the ``old`` one will continue to accept requests. Once it has finished, all new request will go to the ``new`` core, and the ``old`` core will be unloaded.

**host** [str (None)] The solr host to query. `__opts__['host']` is default.

**core\_name** [str] The name of the core to reload

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.reload_core None music
```

Return data is in the following format:

```
{'success':bool, 'data':dict, 'errors':list, 'warnings':list}
```

`salt.modules.solr.reload_import_config`(*handler, host=None, core\_name=None, verbose=False*)

MASTER ONLY re-loads the handler config XML file. This command can only be run if the minion is a `master` type

**handler** [str] The name of the data import handler.

**host** [str (None)] The solr host to query. `__opts__['host']` is default.

**core** [str (None)] The core the handler belongs to.

**verbose** [boolean (False)] Run the command with verbose output.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.reload_import_config dataimport None music {'clean':True}
```

`salt.modules.solr.replication_details`(*host=None, core\_name=None*)

Get the full replication details.

**host** [str (None)] The solr host to query. `__opts__['host']` is default.

**core\_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.replication_details music
```

`salt.modules.solr.set_is_polling`(*polling, host=None, core\_name=None*)

SLAVE CALL Prevent the slaves from polling the master for updates.

**polling** [boolean] True will enable polling. False will disable it.

**host** [str (None)] The solr host to query. `__opts__['host']` is default.

**core\_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.set_is_polling False
```

`salt.modules.solr.set_replication_enabled`(*status, host=None, core\_name=None*)

MASTER ONLY Sets the master to ignore poll requests from the slaves. Useful when you don't want the slaves replicating during indexing or when clearing the index.

**status** [boolean] Sets the replication status to the specified state.

**host** [str (None)] The solr host to query. `__opts__['host']` is default.

**core\_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to set the status on all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.set_replication_enabled false, None, music
```

`salt.modules.solr.signal`(*signal=None*)

Signals Apache Solr to start, stop, or restart. Obviously this is only going to work if the minion resides on the solr host. Additionally Solr doesn't ship with an init script so one must be created.

**signal** [str (None)] The command to pass to the apache solr init valid values are ``start'`, ``stop'`, and ``restart'`

CLI Example:

```
salt '*' solr.signal restart
```

`salt.modules.solr.version`(*core\_name=None*)

Gets the solr version for the core specified. You should specify a core here as all the cores will run under the same servlet container and so will all have the same version.

**core\_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.version
```

### 14.7.362 salt.modules.solrcloud module

Module for solrcloud configuration

New in version 2017.7.0.

For now, module is limited to http-exposed API. It doesn't implement config upload via Solr zkCli

`salt.modules.solrcloud.BOOL_PROPS_LIST` = ['transient', 'loadOnStartup']

Collections options type definition Reference: <https://cwiki.apache.org/confluence/display/solr/Collections+API#CollectionsAPI-api1>

`salt.modules.solrcloud.DICT_OPTIONS_LIST` = ['properties']

Collection unmodifiable options Reference: <https://cwiki.apache.org/confluence/display/solr/Collections+API#CollectionsAPI-modifycoll>

`salt.modules.solrcloud.alias_exists`(*alias\_name, \*\*kwargs*)

Check alias existance

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.alias_exists my_alias
```

`salt.modules.solrcloud.alias_get_collections`(*alias\_name, \*\*kwargs*)

Get collection list for an alias

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.alias_get my_alias
```

`salt.modules.solrcloud.alias_set_collections`(*alias\_name, collections=None, \*\*kwargs*)

Define an alias

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.alias_set my_alias collections=[collection1, colletion2]
```

`salt.modules.solrcloud.cluster_status`(*\*\*kwargs*)

Get cluster status

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.cluster_status
```

`salt.modules.solrcloud.collection_backup`(*collection\_name*, *location*, *backup\_name=None*, *\*\*kwargs*)

Create a backup for a collection.

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.core_backup collection_name /mnt/nfs_backup
```

`salt.modules.solrcloud.collection_backup_all`(*location*, *backup\_name=None*, *\*\*kwargs*)

Create a backup for all collection present on the server.

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.core_backup /mnt/nfs_backup
```

`salt.modules.solrcloud.collection_check_options`(*options*)

Check collections options

CLI Example:

```
salt '*' solrcloud.collection_check_options '{"replicationFactor":4}'
```

`salt.modules.solrcloud.collection_create`(*collection\_name*, *options=None*, *\*\*kwargs*)

Create a collection,

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.collection_create collection_name
```

Collection creation options may be passed using the ``options`` parameter. Do not include option ``name`` since it already specified by the mandatory parameter ``collection\_name``

```
salt '*' solrcloud.collection_create collection_name options={"replicationFactor":
↳2, "numShards":3}
```

Cores options may be passed using the ``properties`` key in options. Do not include property ``name``

```
salt '*' solrcloud.collection_create collection_name options={"replicationFactor":
↳2, "numShards":3, "properties":{"dataDir":"/srv/solr/
↳hugePartitionSollection"}}
```

`salt.modules.solrcloud.collection_creation_options`()

Get collection option list that can only be defined at creation

CLI Example:

```
salt '*' solrcloud.collection_creation_options
```

`salt.modules.solrcloud.collection_exists`(*collection\_name*, *\*\*kwargs*)

Check if a collection exists

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.collection_exists collection_name
```

`salt.modules.solrcloud.collection_get_options(collection_name, **kwargs)`

Get collection options

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.collection_get_options collection_name
```

`salt.modules.solrcloud.collection_list(**kwargs)`

List all collections

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.collection_list
```

`salt.modules.solrcloud.collection_reload(collection, **kwargs)`

Check if a collection exists

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.collection_reload collection_name
```

`salt.modules.solrcloud.collection_set_options(collection_name, options, **kwargs)`

Change collection options

Additional parameters (kwargs) may be passed, they will be proxied to http.query

Note that not every parameter can be changed after collection creation

CLI Example:

```
salt '*' solrcloud.collection_set_options collection_name options={
  ↪ "replicationFactor":4}
```

`salt.modules.solrcloud.log = <salt.log.setup.SaltLoggingClass object>`

Core properties type definition. Reference: <https://cwiki.apache.org/confluence/display/solr/Defining+core+properties>

### 14.7.363 salt.modules.splunk

Module for interop with the Splunk API

New in version 2016.3.0..

**depends**

- splunk-sdk python module

**configuration** Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the `splunk` key by default, if defined.

For example:

```
splunk:
  username: alice
  password: abc123
  host: example.splunkcloud.com
  port: 8080
```

`salt.modules.splunk.create_user` (*email*, *profile='splunk'*, *\*\*kwargs*)  
create a splunk user by name/email

CLI Example:

```
salt myminion splunk.create_user user@example.com roles=['user'] realname="Test User"
name=testuser
```

`salt.modules.splunk.delete_user` (*email*, *profile='splunk'*)  
Delete a splunk user by email

CLI Example:

```
salt myminion splunk_user.delete `user@example.com`
```

`salt.modules.splunk.get_user` (*email*, *profile='splunk'*, *\*\*kwargs*)  
Get a splunk user by name/email

CLI Example:

```
salt myminion splunk.get_user `user@example.com` user_details=false salt myminion
splunk.get_user `user@example.com` user_details=true
```

`salt.modules.splunk.list_users` (*profile='splunk'*)  
List all users in the splunk DB

CLI Example:

```
salt myminion splunk.list_users
```

`salt.modules.splunk.update_user` (*email*, *profile='splunk'*, *\*\*kwargs*)  
Create a splunk user by email

CLI Example:

```
salt myminion splunk.update_user example@domain.com roles=['user'] realname="Test User"
```

### 14.7.364 salt.modules.splunk\_search

Module for interop with the Splunk API

New in version 2015.5.0.

**depends**

- splunk-sdk python module

**configuration** Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the `splunk` key by default, if defined.

For example:

```
splunk:
  username: alice
  password: abc123
```

```
host: example.splunkcloud.com
port: 8080
```

`salt.modules.splunk_search.create` (*name*, *profile='splunk'*, *\*\*kwargs*)  
Create a splunk search

CLI Example:

```
splunk_search.create `my search name' search='error msg'
```

`salt.modules.splunk_search.delete` (*name*, *profile='splunk'*)  
Delete a splunk search

CLI Example:

```
splunk_search.delete `my search name'
```

`salt.modules.splunk_search.get` (*name*, *profile='splunk'*)  
Get a splunk search

CLI Example:

```
splunk_search.get `my search name'
```

`salt.modules.splunk_search.list` (*profile='splunk'*)  
List splunk searches (names only)

CLI Example: `splunk_search.list`

`salt.modules.splunk_search.list_all` (*prefix=None*, *app=None*, *owner=None*, *description\_contains=None*, *name\_not\_contains=None*, *profile='splunk'*)

Get all splunk search details. Produces results that can be used to create an sls file.

if `app` or `owner` are specified, results will be limited to matching saved searches.

if `description_contains` is specified, results will be limited to those where `description_contains` in `description` is true if `name_not_contains` is specified, results will be limited to those where `name_not_contains` not in `name` is true.

If `prefix` parameter is given, alarm names in the output will be prepended with the prefix; alarms that have the prefix will be skipped. This can be used to convert existing alarms to be managed by salt, as follows:

CLI example:

1. **Make a ``backup'' of all existing searches** `$ salt-call splunk_search.list_all --out=txt | sed ``s/local: //' > legacy_searches.sls`
2. **Get all searches with new prefixed names** `$ salt-call splunk_search.list_all ``prefix=**MANAGED BY SALT** " --out=txt | sed ``s/local: //' > managed_searches.sls`
3. **Insert the managed searches into splunk** `$ salt-call state.sls managed_searches.sls`
4. Manually verify that the new searches look right
5. **Delete the original searches** `$ sed s/present/absent/ legacy_searches.sls > remove_legacy_searches.sls`  
`$ salt-call state.sls remove_legacy_searches.sls`
6. **Get all searches again, verify no changes** `$ salt-call splunk_search.list_all --out=txt | sed ``s/local: //' > final_searches.sls`  
`$ diff final_searches.sls managed_searches.sls`

`salt.modules.splunk_search.update` (*name*, *profile='splunk'*, *\*\*kwargs*)  
Update a splunk search

CLI Example:

```
splunk_search.update `my search name' sharing=app
```

### 14.7.365 salt.modules.sqlite3

Support for SQLite3

`salt.modules.sqlite3.fetch`(*db=None, sql=None*)

Retrieve data from an sqlite3 db (returns all rows, be careful!)

CLI Example:

```
salt '*' sqlite3.fetch /root/test.db 'SELECT * FROM test;'
```

`salt.modules.sqlite3.indexes`(*db=None*)

Show all indices in the database, for people with poor spelling skills

CLI Example:

```
salt '*' sqlite3.indexes /root/test.db
```

`salt.modules.sqlite3.indices`(*db=None*)

Show all indices in the database

CLI Example:

```
salt '*' sqlite3.indices /root/test.db
```

`salt.modules.sqlite3.modify`(*db=None, sql=None*)

Issue an SQL query to sqlite3 (with no return data), usually used to modify the database in some way (insert, delete, create, etc)

CLI Example:

```
salt '*' sqlite3.modify /root/test.db 'CREATE TABLE test(id INT, testdata TEXT);'
```

`salt.modules.sqlite3.sqlite_version`()

Return version of sqlite

CLI Example:

```
salt '*' sqlite3.sqlite_version
```

`salt.modules.sqlite3.tables`(*db=None*)

Show all tables in the database

CLI Example:

```
salt '*' sqlite3.tables /root/test.db
```

`salt.modules.sqlite3.version`()

Return version of pysqlite

CLI Example:

```
salt '*' sqlite3.version
```

### 14.7.366 salt.modules.ssh

Manage client ssh components

**Note:** This module requires the use of MD5 hashing. Certain security audits may not permit the use of MD5. For those cases, this module should be disabled or removed.

---

`salt.modules.ssh.auth_keys` (*user=None*, *config='.ssh/authorized\_keys'*, *fingerprint\_hash\_type=None*)

Return the authorized keys for users

CLI Example:

```
salt '*' ssh.auth_keys
salt '*' ssh.auth_keys root
salt '*' ssh.auth_keys user=root
salt '*' ssh.auth_keys user="[user1, user2]"
```

`salt.modules.ssh.check_key` (*user*, *key*, *enc*, *comment*, *options*, *config='.ssh/authorized\_keys'*, *cache\_keys=None*, *fingerprint\_hash\_type=None*)

Check to see if a key needs updating, returns ``update``, ``add`` or ``exists``

CLI Example:

```
salt '*' ssh.check_key <user> <key> <enc> <comment> <options>
```

`salt.modules.ssh.check_key_file` (*user*, *source*, *config='.ssh/authorized\_keys'*, *saltenv='base'*, *fingerprint\_hash\_type=None*)

Check a keyfile from a source destination against the local keys and return the keys to change

CLI Example:

```
salt '*' ssh.check_key_file root salt://ssh/keyfile
```

`salt.modules.ssh.check_known_host` (*user=None*, *hostname=None*, *key=None*, *fingerprint=None*, *config=None*, *port=None*, *fingerprint\_hash\_type=None*)

Check the record in known\_hosts file, either by its value or by fingerprint (it's enough to set up either key or fingerprint, you don't need to set up both).

If provided key or fingerprint doesn't match with stored value, return ``update``, if no value is found for a given host, return ``add``, otherwise return ``exists``.

If neither key, nor fingerprint is defined, then additional validation is not performed.

CLI Example:

```
salt '*' ssh.check_known_host <user> <hostname> key='AAAA...FAaQ=='
```

`salt.modules.ssh.get_known_host` (*user*, *hostname*, *config=None*, *port=None*, *fingerprint\_hash\_type=None*)

Return information about known host from the configfile, if any. If there is no such key, return None.

CLI Example:

```
salt '*' ssh.get_known_host <user> <hostname>
```

`salt.modules.ssh.hash_known_hosts` (*user=None*, *config=None*)

Hash all the hostnames in the known hosts file.

New in version 2014.7.0.

**user** hash known hosts of this user

**config** path to known hosts file: can be absolute or relative to user's home directory

CLI Example:

```
salt '*' ssh.hash_known_hosts
```

`salt.modules.ssh.host_keys` (*keydir=None, private=True*)

Return the minion's host keys

CLI Example:

```
salt '*' ssh.host_keys
salt '*' ssh.host_keys keydir=/etc/ssh
salt '*' ssh.host_keys keydir=/etc/ssh private=False
```

`salt.modules.ssh.key_is_encrypted` (*key*)

New in version 2015.8.7.

Function to determine whether or not a private key is encrypted with a passphrase.

Checks key for a Proc-Type header with ENCRYPTED in the value. If found, returns True, otherwise returns False.

CLI Example:

```
salt '*' ssh.key_is_encrypted /root/id_rsa
```

`salt.modules.ssh.recv_known_host` (*hostname, enc=None, port=None, hash\_known\_hosts=True, timeout=5, fingerprint\_hash\_type=None*)

Retrieve information about host public key from remote server

**hostname** The name of the remote host (e.g. ``github.com``)

**enc** Defines what type of key is being used, can be ed25519, ecdsa ssh-rsa or ssh-dss

**port** optional parameter, denoting the port of the remote host, which will be used in case, if the public key will be requested from it. By default the port 22 is used.

**hash\_known\_hosts** [True] Hash all hostnames and addresses in the known hosts file.

**timeout** [int] Set the timeout for connection attempts. If `timeout` seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.

New in version 2016.3.0.

**fingerprint\_hash\_type** The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to sha256 if not specified.

New in version 2016.11.4.

Changed in version 2017.7.0:: default changed from md5 to sha256

CLI Example:

```
salt '*' ssh.recv_known_host <hostname> enc=<enc> port=<port>
```

`salt.modules.ssh.rm_auth_key` (*user, key, config='ssh/authorized\_keys', fingerprint\_hash\_type=None*)

Remove an authorized key from the specified user's authorized key file

CLI Example:

```
salt '*' ssh.rm_auth_key <user> <key>
```

`salt.modules.ssh.rm_auth_key_from_file` (*user, source, config='ssh/authorized\_keys', saltenv='base', fingerprint\_hash\_type=None*)

Remove an authorized key from the specified user's authorized key file, using a file as source

CLI Example:

```
salt '*' ssh.rm_auth_key_from_file <user> salt://ssh_keys/<user>.id_rsa.pub
```

`salt.modules.ssh.rm_known_host` (*user=None, hostname=None, config=None, port=None*)  
Remove all keys belonging to hostname from a known\_hosts file.

CLI Example:

```
salt '*' ssh.rm_known_host <user> <hostname>
```

`salt.modules.ssh.set_auth_key` (*user, key, enc='ssh-rsa', comment='', options=None, config='.ssh/authorized\_keys', cache\_keys=None, fingerprint\_hash\_type=None*)

Add a key to the authorized\_keys file. The `key` parameter must only be the string of text that is the encoded key. If the key begins with `ssh-rsa` or ends with `user@host`, remove those from the key before passing it to this function.

CLI Example:

```
salt '*' ssh.set_auth_key <user> '<key>' enc='dsa'
```

`salt.modules.ssh.set_auth_key_from_file` (*user, source, config='.ssh/authorized\_keys', saltenv='base', fingerprint\_hash\_type=None*)

Add a key to the authorized\_keys file, using a file as the source.

CLI Example:

```
salt '*' ssh.set_auth_key_from_file <user> salt://ssh_keys/<user>.id_rsa.pub
```

`salt.modules.ssh.set_known_host` (*user=None, hostname=None, fingerprint=None, key=None, port=None, enc=None, config=None, hash\_known\_hosts=True, timeout=5, fingerprint\_hash\_type=None*)

Download SSH public key from remote host `hostname`, optionally validate its fingerprint against `fingerprint` variable and save the record in the known\_hosts file.

If such a record does already exists in there, do nothing.

**user** The user who owns the ssh authorized keys file to modify

**hostname** The name of the remote host (e.g. `github.com`)

**fingerprint** The fingerprint of the key which must be present in the known\_hosts file (optional if key specified)

**key** The public key which must be presented in the known\_hosts file (optional if fingerprint specified)

**port** optional parameter, denoting the port of the remote host, which will be used in case, if the public key will be requested from it. By default the port 22 is used.

**enc** Defines what type of key is being used, can be `ed25519`, `ecdsa`, `ssh-rsa` or `ssh-dss`

**config** The location of the authorized keys file relative to the user's home directory, defaults to `ssh/known_hosts`. If no user is specified, defaults to `/etc/ssh/ssh_known_hosts`. If present, must be an absolute path when a user is not specified.

**hash\_known\_hosts** [True] Hash all hostnames and addresses in the known hosts file.

**timeout** [int] Set the timeout for connection attempts. If `timeout` seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.

New in version 2016.3.0.

**fingerprint\_hash\_type** The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to `sha256` if not specified.

New in version 2016.11.4.

Changed in version 2017.7.0:: default changed from md5 to sha256

CLI Example:

```
salt '*' ssh.set_known_host <user> fingerprint='xx:xx:..:xx' enc='ssh-rsa' config=
↳ '.ssh/known_hosts'
```

`salt.modules.ssh.user_keys` (*user=None, pubfile=None, prvfile=None*)

Return the user's ssh keys on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' ssh.user_keys
salt '*' ssh.user_keys user=user1
salt '*' ssh.user_keys user=user1 pubfile=/home/user1/.ssh/id_rsa.pub prvfile=/
↳ home/user1/.ssh/id_rsa
salt '*' ssh.user_keys user=user1 prvfile=False
salt '*' ssh.user_keys user=["'user1','user2'] pubfile=id_rsa.pub prvfile=id_rsa
```

As you can see you can tell Salt not to read from the user's private (or public) key file by setting the file path to False. This can be useful to prevent Salt from publishing private data via Salt Mine or others.

### 14.7.367 salt.modules.ssh\_package module

Service support for the REST example

### 14.7.368 salt.modules.ssh\_service module

Provide the service module for the proxy-minion SSH sample .. versionadded:: 2015.8.2

`salt.modules.ssh_service.enabled` (*name, sig=None*)

Only the 'redbull' service is 'enabled' in the test

`salt.modules.ssh_service.get_all`()

Return a list of all available services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.ssh_service.list`()

Return a list of all available services.

CLI Example:

```
salt '*' service.list
```

`salt.modules.ssh_service.restart` (*name, sig=None*)

Restart the specified service with rest\_sample CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.ssh_service.running` (*name, sig=None*)

Return whether this service is running.

`salt.modules.ssh_service.start`(*name*, *sig=None*)  
Start the specified service on the rest\_sample

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.ssh_service.status`(*name*, *sig=None*)  
Return the status for a service via rest\_sample, returns a bool whether the service is running.

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.ssh_service.stop`(*name*, *sig=None*)  
Stop the specified service on the rest\_sample

CLI Example:

```
salt '*' service.stop <service name>
```

### 14.7.369 salt.modules.snapper module

Module to manage filesystem snapshots with snapper

New in version 2016.11.0.

**codeauthor** Duncan Mac-Vicar P. <dmacvicar@suse.de>

**codeauthor** Pablo Suárez Hernández <psuarezhernandez@suse.de>

**depends** dbus Python module.

**depends** snapper <http://snapper.io>, available in most distros

**maturity** new

**platform** Linux

`salt.modules.snapper.changed_files`(*config='root'*, *num\_pre=None*, *num\_post=None*)  
Returns the files changed between two snapshots

**config** Configuration name.

**num\_pre** first snapshot ID to compare. Default is last snapshot

**num\_post** last snapshot ID to compare. Default is 0 (current state)

CLI example:

```
salt '*' snapper.changed_files
salt '*' snapper.changed_files num_pre=19 num_post=20
```

`salt.modules.snapper.create_baseline`(*tag='baseline'*, *config='root'*)

Creates a snapshot marked as baseline

**tag** Tag name for the baseline

**config** Configuration name.

CLI Example:

```
salt '*' snapper.create_baseline
salt '*' snapper.create_baseline my_custom_baseline
```

`salt.modules.snapper.create_config`(*name=None, subvolume=None, fstype=None, template=None, extra\_opts=None*)

Creates a new Snapper configuration

**name** Name of the new Snapper configuration.

**subvolume** Path to the related subvolume.

**fstype** Filesystem type of the subvolume.

**template** Configuration template to use. (Default: default)

**extra\_opts** Extra Snapper configuration opts dictionary. It will override the values provided by the given template (if any).

CLI example:

```
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/ fstype=btrfs
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/ fstype=btrfs
↳template="default"
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/ fstype=btrfs
↳extra_opts={'NUMBER_CLEANUP': False}'
```

`salt.modules.snapper.create_snapshot`(*config='root', snapshot\_type='single', pre\_number=None, description=None, cleanup\_algorithm='number', userdata=None, \*\*kwargs*)

Creates an snapshot

**config** Configuration name.

**snapshot\_type** Specifies the type of the new snapshot. Possible values are single, pre and post.

**pre\_number** For post snapshots the number of the pre snapshot must be provided.

**description** Description for the snapshot. If not given, the salt job will be used.

**cleanup\_algorithm** Set the cleanup algorithm for the snapshot.

**number** Deletes old snapshots when a certain number of snapshots is reached.

**timeline** Deletes old snapshots but keeps a number of hourly, daily, weekly, monthly and yearly snapshots.

**empty-pre-post** Deletes pre/post snapshot pairs with empty diffs.

**userdata** Set userdata for the snapshot (key-value pairs).

Returns the number of the created snapshot.

CLI example:

```
salt '*' snapper.create_snapshot
```

`salt.modules.snapper.delete_snapshot`(*snapshots\_ids=None, config='root'*)

Deletes an snapshot

**config** Configuration name. (Default: root)

**snapshots\_ids** List of the snapshots IDs to be deleted.

CLI example:

```
salt '*' snapper.delete_snapshot 54
salt '*' snapper.delete_snapshot config=root 54
salt '*' snapper.delete_snapshot config=root snapshots_ids=[54,55,56]
```

`salt.modules.snapper.diff`(*config='root', filename=None, num\_pre=None, num\_post=None*)

Returns the differences between two snapshots

**config** Configuration name.

**filename** if not provided the showing differences between snapshots for all ``text`` files

**num\_pre** first snapshot ID to compare. Default is last snapshot

**num\_post** last snapshot ID to compare. Default is 0 (current state)

CLI Example:

```
salt '*' snapper.diff
salt '*' snapper.diff filename=/var/log/snapper.log num_pre=19 num_post=20
```

`salt.modules.snapper.diff_jid(jid, config='root')`

Returns the changes applied by a *jid*

**jid** The job id to lookup

**config** Configuration name.

CLI Example:

```
salt '*' snapper.diff_jid jid=20160607130930720112
```

`salt.modules.snapper.get_config(name='root')`

Retrieves all values from a given configuration

CLI example:

```
salt '*' snapper.get_config
```

`salt.modules.snapper.get_snapshot(number=0, config='root')`

Get detailed information about a given snapshot

CLI example:

```
salt '*' snapper.get_snapshot 1
```

`salt.modules.snapper.list_configs()`

List all available configs

CLI example:

```
salt '*' snapper.list_configs
```

`salt.modules.snapper.list_snapshots(config='root')`

List available snapshots

CLI example:

```
salt '*' snapper.list_snapshots config=myconfig
```

`salt.modules.snapper.modify_snapshot(snapshot_id=None, description=None, userdata=None, cleanup=None, config='root')`

Modify attributes of an existing snapshot.

**config** Configuration name. (Default: root)

**snapshot\_id** ID of the snapshot to be modified.

**cleanup** Change the cleanup method of the snapshot. (str)

**description** Change the description of the snapshot. (str)

**userdata** Change the userdata dictionary of the snapshot. (dict)

CLI example:

```
salt '*' snapper.modify_snapshot 54 description="my snapshot description"
salt '*' snapper.modify_snapshot 54 description="my snapshot description"
salt '*' snapper.modify_snapshot 54 userdata={'foo': 'bar'}
salt '*' snapper.modify_snapshot snapshot_id=54 cleanup="number"
```

`salt.modules.snapper.run(function, *args, **kwargs)`

Runs a function from an execution module creating pre and post snapshots and associating the salt job id with those snapshots for easy undo and cleanup.

**function** Salt function to call.

**config** Configuration name. (default: ``root``)

**description** A description for the snapshots. (default: None)

**userdata** Data to include in the snapshot metadata. (default: None)

**cleanup\_algorithm** Snapper cleanup algorithm. (default: ``number``)

**\*args** args for the function to call. (default: None)

**\*\*kwargs** kwargs for the function to call (default: None)

This would run append text to `/etc/motd` using the `file.append` module, and will create two snapshots, pre and post with the associated metadata. The `jid` will be available as `salt_jid` in the `userdata` of the snapshot.

You can immediately see the changes

CLI Example:

```
salt '*' snapper.run file.append args='["/etc/motd", "some text"]'
```

`salt.modules.snapper.set_config`(*name='root', \*\*kwargs*)

Set configuration values

CLI example:

```
salt '*' snapper.set_config SYNC_ACL=True
```

Keys are case insensitive as they will be always uppercased to snapper convention. The above example is equivalent to:

`salt.modules.snapper.status`(*config='root', num\_pre=None, num\_post=None*)

Returns a comparison between two snapshots

**config** Configuration name.

**num\_pre** first snapshot ID to compare. Default is last snapshot

**num\_post** last snapshot ID to compare. Default is 0 (current state)

CLI example:

```
salt '*' snapper.status
salt '*' snapper.status num_pre=19 num_post=20
```

`salt.modules.snapper.status_to_string`(*dbus\_status*)

Converts a numeric dbus snapper status into a string

CLI Example:

```
salt '*' snapper.status_to_string <dbus_status>
```

`salt.modules.snapper.undo`(*config='root', files=None, num\_pre=None, num\_post=None*)

Undo all file changes that happened between `num_pre` and `num_post`, leaving the files into the state of `num_pre`.

**Warning:** If one of the files has changes after `num_post`, they will be overwritten. The snapshots are used to determine the file list, but the current version of the files will be overwritten by the versions in `num_pre`.

You to undo changes between `num_pre` and the current version of the files use `num_post=0`.

CLI Example:

```
salt '*' snapper.undo
```

`salt.modules.snapper.undo_jid`(*jid, config='root'*)

Undo the changes applied by a salt job

**jid** The job id to lookup  
**config** Configuration name.  
CLI Example:

```
salt '*' snapper.undo_jid jid=20160607130930720112
```

### 14.7.370 salt.modules.state

Control the state system on the minion.

#### State Caching

When a highstate is called, the minion automatically caches a copy of the last high data. If you then run a highstate with `cache=True` it will use that cached highdata and won't hit the fileserver except for `salt://` links in the states themselves.

`salt.modules.state.apply` (*mods=None, \*\*kwargs*)

New in version 2015.5.0.

This function will call `state.highstate` or `state.sls` based on the arguments passed to this function. It exists as a more intuitive way of applying states.

#### APPLYING ALL STATES CONFIGURED IN TOP.SLS (A.K.A. HIGHSTATE)

To apply all configured states, simply run `state.apply`:

```
salt '*' state.apply
```

The following additional arguments are also accepted when applying all states configured in `top.sls`:

**test** Run states in test-only (dry-run) mode

**pillar** Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.apply test pillar='{ "foo": "bar" }'
```

---

**Note:** Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

---

**queue** [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

**localconfig** Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, `file_roots`, etc.

```
salt '*' state.apply localconfig=/path/to/minion.yml
```

#### APPLYING INDIVIDUAL SLS FILES (A.K.A. STATE.SLS)

To apply individual SLS files, pass them as a comma-separated list:

```
# Run the states configured in salt://test.sls (or salt://test/init.sls)
salt '*' state.apply test
# Run the states configured in salt://test.sls (or salt://test/init.sls)
# and salt://pkgs.sls (or salt://pkgs/init.sls).
salt '*' state.apply test, pkgs
```

The following additional arguments are also accepted when applying individual SLS files:

**test** Run states in test-only (dry-run) mode

**pillar** Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.apply test pillar='{"foo": "bar"}'
```

**Note:** Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

**queue** [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

**concurrent** [False] Execute state runs concurrently instead of serially

**Warning:** This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same time. Do *not* use this flag for performance optimization.

**saltenv** Specify a salt fileserver environment to be used when applying states

Changed in version 0.17.0: Argument name changed from `env` to `saltenv`

Changed in version 2014.7.0: If no `saltenv` is specified, the minion config will be checked for an `environment` parameter and if found, it will be used. If none is found, `base` will be used. In prior releases, the minion config was not checked and `base` would always be assumed when the `saltenv` was not explicitly set.

**pillarenv** Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

**localconfig** Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, `file_roots`, etc.

```
salt '*' state.apply test localconfig=/path/to/minion.yml
```

`salt.modules.state.check_request` (*name=None*)

New in version 2015.5.0.

Return the state request information, if any

CLI Example:

```
salt '*' state.check_request
```

`salt.modules.state.clear_cache`()

Clear out cached state files, forcing even cache runs to refresh the cache on the next state execution.

Remember that the state cache is completely disabled by default, this execution only applies if `cache=True` is used in states

CLI Example:

```
salt '*' state.clear_cache
```

`salt.modules.state.clear_request` (*name=None*)

New in version 2015.5.0.

Clear out the state execution request without executing it

CLI Example:

```
salt '*' state.clear_request
```

`salt.modules.state.disable` (*states*)

Disable state runs.

CLI Example:

```
salt '*' state.disable highstate
```

```
salt '*' state.disable highstate, test.succeed_without_changes
```

---

**Note:** To disable a state file from running provide the same name that would be passed in a state.sls call.

```
salt '*' state.disable bind.config
```

---

`salt.modules.state.enable` (*states*)

Enable state function or sls run

CLI Example:

```
salt '*' state.enable highstate
```

```
salt '*' state.enable test.succeed_without_changes
```

---

**Note:** To enable a state file from running provide the same name that would be passed in a state.sls call.

```
salt '*' state.disable bind.config
```

---

`salt.modules.state.event` (*tagmatch='\*', count=-1, quiet=False, sock\_dir=None, pretty=False, node='minion'*)

Watch Salt's event bus and block until the given tag is matched

New in version 2016.3.0.

This is useful for utilizing Salt's event bus from shell scripts or for taking simple actions directly from the CLI.

Enable debug logging to see ignored events.

**Parameters**

- **tagmatch** -- the event is written to stdout for each tag that matches this pattern; uses the same matching semantics as Salt's Reactor.
- **count** -- this number is decremented for each event that matches the tagmatch parameter; pass -1 to listen forever.
- **quiet** -- do not print to stdout; just block
- **sock\_dir** -- path to the Salt master's event socket file.
- **pretty** -- Output the JSON all on a single line if False (useful for shell tools); pretty-print the JSON output if True.

- **node** -- Watch the minion-side or master-side event bus.

CLI Example:

```
salt-call --local state.event pretty=True
```

`salt.modules.state.high`(*data*, *test=None*, *queue=False*, *\*\*kwargs*)

Execute the compound calls stored in a single set of high data

This function is mostly intended for testing the state system and is not likely to be needed in everyday usage.

CLI Example:

```
salt '*' state.high '{"vim": {"pkg": ["installed"]}]'
```

`salt.modules.state.highstate`(*test=None*, *queue=False*, *\*\*kwargs*)

Retrieve the state data from the salt master for this minion and execute it

**test** Run states in test-only (dry-run) mode

**pillar** Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.apply test pillar={'foo': "bar"}
```

---

**Note:** Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

---

Changed in version 2016.3.0: GPG-encrypted CLI Pillar data is now supported via the GPG renderer. See [here](#) for details.

**pillar\_enc** Specify which renderer to use to decrypt encrypted data located within the `pillar` value. Currently, only `gpg` is supported.

New in version 2016.3.0.

**saltenv** Specify a salt fileserver environment to be used when applying states

Changed in version 0.17.0: Argument name changed from `env` to `saltenv`.

Changed in version 2014.7.0: If no `saltenv` is specified, the minion config will be checked for a `saltenv` parameter and if found, it will be used. If none is found, `base` will be used. In prior releases, the minion config was not checked and `base` would always be assumed when the `saltenv` was not explicitly set.

**pillarenv** Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

**queue** [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

**localconfig** Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, `file_roots`, etc.

**mock** The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

CLI Examples:

```
salt '*' state.highstate
```

```
salt '*' state.highstate whitelist=sls1_to_run,sls2_to_run
```

```
salt '*' state.highstate exclude=sls_to_exclude
salt '*' state.highstate exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_to_
↳exclude'}]"

salt '*' state.highstate pillar="{foo: 'Foo!', bar: 'Bar!'}"
```

**salt.modules.state.list\_disabled()**

List the states which are currently disabled

CLI Example:

```
salt '*' state.list_disabled
```

**salt.modules.state.low**(data, queue=False, \*\*kwargs)

Execute a single low data call

This function is mostly intended for testing the state system and is not likely to be needed in everyday usage.

CLI Example:

```
salt '*' state.low '{"state": "pkg", "fun": "installed", "name": "vi"}'
```

**salt.modules.state.orchestrate**(mods, saltenv='base', test=None, exclude=None, pillar=None, pillarenv=None)

New in version 2016.11.0.

Execute the orchestrate runner from a masterless minion.

**See also:**

More Orchestrate documentation

- [Full Orchestrate Tutorial](#)
- Docs for the ``salt` state module <salt.states.saltmod>`

CLI Examples:

```
salt-call --local state.orchestrate webserver
salt-call --local state.orchestrate webserver saltenv=dev test=True
salt-call --local state.orchestrate webserver saltenv=dev pillarenv=aws
```

**salt.modules.state.pkg**(pkg\_path, pkg\_sum, hash\_type, test=None, \*\*kwargs)

Execute a packaged state run, the packaged state run will exist in a tarball available locally. This packaged state can be generated using salt-ssh.

CLI Example:

```
salt '*' state.pkg /tmp/salt_state.tgz 760a9353810e36f6d81416366fc426dc md5
```

**salt.modules.state.request**(mods=None, \*\*kwargs)

New in version 2015.5.0.

Request that the local admin execute a state run via *salt-call state.run\_request* All arguments match state.apply

CLI Example:

```
salt '*' state.request
salt '*' state.request test
salt '*' state.request test,pkgs
```

**salt.modules.state.run\_request**(name='default', \*\*kwargs)

New in version 2015.5.0.

Execute the pending state request

CLI Example:

```
salt '*' state.run_request
```

`salt.modules.state.running`(*concurrent=False*)

Return a list of strings that contain state return data if a state function is already running. This function is used to prevent multiple state calls from being run at the same time.

CLI Example:

```
salt '*' state.running
```

`salt.modules.state.show_highstate`(*queue=False, \*\*kwargs*)

Retrieve the highstate data from the salt master and display it

Custom Pillar data can be passed with the `pillar` kwarg.

CLI Example:

```
salt '*' state.show_highstate
```

`salt.modules.state.show_low_sls`(*mods, test=None, queue=False, \*\*kwargs*)

Display the low data from a specific sls. The default environment is `base`, use `saltenv` to specify a different environment.

**saltenv** Specify a salt fileserver environment to be used when applying states

**pillarenv** Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

CLI Example:

```
salt '*' state.show_low_sls foo
salt '*' state.show_low_sls foo saltenv=dev
```

`salt.modules.state.show_lowstate`(*queue=False, \*\*kwargs*)

List out the low data that will be applied to this minion

CLI Example:

```
salt '*' state.show_lowstate
```

`salt.modules.state.show_sls`(*mods, test=None, queue=False, \*\*kwargs*)

Display the state data from a specific sls or list of sls files on the master. The default environment is `base`, use `saltenv` to specify a different environment.

This function does not support topfiles. For `top.sls` please use `show_top` instead.

Custom Pillar data can be passed with the `pillar` kwarg.

**saltenv** Specify a salt fileserver environment to be used when applying states

**pillarenv** Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

CLI Example:

```
salt '*' state.show_sls core,edit.vim dev
```

`salt.modules.state.show_state_usage`(*queue=False, \*\*kwargs*)

Retrieve the highstate data from the salt master to analyse used and unused states

Custom Pillar data can be passed with the `pillar` kwarg.

CLI Example:

```
salt '*' state.show_state_usage
```

`salt.modules.state.show_top` (*queue=False, \*\*kwargs*)  
Return the top data that the minion will use for a highstate

CLI Example:

```
salt '*' state.show_top
```

`salt.modules.state.single` (*fun, name, test=None, queue=False, \*\*kwargs*)  
Execute a single state function with the named kwargs, returns False if insufficient data is sent to the command

By default, the values of the kwargs will be parsed as YAML. So, you can specify lists values, or lists of single entry key-value maps, as you would in a YAML salt file. Alternatively, JSON format of keyword values is also supported.

CLI Example:

```
salt '*' state.single pkg.installed name=vim
```

`salt.modules.state.sls` (*mods, test=None, exclude=None, queue=False, \*\*kwargs*)  
Execute the states in one or more SLS files  
**test** Run states in test-only (dry-run) mode  
**pillar** Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.apply test pillar='{ "foo": "bar" }'
```

---

**Note:** Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

---

Changed in version 2016.3.0: GPG-encrypted CLI Pillar data is now supported via the GPG renderer. See [here](#) for details.

**pillar\_enc** Specify which renderer to use to decrypt encrypted data located within the `pillar` value. Currently, only `gpg` is supported.

New in version 2016.3.0.

**queue** [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

**concurrent** [False] Execute state runs concurrently instead of serially

**Warning:** This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same time. Do *not* use this flag for performance optimization.

**saltenv** Specify a salt fileserver environment to be used when applying states

Changed in version 0.17.0: Argument name changed from `env` to `saltenv`.

Changed in version 2014.7.0: If no `saltenv` is specified, the minion config will be checked for an `environment` parameter and if found, it will be used. If none is found, `base` will be used. In prior

releases, the minion config was not checked and `base` would always be assumed when the `saltenv` was not explicitly set.

**pillarenv** Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

**localconfig**

Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, `file_roots`, etc.

**mock**: The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

CLI Example:

```
salt '*' state.sls core,edit.vim dev
salt '*' state.sls core exclude="{ 'id': 'id_to_exclude'}, {'sls': 'sls_to_exclude'
→ '}'}"
salt '*' state.sls myslsfile pillar="{foo: 'Foo!', bar: 'Bar!'}"
```

`salt.modules.state.sls_id(id_, mods, test=None, queue=False, **kwargs)`

Call a single ID from the named module(s) and handle all requisites

The state ID comes *before* the module ID(s) on the command line.

**id** ID to call

**mods** Comma-delimited list of modules to search for given id and its requisites

New in version 2014.7.0.

**saltenv** [base] Specify a salt filesERVER environment to be used when applying states

**pillarenv** Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

CLI Example:

```
salt '*' state.sls_id my_state my_module
salt '*' state.sls_id my_state my_module,a_common_module
```

`salt.modules.state.template(tem, queue=False, **kwargs)`

Execute the information stored in a template file on the minion.

This function does not ask a master for a SLS file to render but instead directly processes the file at the provided path on the minion.

CLI Example:

```
salt '*' state.template '<Path to template on the minion>'
```

`salt.modules.state.template_str(tem, queue=False, **kwargs)`

Execute the information stored in a string from an sls template

CLI Example:

```
salt '*' state.template_str '<Template String>'
```

`salt.modules.state.top` (*topfn*, *test=None*, *queue=False*, *\*\*kwargs*)

Execute a specific top file instead of the default. This is useful to apply configurations from a different environment (for example, dev or prod), without modifying the default top file.

**queue** [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

**saltenv** Specify a salt fileserver environment to be used when applying states

**pillarenv** Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the *pillarenv* option. When neither the *pillarenv* minion config option nor this CLI argument is used, all Pillar environments will be merged together.

New in version 2017.7.0.

CLI Example:

```
salt '*' state.top reverse_top.sls
salt '*' state.top prod_top.sls exclude=sls_to_exclude
salt '*' state.top dev_top.sls exclude="{ 'id': 'id_to_exclude'}, {'sls': 'sls_to_
↳exclude'}]"
```

### 14.7.371 salt.modules.status

Module for returning various status data about a minion. These data can be useful for compiling into stats later.

`salt.modules.status.all_status`()

Return a composite of all status data and info for this minion. Warning: There is a LOT here!

CLI Example:

```
salt '*' status.all_status
```

`salt.modules.status.cpuinfo`()

Changed in version 2016.3.2: Return the CPU info for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.cpuinfo
```

`salt.modules.status.cputats`()

Return the CPU stats for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.cputats
```

`salt.modules.status.custom`()

Return a custom composite of status data and info for this minion, based on the minion config file. An example config like might be:

```
status.cputats.custom: [ 'cpu', 'ctxt', 'btime', 'processes' ]
```

Where `status` refers to `status.py`, `cputats` is the function where we get our data, and `custom` is this function. It is followed by a list of keys that we want returned.

This function is meant to replace `all_status()`, which returns anything and everything, which we probably don't want.

By default, nothing is returned. Warning: Depending on what you include, there can be a LOT here!

CLI Example:

```
salt '*' status.custom
```

`salt.modules.status.diskstats()`

Changed in version 2016.3.2: Return the disk stats for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.diskstats
```

`salt.modules.status.diskusage(*args)`

Return the disk usage for this minion

Usage:

```
salt '*' status.diskusage [paths and/or filesystem types]
```

CLI Example:

```
salt '*' status.diskusage           # usage for all filesystems
salt '*' status.diskusage / /tmp   # usage for / and /tmp
salt '*' status.diskusage ext?     # usage for ext[234] filesystems
salt '*' status.diskusage / ext?   # usage for / and all ext filesystems
```

`salt.modules.status.loadavg()`

Return the load averages for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.loadavg
:raises CommandExecutionError: If the system cannot report loadaverages to Python
```

`salt.modules.status.master(master=None, connected=True)`

New in version 2014.7.0.

Return the connection status with master. Fire an event if the connection to master is not as expected. This function is meant to be run via a scheduled job from the minion. If `master_ip` is an FQDN/Hostname, it must be resolvable to a valid IPv4 address.

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.master
```

`salt.modules.status.meminfo()`

Return the memory info for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.meminfo
```

`salt.modules.status.netdev()`

Changed in version 2016.3.2: Return the network device stats for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.netdev
```

`salt.modules.status.netstats()`

Return the network stats for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.netstats
```

`salt.modules.status.nproc()`

Return the number of processing units available on this system

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.nproc
```

`salt.modules.status.pid(sig)`

Return the PID or an empty string if the process is running or not. Pass a signature to use to find the process via ps. Note you can pass a Python-compatible regular expression to return all pids of processes matching the regexp.

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.pid <sig>
```

`salt.modules.status.ping_master(master)`

New in version 2016.3.0.

Sends ping request to the given master. Fires `__master_failback` event on success. Returns bool result.

CLI Example:

```
salt '*' status.ping_master localhost
```

`salt.modules.status.procs()`

Return the process data

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.procs
```

`salt.modules.status.proxy_reconnect(proxy_name, opts=None)`

Forces proxy minion reconnection when not alive.

`proxy_name` The virtual name of the proxy module.

**opts:** **None** Opts dictionary. Not intended for CLI usage.

CLI Example:

```
salt '*' status.proxy_reconnect rest_sample
```

**salt.modules.status.time** (*format='%A, %d. %B %Y %l:%M%p'*)

New in version 2016.3.0.

Return the current time on the minion, formatted based on the format parameter.

Default date format: Monday, 27. July 2015 07:55AM

CLI Example:

```
salt '*' status.time
salt '*' status.time '%s'
```

**salt.modules.status.uptime**()

Return the uptime for this system.

Changed in version 2015.8.9: The uptime function was changed to return a dictionary of easy-to-read key/value pairs containing uptime information, instead of the output from a `cmd.run` call.

Changed in version 2016.11.0: Support for OpenBSD, FreeBSD, NetBSD, MacOS, and Solaris

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.uptime
```

**salt.modules.status.version**()

Return the system version for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.version
```

**salt.modules.status.vfstats**()

Changed in version 2016.3.2: Return the virtual memory stats for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.vfstats
```

**salt.modules.status.w**()

Return a list of logged in users for this minion, using the `w` command

CLI Example:

```
salt '*' status.w
```

### 14.7.372 salt.modules.statuspage

#### StatusPage

Handle requests for the `StatusPage` API.

In the minion configuration file, the following block is required:

```
statuspage:
  api_key: <API_KEY>
  page_id: <PAGE_ID>
```

New in version 2017.7.0.

```
salt.modules.statuspage.create(endpoint='incidents', api_url=None, page_id=None,
                               api_key=None, api_version=None, **kwargs)
```

Insert a new entry under a specific endpoint.

**endpoint: incidents** Insert under this specific endpoint.

**page\_id** Page ID. Can also be specified in the config file.

**api\_key** API key. Can also be specified in the config file.

**api\_version: 1** API version. Can also be specified in the config file.

**api\_url** Custom API URL in case the user has a StatusPage service running in a custom environment.

**\*\*kwargs** Other params.

CLI Example:

```
salt 'minion' statuspage.create endpoint='components' name='my component' group_
↳ id='993vgplshj12'
```

Example output:

```
minion:
  -----
  comment:
  out:
  -----
  created_at:
    2017-01-05T19:35:27.135Z
  description:
    None
  group_id:
    993vgplshj12
  id:
    mjkm5lhdgc
  name:
    my component
  page_id:
    ksdhgyiuhaa
  position:
    7
  status:
    operational
  updated_at:
    2017-01-05T19:35:27.135Z
  result:
    True
```

```
salt.modules.statuspage.delete(endpoint='incidents', id=None, api_url=None, page_id=None,
                               api_key=None, api_version=None)
```

Remove an entry from an endpoint.

**endpoint: incidents** Request a specific endpoint.

**page\_id** Page ID. Can also be specified in the config file.

**api\_key** API key. Can also be specified in the config file.

**api\_version: 1** API version. Can also be specified in the config file.

**api\_url** Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:

```
salt 'minion' statuspage.delete endpoint='components' id='ftgks51sfs2d'
```

Example output:

```
minion:
-----
comment:
out:
  None
result:
  True
```

`salt.modules.statuspage.retrieve` (*endpoint='incidents', api\_url=None, page\_id=None, api\_key=None, api\_version=None*)

Retrieve a specific endpoint from the Statuspage API.

**endpoint: incidents** Request a specific endpoint.

**page\_id** Page ID. Can also be specified in the config file.

**api\_key** API key. Can also be specified in the config file.

**api\_version: 1** API version. Can also be specified in the config file.

**api\_url** Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:

```
salt 'minion' statuspage.retrieve components
```

Example output:

```
minion:
-----

```

`salt.modules.statuspage.update` (*endpoint='incidents', id=None, api\_url=None, page\_id=None, api\_key=None, api\_version=None, \*\*kwargs*)

Update attribute(s) of a specific endpoint.

**id** The unique ID of the endpoint entry.

**endpoint: incidents** Endpoint name.

**page\_id** Page ID. Can also be specified in the config file.

**api\_key** API key. Can also be specified in the config file.

**api\_version: 1** API version. Can also be specified in the config file.

**api\_url** Custom API URL in case the user has a StatusPage service running in a custom environment.  
CLI Example:

```
salt 'minion' statuspage.update id=dz959yz2nd4l status=resolved
```

Example output:

```
minion:
-----
comment:
out:
-----
  created_at:
    2017-01-03T15:25:30.718Z

result:
  True
```

### 14.7.373 salt.modules.stormpath

Support for Stormpath

New in version 2015.8.0.

**salt.modules.stormpath.create\_account**(*directory\_id*, *email*, *password*, *givenName*, *surname*, **\*\*kwargs**)

Create an account

CLI Examples:

```
salt myminion stormpath.create_account <directory_id> shemp@example.com letmein Shemp
Howard
```

**salt.modules.stormpath.delete\_account**(*account\_id*)

Delete an account.

CLI Examples:

```
salt myminion stormpath.delete_account <account_id>
```

**salt.modules.stormpath.list\_accounts**()

Show all accounts.

CLI Example:

```
salt myminion stormpath.list_accounts
```

`salt.modules.stormpath.list_directories()`

Show all directories.

CLI Example:

```
salt myminion stormpath.list_directories
```

`salt.modules.stormpath.show_account(account_id=None, email=None, directory_id=None, application_id=None, group_id=None, **kwargs)`

Show a specific account.

CLI Example:

```
salt myminion stormpath.show_account <account_id>
```

`salt.modules.stormpath.show_tenant()`

Get the tenant for the login being used.

`salt.modules.stormpath.update_account(account_id, key=None, value=None, items=None)`

Update one or more items for this account. Specifying an empty value will clear it for that account.

CLI Examples:

```
salt myminion stormpath.update_account <account_id> givenName shemp salt myminion stormpath.update_account <account_id> middleName `` salt myminion stormpath.update_account <account_id> items={'givenName': ``Shemp`} salt myminion stormpath.update_account <account_id> items={'middlename': ``}
```

### 14.7.374 salt.modules.supervisord

Provide the service module for system supervisord or supervisord in a virtualenv

`salt.modules.supervisord.add(name, user=None, conf_file=None, bin_env=None)`

Activates any updates in config for process/group.

**user** user to run supervisorctl as

**conf\_file** path to supervisord config file

**bin\_env** path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.add <name>
```

`salt.modules.supervisord.custom(command, user=None, conf_file=None, bin_env=None)`

Run any custom supervisord command

**user** user to run supervisorctl as

**conf\_file** path to supervisord config file

**bin\_env** path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.custom "mstop '*gunicorn*'"
```

`salt.modules.supervisord.options(name, conf_file=None)`

New in version 2014.1.0.

Read the config file and return the config options for a given process

**name** Name of the configured process

**conf\_file** path to supervisord config file

CLI Example:

```
salt '*' supervisord.options foo
```

`salt.modules.supervisord.remove`(*name*, *user=None*, *conf\_file=None*, *bin\_env=None*)

Removes process/group from active config

**user** user to run supervisorctl as

**conf\_file** path to supervisord config file

**bin\_env** path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.remove <name>
```

`salt.modules.supervisord.reread`(*user=None*, *conf\_file=None*, *bin\_env=None*)

Reload the daemon's configuration files

**user** user to run supervisorctl as

**conf\_file** path to supervisord config file

**bin\_env** path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.reread
```

`salt.modules.supervisord.restart`(*name='all'*, *user=None*, *conf\_file=None*, *bin\_env=None*)

Restart the named service. Process group names should not include a trailing asterisk.

**user** user to run supervisorctl as

**conf\_file** path to supervisord config file

**bin\_env** path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.restart <service>
salt '*' supervisord.restart <group>:
```

`salt.modules.supervisord.start`(*name='all'*, *user=None*, *conf\_file=None*, *bin\_env=None*)

Start the named service. Process group names should not include a trailing asterisk.

**user** user to run supervisorctl as

**conf\_file** path to supervisord config file

**bin\_env** path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.start <service>
salt '*' supervisord.start <group>:
```

`salt.modules.supervisord.status`(*name=None*, *user=None*, *conf\_file=None*, *bin\_env=None*)

List programs and its state

**user** user to run supervisorctl as

**conf\_file** path to supervisord config file

**bin\_env** path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.status
```

`salt.modules.supervisord.status_raw`(*name=None*, *user=None*, *conf\_file=None*, *bin\_env=None*)

Display the raw output of status

**user** user to run supervisorctl as

**conf\_file** path to supervisord config file

**bin\_env** path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.status_raw
```

`salt.modules.supervisord.stop` (*name='all', user=None, conf\_file=None, bin\_env=None*)

Stop the named service. Process group names should not include a trailing asterisk.

**user** user to run supervisorctl as

**conf\_file** path to supervisord config file

**bin\_env** path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.stop <service>
salt '*' supervisord.stop <group>:
```

`salt.modules.supervisord.update` (*user=None, conf\_file=None, bin\_env=None, name=None*)

Reload config and add/remove/update as necessary

**user** user to run supervisorctl as

**conf\_file** path to supervisord config file

**bin\_env** path to supervisorctl bin or path to virtualenv with supervisor installed

**name** name of the process group to update. if none then update any process group that has changes

CLI Example:

```
salt '*' supervisord.update
```

### 14.7.375 salt.modules.suse\_apache

Support for Apache

Please note: The functions in here are SUSE-specific. Placing them in this separate file will allow them to load only on SUSE systems, while still loading under the `apache` namespace.

`salt.modules.suse_apache.a2dismod` (*mod*)

Runs `a2dismod` for the given mod.

CLI Example:

```
salt '*' apache.a2dismod vhost_alias
```

`salt.modules.suse_apache.a2enmod` (*mod*)

Runs `a2enmod` for the given mod.

CLI Example:

```
salt '*' apache.a2enmod vhost_alias
```

`salt.modules.suse_apache.check_mod_enabled` (*mod*)

Checks to see if the specific apache mod is enabled.

This will only be functional on operating systems that support `a2enmod -l` to list the enabled mods.

CLI Example:

```
salt '*' apache.check_mod_enabled status
```

### 14.7.376 salt.modules.svn

Subversion SCM

`salt.modules.svn.add` (*cwd, targets, user=None, username=None, password=None, \*opts*)

Add files to be tracked by the Subversion working-copy checkout

**cwd** The path to the Subversion repository  
**targets** [None] files and directories to pass to the command as arguments  
**user** [None] Run svn as a user other than what the minion runs as  
**username** [None] Connect to the Subversion server as another user  
**password** [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.add /path/to/repo /path/to/new/file
```

**salt.modules.svn.checkout**(*cwd, remote, target=None, user=None, username=None, password=None, \*opts*)

Download a working copy of the remote Subversion repository directory or file

**cwd** The path to the Subversion repository  
**remote** [None] URL to checkout  
**target** [None] The name to give the file or directory working copy Default: svn uses the remote basename  
**user** [None] Run svn as a user other than what the minion runs as  
**username** [None] Connect to the Subversion server as another user  
**password** [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.checkout /path/to/repo svn://remote/repo
```

**salt.modules.svn.commit**(*cwd, targets=None, msg=None, user=None, username=None, password=None, \*opts*)

Commit the current directory, files, or directories to the remote Subversion repository

**cwd** The path to the Subversion repository  
**targets** [None] files and directories to pass to the command as arguments Default: svn uses `.`  
**msg** [None] Message to attach to the commit log  
**user** [None] Run svn as a user other than what the minion runs as  
**username** [None] Connect to the Subversion server as another user  
**password** [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.commit /path/to/repo
```

**salt.modules.svn.diff**(*cwd, targets=None, user=None, username=None, password=None, \*opts*)

Return the diff of the current directory, files, or directories from the remote Subversion repository

**cwd** The path to the Subversion repository  
**targets** [None] files and directories to pass to the command as arguments Default: svn uses `.`  
**user** [None] Run svn as a user other than what the minion runs as  
**username** [None] Connect to the Subversion server as another user  
**password** [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.diff /path/to/repo
```

**salt.modules.svn.export**(*cwd, remote, target=None, user=None, username=None, password=None, revision='HEAD', \*opts*)

Create an unversioned copy of a tree.

**cwd** The path to the Subversion repository

**remote** [None] URL and path to file or directory checkout  
**target** [None] The name to give the file or directory working copy Default: svn uses the remote basename  
**user** [None] Run svn as a user other than what the minion runs as  
**username** [None] Connect to the Subversion server as another user  
**password** [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.export /path/to/repo svn://remote/repo
```

**salt.modules.svn.info**(*cwd, targets=None, user=None, username=None, password=None, fmt='str'*)

Display the Subversion information from the checkout.

**cwd** The path to the Subversion repository

**targets** [None] files, directories, and URLs to pass to the command as arguments svn uses `!` by default

**user** [None] Run svn as a user other than what the minion runs as

**username** [None] Connect to the Subversion server as another user

**password** [None] Connect to the Subversion server with this password

New in version 0.17.0.

**fmt** [str] How to fmt the output from info. (str, xml, list, dict)

CLI Example:

```
salt '*' svn.info /path/to/svn/repo
```

**salt.modules.svn.remove**(*cwd, targets, msg=None, user=None, username=None, password=None, \*opts*)

Remove files and directories from the Subversion repository

**cwd** The path to the Subversion repository

**targets** [None] files, directories, and URLs to pass to the command as arguments

**msg** [None] Message to attach to the commit log

**user** [None] Run svn as a user other than what the minion runs as

**username** [None] Connect to the Subversion server as another user

**password** [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.remove /path/to/repo /path/to/repo/remove
```

**salt.modules.svn.status**(*cwd, targets=None, user=None, username=None, password=None, \*opts*)

Display the status of the current directory, files, or directories in the Subversion repository

**cwd** The path to the Subversion repository

**targets** [None] files, directories, and URLs to pass to the command as arguments Default: svn uses `!`

**user** [None] Run svn as a user other than what the minion runs as

**username** [None] Connect to the Subversion server as another user

**password** [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.status /path/to/repo
```

**salt.modules.svn.switch**(*cwd, remote, target=None, user=None, username=None, password=None, \*opts*)

New in version 2014.1.0.

Switch a working copy of a remote Subversion repository directory

**cwd** The path to the Subversion repository  
**remote** [None] URL to switch  
**target** [None] The name to give the file or directory working copy Default: svn uses the remote basename  
**user** [None] Run svn as a user other than what the minion runs as  
**username** [None] Connect to the Subversion server as another user  
**password** [None] Connect to the Subversion server with this password  
 CLI Example:

```
salt '*' svn.switch /path/to/repo svn://remote/repo
```

**salt.modules.svn.update** (*cwd, targets=None, user=None, username=None, password=None, \*opts*)

Update the current directory, files, or directories from the remote Subversion repository

**cwd** The path to the Subversion repository  
**targets** [None] files and directories to pass to the command as arguments Default: svn uses `'  
**user** [None] Run svn as a user other than what the minion runs as  
**password** [None] Connect to the Subversion server with this password

New in version 0.17.0.

**username** [None] Connect to the Subversion server as another user  
 CLI Example:

```
salt '*' svn.update /path/to/repo
```

### 14.7.377 salt.modules.swift

Module for handling OpenStack Swift calls Author: Anthony Stanton <anthony.stanton@gmail.com>

Inspired by the S3 and Nova modules

#### depends

- swiftclient Python module

**configuration** This module is not usable until the user, tenant, auth URL, and password or auth\_key are specified either in a pillar or in the minion's config file. For example:

```
keystone.user: admin
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
keystone.password: verybadpass
# or
keystone.auth_key: 203802934809284k2j34lkj2l3kj43k
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

```
openstack1:
  keystone.user: admin
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
  keystone.password: verybadpass
  # or
  keystone.auth_key: 203802934809284k2j34lkj2l3kj43k

openstack2:
  keystone.user: admin
  keystone.tenant: admin
```

```
keystone.auth_url: 'http://127.0.0.2:5000/v2.0/'
keystone.password: verybadpass
# or
keystone.auth_key: 303802934809284k2j34lkj2l3kj43k
```

With this configuration in place, any of the swift functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' swift.get mycontainer myfile /tmp/file profile=openstack1
```

NOTE: For Rackspace cloud files setting `keystone.auth_version = 1` is recommended.

`salt.modules.swift.delete` (*cont*, *path=None*, *profile=None*)

Delete a container, or delete an object from a container.

CLI Example to delete a container:

```
salt myminion swift.delete mycontainer
```

CLI Example to delete an object from a container:

```
salt myminion swift.delete mycontainer remoteobject
```

`salt.modules.swift.get` (*cont=None*, *path=None*, *local\_file=None*, *return\_bin=False*, *profile=None*)

List the contents of a container, or return an object from a container. Set `return_bin` to `True` in order to retrieve an object wholesale. Otherwise, Salt will attempt to parse an XML response.

CLI Example to list containers:

```
salt myminion swift.get
```

CLI Example to list the contents of a container:

```
salt myminion swift.get mycontainer
```

CLI Example to return the binary contents of an object:

```
salt myminion swift.get mycontainer myfile.png return_bin=True
```

CLI Example to save the binary contents of an object to a local file:

```
salt myminion swift.get mycontainer myfile.png local_file=/tmp/myfile.png
```

`salt.modules.swift.put` (*cont*, *path=None*, *local\_file=None*, *profile=None*)

Create a new container, or upload an object to a container.

CLI Example to create a container:

```
salt myminion swift.put mycontainer
```

CLI Example to upload an object to a container:

```
salt myminion swift.put mycontainer remotepath local_file=/path/to/file
```

### 14.7.378 salt.modules.sysbench

The `sysbench` module is used to analyze the performance of the minions, right from the master! It measures various system parameters such as CPU, Memory, File I/O, Threads and Mutex.

`salt.modules.sysbench.cpu()`

Tests for the CPU performance of minions.

CLI Examples:

```
salt '*' sysbench.cpu
```

`salt.modules.sysbench.fileio()`

This tests for the file read and write operations Various modes of operations are

- sequential write
- sequential rewrite
- sequential read
- random read
- random write
- random read and write

The test works with 32 files with each file being 1Gb in size The test consumes a lot of time. Be patient!

CLI Examples:

```
salt '*' sysbench.fileio
```

`salt.modules.sysbench.memory()`

This tests the memory for read and write operations.

CLI Examples:

```
salt '*' sysbench.memory
```

`salt.modules.sysbench.mutex()`

Tests the implementation of mutex

CLI Examples:

```
salt '*' sysbench.mutex
```

`salt.modules.sysbench.threads()`

This tests the performance of the processor's scheduler

CLI Example:

```
salt '*' sysbench.threads
```

### 14.7.379 salt.modules.sysfs module

Module for interfacing with SysFS

**See also:**

<https://www.kernel.org/doc/Documentation/filesystems/sysfs.txt>

New in version 2016.3.0.

`salt.modules.sysfs.attr(key, value=None)`

Access/write a SysFS attribute. If the attribute is a symlink, it's destination is returned

Returns value or bool

CLI example:

```
salt '*' sysfs.attr block/sda/queue/logical_block_size
```

`salt.modules.sysfs.interfaces`(*root*)

Generate a dictionary with all available interfaces relative to root. Symlinks are not followed.

CLI example:

```
salt '*' sysfs.interfaces block/bcache0/bcache
```

Output example:

```
{
  "r": [
    "state",
    "partial_stripes_expensive",
    "writeback_rate_debug",
    "stripe_size",
    "dirty_data",
    "stats_total/cache_hits",
    "stats_total/cache_bypass_misses",
    "stats_total/bypassed",
    "stats_total/cache_readaheads",
    "stats_total/cache_hit_ratio",
    "stats_total/cache_miss_collisions",
    "stats_total/cache_misses",
    "stats_total/cache_bypass_hits",
  ],
  "rw": [
    "writeback_rate",
    "writeback_rate_update_seconds",
    "cache_mode",
    "writeback_delay",
    "label",
    "writeback_running",
    "writeback_metadata",
    "running",
    "writeback_rate_p_term_inverse",
    "sequential_cutoff",
    "writeback_percent",
    "writeback_rate_d_term",
    "readahead"
  ],
  "w": [
    "stop",
    "clear_stats",
    "attach",
    "detach"
  ]
}
```

---

**Note:**

- `r` interfaces are read-only
  - `w` interfaces are write-only (e.g. actions)
  - `rw` are interfaces that can both be read or written
-

`salt.modules.sysfs.read(key, root='')`

Read from SysFS

**Parameters** **key** -- file or path in SysFS; if key is a list then root will be prefixed on each key

**Returns** the full (tree of) SysFS attributes under key

CLI example:

```
salt '*' sysfs.read class/net/em1/statistics
```

`salt.modules.sysfs.target(key, full=True)`

Return the basename of a SysFS key path

**Parameters**

- **key** -- the location to resolve within SysFS
- **full** -- full path instead of basename

**Returns** fullpath or basename of path

CLI example:

```
salt '*' sysfs.read class/ttyS0
```

`salt.modules.sysfs.write(key, value)`

Write a SysFS attribute/action

CLI example:

```
salt '*' sysfs.write devices/system/cpu/cpu0/cpufreq/scaling_governor
→ 'performance'
```

### 14.7.380 salt.modules.syslog\_ng

Module for getting information about syslog-ng

**maintainer** Tibor Benke <btibi@sch.bme.hu>

**maturity** new

**depends** cmd

**platform** all

This module is capable of managing syslog-ng instances which were installed via a package manager or from source. Users can use a directory as a parameter in the case of most functions, which contains the syslog-ng and syslog-ng-ctl binaries.

Syslog-ng can be installed via a package manager or from source. In the latter case, the syslog-ng and syslog-ng-ctl binaries are not available from the PATH, so users should set location of the sbin directory with `syslog_ng.set_binary_path`.

Similarly, users can specify the location of the configuration file with `syslog_ng.set_config_file`, then the module will use it. If it is not set, syslog-ng uses the default configuration file.

**class** `salt.modules.syslog_ng.Argument(value='')`

A TypedParameterValue has one or more Arguments. For example this can be the value of `key_file`.

Does not need examples.

**class** `salt.modules.syslog_ng.Buildable(iterable, join_body_on='', append_extra_newline=True)`

Base class of most classes, which have a build method.

It contains a common build function.

Does not need examples.

**build()**

Builds the textual representation of the whole configuration object with it's children.

**build\_body()**

Builds the body of a syslog-ng configuration object.

**build\_header()**

Builds the header of a syslog-ng configuration object.

**build\_tail()**

Builds the tail of a syslog-ng configuration object.

**class** salt.modules.syslog\_ng.**GivenStatement**(*value*, *add\_newline=True*)

This statement returns a string without modification. It can be used to use existing configuration snippets. Does not need examples.

**class** salt.modules.syslog\_ng.**NamedStatement**(*type*, *id=''*, *options=None*)

It represents a configuration statement, which has a name, e.g. a source.

Does not need examples.

**class** salt.modules.syslog\_ng.**Option**(*type=''*, *params=None*)

A Statement class contains Option instances.

An instance of Option can represent a file(), tcp(), udp(), etc. option.

Does not need examples.

**class** salt.modules.syslog\_ng.**Parameter**(*iterable=None*, *join\_body\_on=''*)

An Option has one or more Parameter instances.

Does not need examples.

**class** salt.modules.syslog\_ng.**ParameterValue**(*iterable=None*, *join\_body\_on=''*)

A TypedParameter can have one or more values.

Does not need examples.

**class** salt.modules.syslog\_ng.**SimpleParameter**(*value=''*)

A Parameter is a SimpleParameter, if it's just a simple type, like a string.

For example:

```
destination d_file {
    file(
        '/var/log/messages'
    );
};
```

/var/log/messages is a SimpleParameter.

Does not need examples.

**class** salt.modules.syslog\_ng.**SimpleParameterValue**(*value=''*)

A ParameterValue which holds a simple type, like a string or a number.

For example in ip(127.0.0.1) 127.0.0.1 is a SimpleParameterValue.

Does not need examples.

**class** salt.modules.syslog\_ng.**Statement**(*type*, *id=''*, *options=None*, *has\_name=True*)

It represents a syslog-ng configuration statement, e.g. source, destination, filter.

Does not need examples.

**class salt.modules.syslog\_ng.TypedParameter** (*type='', values=None*)

A Parameter, which has a type:

```
destination d_tcp {
  tcp(
    ip(127.0.0.1)
  );
};
```

`ip(127.0.0.1)` is a TypedParameter.

Does not need examples.

**class salt.modules.syslog\_ng.TypedParameterValue** (*type='', arguments=None*)

We have to go deeper..

A TypedParameter can have a `parameter`, which also have a type. For example `key_file` and `cert_file`:

```
source demo_tls_source {
  tcp(
    ip(0.0.0.0)
    port(1999)
    tls(
      key_file('/opt/syslog-ng/etc/syslog-ng/key.d/syslog-ng.key')
      cert_file('/opt/syslog-ng/etc/syslog-ng/cert.d/syslog-ng.cert')
    )
  );
};
```

Does not need examples.

**class salt.modules.syslog\_ng.UnnamedStatement** (*type, options=None*)

It represents a configuration statement, which doesn't have a name, e.g. a log path.

Does not need examples.

**salt.modules.syslog\_ng.config** (*name, config, write=True*)

Builds syslog-ng configuration. This function is intended to be used from the state module, users should not use it directly!

`name` : the id of the Salt document or it is the format of `<statement name>.id`  
`config` : the parsed YAML code  
`write` : if True, it writes the config into the configuration file, otherwise just returns it

CLI Example:

```
salt '*' syslog_ng.config name='s_local' config="['tcp': [{'ip': '127.0.0.1'}, {
↳ 'port': 1233}]]"
```

**salt.modules.syslog\_ng.config\_test** (*syslog\_ng\_sbin\_dir=None, cfgfile=None*)

Runs syntax check against `cfgfile`. If `syslog_ng_sbin_dir` is specified, it is added to the PATH during the test.

CLI Example:

```
salt '*' syslog_ng.config_test
salt '*' syslog_ng.config_test /home/user/install/syslog-ng/sbin
salt '*' syslog_ng.config_test /home/user/install/syslog-ng/sbin /etc/syslog-ng/
↳ syslog-ng.conf
```

**salt.modules.syslog\_ng.get\_config\_file** ()

Returns the configuration directory, which contains `syslog-ng.conf`.

CLI Example:

```
salt '*' syslog_ng.get_config_file
```

`salt.modules.syslog_ng.modules`(*syslog\_ng\_sbin\_dir=None*)

Returns the available modules. If `syslog_ng_sbin_dir` is specified, it is added to the PATH during the execution of the command `syslog-ng`.

CLI Example:

```
salt '*' syslog_ng.modules
salt '*' syslog_ng.modules /home/user/install/syslog-ng/sbin
```

`salt.modules.syslog_ng.reload`(*name*)

Reloads `syslog-ng`. This function is intended to be used from states.

If `syslog_ng.set_config_file`, is called before, this function will use the set binary path.

CLI Example:

```
salt '*' syslog_ng.reload
```

`salt.modules.syslog_ng.set_binary_path`(*name*)

Sets the path, where the `syslog-ng` binary can be found. This function is intended to be used from states.

If `syslog-ng` is installed via a package manager, users don't need to use this function.

CLI Example:

```
salt '*' syslog_ng.set_binary_path name=/usr/sbin
```

`salt.modules.syslog_ng.set_config_file`(*name*)

Sets the configuration's name. This function is intended to be used from states.

CLI Example:

```
salt '*' syslog_ng.set_config_file name=/etc/syslog-ng
```

`salt.modules.syslog_ng.set_parameters`(*version=None, binary\_path=None, config\_file=None, \*args, \*\*kwargs*)

Sets variables.

CLI Example:

```
salt '*' syslog_ng.set_parameters version='3.6'
salt '*' syslog_ng.set_parameters binary_path=/home/user/install/syslog-ng/sbin
↪config_file=/home/user/install/syslog-ng/etc/syslog-ng.conf
```

`salt.modules.syslog_ng.start`(*name=None, user=None, group=None, chroot=None, caps=None, no\_caps=False, pidfile=None, enable\_core=False, fd\_limit=None, verbose=False, debug=False, trace=False, yydebug=False, persist\_file=None, control=None, worker\_threads=None*)

Ensures, that `syslog-ng` is started via the given parameters. This function is intended to be used from the state module.

Users shouldn't use this function, if the service module is available on their system. If `syslog-ng.set_config_file`, is called before, this function will use the set binary path.

CLI Example:

```
salt '*' syslog_ng.start
```

`salt.modules.syslog_ng.stats`(*syslog\_ng\_sbin\_dir=None*)

Returns statistics from the running syslog-ng instance. If `syslog_ng_sbin_dir` is specified, it is added to the PATH during the execution of the command `syslog-ng-ctl`.

CLI Example:

```
salt '*' syslog_ng.stats
salt '*' syslog_ng.stats /home/user/install/syslog-ng/sbin
```

`salt.modules.syslog_ng.stop`(*name=None*)

Kills syslog-ng. This function is intended to be used from the state module.

Users shouldn't use this function, if the service module is available on their system. If `syslog-ng.set_config_file` is called before, this function will use the set binary path.

CLI Example:

```
salt '*' syslog_ng.stop
```

`salt.modules.syslog_ng.version`(*syslog\_ng\_sbin\_dir=None*)

Returns the version of the installed syslog-ng. If `syslog_ng_sbin_dir` is specified, it is added to the PATH during the execution of the command `syslog-ng`.

CLI Example:

```
salt '*' syslog_ng.version
salt '*' syslog_ng.version /home/user/install/syslog-ng/sbin
```

`salt.modules.syslog_ng.write_config`(*config, newlines=2*)

Writes the given parameter `config` into the config file. This function is intended to be used from states.

If `syslog-ng.set_config_file`, is called before, this function will use the set config file.

CLI Example:

```
salt '*' syslog_ng.write_config config='# comment'
```

`salt.modules.syslog_ng.write_version`(*name*)

Removes the previous configuration file, then creates a new one and writes the name line. This function is intended to be used from states.

If `syslog-ng.set_config_file`, is called before, this function will use the set config file.

CLI Example:

```
salt '*' syslog_ng.write_version name="3.6"
```

### 14.7.381 salt.modules.sysmod

The `sys` module provides information about the available functions on the minion

`salt.modules.sysmod.argspec`(*module=""*)

Return the argument specification of functions in Salt execution modules.

CLI Example:

```
salt '*' sys.argspec pkg.install
salt '*' sys.argspec sys
salt '*' sys.argspec
```

Module names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.argspec 'pkg.*'
```

**salt.modules.sysmod.doc(\*args)**

Return the docstrings for all modules. Optionally, specify a module or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple modules/functions can be specified.

CLI Example:

```
salt '*' sys.doc
salt '*' sys.doc sys
salt '*' sys.doc sys.doc
salt '*' sys.doc network.traceroute user.info
```

Modules can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.doc 'sys.*'
salt '*' sys.doc 'sys.list_*'
```

**salt.modules.sysmod.list\_functions(\*args, \*\*kwargs)**

List the functions for all modules. Optionally, specify a module or modules from which to list.

CLI Example:

```
salt '*' sys.list_functions
salt '*' sys.list_functions sys
salt '*' sys.list_functions sys user
```

Function names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_functions 'sys.list_*'
```

New in version ?.

```
salt '*' sys.list_functions 'module.specific_function'
```

**salt.modules.sysmod.list\_modules(\*args)**

List the modules loaded on the minion

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.list_modules
```

Module names can be specified as globs.

```
salt '*' sys.list_modules 's*'
```

**salt.modules.sysmod.list\_renderers(\*args)**

List the renderers loaded on the minion

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.list_renderers
```

Render names can be specified as globs.

```
salt '*' sys.list_renderers 'yaml*'
```

`salt.modules.sysmod.list_returner_functions(*args, **kwargs)`

List the functions for all returner modules. Optionally, specify a returner module or modules from which to list.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_returner_functions
salt '*' sys.list_returner_functions mysql
salt '*' sys.list_returner_functions mysql etcd
```

Returner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_returner_functions 'sqlite3.get_*'
```

`salt.modules.sysmod.list_returners(*args)`

List the returners loaded on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_returners
```

Returner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_returners 's*'
```

`salt.modules.sysmod.list_runner_functions(*args, **kwargs)`

List the functions for all runner modules. Optionally, specify a runner module or modules from which to list.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_runner_functions
salt '*' sys.list_runner_functions state
salt '*' sys.list_runner_functions state virt
```

Runner function names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_runner_functions 'state.*' 'virt.*'
```

`salt.modules.sysmod.list_runners(*args)`

List the runners loaded on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_runners
```

Runner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_runners 'm*'
```

`salt.modules.sysmod.list_state_functions(*args, **kwargs)`

List the functions for all state modules. Optionally, specify a state module or modules from which to list.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_state_functions
salt '*' sys.list_state_functions file
salt '*' sys.list_state_functions pkg user
```

State function names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_state_functions 'file.*'
salt '*' sys.list_state_functions 'file.s*'
```

New in version ?.

```
salt '*' sys.list_state_functions 'module.specific_function'
```

`salt.modules.sysmod.list_state_modules(*args)`

List the modules loaded on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_state_modules
```

State module names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_state_modules 'mysql_*'
```

`salt.modules.sysmod.reload_modules()`

Tell the minion to reload the execution modules

CLI Example:

```
salt '*' sys.reload_modules
```

`salt.modules.sysmod.renderer_doc(*args)`

Return the docstrings for all renderers. Optionally, specify a renderer or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple renderers can be specified.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.renderer_doc
salt '*' sys.renderer_doc cheetah
salt '*' sys.renderer_doc jinja json
```

Renderer names can be specified as globs.

```
salt '*' sys.renderer_doc 'c*' 'j*'
```

`salt.modules.sysmod.returnspec(module='')`

Return the argument specification of functions in Salt returner modules.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.returnspec xmpp
salt '*' sys.returnspec xmpp smtp
salt '*' sys.returnspec
```

Returner names can be specified as globs.

```
salt '*' sys.returnspec 'sqlite3.*'
```

`salt.modules.sysmod.returnspec(*args)`

Return the docstrings for all returners. Optionally, specify a returner or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple returners/functions can be specified.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.returnspec
salt '*' sys.returnspec sqlite3
salt '*' sys.returnspec sqlite3.get_fun
salt '*' sys.returnspec sqlite3.get_fun etcd.get_fun
```

Returner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.returnspec 'sqlite3.get_*'
```

`salt.modules.sysmod.runner_argspec(module='')`

Return the argument specification of functions in Salt runner modules.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.runner_argspec state
salt '*' sys.runner_argspec http
salt '*' sys.runner_argspec
```

Runner names can be specified as globs.

```
salt '*' sys.runner_argspec 'winrepo.*'
```

`salt.modules.sysmod.runner_doc(*args)`

Return the docstrings for all runners. Optionally, specify a runner or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple runners/functions can be specified.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.runner_doc
salt '*' sys.runner_doc cache
salt '*' sys.runner_doc cache.grains
salt '*' sys.runner_doc cache.grains mine.get
```

Runner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.runner_doc 'cache.clear.*'
```

`salt.modules.sysmod.state_argspec(module='')`

Return the argument specification of functions in Salt state modules.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.state_argspec pkg.installed
salt '*' sys.state_argspec file
salt '*' sys.state_argspec
```

State names can be specified as globs.

```
salt '*' sys.state_argspec 'pkg.*'
```

`salt.modules.sysmod.state_doc(*args)`

Return the docstrings for all states. Optionally, specify a state or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple states/functions can be specified.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.state_doc
salt '*' sys.state_doc service
salt '*' sys.state_doc service.running
salt '*' sys.state_doc service.running ipables.append
```

State names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.state_doc 'service.*' 'iptables.*'
```

`salt.modules.sysmod.state_schema(module='')`  
Return a JSON Schema for the given state function(s)

New in version 2016.3.0.

CLI Example:

```
salt '*' sys.state_schema
salt '*' sys.state_schema pkg.installed
```

### 14.7.382 salt.modules.sysrc

sysrc module for FreeBSD

`salt.modules.sysrc.get(**kwargs)`  
Return system rc configuration variables

CLI Example:

```
salt '*' sysrc.get includeDefaults=True
```

`salt.modules.sysrc.remove(name, **kwargs)`  
Remove system rc configuration variables

CLI Example:

```
salt '*' sysrc.remove name=sshd_enable
```

`salt.modules.sysrc.set(name, value, **kwargs)`  
Set system rc configuration variables

CLI Example:

```
salt '*' sysrc.set name=sshd_flags value="-p 2222"
```

### 14.7.383 salt.modules.system

Support for reboot, shutdown, etc

`salt.modules.system.get_computer_desc()`  
Get PRETTY\_HOSTNAME value stored in /etc/machine-info If this file doesn't exist or the variable doesn't exist return False.

**Returns** Value of PRETTY\_HOSTNAME if this does not exist False.

**Return type** `str`

CLI Example:

```
salt '*' system.get_computer_desc
```

`salt.modules.system.get_computer_name()`  
Get hostname.

CLI Example:

```
salt '*' network.get_hostname
```

`salt.modules.system.get_system_date(utc_offset=None)`

Get the system date

**Parameters** `utc_offset` (*str*) -- The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use ``'+0000'`. Note: if being passed through the command line will need to be quoted twice to allow negative offsets. :return: Returns the system date. :rtype: str

CLI Example:

```
salt '*' system.get_system_date
```

`salt.modules.system.get_system_date_time(utc_offset=None)`

Get the system date/time.

**Parameters** `utc_offset` (*str*) -- The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use ``'+0000'`. Note: if being passed through the command line will need to be quoted twice to allow negative offsets. :return: Returns the system time in YYYY-MM-DD hh:mm:ss format. :rtype: str

CLI Example:

```
salt '*' system.get_system_date_time "'-0500'"
```

`salt.modules.system.get_system_time(utc_offset=None)`

Get the system time.

**Parameters** `utc_offset` (*str*) -- The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use ``'+0000'`. Note: if being passed through the command line will need to be quoted twice to allow negative offsets. :return: Returns the system time in HH:MM:SS AM/PM format. :rtype: str

CLI Example:

```
salt '*' system.get_system_time
```

`salt.modules.system.halt()`

Halt a running system

CLI Example:

```
salt '*' system.halt
```

`salt.modules.system.has_settable_hwclock()`

Returns True if the system has a hardware clock capable of being set from software.

CLI Example:

```
salt '*' system.has_settable_hwclock
```

`salt.modules.system.init(runlevel)`

Change the system runlevel on sysV compatible systems

CLI Example:

```
salt '*' system.init 3
```

`salt.modules.system.poweroff()`

Poweroff a running system

CLI Example:

```
salt '*' system.poweroff
```

`salt.modules.system.reboot` (*at\_time=None*)

Reboot the system

**at\_time** The wait time in minutes before the system will be rebooted.

CLI Example:

```
salt '*' system.reboot
```

`salt.modules.system.set_computer_desc` (*desc*)

Set PRETTY\_HOSTNAME value stored in /etc/machine-info This will create the file if it does not exist. If it is unable to create or modify this file returns False.

**Parameters** **desc** (*str*) -- The computer description

**Returns** False on failure. True if successful.

CLI Example:

```
salt '*' system.set_computer_desc "Michael's laptop"
```

`salt.modules.system.set_computer_name` (*hostname*)

Modify hostname.

CLI Example:

```
salt '*' system.set_computer_name master.saltstack.com
```

`salt.modules.system.set_system_date` (*newdate, utc\_offset=None*)

Set the Windows system date. Use <mm-dd-yy> format for the date.

**Parameters** **newdate** (*str*) -- The date to set. Can be any of the following formats - YYYY-MM-DD - MM-DD-YYYY - MM-DD-YY - MM/DD/YYYY - MM/DD/YY - YYYY/MM/DD

CLI Example:

```
salt '*' system.set_system_date '03-28-13'
```

`salt.modules.system.set_system_date_time` (*years=None, months=None, days=None, hours=None, minutes=None, seconds=None, utc\_offset=None*)

Set the system date and time. Each argument is an element of the date, but not required. If an element is not passed, the current system value for that element will be used. For example, if you don't pass the year, the current system year will be used. (Used by `set_system_date` and `set_system_time`)

Updates hardware clock, if present, in addition to software (kernel) clock.

**Parameters**

- **years** (*int*) -- Years digit, ie: 2015
- **months** (*int*) -- Months digit: 1 - 12
- **days** (*int*) -- Days digit: 1 - 31
- **hours** (*int*) -- Hours digit: 0 - 23
- **minutes** (*int*) -- Minutes digit: 0 - 59
- **seconds** (*int*) -- Seconds digit: 0 - 59
- **utc\_offset** (*str*) -- The utc offset in 4 digit (+0600) format with an

optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use ``+0000``. Note: if being passed through the command line will need to be quoted twice to allow negative offsets. :return: True if successful. Otherwise False. :rtype: bool

CLI Example:

```
salt '*' system.set_system_date_time 2015 5 12 11 37 53 "'-0500'"
```

`salt.modules.system.set_system_time` (*newtime*, *utc\_offset=None*)

Set the system time.

#### Parameters

- **newtime** (*str*) -- The time to set. Can be any of the following formats. - HH:MM:SS AM/PM - HH:MM AM/PM - HH:MM:SS (24 hour) - HH:MM (24 hour)

Note that the salt command line parser parses the date/time before we obtain the argument (preventing us from doing utc) Therefore the argument must be passed in as a string. Meaning you may have to quote the text twice from the command line.

- **utc\_offset** (*str*) -- The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use ``'+0000'`. Note: if being passed through the command line will need to be quoted twice to allow negative offsets. :return: Returns True if successful. Otherwise False. :rtype: bool

CLI Example:

```
salt '*' system.set_system_time "'11:20'"
```

`salt.modules.system.shutdown` (*at\_time=None*)

Shutdown a running system

**at\_time** The wait time in minutes before the system will be shutdown.

CLI Example:

```
salt '*' system.shutdown 5
```

## 14.7.384 salt.modules.system\_profiler

System Profiler Module

Interface with macOS's command-line System Profiler utility to get information about package receipts and installed applications.

New in version 2015.5.0.

`salt.modules.system_profiler.applications` ()

Return the results of a call to `system_profiler -xml -detail full SPApplicationsDataType` as a dictionary. Top-level keys of the dictionary are the names of each set of install receipts, since there can be multiple receipts with the same name. Contents of each key are a list of dictionaries.

Note that this can take a long time depending on how many applications are installed on the target Mac.

CLI Example:

```
salt '*' systemprofiler.applications
```

`salt.modules.system_profiler.receipts` ()

Return the results of a call to `system_profiler -xml -detail full SPInstallHistoryDataType` as a dictionary. Top-level keys of the dictionary are the names of each set of install receipts, since there can be multiple receipts with the same name. Contents of each key are a list of dictionaries.

CLI Example:

```
salt '*' systemprofiler.receipts
```

### 14.7.385 salt.modules.systemd

Provides the service module for systemd

New in version 0.10.0.

---

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `'service.start' is not available`), see [here](#).

---

`salt.modules.systemd.available(name)`

New in version 0.10.4.

Check that the given service is available taking into account template units.

CLI Example:

```
salt '*' service.available sshd
```

`salt.modules.systemd.disable(name, no_block=False, **kwargs)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Disable the named service to not start when the system boots

**no\_block** [False] Set to True to start the service using `--no-block`.

New in version 2017.7.0.

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.systemd.disabled(name)`

Return if the named service is disabled from starting on boot

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.systemd.enable(name, no_block=False, unmask=False, unmask_runtime=False, **kwargs)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Enable the named service to start when the system boots

**no\_block** [False] Set to True to start the service using `--no-block`.

New in version 2017.7.0.

**unmask** [False] Set to True to remove an indefinite mask before attempting to enable the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before enabling. This behavior is no longer the default.

**unmask\_runtime** [False] Set to True to remove a runtime mask before attempting to enable the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before enabling. This behavior is no longer the default.

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.systemd.enabled(name, **kwargs)`

Return if the named service is enabled to start on boot

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.systemd.execs()`

New in version 2014.7.0.

Return a list of all files specified as `ExecStart` for all services.

CLI Example:

```
salt '*' service.execs
```

`salt.modules.systemd.force_reload(name, no_block=True, unmask=False, unmask_runtime=False)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd<=205`, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

New in version 0.12.0.

Force-reload the specified service with `systemd`

**no\_block** [False] Set to `True` to start the service using `--no-block`.

New in version 2017.7.0.

**unmask** [False] Set to `True` to remove an indefinite mask before attempting to force-reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before force-reloading. This behavior is no longer the default.

**unmask\_runtime** [False] Set to `True` to remove a runtime mask before attempting to force-reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before force-reloading. This behavior is no longer the default.

CLI Example:

```
salt '*' service.force_reload <service name>
```

`salt.modules.systemd.get_all()`

Return a list of all available services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.systemd.get_disabled()`

Return a list of all disabled services

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.systemd.get_enabled()`

Return a list of all enabled services

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.systemd.get_running()`

Return a list of all running services, so far as systemd is concerned

CLI Example:

```
salt '*' service.get_running
```

`salt.modules.systemd.get_static()`

New in version 2015.8.5.

Return a list of all static services

CLI Example:

```
salt '*' service.get_static
```

`salt.modules.systemd.mask(name, runtime=False)`

New in version 2015.5.0.

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Mask the specified service with systemd

**runtime** [False] Set to `True` to mask this service only until the next reboot

New in version 2015.8.5.

CLI Example:

```
salt '*' service.mask foo
salt '*' service.mask foo runtime=True
```

`salt.modules.systemd.masked(name, runtime=False)`

New in version 2015.8.0.

Changed in version 2015.8.5: The return data for this function has changed. If the service is masked, the return value will now be the output of the `systemctl is-enabled` command (so that a persistent mask can be distinguished from a runtime mask). If the service is not masked, then `False` will be returned.

Changed in version 2017.7.0: This function now returns a boolean telling the user whether a mask specified by the new `runtime` argument is set. If `runtime` is `False`, this function will return `True` if an indefinite mask is set for the named service (otherwise `False` will be returned). If `runtime` is `False`, this function will return `True` if a runtime mask is set, otherwise `False`.

Check whether or not a service is masked

**runtime** [False] Set to `True` to check for a runtime mask

New in version 2017.7.0: In previous versions, this function would simply return the output of `systemctl is-enabled` when the service was found to be masked. However, since it is possible to both have both indefinite and runtime masks on a service simultaneously, this function now only checks for runtime masks if this argument is set to `True`. Otherwise, it will check for an indefinite mask.

CLI Examples:

```
salt '*' service.masked foo
salt '*' service.masked foo runtime=True
```

`salt.modules.systemd.missing`(*name*)

New in version 2014.1.0.

The inverse of `service.available`. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.systemd.reload`(*name*, *no\_block=False*, *unmask=False*, *unmask\_runtime=False*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Reload the specified service with `systemd`

**no\_block** [False] Set to True to reload the service using `--no-block`.

New in version 2017.7.0.

**unmask** [False] Set to True to remove an indefinite mask before attempting to reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before reloading. This behavior is no longer the default.

**unmask\_runtime** [False] Set to True to remove a runtime mask before attempting to reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before reloading. This behavior is no longer the default.

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.systemd.restart`(*name*, *no\_block=False*, *unmask=False*, *unmask\_runtime=False*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Restart the specified service with `systemd`

**no\_block** [False] Set to True to start the service using `--no-block`.

New in version 2017.7.0.

**unmask** [False] Set to True to remove an indefinite mask before attempting to restart the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before restarting. This behavior is no longer the default.

**unmask\_runtime** [False] Set to True to remove a runtime mask before attempting to restart the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before restarting. This behavior is no longer the default.

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.systemd.show`(*name*)

New in version 2014.7.0.

Show properties of one or more units/jobs or the manager

CLI Example:

```
salt '*' service.show <service name>
```

`salt.modules.systemd.start`(*name*, *no\_block=False*, *unmask=False*, *unmask\_runtime=False*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd<=205, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Start the specified service with `systemd`

**no\_block** [False] Set to True to start the service using `--no-block`.

New in version 2017.7.0.

**unmask** [False] Set to True to remove an indefinite mask before attempting to start the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before starting. This behavior is no longer the default.

**unmask\_runtime** [False] Set to True to remove a runtime mask before attempting to start the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before starting. This behavior is no longer the default.

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.systemd.status`(*name*, *sig=None*)

Return the status for a service via `systemd`, returns True if the service is running and False if it is not.

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.systemd.stop`(*name*, *no\_block=False*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd<=205, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Stop the specified service with `systemd`

**no\_block** [False] Set to True to start the service using `--no-block`.

New in version 2017.7.0.

CLI Example:

```
salt '*' service.stop <service name>
```

`salt.modules.systemd.systemctl_reload`()

New in version 0.15.0.

Reloads `systemctl`, an action needed whenever unit files are updated.

CLI Example:

```
salt '*' service.systemctl_reload
```

`salt.modules.systemd.unmask`(*name*, *runtime=False*)

New in version 2015.5.0.

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Unmask the specified service with `systemd`

**runtime** [False] Set to `True` to unmask this service only until the next reboot

New in version 2017.7.0: In previous versions, this function would remove whichever mask was identified by running `systemctl is-enabled` on the service. However, since it is possible to both have both indefinite and runtime masks on a service simultaneously, this function now removes a runtime mask only when this argument is set to `True`, and otherwise removes an indefinite mask.

CLI Example:

```
salt '*' service.unmask foo
salt '*' service.unmask foo runtime=True
```

### 14.7.386 salt.modules.telemetry

Connection module for Telemetry

New in version 2016.3.0.

<https://github.com/mongolab/mongolab-telemetry-api-docs/blob/master/alerts.md>

**configuration** This module accepts explicit telemetry credentials or can also read api key credentials from a pillar. More Information available at:

<https://github.com/mongolab/mongolab-telemetry-api-docs/blob/master/alerts.md>

In the minion's config file:

```
telemetry.telemetry_api_keys:
  - abc123 # Key 1
  - efg321 # Backup Key 1
telemetry_api_base_url: https://telemetry-api.mongolab.com/v0
```

**depends** requests

`salt.modules.telemetry.create_alarm`(*deployment\_id*, *metric\_name*, *data*, *api\_key=None*, *profile='telemetry'*)

create an telemetry alarms.

*data* is a dict of alert configuration data.

Returns (bool success, str message) tuple.

CLI Example:

```
salt myminion telemetry.create_alarm rs-ds033197 {} profile=telemetry
```

`salt.modules.telemetry.delete_alarms`(*deployment\_id*, *alert\_id=None*, *metric\_name=None*, *api\_key=None*, *profile='telemetry'*)

delete an alert specified by *alert\_id* or if not specified blows away all the alerts in the current deployment.

Returns (bool success, str message) tuple.

CLI Example:

```
salt myminion telemetry.delete_alarms rs-ds033197 profile=telemetry
```

`salt.modules.telemetry.get_alarms`(*deployment\_id*, *profile*='telemetry')  
get all the alarms set up against the current deployment

Returns dictionary of alarm information

CLI Example:

```
salt myminion telemetry.get_alarms rs-ds033197 profile=telemetry
```

`salt.modules.telemetry.get_alert_config`(*deployment\_id*, *metric\_name*=None, *api\_key*=None, *profile*='telemetry')

Get all alert definitions associated with a given deployment or if *metric\_name* is specified, obtain the specific alert config

Returns dictionary or list of dictionaries.

CLI Example:

```
salt myminion telemetry.get_alert_config rs-ds033197 currentConnections profile=telemetry salt myminion telemetry.get_alert_config rs-ds033197 profile=telemetry
```

`salt.modules.telemetry.get_notification_channel_id`(*notify\_channel*, *profile*, *file*='telemetry')

Given an email address, creates a notification-channels if one is not found and also returns the corresponding notification channel id.

**notify\_channel** Email escalation policy

**profile** A dict of telemetry config information.

CLI Example:

```
salt myminion telemetry.get_notification_channel_id userx@company.com profile=telemetry
```

`salt.modules.telemetry.update_alarm`(*deployment\_id*, *metric\_name*, *data*, *api\_key*=None, *profile*='telemetry')

update an telemetry alarms. *data* is a dict of alert configuration data.

Returns (bool success, str message) tuple.

CLI Example:

```
salt myminion telemetry.update_alarm rs-ds033197 {} profile=telemetry
```

### 14.7.387 salt.modules.temp

Simple module for creating temporary directories and files

This is a thin wrapper around Python's tempfile module

New in version 2015.8.0.

`salt.modules.temp.dir`(*suffix*='', *prefix*='tmp', *parent*=None)  
Create a temporary directory

CLI Example:

```
salt '*' temp.dir
salt '*' temp.dir prefix='mytemp-' parent='/var/run/'
```

`salt.modules.temp.file`(*suffix*='', *prefix*='tmp', *parent*=None)  
Create a temporary file

CLI Example:

```
salt '*' temp.file
salt '*' temp.file prefix='mytemp-' parent='/var/run/'
```

### 14.7.388 salt.modules.test

Module for running arbitrary tests

**salt.modules.test.arg**(\*args, \*\*kwargs)

Print out the data passed into the function \*args and `kwargs, this is used to both test the publication data and cli argument passing, but also to display the information available within the publication data. Returns {'args': args, 'kwargs': kwargs}.

CLI Example:

```
salt '*' test.arg 1 "two" 3.1 txt="hello" wow='{a: 1, b: "hello"}'
```

**salt.modules.test.arg\_clean**(\*args, \*\*kwargs)

Like test.arg but cleans kwargs of the \_\_pub\* items CLI Example:

```
salt '*' test.arg_clean 1 "two" 3.1 txt="hello" wow='{a: 1, b: "hello"}'
```

**salt.modules.test.arg\_repr**(\*args, \*\*kwargs)

Print out the data passed into the function \*args and `kwargs, this is used to both test the publication data and cli argument passing, but also to display the information available within the publication data. Returns {'args': repr(args), 'kwargs': repr(kwargs)}.

CLI Example:

```
salt '*' test.arg_repr 1 "two" 3.1 txt="hello" wow='{a: 1, b: "hello"}'
```

**salt.modules.test.arg\_type**(\*args, \*\*kwargs)

Print out the types of the args and kwargs. This is used to test the types of the args and kwargs passed down to the minion

CLI Example:

```
salt '*' test.arg_type 1 'int'
```

**salt.modules.test.assertion**(assertion)

Assert the given argument

CLI Example:

```
salt '*' test.assertion False
```

**salt.modules.test.attr\_call**()

Call grains.items via the attribute

CLI Example:

```
salt '*' test.attr_call
```

**salt.modules.test.collatz**(start)

Execute the collatz conjecture from the passed starting number, returns the sequence and the time it took to compute. Used for performance tests.

CLI Example:

```
salt '*' test.collatz 3
```

`salt.modules.test.conf_test()`

Return the value for test.foo in the minion configuration file, or return the default value

CLI Example:

```
salt '*' test.conf_test
```

`salt.modules.test.cross_test(func, args=None)`

Execute a minion function via the `__salt__` object in the test module, used to verify that the minion functions can be called via the `__salt__` module.

CLI Example:

```
salt '*' test.cross_test file.gid_to_group 0
```

`salt.modules.test.echo(text)`

Return a string - used for testing the connection

CLI Example:

```
salt '*' test.echo 'foo bar baz quo qux'
```

`salt.modules.test.exception(message='Test Exception')`

Raise an exception

Optionally provide an error message or output the full stack.

CLI Example:

```
salt '*' test.exception 'Oh noes!'
```

`salt.modules.test.false()`

Always return False

CLI Example:

```
salt '*' test.false
```

`salt.modules.test.fib(num)`

Return the num-th Fibonacci number, and the time it took to compute in seconds. Used for performance tests.

This function is designed to have terrible performance.

CLI Example:

```
salt '*' test.fib 3
```

`salt.modules.test.get_opts()`

Return the configuration options passed to this minion

CLI Example:

```
salt '*' test.get_opts
```

`salt.modules.test.kwarg(**kwargs)`

Print out the data passed into the function `**kwargs`, this is used to both test the publication data and cli kwarg passing, but also to display the information available within the publication data.

CLI Example:

```
salt '*' test.kwarg num=1 txt="two" env='{a: 1, b: "hello"}'
```

`salt.modules.test.module_report()`

Return a dict containing all of the execution modules with a report on the overall availability via different references

CLI Example:

```
salt '*' test.module_report
```

`salt.modules.test.not_loaded()`

List the modules that were not loaded by the salt loader system

CLI Example:

```
salt '*' test.not_loaded
```

`salt.modules.test.opts_pkg()`

Return an opts package with the grains and opts for this minion. This is primarily used to create the options used for master side state compiling routines

CLI Example:

```
salt '*' test.opts_pkg
```

`salt.modules.test.outputter(data)`

Test the outputter, pass in data to return

CLI Example:

```
salt '*' test.outputter foobar
```

`salt.modules.test.ping()`

Used to make sure the minion is up and responding. Not an ICMP ping.

Returns True.

CLI Example:

```
salt '*' test.ping
```

`salt.modules.test.provider(module)`

Pass in a function name to discover what provider is being used

CLI Example:

```
salt '*' test.provider service
```

`salt.modules.test.providers()`

Return a dict of the provider names and the files that provided them

CLI Example:

```
salt '*' test.providers
```

`salt.modules.test.rand_sleep(max=60)`

Sleep for a random number of seconds, used to test long-running commands and minions returning at differing intervals

CLI Example:

```
salt '*' test.rand_sleep 60
```

`salt.modules.test.rand_str` (*size=999999999, hash\_type=None*)

Return a random string

**size** size of the string to generate

**hash\_type** hash type to use

New in version 2015.5.2.

CLI Example:

```
salt '*' test.rand_str
```

`salt.modules.test.retcode` (*code=42*)

Test that the returncode system is functioning correctly

CLI Example:

```
salt '*' test.retcode 42
```

`salt.modules.test.sleep` (*length*)

Instruct the minion to initiate a process that will sleep for a given period of time.

CLI Example:

```
salt '*' test.sleep 20
```

`salt.modules.test.stack`()

Return the current stack trace

CLI Example:

```
salt '*' test.stack
```

`salt.modules.test.true`()

Always return True

CLI Example:

```
salt '*' test.true
```

`salt.modules.test.try_` (*module, return\_try\_exception=False, \*\*kwargs*)

Try to run a module command. On an exception return None. If *return\_try\_exception* is set True return the exception. This can be helpful in templates where running a module might fail as expected.

CLI Example:

```
<pre>
{% for i in range(0,230) %}
  {{ salt['test.try'](module='ipmi.get_users', bmc_host='172.2.2.
  ↳'+i)|yaml(False) }}
{% endfor %}
</pre>
```

`salt.modules.test.tty` (*\*args, \*\*kwargs*)

Deprecated! Moved to cmdmod.

CLI Example:

```
salt '*' test.tty tty0 'This is a test'
salt '*' test.tty pts3 'This is a test'
```

#### `salt.modules.test.version()`

Return the version of salt on the minion

CLI Example:

```
salt '*' test.version
```

#### `salt.modules.test.versions()`

This function is an alias of `versions_report`.

Returns versions of components used by salt

CLI Example:

```
salt '*' test.versions_report
```

#### `salt.modules.test.versions_information()`

Report the versions of dependent and system software

CLI Example:

```
salt '*' test.versions_information
```

#### `salt.modules.test.versions_report()`

Returns versions of components used by salt

CLI Example:

```
salt '*' test.versions_report
```

### 14.7.389 `salt.modules.testinfra` module

This module exposes the functionality of the TestInfra library for use with SaltStack in order to verify the state of your minions. In order to allow for the addition of new resource types in TestInfra this module dynamically generates wrappers for the various resources by iterating over the values in the `__all__` variable exposed by the `testinfra.modules` namespace.

### 14.7.390 `salt.modules.test_virtual`

Module for running arbitrary tests with a `__virtual__` function

### 14.7.391 `salt.modules.timezone`

Module for managing timezone on POSIX-like systems.

#### `salt.modules.timezone.get_hwclock()`

Get current hardware clock setting (UTC or localtime)

CLI Example:

```
salt '*' timezone.get_hwclock
```

`salt.modules.timezone.get_offset()`

Get current numeric timezone offset from UCT (i.e. -0700)

CLI Example:

```
salt '*' timezone.get_offset
```

`salt.modules.timezone.get_zone()`

Get current timezone (i.e. America/Denver)

Changed in version 2016.11.4.

---

**Note:** On AIX operating systems, Posix values can also be returned `'CST6CDT,M3.2.0/2:00:00,M11.1.0/2:00:00'`

---

CLI Example:

```
salt '*' timezone.get_zone
```

`salt.modules.timezone.get_zonecode()`

Get current timezone (i.e. PST, MDT, etc)

CLI Example:

```
salt '*' timezone.get_zonecode
```

`salt.modules.timezone.set_hwclock(clock)`

Sets the hardware clock to be either UTC or localtime

CLI Example:

```
salt '*' timezone.set_hwclock UTC
```

`salt.modules.timezone.set_zone(timezone)`

Unlinks, then symlinks `/etc/localtime` to the set timezone.

The timezone is crucial to several system processes, each of which SHOULD be restarted (for instance, whatever you system uses as its cron and syslog daemons). This will not be automagically done and must be done manually!

CLI Example:

```
salt '*' timezone.set_zone 'America/Denver'
```

Changed in version 2016.11.4.

---

**Note:** On AIX operating systems, Posix values are also allowed, see below

---

```
salt '*' timezone.set_zone 'CST6CDT,M3.2.0/2:00:00,M11.1.0/2:00:00'
```

`salt.modules.timezone.zone_compare(timezone)`

Compares the given timezone name with the system timezone name. Checks the hash sum between the given timezone, and the one set in `/etc/localtime`. Returns True if names and hash sums match, and False if not. Mostly useful for running state checks.

Changed in version 2016.3.0.

---

**Note:** On Solaris-link operating systems only a string comparison is done.

---

Changed in version 2016.11.4.

---

**Note:** On AIX operating systems only a string comparison is done.

---

CLI Example:

```
salt '*' timezone.zone_compare 'America/Denver'
```

### 14.7.392 salt.modules.tls

A salt module for SSL/TLS. Can create a Certificate Authority (CA) or use Self-Signed certificates.

#### depends

- PyOpenSSL Python module (0.10 or later, 0.14 or later for X509 extension support)

**configuration** Add the following values in `/etc/salt/minion` for the CA module to function properly:

```
ca.cert_base_path: '/etc/pki'
```

CLI Example #1 Creating a CA, a server request and its signed certificate:

```
# salt-call tls.create_ca my_little \  
days=5 \  
CN='My Little CA' \  
C=US \  
ST=Utah \  
L=Salt Lake City \  
O=Saltstack \  
emailAddress=pleasedontemail@example.com  
  
Created Private Key: "/etc/pki/my_little/my_little_ca_cert.key"  
Created CA "my_little_ca": "/etc/pki/my_little_ca/my_little_ca_cert.crt"  
  
# salt-call tls.create_csr my_little CN=www.example.com  
Created Private Key: "/etc/pki/my_little/certs/www.example.com.key"  
Created CSR for "www.example.com": "/etc/pki/my_little/certs/www.example.com.csr"  
  
# salt-call tls.create_ca_signed_cert my_little CN=www.example.com  
Created Certificate for "www.example.com": /etc/pki/my_little/certs/www.example.com.crt  
→"
```

CLI Example #2: Creating a client request and its signed certificate

```
# salt-call tls.create_csr my_little CN=DBReplica_No.1 cert_type=client  
Created Private Key: "/etc/pki/my_little/certs//DBReplica_No.1.key."  
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1.csr."  
  
# salt-call tls.create_ca_signed_cert my_little CN=DBReplica_No.1  
Created Certificate for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1.crt"
```

CLI Example #3: Creating both a server and client req + cert for the same CN

```
# salt-call tls.create_csr my_little CN=MasterDBReplica_No.2 \
  cert_type=client
Created Private Key: "/etc/pki/my_little/certs/MasterDBReplica_No.2.key."
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/MasterDBReplica_No.2.csr."

# salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2
Created Certificate for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1.crt"

# salt-call tls.create_csr my_little CN=MasterDBReplica_No.2 \
  cert_type=server
Certificate "MasterDBReplica_No.2" already exists

(doh!)

# salt-call tls.create_csr my_little CN=MasterDBReplica_No.2 \
  cert_type=server type_ext=True
Created Private Key: "/etc/pki/my_little/certs/DBReplica_No.1_client.key."
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1_client.csr."

# salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2
Certificate "MasterDBReplica_No.2" already exists

(DOH!)

# salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2 \
  cert_type=server type_ext=True
Created Certificate for "MasterDBReplica_No.2": "/etc/pki/my_little/certs/
↳MasterDBReplica_No.2_server.crt"
```

CLI Example #4: Create a server req + cert with non-CN filename for the cert

```
# salt-call tls.create_csr my_little CN=www.anothersometh.ing \
  cert_type=server type_ext=True
Created Private Key: "/etc/pki/my_little/certs/www.anothersometh.ing_server.key."
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/www.anothersometh.ing_
↳server.csr."

# salt-call tls.create_ca_signed_cert my_little CN=www.anothersometh.ing \
  cert_type=server cert_filename="something_completely_different"
Created Certificate for "www.anothersometh.ing": /etc/pki/my_little/certs/something_
↳completely_different.crt"
```

`salt.modules.tls.ca_exists` (*ca\_name*, *cacert\_path*=None, *ca\_filename*=None)

Verify whether a Certificate Authority (CA) already exists

**ca\_name** name of the CA

**cacert\_path** absolute path to ca certificates root directory

**ca\_filename** alternative filename for the CA

New in version 2015.5.3.

CLI Example:

```
salt '*' tls.ca_exists test_ca /etc/certs
```

`salt.modules.tls.cert_base_path` (*cacert\_path*=None)

Return the base path for certs from CLI or from options

**cacert\_path** absolute path to ca certificates root directory

CLI Example:

```
salt '*' tls.cert_base_path
```

**salt.modules.tls.cert\_info**(*cert\_path*, *digest='sha256'*)

Return information for a particular certificate

**cert\_path** path to the cert file

**digest** what digest to use for fingerprinting

CLI Example:

```
salt '*' tls.cert_info /dir/for/certs/cert.pem
```

**salt.modules.tls.create\_ca**(*ca\_name*, *bits=2048*, *days=365*, *CN='localhost'*, *C='US'*, *ST='Utah'*, *L='Salt Lake City'*, *O='SaltStack'*, *OU=None*, *emailAddress='xyz@pdq.net'*, *fixmode=False*, *cacert\_path=None*, *ca\_filename=None*, *digest='sha256'*, *onlyif=None*, *unless=None*, *replace=False*)

Create a Certificate Authority (CA)

**ca\_name** name of the CA

**bits** number of RSA key bits, default is 2048

**days** number of days the CA will be valid, default is 365

**CN** common name in the request, default is ``localhost``

**C** country, default is ``US``

**ST** state, default is ``Utah``

**L** locality, default is ``Centerville``, the city where SaltStack originated

**O** organization, default is ``SaltStack``

**OU** organizational unit, default is None

**emailAddress** email address for the CA owner, default is ``xyz@pdq.net``

**cacert\_path** absolute path to ca certificates root directory

**ca\_filename** alternative filename for the CA

New in version 2015.5.3.

**digest** The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by `EVP_get_digestbyname`, specifically). For example, ``md5`` or ``sha1``. Default: ``sha256``

**replace** Replace this certificate even if it exists

New in version 2015.5.1.

Writes out a CA certificate based upon defined config values. If the file already exists, the function just returns assuming the CA certificate already exists.

If the following values were set:

```
ca.cert_base_path='/etc/pki'
ca_name='koji'
```

the resulting CA, and corresponding key, would be written in the following location:

```
/etc/pki/koji/koji_ca_cert.crt
/etc/pki/koji/koji_ca_cert.key
```

CLI Example:

```
salt '*' tls.create_ca test_ca
```

**salt.modules.tls.create\_ca\_signed\_cert**(*ca\_name*, *CN*, *days=365*, *cacert\_path=None*, *ca\_filename=None*, *cert\_path=None*, *cert\_filename=None*, *digest='sha256'*, *cert\_type=None*, *type\_ext=False*, *replace=False*)

Create a Certificate (CERT) signed by a named Certificate Authority (CA)

If the certificate file already exists, the function just returns assuming the CERT already exists.

The CN *must* match an existing CSR generated by `create_csr`. If it does not, this method does nothing.

**ca\_name** name of the CA

**CN** common name matching the certificate signing request

**days** number of days certificate is valid, default is 365 (1 year)

**cacert\_path** absolute path to ca certificates root directory

**ca\_filename** alternative filename for the CA

New in version 2015.5.3.

**cert\_path** full path to the certificates directory

**cert\_filename** alternative filename for the certificate, useful when using special characters in the CN. If this option is set it will override the certificate filename output effects of `cert_type`. `type_ext` will be completely overridden.

New in version 2015.5.3.

**digest** The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by `EVP_get_digestbyname`, specifically). For example, `md5` or `sha1`. Default: `sha256`

**replace** Replace this certificate even if it exists

New in version 2015.5.1.

**cert\_type** string. Either `server` or `client` (see `create_csr()` for details).

If `create_csr(type_ext=True)` this function **must** be called with the same `cert_type` so it can find the CSR file.

---

**Note:** `create_csr()` defaults to `cert_type='server'`; therefore, if it was also called with `type_ext`, `cert_type` becomes a required argument for `create_ca_signed_cert()`

---

**type\_ext** bool. If set True, use `cert_type` as an extension to the CN when formatting the filename.

e.g.: `some_subject_CN_server.crt` or `some_subject_CN_client.crt`

This facilitates the context where both types are required for the same subject

If `cert_filename` is *not None*, setting `type_ext` has no effect

If the following values were set:

```
ca.cert_base_path='/etc/pki'
ca_name='koji'
CN='test.egavas.org'
```

the resulting signed certificate would be written in the following location:

```
/etc/pki/koji/certs/test.egavas.org.crt
```

CLI Example:

```
salt '*' tls.create_ca_signed_cert test localhost
```

```
salt.modules.tls.create_csr(ca_name, bits=2048, CN='localhost', C='US', ST='Utah', L='Salt
Lake City', O='SaltStack', OU=None, emailAddress='xyz@pdq.net',
subjectAltName=None, cacert_path=None, ca_filename=None,
csr_path=None, csr_filename=None, digest='sha256', type_ext=False,
cert_type='server', replace=False)
```

Create a Certificate Signing Request (CSR) for a particular Certificate Authority (CA)

**ca\_name** name of the CA

**bits** number of RSA key bits, default is 2048  
**CN** common name in the request, default is ``localhost``  
**C** country, default is ``US``  
**ST** state, default is ``Utah``  
**L** locality, default is ``Centerville``, the city where SaltStack originated  
**O** organization, default is ``SaltStack`` NOTE: Must the same as CA certificate or an error will be raised  
**OU** organizational unit, default is None  
**emailAddress** email address for the request, default is `xyz@pdq.net`  
**subjectAltName** valid subjectAltNames in full form, e.g. to add DNS entry you would call this function with this value:  
**examples:** ['DNS:somednsname.com`, `DNS:1.2.3.4`, `IP:1.2.3.4`, `IP:2001:4801:7821:77:be76:4eff:fe11:e51`, `email:me@i.like.pie.com']

---

**Note:** some libraries do not properly query IP: prefixes, instead looking for the given req. source with a DNS: prefix. To be thorough, you may want to include both DNS: and IP: entries if you are using subjectAltNames for destinations for your TLS connections. e.g.: requests to <https://1.2.3.4> will fail from python's requests library w/out the second entry in the above list

---

New in version 2015.8.0.

**cert\_type** Specify the general certificate type. Can be either *server* or *client*. Indicates the set of common extensions added to the CSR.

```

server: {
  'basicConstraints': 'CA:FALSE',
  'extendedKeyUsage': 'serverAuth',
  'keyUsage': 'digitalSignature, keyEncipherment'
}

client: {
  'basicConstraints': 'CA:FALSE',
  'extendedKeyUsage': 'clientAuth',
  'keyUsage': 'nonRepudiation, digitalSignature, keyEncipherment'
}
  
```

**type\_ext** boolean. Whether or not to extend the filename with CN\_[cert\_type] This can be useful if a server and client certificate are needed for the same CN. Defaults to False to avoid introducing an unexpected file naming pattern

The files normally named some\_subject\_CN.csr and some\_subject\_CN.key will then be saved

**replace** Replace this signing request even if it exists

New in version 2015.5.1.

Writes out a Certificate Signing Request (CSR) If the file already exists, the function just returns assuming the CSR already exists.

If the following values were set:

```

ca.cert_base_path='/etc/pki'
ca_name='koji'
CN='test.egavas.org'
  
```

the resulting CSR, and corresponding key, would be written in the following location:

```

/etc/pki/koji/certs/test.egavas.org.csr
/etc/pki/koji/certs/test.egavas.org.key
  
```

CLI Example:

```
salt '*' tls.create_csr test
```

`salt.modules.tls.create_empty_crl`(*ca\_name*, *cacert\_path*=None, *ca\_filename*=None, *crl\_file*=None)

Create an empty Certificate Revocation List.

New in version 2015.8.0.

**ca\_name** name of the CA

**cacert\_path** absolute path to ca certificates root directory

**ca\_filename** alternative filename for the CA

New in version 2015.5.3.

**crl\_file** full path to the CRL file

CLI Example:

```
salt '*' tls.create_empty_crl ca_name='koji' ca_filename='ca'
→                               crl_file='/etc/openssl/team1/crl.pem'
```

`salt.modules.tls.create_pkcs12`(*ca\_name*, *CN*, *passphrase*='', *cacert\_path*=None, *replace*=False)

Create a PKCS#12 browser certificate for a particular Certificate (CN)

**ca\_name** name of the CA

**CN** common name matching the certificate signing request

**passphrase** used to unlock the PKCS#12 certificate when loaded into the browser

**cacert\_path** absolute path to ca certificates root directory

**replace** Replace this certificate even if it exists

New in version 2015.5.1.

If the following values were set:

```
ca.cert_base_path='/etc/pki'
ca_name='koji'
CN='test.egavas.org'
```

the resulting signed certificate would be written in the following location:

```
/etc/pki/koji/certs/test.egavas.org.p12
```

CLI Example:

```
salt '*' tls.create_pkcs12 test localhost
```

`salt.modules.tls.create_self_signed_cert`(*tls\_dir*='tls', *bits*=2048, *days*=365, *CN*='localhost', *C*='US', *ST*='Utah', *L*='Salt Lake City', *O*='SaltStack', *OU*=None, *emailAddress*='xyz@pdq.net', *cacert\_path*=None, *cert\_filename*=None, *digest*='sha256', *replace*=False)

Create a Self-Signed Certificate (CERT)

**tls\_dir** location appended to the `ca.cert_base_path`, default is `'tls'`

**bits** number of RSA key bits, default is 2048

**CN** common name in the request, default is `'localhost'`

**C** country, default is `'US'`

**ST** state, default is `'Utah'`

**L** locality, default is `'Centerville'`, the city where SaltStack originated

**O** organization, default is `'SaltStack'` NOTE: Must be the same as CA certificate or an error will be raised

**OU** organizational unit, default is None

**emailAddress** email address for the request, default is `'xyz@pdq.net'`

**cacert\_path** absolute path to ca certificates root directory  
**digest** The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by `EVP_get_digestbyname`, specifically). For example, `md5` or `sha1`. Default: `sha256`  
**replace** Replace this certificate even if it exists

New in version 2015.5.1.

Writes out a Self-Signed Certificate (CERT). If the file already exists, the function just returns.

If the following values were set:

```
ca.cert_base_path='/etc/pki'
tls_dir='koji'
CN='test.egavas.org'
```

the resulting CERT, and corresponding key, would be written in the following location:

```
/etc/pki/koji/certs/test.egavas.org.crt
/etc/pki/koji/certs/test.egavas.org.key
```

CLI Example:

```
salt '*' tls.create_self_signed_cert
```

Passing options from the command line:

```
salt 'minion' tls.create_self_signed_cert CN='test.mysite.org'
```

`salt.modules.tls.get_ca`(*ca\_name*, *as\_text=False*, *cacert\_path=None*)

Get the certificate path or content

**ca\_name** name of the CA

**as\_text** if true, return the certificate content instead of the path

**cacert\_path** absolute path to ca certificates root directory

CLI Example:

```
salt '*' tls.get_ca test_ca as_text=False cacert_path=/etc/certs
```

`salt.modules.tls.get_ca_signed_cert`(*ca\_name*, *CN='localhost'*, *as\_text=False*, *cacert\_path=None*, *cert\_filename=None*)

Get the certificate path or content

**ca\_name** name of the CA

**CN** common name of the certificate

**as\_text** if true, return the certificate content instead of the path

**cacert\_path** absolute path to certificates root directory

**cert\_filename** alternative filename for the certificate, useful when using special characters in the CN

New in version 2015.5.3.

CLI Example:

```
salt '*' tls.get_ca_signed_cert test_ca CN=localhost as_text=False cacert_path=/etc/certs
```

`salt.modules.tls.get_ca_signed_key`(*ca\_name*, *CN='localhost'*, *as\_text=False*, *cacert\_path=None*, *key\_filename=None*)

Get the certificate path or content

**ca\_name** name of the CA

**CN** common name of the certificate

**as\_text** if true, return the certificate content instead of the path

**cacert\_path** absolute path to certificates root directory

**key\_filename** alternative filename for the key, useful when using special characters

New in version 2015.5.3.

in the CN

CLI Example:

```
salt '*' tls.get_ca_signed_key test_ca CN=localhost
↳as_text=False cacert_path=/etc/certs
```

**salt.modules.tls.get\_extensions**(*cert\_type*)

Fetch X509 and CSR extension definitions from `tls:extensions:` (`common|server|client`) or set them to standard defaults.

New in version 2015.8.0.

**cert\_type**: The type of certificate such as `server` or `client`.

CLI Example:

```
salt '*' tls.get_extensions client
```

**salt.modules.tls.maybe\_fix\_ssl\_version**(*ca\_name*, *cacert\_path=None*, *ca\_filename=None*)

Check that the X509 version is correct (was incorrectly set in previous salt versions). This will fix the version if needed.

**ca\_name** ca authority name

**cacert\_path** absolute path to ca certificates root directory

**ca\_filename** alternative filename for the CA

New in version 2015.5.3.

CLI Example:

```
salt '*' tls.maybe_fix_ssl_version test_ca /etc/certs
```

**salt.modules.tls.revoke\_cert**(*ca\_name*, *CN*, *cacert\_path=None*, *ca\_filename=None*, *cert\_path=None*, *cert\_filename=None*, *crl\_file=None*)

Revoke a certificate.

New in version 2015.8.0.

**ca\_name** Name of the CA.

**CN** Common name matching the certificate signing request.

**cacert\_path** Absolute path to ca certificates root directory.

**ca\_filename** Alternative filename for the CA.

**cert\_path** Path to the cert file.

**cert\_filename** Alternative filename for the certificate, useful when using special characters in the CN.

**crl\_file** Full path to the CRL file.

CLI Example:

```
salt '*' tls.revoke_cert ca_name='koji' ca_filename='ca'
↳ crl_file='/etc/openvpn/team1/crl.pem'
```

**salt.modules.tls.set\_ca\_path**(*cacert\_path*)

If wanted, store the aforementioned `cacert_path` in context to be used as the basepath for further operations

CLI Example:

```
salt '*' tls.set_ca_path /etc/certs
```

### 14.7.393 salt.modules.tomcat

#### Support for Tomcat

This module uses the manager webapp to manage Apache tomcat webapps. If the manager webapp is not configured some of the functions won't work.

#### configuration

- Java bin path should be in default path
- If ipv6 is enabled make sure you permit manager access to ipv6 interface ``0:0:0:0:0:0:1``
- If you are using tomcat.tar.gz it has to be installed or symlinked under /opt, preferably using name tomcat
- ``tomcat.signal start/stop`` works but it does not use the startup scripts

The following grains/pillar should be set:

```
tomcat-manager:  
  user: <username>  
  passwd: <password>
```

or the old format:

```
tomcat-manager.user: <username>  
tomcat-manager.passwd: <password>
```

Also configure a user in the conf/tomcat-users.xml file:

```
<?xml version='1.0' encoding='utf-8'?>  
<tomcat-users>  
  <role rolename="manager-script"/>  
  <user username="tomcat" password="tomcat" roles="manager-script"/>  
</tomcat-users>
```

---

#### Note:

- More information about tomcat manager: <http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html>
  - if you use only this module for deployments you've might want to strict access to the manager only from local-host for more info: [http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html#Configuring\\_Manager\\_Application\\_Access](http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html#Configuring_Manager_Application_Access)
  - Tested on:
    - JVM Vendor:** Sun Microsystems Inc.
    - JVM Version:** 1.6.0\_43-b01
    - OS Architecture:** amd64
    - OS Name:** Linux
    - OS Version:** 2.6.32-358.el6.x86\_64
    - Tomcat Version:** Apache Tomcat/7.0.37
-

```
salt.modules.tomcat.deploy_war(war, context, force='no', url='http://localhost:8080/manager',
                               saltenv='base', timeout=180, temp_war_location=None, version=True)
```

Deploy a WAR file

**war** absolute path to WAR file (should be accessible by the user running tomcat) or a path supported by the salt.modules.cp.get\_file function

**context** the context path to deploy

**force** [False] set True to deploy the webapp even one is deployed in the context

**url** [http://localhost:8080/manager] the URL of the server manager webapp

**saltenv** [base] the environment for WAR file in used by salt.modules.cp.get\_url function

**timeout** [180] timeout for HTTP request

**temp\_war\_location** [None] use another location to temporarily copy to war file by default the system's temp directory is used

**version** [``] Specify the war version. If this argument is provided, it overrides the version encoded in the war file name, if one is present.

Examples:

```
salt '*' tomcat.deploy_war salt://salt-2015.8.6.war version=2015.08.r6
```

New in version 2015.8.6.

CLI Examples:

cp module

```
salt '*' tomcat.deploy_war salt://application.war /api
salt '*' tomcat.deploy_war salt://application.war /api no
salt '*' tomcat.deploy_war salt://application.war /api yes http://localhost:8080/
↪manager
```

minion local file system

```
salt '*' tomcat.deploy_war /tmp/application.war /api
salt '*' tomcat.deploy_war /tmp/application.war /api no
salt '*' tomcat.deploy_war /tmp/application.war /api yes http://localhost:8080/
↪manager
```

```
salt.modules.tomcat.extract_war_version(war)
```

Extract the version from the war file name. There does not seem to be a standard for encoding the version into the [war file name](#).

Examples:

```
salt.modules.tomcat.fullversion()
```

Return all server information from catalina.sh version

CLI Example:

```
salt '*' tomcat.fullversion
```

```
salt.modules.tomcat.leaks(url='http://localhost:8080/manager', timeout=180)
```

Find memory leaks in tomcat

**url** [http://localhost:8080/manager] the URL of the server manager webapp

**timeout** [180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.leaks
```

`salt.modules.tomcat.ls` (*url*='http://localhost:8080/manager', *timeout*=180)  
list all the deployed webapps  
**url** [http://localhost:8080/manager] the URL of the server manager webapp  
**timeout** [180] timeout for HTTP request  
CLI Examples:

```
salt '*' tomcat.ls
salt '*' tomcat.ls http://localhost:8080/manager
```

`salt.modules.tomcat.passwd` (*passwd*, *user*='', *alg*='sha1', *realm*=None)  
This function replaces the \$CATALINA\_HOME/bin/digest.sh script convert a clear-text password to the \$CATALINA\_BASE/conf/tomcat-users.xml format

CLI Examples:

```
salt '*' tomcat.passwd secret
salt '*' tomcat.passwd secret tomcat sha1
salt '*' tomcat.passwd secret tomcat sha1 'Protected Realm'
```

`salt.modules.tomcat.reload` (*app*, *url*='http://localhost:8080/manager', *timeout*=180)  
Reload the webapp  
**app** the webapp context path  
**url** [http://localhost:8080/manager] the URL of the server manager webapp  
**timeout** [180] timeout for HTTP request  
CLI Examples:

```
salt '*' tomcat.reload /jenkins
salt '*' tomcat.reload /jenkins http://localhost:8080/manager
```

`salt.modules.tomcat.serverinfo` (*url*='http://localhost:8080/manager', *timeout*=180)  
return details about the server  
**url** [http://localhost:8080/manager] the URL of the server manager webapp  
**timeout** [180] timeout for HTTP request  
CLI Examples:

```
salt '*' tomcat.serverinfo
salt '*' tomcat.serverinfo http://localhost:8080/manager
```

`salt.modules.tomcat.sessions` (*app*, *url*='http://localhost:8080/manager', *timeout*=180)  
return the status of the webapp sessions  
**app** the webapp context path  
**url** [http://localhost:8080/manager] the URL of the server manager webapp  
**timeout** [180] timeout for HTTP request  
CLI Examples:

```
salt '*' tomcat.sessions /jenkins
salt '*' tomcat.sessions /jenkins http://localhost:8080/manager
```

`salt.modules.tomcat.signal` (*signal*=None)  
Signals catalina to start, stop, securestart, forcestop.  
CLI Example:

```
salt '*' tomcat.signal start
```

`salt.modules.tomcat.start` (*app*, *url*='http://localhost:8080/manager', *timeout*=180)  
Start the webapp

**app** the webapp context path  
**url** [<http://localhost:8080/manager>] the URL of the server manager webapp  
**timeout** timeout for HTTP request  
 CLI Examples:

```
salt '*' tomcat.start /jenkins
salt '*' tomcat.start /jenkins http://localhost:8080/manager
```

**salt.modules.tomcat.status**(*url='http://localhost:8080/manager', timeout=180*)

Used to test if the tomcat manager is up  
**url** [<http://localhost:8080/manager>] the URL of the server manager webapp  
**timeout** [180] timeout for HTTP request  
 CLI Examples:

```
salt '*' tomcat.status
salt '*' tomcat.status http://localhost:8080/manager
```

**salt.modules.tomcat.status\_webapp**(*app, url='http://localhost:8080/manager', timeout=180*)

return the status of the webapp (stopped | running | missing)  
**app** the webapp context path  
**url** [<http://localhost:8080/manager>] the URL of the server manager webapp  
**timeout** [180] timeout for HTTP request  
 CLI Examples:

```
salt '*' tomcat.status_webapp /jenkins
salt '*' tomcat.status_webapp /jenkins http://localhost:8080/manager
```

**salt.modules.tomcat.stop**(*app, url='http://localhost:8080/manager', timeout=180*)

Stop the webapp  
**app** the webapp context path  
**url** [<http://localhost:8080/manager>] the URL of the server manager webapp  
**timeout** [180] timeout for HTTP request  
 CLI Examples:

```
salt '*' tomcat.stop /jenkins
salt '*' tomcat.stop /jenkins http://localhost:8080/manager
```

**salt.modules.tomcat.undeploy**(*app, url='http://localhost:8080/manager', timeout=180*)

Undeploy a webapp  
**app** the webapp context path  
**url** [<http://localhost:8080/manager>] the URL of the server manager webapp  
**timeout** [180] timeout for HTTP request  
 CLI Examples:

```
salt '*' tomcat.undeploy /jenkins
salt '*' tomcat.undeploy /jenkins http://localhost:8080/manager
```

**salt.modules.tomcat.version**()

Return server version from catalina.sh version  
 CLI Example:

```
salt '*' tomcat.version
```

### 14.7.394 salt.modules.trafficserver

Apache Traffic Server execution module.

New in version 2015.8.0.

`traffic_ctl` is used to execute individual Traffic Server commands and to script multiple commands in a shell.

`salt.modules.trafficserver.alarms()`

List all alarm events that have not been acknowledged (cleared).

```
salt '*' trafficserver.alarms
```

`salt.modules.trafficserver.bounce_cluster()`

Bounce all Traffic Server nodes in the cluster. Bouncing Traffic Server shuts down and immediately restarts Traffic Server, node-by-node.

```
salt '*' trafficserver.bounce_cluster
```

`salt.modules.trafficserver.bounce_local(drain=False)`

Bounce Traffic Server on the local node. Bouncing Traffic Server shuts down and immediately restarts the Traffic Server node.

**drain** This option modifies the restart behavior such that `traffic_server` is not shut down until the number of active client connections drops to the number given by the `proxy.config.restart.active_client_threshold` configuration variable.

```
salt '*' trafficserver.bounce_local
salt '*' trafficserver.bounce_local drain=True
```

`salt.modules.trafficserver.clear_alarms(alarm)`

Clear (acknowledge) an alarm event. The arguments are “all” for all current alarms, a specific alarm number (e.g. “1”), or an alarm string identifier (e.g. “MGMT\_ALARM\_PROXY\_CONFIG\_ERROR”).

```
salt '*' trafficserver.clear_alarms [all | #event | name]
```

`salt.modules.trafficserver.clear_cluster()`

Clears accumulated statistics on all nodes in the cluster.

```
salt '*' trafficserver.clear_cluster
```

`salt.modules.trafficserver.clear_node()`

Clears accumulated statistics on the local node.

```
salt '*' trafficserver.clear_node
```

`salt.modules.trafficserver.match_config(regex)`

Display the current values of all configuration variables whose names match the given regular expression.

New in version 2016.11.0.

```
salt '*' trafficserver.match_config regex
```

`salt.modules.trafficserver.match_metric(regex)`

Display the current values of all metrics whose names match the given regular expression.

New in version 2016.11.0.

```
salt '*' trafficserver.match_metric regex
```

`salt.modules.trafficserver.match_var(regex)`

Display the current values of all performance statistics or configuration variables whose names match the given regular expression.

Deprecated since version Fluorine: Use `match_metric` or `match_config` instead.

```
salt '*' trafficserver.match_var regex
```

`salt.modules.trafficserver.offline(path)`

Mark a cache storage device as offline. The storage is identified by a path which must match exactly a path specified in `storage.config`. This removes the storage from the cache and redirects requests that would have used this storage to other storage. This has exactly the same effect as a disk failure for that storage. This does not persist across restarts of the `traffic_server` process.

```
salt '*' trafficserver.offline /path/to/cache
```

`salt.modules.trafficserver.read_config(*args)`

Read Traffic Server configuration variable definitions.

New in version 2016.11.0.

```
salt '*' trafficserver.read_config proxy.config.http.keep_alive_post_out
```

`salt.modules.trafficserver.read_metric(*args)`

Read Traffic Server one or more metrics.

New in version 2016.11.0.

```
salt '*' trafficserver.read_metric proxy.process.http.tcp_hit_count_stat
```

`salt.modules.trafficserver.read_var(*args)`

Read variable definitions from the `traffic_line` command.

Deprecated since version Fluorine: Use `read_metric` or `read_config` instead. Note that this function does not work for Traffic Server versions `>= 7.0`.

```
salt '*' trafficserver.read_var proxy.process.http.tcp_hit_count_stat
```

`salt.modules.trafficserver.refresh()`

Initiate a Traffic Server configuration file reread. Use this command to update the running configuration after any configuration file modification.

The timestamp of the last reconfiguration event (in seconds since epoch) is published in the `proxy.node.config.reconfigure_time` metric.

```
salt '*' trafficserver.refresh
```

`salt.modules.trafficserver.restart_cluster()`

Restart the `traffic_manager` process and the `traffic_server` process on all the nodes in a cluster.

```
salt '*' trafficserver.restart_cluster
```

`salt.modules.trafficserver.restart_local(drain=False)`

Restart the `traffic_manager` and `traffic_server` processes on the local node.

**drain** This option modifies the restart behavior such that `traffic_server` is not shut down until the number of active client connections drops to the number given by the `proxy.config.restart.active_client_threshold` configuration variable.

```
salt '*' trafficserver.restart_local
salt '*' trafficserver.restart_local drain=True
```

`salt.modules.trafficserver.set_config(variable, value)`

Set the value of a Traffic Server configuration variable.

**variable** Name of a Traffic Server configuration variable.

**value** The new value to set.

New in version 2016.11.0.

```
salt '*' trafficserver.set_config proxy.config.http.keep_alive_post_out 0
```

`salt.modules.trafficserver.set_var(variable, value)`

Deprecated since version Fluorine: Use `set_config` instead. Note that this function does not work for Traffic Server versions  $\geq 7.0$ .

```
salt '*' trafficserver.set_var proxy.config.http.server_ports
```

`salt.modules.trafficserver.shutdown()`

Shut down Traffic Server on the local node.

```
salt '*' trafficserver.shutdown
```

`salt.modules.trafficserver.startup()`

Start Traffic Server on the local node.

```
salt '*' trafficserver.start
```

`salt.modules.trafficserver.status()`

Show the current proxy server status, indicating if we're running or not.

```
salt '*' trafficserver.status
```

`salt.modules.trafficserver.zero_cluster()`

Reset performance statistics to zero across the cluster.

```
salt '*' trafficserver.zero_cluster
```

`salt.modules.trafficserver.zero_node()`

Reset performance statistics to zero on the local node.

```
salt '*' trafficserver.zero_cluster
```

### 14.7.395 salt.modules.travisci

Commands for working with travisci.

**depends** pyOpenSSL  $\geq 16.0.0$

`salt.modules.travisci.verify_webhook(signature, body)`

Verify the webhook signature from travisci

**signature** The signature header from the webhook header

**body** The full payload body from the webhook post

---

**Note:** The body needs to be the urlencoded version of the body.

---

CLI Example:

```
salt '*' travisci.verify_webhook 'M6NucCX5722bxisQs7e...' 'payload=%7B%22id%22
↳%3A183791261%2C%22repository...''
```

### 14.7.396 salt.modules.tuned

Interface to Red Hat tuned-adm module

**maintainer** Syed Ali <alicsyed@gmail.com>

**maturity** new

**depends** tuned-adm

**platform** Linux

**salt.modules.tuned.active()**

Return current active profile

CLI Example:

```
salt '*' tuned.active
```

**salt.modules.tuned.list()**

List the profiles available

CLI Example:

```
salt '*' tuned.list
```

**salt.modules.tuned.off()**

Turn off all profiles

CLI Example:

```
salt '*' tuned.off
```

**salt.modules.tuned.profile(profile\_name)**

Activate specified profile

CLI Example:

```
salt '*' tuned.profile virtual-guest
```

### 14.7.397 salt.modules.twilio\_notify

Module for notifications via Twilio

New in version 2014.7.0.

**depends**

- twilio python module

**configuration** Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:

```
my-twilio-account:
  twilio.account_sid: AC32a3c83990934481add5ce1659f04d2
  twilio.auth_token: mytoken
```

`salt.modules.twilio_notify.send_sms` (*profile, body, to, from\_*)  
Send an sms

CLI Example:

```
twilio.send_sms twilio-account 'Test sms' '+18019999999' '+18011111111'
```

### 14.7.398 salt.modules.udev

Manage and query udev info

New in version 2015.8.0.

`salt.modules.udev.env` (*dev*)  
Return all environment variables udev has for dev

CLI Example:

```
salt '*' udev.env /dev/sda
salt '*' udev.env /sys/class/net/eth0
```

`salt.modules.udev.exportdb` ()  
Return all the udev database

CLI Example:

`salt.modules.udev.info` (*dev*)  
Extract all info delivered by udevadm

CLI Example:

```
salt '*' udev.info /dev/sda
salt '*' udev.info /sys/class/net/eth0
```

`salt.modules.udev.links` (*dev*)  
Return all udev-created device symlinks

CLI Example:

```
salt '*' udev.links /dev/sda
salt '*' udev.links /sys/class/net/eth0
```

`salt.modules.udev.name` (*dev*)  
Return the actual dev name(s?) according to udev for dev

CLI Example:

```
salt '*' udev.dev /dev/sda
salt '*' udev.dev /sys/class/net/eth0
```

`salt.modules.udev.path` (*dev*)  
Return the physical device path(s?) according to udev for dev

CLI Example:

```
salt '*' udev.path /dev/sda
salt '*' udev.path /sys/class/net/eth0
```

### 14.7.399 salt.modules.upstart

Module for the management of upstart systems. The Upstart system only supports service starting, stopping and restarting.

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `'service.start' is not available`), see [here](#).

Currently (as of Ubuntu 12.04) there is no tool available to disable Upstart services (like `update-rc.d`). This<sup>[1]</sup> is the recommended way to disable an Upstart service. So we assume that all Upstart services that have not been disabled in this manner are enabled.

But this is broken because we do not check to see that the dependent services are enabled. Otherwise we would have to do something like parse the output of `initctl show-config` to determine if all service dependencies are enabled to start on boot. For example, see the `start on` condition for the `lightdm` service below<sup>[2]</sup>. And this would be too hard. So we wait until the upstart developers have solved this problem. :) This is to say that an Upstart service that is enabled may not really be enabled.

Also, when an Upstart service is enabled, should the dependent services be enabled too? Probably not. But there should be a notice about this, at least.

[1] <http://upstart.ubuntu.com/cookbook/#disabling-a-job-from-automatically-starting>

[2] example upstart configuration file:

```
lightdm
emits login-session-start
emits desktop-session-start
emits desktop-shutdown
start on (((filesystem and runlevel [!06]) and started dbus) and (drm-device-added
→card0 PRIMARY_DEVICE_FOR_DISPLAY=1 or stopped udev-fallback-graphics)) or runlevel
→PREVLEVEL=S)
stop on runlevel [016]
```

**Warning:** This module should not be used on Red Hat systems. For these, the `rh_service` module should be used, as it supports the hybrid upstart/sysvinit system used in RHEL/CentOS 6.

`salt.modules.upstart.available(name)`

Returns True if the specified service is available, otherwise returns False.

CLI Example:

```
salt '*' service.available sshd
```

`salt.modules.upstart.disable(name, **kwargs)`

Disable the named service from starting on boot

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.upstart.disabled(name)`

Check to see if the named service is disabled to start on boot

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.upstart.enable(name, **kwargs)`

Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.upstart.enabled(name, **kwargs)`

Check to see if the named service is enabled to start on boot

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.upstart.force_reload(name)`

Force-reload the named service

CLI Example:

```
salt '*' service.force_reload <service name>
```

`salt.modules.upstart.full_restart(name)`

Do a full restart (stop/start) of the named service

CLI Example:

```
salt '*' service.full_restart <service name>
```

`salt.modules.upstart.get_all()`

Return all installed services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.upstart.get_disabled()`

Return the disabled services

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.upstart.get_enabled()`

Return the enabled services

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.upstart.missing(name)`

The inverse of `service.available`. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.upstart.reload(name)`

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.upstart.restart(name)`

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.upstart.start(name)`

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.upstart.status(name, sig=None)`

Return the status for a service, returns a bool whether the service is running.

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.upstart.stop(name)`

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

## 14.7.400 salt.modules.uptime

### Wrapper around uptime API

`salt.modules.uptime.check_exists(name)`

Check if a given URL is in being monitored by uptime

CLI Example:

```
salt '*' uptime.check_exists http://example.org
```

`salt.modules.uptime.checks_list()`

List URL checked by uptime

CLI Example:

```
salt '*' uptime.checks_list
```

`salt.modules.uptime.create`(*name*, *\*\*params*)

Create a check on a given URL.

Additional parameters can be used and are passed to API (for example `interval`, `maxTime`, etc). See the documentation <https://github.com/fzaninotto/uptime> for a full list of the parameters.

CLI Example:

```
salt '*' uptime.create http://example.org
```

`salt.modules.uptime.delete`(*name*)

Delete a check on a given URL

CLI Example:

```
salt '*' uptime.delete http://example.org
```

### 14.7.401 salt.modules.useradd

Manage users with the `useradd` command

---

**Important:** If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to `'user.info' is not available`), see [here](#).

---

`salt.modules.useradd.add`(*name*, *uid=None*, *gid=None*, *groups=None*, *home=None*, *shell=None*, *unique=True*, *system=False*, *fullname=''*, *roomnumber=''*, *workphone=''*, *homephone=''*, *createhome=True*, *loginclass=None*, *root=None*, *nologinit=False*)

Add a user to the minion

CLI Example:

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

`salt.modules.useradd.chfullname`(*name*, *fullname*)

Change the user's Full Name

CLI Example:

```
salt '*' user.chfullname foo "Foo Bar"
```

`salt.modules.useradd.chgid`(*name*, *gid*, *root=None*)

Change the default group of the user

CLI Example:

```
salt '*' user.chgid foo 4376
```

`salt.modules.useradd.chgroups`(*name*, *groups*, *append=False*, *root=None*)

Change the groups to which this user belongs

**name** User to modify

**groups** Groups to set for the user

**append** [False] If True, append the specified group(s). Otherwise, this function will replace the user's groups with the specified group(s).

CLI Examples:

```
salt '*' user.chgroups foo wheel,root
salt '*' user.chgroups foo wheel,root append=True
```

`salt.modules.useradd.chhome` (*name, home, persist=False, root=None*)

Change the home directory of the user, pass True for persist to move files to the new home directory if the old home directory exist.

CLI Example:

```
salt '*' user.chhome foo /home/users/foo True
```

`salt.modules.useradd.chhomephone` (*name, homephone*)

Change the user's Home Phone

CLI Example:

```
salt '*' user.chhomephone foo 7735551234
```

`salt.modules.useradd.chloginclass` (*name, loginclass, root=None*)

Change the default login class of the user

---

**Note:** This function only applies to OpenBSD systems.

---

CLI Example:

```
salt '*' user.chloginclass foo staff
```

`salt.modules.useradd.chroomnumber` (*name, roomnumber*)

Change the user's Room Number

CLI Example:

```
salt '*' user.chroomnumber foo 123
```

`salt.modules.useradd.chshell` (*name, shell, root=None*)

Change the default shell of the user

CLI Example:

```
salt '*' user.chshell foo /bin/zsh
```

`salt.modules.useradd.chuid` (*name, uid*)

Change the uid for a named user

CLI Example:

```
salt '*' user.chuid foo 4376
```

`salt.modules.useradd.chworkphone` (*name, workphone*)

Change the user's Work Phone

CLI Example:

```
salt '*' user.chworkphone foo 7735550123
```

`salt.modules.useradd.delete`(*name*, *remove=False*, *force=False*, *root=None*)

Remove a user from the minion

CLI Example:

```
salt '*' user.delete name remove=True force=True
```

`salt.modules.useradd.get_loginclass`(*name*)

Get the login class of the user

---

**Note:** This function only applies to OpenBSD systems.

---

CLI Example:

```
salt '*' user.get_loginclass foo
```

`salt.modules.useradd.getent`(*refresh=False*)

Return the list of all info for all users

CLI Example:

```
salt '*' user.getent
```

`salt.modules.useradd.info`(*name*)

Return user information

CLI Example:

```
salt '*' user.info root
```

`salt.modules.useradd.list_groups`(*name*)

Return a list of groups the named user belongs to

CLI Example:

```
salt '*' user.list_groups foo
```

`salt.modules.useradd.list_users`()

Return a list of all users

CLI Example:

```
salt '*' user.list_users
```

`salt.modules.useradd.primary_group`(*name*)

Return the primary group of the named user

New in version 2016.3.0.

CLI Example:

```
salt '*' user.primary_group saltadmin
```

`salt.modules.useradd.rename`(*name*, *new\_name*, *root=None*)

Change the username for a named user

CLI Example:

```
salt '*' user.rename name new_name
```

### 14.7.402 salt.modules.uwsgi

uWSGI stats server <https://uwsgi-docs.readthedocs.io/en/latest/StatsServer.html>

**maintainer** Peter Baumgartner <pete@lincolnloop.com>

**maturity** new

**platform** all

**salt.modules.uwsgi.stats**(*socket*)

Return the data from *uwsgi --connect-and-read* as a dictionary.

**socket** The socket the uWSGI stats server is listening on

CLI Example:

```
salt '*' uwsgi.stats /var/run/mystatsserver.sock
salt '*' uwsgi.stats 127.0.0.1:5050
```

### 14.7.403 salt.modules.varnish

Support for Varnish

New in version 2014.7.0.

---

**Note:** These functions are designed to work with all implementations of Varnish from 3.x onwards

---

**salt.modules.varnish.ban**(*ban\_expression*)

Add ban to the varnish cache

CLI Example:

```
salt '*' varnish.ban ban_expression
```

**salt.modules.varnish.ban\_list**()

List varnish cache current bans

CLI Example:

```
salt '*' varnish.ban_list
```

**salt.modules.varnish.param\_set**(*param, value*)

Set a param in varnish cache

CLI Example:

```
salt '*' varnish.param_set param value
```

**salt.modules.varnish.param\_show**(*param=None*)

Show params of varnish cache

CLI Example:

```
salt '*' varnish.param_show param
```

`salt.modules.varnish.purge()`

Purge the varnish cache

CLI Example:

```
salt '*' varnish.purge
```

`salt.modules.varnish.version()`

Return server version from varnishd -V

CLI Example:

```
salt '*' varnish.version
```

#### 14.7.404 salt.modules.vault module

**maintainer** SaltStack

**maturity** new

**platform** all

Functions to interact with Hashicorp Vault.

**configuration** The salt-master must be configured to allow peer-runner configuration, as well as configuration for the module.

Add this segment to the master configuration file, or /etc/salt/master.d/vault.conf:

```
vault:
  url: https://vault.service.domain:8200
  auth:
    method: token
    token: 11111111-2222-3333-4444-555555555555
  policies:
    - saltstack/minions
    - saltstack/minion/{minion}
    .. more policies
```

**url** Url to your Vault installation. Required.

**auth** Currently only token auth is supported. The token must be able to create tokens with the policies that should be assigned to minions. Required.

**policies** Policies that are assigned to minions when requesting a token. These can either be static, eg saltstack/minions, or templated, eg saltstack/minion/{minion}. {minion} is shorthand for grains[id]. Grains are also available, for example like this: my-policies/{grains[os]}

If a template contains a grain which evaluates to a list, it will be expanded into multiple policies. For example, given the template saltstack/by-role/{grains[roles]}, and a minion having these grains:

The minion will have the policies saltstack/by-role/web and saltstack/by-role/database. Note however that list members which do not have simple string representations, such as dictionaries or objects, do not work and will throw an exception. Strings and numbers are examples of types which work well.

Optional. If `polices` is not configured, `saltstack/minions` and `saltstack/{minion}` are used as defaults.

Add this segment to the master configuration file, or `/etc/salt/master.d/peer_run.conf`:

```
peer_run:
  .*:
    - vault.generate_token
```

`salt.modules.vault.delete_secret(path)`

Delete secret at the path in vault. The vault policy used must allow this.

CLI Example:

`salt.modules.vault.list_secrets(path)`

List secret keys at the path in vault. The vault policy used must allow this. The path should end with a trailing slash.

CLI Example:

`salt.modules.vault.read_secret(path, key=None)`

Return the value of key at path in vault, or entire secret

Jinja Example:

```
my-secret: {{ salt['vault'].read_secret('secret/my/secret', 'some-key') }}
```

```
{% set supersecret = salt['vault'].read_secret('secret/my/secret') %}
secrets:
  first: {{ supersecret.first }}
  second: {{ supersecret.second }}
```

`salt.modules.vault.write_secret(path, **kwargs)`

Set secret at the path in vault. The vault policy used must allow this.

CLI Example:

#### 14.7.405 salt.modules.vbox\_guest

VirtualBox Guest Additions installer

`salt.modules.vbox_guest.additions_install(*args, **kwargs)`

Install VirtualBox Guest Additions. Uses the CD, connected by VirtualBox.

To connect VirtualBox Guest Additions via VirtualBox graphical interface press `Host+D` (`Host` is usually `Right Ctrl`).

See <https://www.virtualbox.org/manual/ch04.html#idp52733088> for more details.

CLI Example:

```
salt '*' vbox_guest.additions_install
salt '*' vbox_guest.additions_install reboot=True
salt '*' vbox_guest.additions_install upgrade_os=True
```

**Parameters**

- **reboot** (*bool*) -- reboot computer to complete installation
- **upgrade\_os** (*bool*) -- upgrade OS (to ensure the latests version of kernel and developer tools are installed)

**Returns** version of VirtualBox Guest Additions or string with error

`salt.modules.vbox_guest.additions_mount()`

Mount VirtualBox Guest Additions CD to the temp directory.

To connect VirtualBox Guest Additions via VirtualBox graphical interface press `Host+D` (`Host` is usually `Right Ctrl`).

CLI Example:

```
salt '*' vbox_guest.additions_mount
```

**Returns** True or OSError exception

`salt.modules.vbox_guest.additions_remove(**kwargs)`

Remove VirtualBox Guest Additions.

Firstly it tries to uninstall itself by executing `/opt/VBoxGuestAdditions-VERSION/uninstall.run uninstall`. It uses the CD, connected by VirtualBox if it fails.

CLI Example:

```
salt '*' vbox_guest.additions_remove
salt '*' vbox_guest.additions_remove force=True
```

**Parameters** **force** (*bool*) -- force VirtualBox Guest Additions removing

**Returns** True if VirtualBox Guest Additions were removed successfully else False

`salt.modules.vbox_guest.additions_umount(mount_point)`

Unmount VirtualBox Guest Additions CD from the temp directory.

CLI Example:

```
salt '*' vbox_guest.additions_umount
```

**Parameters** **mount\_point** -- directory VirtualBox Guest Additions is mounted to

**Returns** True or an string with error

`salt.modules.vbox_guest.additions_version()`

Check VirtualBox Guest Additions version.

CLI Example:

```
salt '*' vbox_guest.additions_version
```

**Returns** version of VirtualBox Guest Additions or False if they are not installed

`salt.modules.vbox_guest.grant_access_to_shared_folders_to(name, users=None)`

Grant access to auto-mounted shared folders to the users.

User is specified by it's name. To grant access for several users use argument *users*. Access will be denied to the users not listed in *users* argument.

See [https://www.virtualbox.org/manual/ch04.html#sf\\_mount\\_auto](https://www.virtualbox.org/manual/ch04.html#sf_mount_auto) for more details.

CLI Example:

```
salt '*' vbox_guest.grant_access_to_shared_folders_to fred
salt '*' vbox_guest.grant_access_to_shared_folders_to users ['fred', 'roman']
```

**Parameters**

- **name** (*str*) -- name of the user to grant access to auto-mounted shared folders to
- **users** (*list of str*) -- list of names of users to grant access to auto-mounted shared folders to (if specified, *name* will not be taken into account)

**Returns** list of users who have access to auto-mounted shared folders

`salt.modules.vbox_guest.list_shared_folders_users()`

List users who have access to auto-mounted shared folders.

See [https://www.virtualbox.org/manual/ch04.html#sf\\_mount\\_auto](https://www.virtualbox.org/manual/ch04.html#sf_mount_auto) for more details.

CLI Example:

```
salt '*' vbox_guest.list_shared_folders_users
```

**Returns** list of users who have access to auto-mounted shared folders

#### 14.7.406 salt.modules.vboxmanage module

Support for VirtualBox using the VBoxManage command

New in version 2016.3.0.

If the `vboxdrv` kernel module is not loaded, this module can automatically load it by configuring `autoload_vboxdrv` in `/etc/salt/minion`:

The default for this setting is `False`.

**depends** virtualbox

`salt.modules.vboxmanage.clonemedium`(*medium, uuid\_in=None, file\_in=None, uuid\_out=None, file\_out=None, mformat=None, variant=None, existing=False, \*\*kwargs*)

Clone a new VM from an existing VM

CLI Example:

```
salt 'hypervisor' vboxmanage.clonemedium <name> <new_name>
```

`salt.modules.vboxmanage.clonevm`(*name=None, uuid=None, new\_name=None, snapshot\_uuid=None, snapshot\_name=None, mode='machine', options=None, basefolder=None, new\_uuid=None, register=False, groups=None, \*\*kwargs*)

Clone a new VM from an existing VM

CLI Example:

```
salt 'hypervisor' vboxmanage.clonevm <name> <new_name>
```

`salt.modules.vboxmanage.create`(*name, groups=None, ostype=None, register=True, basefolder=None, new\_uuid=None, \*\*kwargs*)

Create a new VM

CLI Example:

```
salt 'hypervisor' vboxmanage.create <name>
```

`salt.modules.vboxmanage.destroy`(*name*)

Unregister and destroy a VM

CLI Example:

```
salt '*' vboxmanage.destroy my_vm
```

`salt.modules.vboxmanage.list_items(item, details=False, group_by='UUID')`

Return a list of a specific type of item. The following items are available:

vms runningvms otypes hostdvs hostfloppies intnets bridgedifs hostonlyifs natnets  
dhcpserver hostinfo hostcpuids hddbackends hdds dvds floppies usbhost usbfilters sys-  
temproperties extpacks groups webcams screenshotformats

CLI Example:

```
salt 'hypervisor' vboxmanage.items <item>
salt 'hypervisor' vboxmanage.items <item> details=True
salt 'hypervisor' vboxmanage.items <item> details=True group_by=Name
```

Some items do not display well, or at all, unless `details` is set to `True`. By default, items are grouped by the `UUID` field, but not all items contain that field. In those cases, another field must be specified.

`salt.modules.vboxmanage.list_nodes()`

Return a list of registered VMs

CLI Example:

```
salt '*' vboxmanage.list_nodes
```

`salt.modules.vboxmanage.list_nodes_full()`

Return a list of registered VMs, with detailed information

CLI Example:

```
salt '*' vboxmanage.list_nodes_full
```

`salt.modules.vboxmanage.list_nodes_min()`

Return a list of registered VMs, with minimal information

CLI Example:

```
salt '*' vboxmanage.list_nodes_min
```

`salt.modules.vboxmanage.list_ostypes()`

List the available OS Types

CLI Example:

```
salt '*' vboxmanage.list_ostypes
```

`salt.modules.vboxmanage.register(filename)`

Register a VM

CLI Example:

```
salt '*' vboxmanage.register my_vm_filename
```

`salt.modules.vboxmanage.start(name)`

Start a VM

CLI Example:

```
salt '*' vboxmanage.start my_vm
```

`salt.modules.vboxmanage.stop(name)`

Stop a VM

CLI Example:

```
salt '*' vboxmanage.stop my_vm
```

`salt.modules.vboxmanage.unregister` (*name*, *delete=False*)

Unregister a VM

CLI Example:

```
salt '*' vboxmanage.unregister my_vm_filename
```

`salt.modules.vboxmanage.vboxcmd` ()

Return the location of the VBoxManage command

CLI Example:

```
salt '*' vboxmanage.vboxcmd
```

### 14.7.407 salt.modules.victorops

Support for VictorOps

New in version 2015.8.0.

Requires an `api_key` in `/etc/salt/minion`:

`salt.modules.victorops.create_event` (*message\_type=None*, *routing\_key='everybody'*, *\*\*kwargs*)

Create an event in VictorOps. Designed for use in states.

The following parameters are required:

**Parameters** `message_type` -- One of the following values: INFO, WARNING, ACKNOWLEDGEMENT, CRITICAL, RECOVERY.

The following parameters are optional:

**Parameters**

- **routing\_key** -- The key for where messages should be routed. By default, sent to 'everyone' route.
- **entity\_id** -- The name of alerting entity. If not provided, a random name will be assigned.
- **timestamp** -- Timestamp of the alert in seconds since epoch. Defaults to the time the alert is received at VictorOps.

`:param timestamp_fmt` The date format for the timestamp parameter.

**Parameters**

- **state\_start\_time** -- The time this entity entered its current state (seconds since epoch). Defaults to the time alert is received.
- **state\_start\_time\_fmt** -- The date format for the timestamp parameter.
- **state\_message** -- Any additional status information from the alert item.
- **entity\_is\_host** -- Used within VictorOps to select the appropriate display format for the incident.
- **entity\_display\_name** -- Used within VictorOps to display a human-readable name for the entity.
- **ack\_message** -- A user entered comment for the acknowledgment.
- **ack\_author** -- The user that acknowledged the incident.

**Returns** A dictionary with `result`, `entity_id`, and `message` if result was failure.

CLI Example:

```
salt myminion victorops.create_event message_type='CRITICAL' routing_key='everyone'
↳ 'entity_id='hostname/diskspace'
```

```

salt myminion victorops.create_event message_type='ACKNOWLEDGEMENT' routing_key=
↳ 'everyone'                entity_id='hostname/diskspace' ack_message=
↳ 'Acknowledged' ack_author='username'

salt myminion victorops.create_event message_type='RECOVERY' routing_key='everyone
↳ '                entity_id='hostname/diskspace'

```

The following parameters are required: `message_type`

#### 14.7.408 salt.modules.virt

Work with virtual machines managed by libvirt

**depends** libvirt Python module

`salt.modules.virt.cpu_baseline` (*full=False, migratable=False, out='libvirt'*)

Return the optimal `custom` CPU baseline config for VM's on this minion

New in version 2016.3.0.

##### Parameters

- **full** -- Return all CPU features rather than the ones on top of the closest CPU model
- **migratable** -- Exclude CPU features that are unmigratable (libvirt 2.13+)
- **out** -- `libvirt` (default) for usable libvirt XML definition, `salt` for nice dict

CLI Example:

```
salt '*' virt.cpu_baseline
```

`salt.modules.virt.create_xml_path` (*path*)

Start a domain based on the XML-file path passed to the function

CLI Example:

```
salt '*' virt.create_xml_path <path to XML file on the node>
```

`salt.modules.virt.create_xml_str` (*xml*)

Start a domain based on the XML passed to the function

CLI Example:

```
salt '*' virt.create_xml_str <XML in string format>
```

`salt.modules.virt.ctrl_alt_del` (*vm\_*)

Sends CTRL+ALT+DEL to a VM

CLI Example:

```
salt '*' virt.ctrl_alt_del <domain>
```

`salt.modules.virt.define_vol_xml_path` (*path*)

Define a volume based on the XML-file path passed to the function

CLI Example:

```
salt '*' virt.define_vol_xml_path <path to XML file on the node>
```

`salt.modules.virt.define_vol_xml_str` (*xml*)

Define a volume based on the XML passed to the function

CLI Example:

```
salt '*' virt.define_vol_xml_str <XML in string format>
```

`salt.modules.virt.define_xml_path(path)`

Define a domain based on the XML-file path passed to the function

CLI Example:

```
salt '*' virt.define_xml_path <path to XML file on the node>
```

`salt.modules.virt.define_xml_str(xml)`

Define a domain based on the XML passed to the function

CLI Example:

```
salt '*' virt.define_xml_str <XML in string format>
```

`salt.modules.virt.delete_snapshots(name, *names, **kwargs)`

Delete one or more snapshots of the given VM.

Options:

- **all**: Remove all snapshots. Values: True or False (default False).

New in version 2016.3.0.

CLI Example:

```
salt '*' virt.delete_snapshots <domain> all=True
salt '*' virt.delete_snapshots <domain> <snapshot>
salt '*' virt.delete_snapshots <domain> <snapshot1> <snapshot2> ...
```

`salt.modules.virt.freecpu()`

Return an int representing the number of unallocated cpus on this hypervisor

CLI Example:

```
salt '*' virt.freecpu
```

`salt.modules.virt.freemem()`

Return an int representing the amount of memory (in MB) that has not been given to virtual machines on this node

CLI Example:

```
salt '*' virt.freemem
```

`salt.modules.virt.full_info()`

Return the node\_info, vm\_info and freemem

CLI Example:

```
salt '*' virt.full_info
```

`salt.modules.virt.get_disks(vm_)`

Return the disks of a named vm

CLI Example:

```
salt '*' virt.get_disks <domain>
```

`salt.modules.virt.get_graphics(vm_)`  
Returns the information on vnc for a given vm

CLI Example:

```
salt '*' virt.get_graphics <domain>
```

`salt.modules.virt.get_macs(vm_)`  
Return a list off MAC addresses from the named vm

CLI Example:

```
salt '*' virt.get_macs <domain>
```

`salt.modules.virt.get_nics(vm_)`  
Return info about the network interfaces of a named vm

CLI Example:

```
salt '*' virt.get_nics <domain>
```

`salt.modules.virt.get_profiles(hypervisor=None)`  
Return the virt profiles for hypervisor.

Currently there are profiles for:

- nic
- disk

CLI Example:

```
salt '*' virt.get_profiles
salt '*' virt.get_profiles hypervisor=esxi
```

`salt.modules.virt.get_xml(vm_)`  
Returns the XML for a given vm

CLI Example:

```
salt '*' virt.get_xml <domain>
```

`salt.modules.virt.init(name, cpu, mem, image=None, nic='default', hypervisor='kvm', start=True, disk='default', saltenv='base', seed=True, install=True, pub_key=None, priv_key=None, seed_cmd='seed.apply', enable_vnc=False, enable_qcow=False, **kwargs)`

Initialize a new vm

CLI Example:

```
salt 'hypervisor' virt.init vm_name 4 512 salt://path/to/image.raw
salt 'hypervisor' virt.init vm_name 4 512 /var/lib/libvirt/images/img.raw
salt 'hypervisor' virt.init vm_name 4 512 nic=profile disk=profile
```

`salt.modules.virt.is_hyper()`  
Returns a bool whether or not this node is a hypervisor of any kind

CLI Example:

```
salt '*' virt.is_hyper
```

`salt.modules.virt.is_kvm_hyper()`  
Returns a bool whether or not this node is a KVM hypervisor

CLI Example:

```
salt '*' virt.is_kvm_hyper
```

`salt.modules.virt.is_xen_hyper()`

Returns a bool whether or not this node is a XEN hypervisor

CLI Example:

```
salt '*' virt.is_xen_hyper
```

`salt.modules.virt.list_active_vms()`

Return a list of names for active virtual machine on the minion

CLI Example:

```
salt '*' virt.list_active_vms
```

`salt.modules.virt.list_domains()`

Return a list of available domains.

CLI Example:

```
salt '*' virt.list_domains
```

`salt.modules.virt.list_inactive_vms()`

Return a list of names for inactive virtual machine on the minion

CLI Example:

```
salt '*' virt.list_inactive_vms
```

`salt.modules.virt.list_snapshots(domain=None)`

List available snapshots for certain vm or for all.

New in version 2016.3.0.

CLI Example:

```
salt '*' virt.list_snapshots
salt '*' virt.list_snapshots <domain>
```

`salt.modules.virt.migrate(vm_, target, ssh=False)`

Shared storage migration

CLI Example:

```
salt '*' virt.migrate <domain> <target hypervisor>
```

`salt.modules.virt.migrate_non_shared(vm_, target, ssh=False)`

Attempt to execute non-shared storage ``all" migration

CLI Example:

```
salt '*' virt.migrate_non_shared <vm name> <target hypervisor>
```

`salt.modules.virt.migrate_non_shared_inc(vm_, target, ssh=False)`

Attempt to execute non-shared storage ``all" migration

CLI Example:

```
salt '*' virt.migrate_non_shared_inc <vm name> <target hypervisor>
```

`salt.modules.virt.node_info()`  
Return a dict with information about this node

CLI Example:

```
salt '*' virt.node_info
```

`salt.modules.virt.pause(vm_)`  
Pause the named vm

CLI Example:

```
salt '*' virt.pause <domain>
```

`salt.modules.virt.purge(vm_, dirs=False)`  
Recursively destroy and delete a virtual machine, pass True for dir's to also delete the directories containing the virtual machine disk images - USE WITH EXTREME CAUTION!

CLI Example:

```
salt '*' virt.purge <domain>
```

`salt.modules.virt.reboot(name)`  
Reboot a domain via ACPI request

CLI Example:

```
salt '*' virt.reboot <domain>
```

`salt.modules.virt.reset(vm_)`  
Reset a VM by emulating the reset button on a physical machine

CLI Example:

```
salt '*' virt.reset <domain>
```

`salt.modules.virt.resume(vm_)`  
Resume the named vm

CLI Example:

```
salt '*' virt.resume <domain>
```

`salt.modules.virt.revert_snapshot(name, snapshot=None, cleanup=False)`  
Revert snapshot to the previous from current (if available) or to the specific.

Options:

- cleanup**: Remove all newer than reverted snapshots. Values: True or False (default False).

New in version 2016.3.0.

CLI Example:

```
salt '*' virt.revert <domain>
salt '*' virt.revert <domain> <snapshot>
```

`salt.modules.virt.seed_non_shared_migrate(disks, force=False)`  
Non shared migration requires that the disks be present on the migration destination, pass the disks information via this function, to the migration destination before executing the migration.

CLI Example:

```
salt '*' virt.seed_non_shared_migrate <disks>
```

`salt.modules.virt.set_autostart`(*vm\_*, *state='on'*)

Set the autostart flag on a VM so that the VM will start with the host system on reboot.

CLI Example:

```
salt "*" virt.set_autostart <domain> <on | off>
```

`salt.modules.virt.setmem`(*vm\_*, *memory*, *config=False*)

Changes the amount of memory allocated to VM. The VM must be shutdown for this to work.

memory is to be specified in MB If config is True then we ask libvirt to modify the config as well

CLI Example:

```
salt '*' virt.setmem <domain> <size>
salt '*' virt.setmem my_domain 768
```

`salt.modules.virt.setvcpus`(*vm\_*, *vcpus*, *config=False*)

Changes the amount of vcpus allocated to VM. The VM must be shutdown for this to work.

vcpus is an int representing the number to be assigned If config is True then we ask libvirt to modify the config as well

CLI Example:

```
salt '*' virt.setvcpus <domain> <amount>
salt '*' virt.setvcpus my_domain 4
```

`salt.modules.virt.shutdown`(*vm\_*)

Send a soft shutdown signal to the named vm

CLI Example:

```
salt '*' virt.shutdown <domain>
```

`salt.modules.virt.snapshot`(*domain*, *name=None*, *suffix=None*)

Create a snapshot of a VM.

Options:

- name:** Name of the snapshot. If the name is omitted, then will be used original domain name with ISO 8601 time as a suffix.
- suffix:** Add suffix for the new name. Useful in states, where such snapshots can be distinguished from manually created.

New in version 2016.3.0.

CLI Example:

```
salt '*' virt.snapshot <domain>
```

`salt.modules.virt.start`(*name*)

Start a defined domain

CLI Example:

```
salt '*' virt.start <domain>
```

`salt.modules.virt.stop(name)`

Hard power down the virtual machine, this is equivalent to pulling the power.

CLI Example:

```
salt '*' virt.stop <domain>
```

`salt.modules.virt.undefine(vm_)`

Remove a defined vm, this does not purge the virtual machine image, and this only works if the vm is powered down

CLI Example:

```
salt '*' virt.undefine <domain>
```

`salt.modules.virt.virt_type()`

Returns the virtual machine type as a string

CLI Example:

```
salt '*' virt.virt_type
```

`salt.modules.virt.vm_cputime(vm_=None)`

Return cputime used by the vms on this hyper in a list of dicts:

```
[
  'your-vm': {
    'cputime' <int>
    'cputime_percent' <int>
  },
  ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_cputime
```

`salt.modules.virt.vm_diskstats(vm_=None)`

Return disk usage counters used by the vms on this hyper in a list of dicts:

```
[
  'your-vm': {
    'rd_req' : 0,
    'rd_bytes' : 0,
    'wr_req' : 0,
    'wr_bytes' : 0,
    'errs' : 0
  },
  ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_blockstats
```

`salt.modules.virt.vm_info`(*vm\_=None*)

Return detailed information about the vms on this hyper in a list of dicts:

```
[
  'your-vm': {
    'cpu': <int>,
    'maxMem': <int>,
    'mem': <int>,
    'state': '<state>',
    'cputime' <int>
  },
  ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_info
```

`salt.modules.virt.vm_netstats`(*vm\_=None*)

Return combined network counters used by the vms on this hyper in a list of dicts:

```
[
  'your-vm': {
    'rx_bytes' : 0,
    'rx_packets' : 0,
    'rx_errs' : 0,
    'rx_drop' : 0,
    'tx_bytes' : 0,
    'tx_packets' : 0,
    'tx_errs' : 0,
    'tx_drop' : 0
  },
  ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_netstats
```

`salt.modules.virt.vm_state`(*vm\_=None*)

Return list of all the vms and their state.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_state <domain>
```

### 14.7.409 salt.modules.virtualenv

Create virtualenv environments.

New in version 0.17.0.

```

salt.modules.virtualenv_mod.create(path, venv_bin=None, system_site_packages=False,
                                     distribute=False, clear=False, python=None, ex-
                                     tra_search_dir=None, never_download=None,
                                     prompt=None, pip=False, symlinks=None, upgrade=None,
                                     user=None, use_vt=False, saltenv='base')

```

Create a virtualenv

**path** The path to the virtualenv to be created

**venv\_bin** The name (and optionally path) of the virtualenv command. This can also be set globally in the minion config file as `virtualenv.venv_bin`. Defaults to `virtualenv`.

**system\_site\_packages** [False] Passthrough argument given to virtualenv or pyvenv

**distribute** [False] Passthrough argument given to virtualenv

**pip** [False] Install pip after creating a virtual environment. Implies `distribute=True`

**clear** [False] Passthrough argument given to virtualenv or pyvenv

**python** [None (default)] Passthrough argument given to virtualenv

**extra\_search\_dir** [None (default)] Passthrough argument given to virtualenv

**never\_download** [None (default)] Passthrough argument given to virtualenv if True

**prompt** [None (default)] Passthrough argument given to virtualenv if not None

**symlinks** [None] Passthrough argument given to pyvenv if True

**upgrade** [None] Passthrough argument given to pyvenv if True

**user** [None] Set ownership for the virtualenv

**runas** [None] Set ownership for the virtualenv

Deprecated since version 2014.1.0: `user` should be used instead

**use\_vt** [False] Use VT terminal emulation (see output while installing)

New in version 2015.5.0.

**saltenv** ['base'] Specify a different environment. The default environment is `base`.

New in version 2014.1.0.

---

**Note:** The `runas` argument is deprecated as of 2014.1.0. `user` should be used instead.

---

CLI Example:

```

salt '*' virtualenv.create /path/to/new/virtualenv

```

```

salt.modules.virtualenv_mod.get_distribution_path(venv, distribution)

```

Return the path to a distribution installed inside a virtualenv

New in version 2016.3.0.

**venv** Path to the virtualenv.

**distribution** Name of the distribution. Note, all non-alphanumeric characters will be converted to dashes.

CLI Example:

```

salt '*' virtualenv.get_distribution_path /path/to/my/venv my_distribution

```

```

salt.modules.virtualenv_mod.get_resource_content(venv, package=None, resource=None)

```

Return the content of a package resource installed inside a virtualenv

New in version 2015.5.0.

**venv** Path to the virtualenv

**package** Name of the package in which the resource resides

New in version 2016.3.0.

**resource** Name of the resource of which the content is to be returned

New in version 2016.3.0.

CLI Example:

```
salt '*' virtualenv.get_resource_content /path/to/my/venv my_package my/resource.
↳xml
```

`salt.modules.virtualenv_mod.get_resource_path(venv, package=None, resource=None)`

Return the path to a package resource installed inside a virtualenv

New in version 2015.5.0.

**venv** Path to the virtualenv

**package** Name of the package in which the resource resides

New in version 2016.3.0.

**resource** Name of the resource of which the path is to be returned

New in version 2016.3.0.

CLI Example:

```
salt '*' virtualenv.get_resource_path /path/to/my/venv my_package my/resource.xml
```

`salt.modules.virtualenv_mod.get_site_packages(venv)`

Return the path to the site-packages directory of a virtualenv

**venv** Path to the virtualenv.

CLI Example:

```
salt '*' virtualenv.get_site_packages /path/to/my/venv
```

## 14.7.410 salt.modules.vsphere

Manage VMware vCenter servers and ESXi hosts.

New in version 2015.8.4.

**codeauthor** :email:`Alexandru Bleotu <alexandru.bleotu@morganstaley.com>`

### Dependencies

- pyVmomi Python Module
- ESXCLI

### pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

**Note:** Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.6, Python 2.7.9, or newer must be present. This is due to an upstream dependency

in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See [Issue #29537](#) for more information.

---

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original vSphere Execution Module was developed against.

### ESXCLI

Currently, about a third of the functions used in the vSphere Execution Module require the ESXCLI package be installed on the machine running the Proxy Minion process.

The ESXCLI package is also referred to as the VMware vSphere CLI, or vCLI. VMware provides vCLI package installation instructions for [vSphere 5.5](#) and [vSphere 6.0](#).

Once all of the required dependencies are in place and the vCLI package is installed, you can check to see if you can connect to your ESXi host or vCenter server by running the following command:

```
esxcli -s <host-location> -u <username> -p <password> system syslog config get
```

If the connection was successful, ESXCLI was successfully installed on your system. You should see output related to the ESXi host's syslog configuration.

---

**Note:** Be aware that some functionality in this execution module may depend on the type of license attached to a vCenter Server or ESXi host(s).

For example, certain services are only available to manipulate service state or policies with a VMware vSphere Enterprise or Enterprise Plus license, while others are available with a Standard license. The ntpd service is restricted to an Enterprise Plus license, while ssh is available via the Standard license.

Please see the [vSphere Comparison](#) page for more information.

---

### About

This execution module was designed to be able to handle connections both to a vCenter Server, as well as to an ESXi host. It utilizes the pyVmomi Python library and the ESXCLI package to run remote execution functions against either the defined vCenter server or the ESXi host.

Whether or not the function runs against a vCenter Server or an ESXi host depends entirely upon the arguments passed into the function. Each function requires a `host` location, `username`, and `password`. If the credentials provided apply to a vCenter Server, then the function will be run against the vCenter Server. For example, when listing hosts using vCenter credentials, you'll get a list of hosts associated with that vCenter Server:

```
# salt my-minion vsphere.list_hosts <vcenter-ip> <vcenter-user> <vcenter-password>
my-minion:
- esxi-1.example.com
- esxi-2.example.com
```

However, some functions should be used against ESXi hosts, not vCenter Servers. Functionality such as getting a host's coredump network configuration should be performed against a host and not a vCenter server. If the authentication information you're using is against a vCenter server and not an ESXi host, you can provide the host

---

name that is associated with the vCenter server in the command, as a list, using the `host_names` or `esxi_host` kwarg. For example:

```
# salt my-minion vsphere.get_coredump_network_config <vcenter-ip> <vcenter-user>
→ <vcenter-password> esxi_hosts='[esxi-1.example.com, esxi-2.example.com]'
my-minion:
-----
  esxi-1.example.com:
  -----
    Coredump Config:
    -----
      enabled:
      False
  esxi-2.example.com:
  -----
    Coredump Config:
    -----
      enabled:
      True
      host_vnic:
      vmk0
      ip:
      coredump-location.example.com
      port:
      6500
```

You can also use these functions against an ESXi host directly by establishing a connection to an ESXi host using the host's location, username, and password. If ESXi connection credentials are used instead of vCenter credentials, the `host_names` and `esxi_hosts` arguments are not needed.

```
# salt my-minion vsphere.get_coredump_network_config esxi-1.example.com root <host-
→password>
local:
-----
  10.4.28.150:
  -----
    Coredump Config:
    -----
      enabled:
      True
      host_vnic:
      vmk0
      ip:
      coredump-location.example.com
      port:
      6500
```

`salt.modules.vsphere.coredump_network_enable`(*host*, *username*, *password*, *enabled*, *protocol*=None, *port*=None, *esxi\_hosts*=None, *credstore*=None)

Enable or disable ESXi core dump collection. Returns `True` if coredump is enabled and returns `False` if core dump is not enabled. If there was an error, the error will be the value printed in the `Error` key dictionary for the given host.

**host** The location of the host.

**username** The username used to login to the host, such as `root`.

**password** The password used to login to the host.

**enabled** Python `True` or `False` to enable or disable coredumps.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is

https.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**esxi\_hosts** If host is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

**credstore** Optionally set to path to the credential store file.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.coredump_network_enable my.esxi.host root bad-password True

# Used for connecting to a vCenter Server
salt '*' vsphere.coredump_network_enable my.vcenter.location root bad-password
↳ True                               esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.enable_firewall_ruleset`(*host, username, password, ruleset\_enable, ruleset\_name, protocol=None, port=None, esxi\_hosts=None, credstore=None*)

Enable or disable an ESXi firewall rule set.

**host** The location of the host.

**username** The username used to login to the host, such as root.

**password** The password used to login to the host.

**ruleset\_enable** True to enable the ruleset, false to disable.

**ruleset\_name** Name of ruleset to target.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**esxi\_hosts** If host is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

**credstore** Optionally set to path to the credential store file.

**Returns** A standard `cmd.run_all` dictionary, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.enable_firewall_ruleset my.esxi.host root bad-password True
↳ 'syslog'

# Used for connecting to a vCenter Server
salt '*' vsphere.enable_firewall_ruleset my.vcenter.location root bad-password
↳ True 'syslog'                               esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.esxcli_cmd`(*cmd\_str, host=None, username=None, password=None, protocol=None, port=None, esxi\_hosts=None, credstore=None*)

Run an ESXCLI command directly on the host or list of hosts.

**host** The location of the host.

**username** The username used to login to the host, such as root.

**password** The password used to login to the host.

**cmd\_str** The ESXCLI command to run. Note: This should not include the `-s`, `-u`, `-p`, `-h`, `--protocol`, or `--portnumber` arguments that are frequently passed when using a bare ESXCLI command from the command line. Those arguments are handled by this function via the other args and kwargs.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**esxi\_hosts** If host is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

**credstore** Optionally set to path to the credential store file.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.esxcli_cmd my.esxi.host root bad-password 'system
↳ coredump network get'

# Used for connecting to a vCenter Server
salt '*' vsphere.esxcli_cmd my.vcenter.location root bad-password
↳ 'system coredump network get' esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

```
salt.modules.vsphere.get_coredump_network_config(host, username, password,
                                                  protocol=None, port=None,
                                                  esxi_hosts=None, credstore=None)
```

Retrieve information on ESXi or vCenter network dump collection and format it into a dictionary.

**host** The location of the host.

**username** The username used to login to the host, such as root.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**esxi\_hosts** If host is a vCenter host, then use esxi\_hosts to execute this function on a list of one or more ESXi machines.

**credstore** Optionally set to path to the credential store file.

**Returns** A dictionary with the network configuration, or, if getting the network config failed, a an error message retrieved from the standard cmd.run\_all dictionary, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.get_coredump_network_config my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_coredump_network_config my.vcenter.location root bad-
↳ password esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

```
salt.modules.vsphere.get_firewall_status(host, username, password, protocol=None,
                                          port=None, esxi_hosts=None, credstore=None)
```

Show status of all firewall rule sets.

**host** The location of the host.

**username** The username used to login to the host, such as root.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**esxi\_hosts** If host is a vCenter host, then use esxi\_hosts to execute this function on a list of one or more ESXi machines.

**credstore** Optionally set to path to the credential store file.

**Returns** Nested dictionary with two toplevel keys rulesets and success success will be True or False depending on query success rulesets will list the rulesets and their statuses if success was true, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.get_firewall_status my.esxi.host root bad-password
```

```
# Used for connecting to a vCenter Server
salt '*' vsphere.get_firewall_status my.vcenter.location root bad-password
↳ esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.get_proxy_type()`

Returns the proxy type

CLI Example:

```
salt '*' vsphere.get_proxy_type
```

`salt.modules.vsphere.get_syslog_config(host, username, password, protocol=None, port=None, esxi_hosts=None, credstore=None)`

Retrieve the syslog configuration.

**host** The location of the host.

**username** The username used to login to the host, such as root.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**esxi\_hosts** If host is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

**credstore** Optionally set to path to the credential store file.

**Returns** Dictionary with keys and values corresponding to the syslog configuration, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.get_syslog_config my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_syslog_config my.vcenter.location root bad-password
↳ esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.gets_service_instance_via_proxy(fn)`

Decorator that connects to a target system (vCenter or ESXi host) using the proxy details and passes the connection (`vim.ServiceInstance`) to the decorated function.

### Notes

1. The decorated function must have a `service_instance` parameter or a `**kwarg` type argument (name of argument is not important);
2. If the `service_instance` parameter is already defined, the value is passed through to the decorated function;
3. If the `service_instance` parameter is not defined, the connection is created using the proxy details and the service instance is returned.

**CLI Example:** None, this is a decorator

`salt.modules.vsphere.reset_syslog_config(host, username, password, protocol=None, port=None, syslog_config=None, esxi_hosts=None, credstore=None)`

Reset the syslog service to its default settings.

Valid `syslog_config` values are `logdir`, `loghost`, `logdir-unique`, `default-rotate`, `default-size`, `default-timeout`, or `all` for all of these.

**host** The location of the host.

**username** The username used to login to the host, such as root.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**syslog\_config** List of parameters to reset, provided as a comma-delimited string, or `all` to reset all syslog configuration parameters. Required.

**esxi\_hosts** If host is a vCenter host, then use esxi\_hosts to execute this function on a list of one or more ESXi machines.

**credstore** Optionally set to path to the credential store file.

**Returns** Dictionary with a top-level key of `success` which indicates if all the parameters were reset, and individual keys for each parameter indicating which succeeded or failed, per host.

CLI Example:

syslog\_config can be passed as a quoted, comma-separated string, e.g.

```
# Used for ESXi host connection information
salt '*' vsphere.reset_syslog_config my.esxi.host root bad-password
↳ syslog_config='logdir,loghost'

# Used for connecting to a vCenter Server
salt '*' vsphere.reset_syslog_config my.vcenter.location root bad-password
↳ syslog_config='logdir,loghost' esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

**salt.modules.vsphere.set\_coredump\_network\_config**(*host, username, password, dump\_ip, protocol=None, port=None, host\_vnic='vmk0', dump\_port=6500, esxi\_hosts=None, credstore=None*)

Set the network parameters for a network coredump collection. Note that ESXi requires that the dumps first be enabled (see *coredump\_network\_enable*) before these parameters may be set.

**host** The location of the host.

**username** The username used to login to the host, such as root.

**password** The password used to login to the host.

**dump\_ip** IP address of host that will accept the dump.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**esxi\_hosts** If host is a vCenter host, then use esxi\_hosts to execute this function on a list of one or more ESXi machines.

**host\_vnic** Host VNIC port through which to communicate. Defaults to vmk0.

**dump\_port** TCP port to use for the dump, defaults to 6500.

**credstore** Optionally set to path to the credential store file.

**Returns** A standard cmd.run\_all dictionary with a *success* key added, per host. *success* will be True if the set succeeded, False otherwise.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.set_coredump_network_config my.esxi.host root bad-password 'dump_ip.host.com'

# Used for connecting to a vCenter Server
salt '*' vsphere.set_coredump_network_config my.vcenter.location root bad-password
↳ 'dump_ip.host.com' esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

```
salt.modules.vsphere.set_syslog_config(host, username, password, syslog_config, con-
                                     fig_value, protocol=None, port=None, fire-
                                     wall=True, reset_service=True, esxi_hosts=None,
                                     credstore=None)
```

Set the specified syslog configuration parameter. By default, this function will reset the syslog service after the configuration is set.

**host** ESXi or vCenter host to connect to.

**username** User to connect as, usually root.

**password** Password to connect with.

**syslog\_config** Name of parameter to set (corresponds to the command line switch for esxcli without the double dashes (--))

Valid syslog\_config values are logdir, loghost, default-rotate`, ``default-size, de-  
fault-timeout, and logdir-unique.

**config\_value** Value for the above parameter. For loghost, URLs or IP addresses to use for logging. Multiple log servers can be specified by listing them, comma-separated, but without spaces before or after commas.

(reference: <https://blogs.vmware.com/vsphere/2012/04/configuring-multiple-syslog-servers-for-esxi-5.html>)

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**firewall** Enable the firewall rule set for syslog. Defaults to True.

**reset\_service** After a successful parameter set, reset the service. Defaults to True.

**esxi\_hosts** If host is a vCenter host, then use esxi\_hosts to execute this function on a list of one or more ESXi machines.

**credstore** Optionally set to path to the credential store file.

**Returns** Dictionary with a top-level key of `success' which indicates if all the parameters were reset, and individual keys for each parameter indicating which succeeded or failed, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.set_syslog_config my.esxi.host root bad-password
↳ loghost ssl://localhost:5432,tcp://10.1.0.1:1514

# Used for connecting to a vCenter Server
salt '*' vsphere.set_syslog_config my.vcenter.location root bad-password
↳ loghost ssl://localhost:5432,tcp://10.1.0.1:1514 esxi_hosts=
↳ '[esxi-1.host.com, esxi-2.host.com]'
```

```
salt.modules.vsphere.supports_proxies(*proxy_types)
```

Decorator to specify which proxy types are supported by a function

**proxy\_types**: Arbitrary list of strings with the supported types of proxies

```
salt.modules.vsphere.syslog_service_reload(host, username, password, protocol=None,
                                           port=None, esxi_hosts=None, credstore=None)
```

Reload the syslog service so it will pick up any changes.

**host** The location of the host.

**username** The username used to login to the host, such as root.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**esxi\_hosts** If host is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

**credstore** Optionally set to path to the credential store file.

**Returns** A standard `cmd.run_all` dictionary. This dictionary will at least have a `retcode` key. If `retcode` is 0 the command was successful.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.syslog_service_reload my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.syslog_service_reload my.vcenter.location root bad-password
↪      esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

### 14.7.411 salt.modules.win\_autoruns

Module for listing programs that automatically run on startup (very alpha...not tested on anything but my Win 7x64)

`salt.modules.win_autoruns.list()`

Get a list of automatically running programs

CLI Example:

```
salt '*' autoruns.list
```

### 14.7.412 salt.modules.win\_certutil module

This module allows you to install certificates into the windows certificate manager.

```
salt '*' certutil.add_store salt://cert.cer "TrustedPublisher"
```

`salt.modules.win_certutil.add_store(source, store, saltenv='base')`

Add the given cert into the given Certificate Store

**source** The source certificate file this can be in the form `salt://path/to/file`

**store** The certificate store to add the certificate to

**saltenv** The salt environment to use this is ignored if the path is local

CLI Example:

```
salt '*' certutil.add_store salt://cert.cer TrustedPublisher
```

`salt.modules.win_certutil.del_store(source, store, saltenv='base')`

Delete the given cert into the given Certificate Store

**source** The source certificate file this can be in the form `salt://path/to/file`

**store** The certificate store to delete the certificate from

**saltenv** The salt environment to use this is ignored if the path is local

CLI Example:

```
salt '*' certutil.del_store salt://cert.cer TrustedPublisher
```

`salt.modules.win_certutil.get_cert_serial(cert_file)`

Get the serial number of a certificate file

**cert\_file** The certificate file to find the serial for

CLI Example:

```
salt '*' certutil.get_cert_serial <certificate name>
```

`salt.modules.win_certutil.get_stored_cert_serials`(*store*)

Get all of the certificate serials in the specified store

**store** The store to get all the certificate serials from

CLI Example:

```
salt '*' certutil.get_stored_cert_serials <store>
```

### 14.7.413 salt.modules.win\_dacl

Manage DACLs on Windows

**depends**

- winreg Python module

`salt.modules.win_dacl.add_ace`(*path, objectType, user, permission, acetype, propagation*)

add an ace to an object

**path**: path to the object (i.e. c:\temp\file, HKEY\_LOCAL\_MACHINE\SOFTWARE\KEY, etc) **user**: user to add

**permission**: permissions for the user **acetype**: either allow/deny for each user/permission (ALLOW, DENY)

**propagation**: how the ACE applies to children for Registry Keys and Directories(KEY, KEY&SUBKEYS, SUBKEYS)

CLI Example:

```
allow domain\fakeuser full control on HKLM\SOFTWARE\somekey, propagate to this
↳key and subkeys
  salt 'myminion' win_dacl.add_ace 'HKEY_LOCAL_MACHINE\SOFTWARE\somekey'
↳'Registry' 'domain\fakeuser' 'FULLCONTROL' 'ALLOW' 'KEY&SUBKEYS'
```

`salt.modules.win_dacl.check_ace`(*path, objectType, user, permission=None, acetype=None, propagation=None, exactPermissionMatch=False*)

Checks a path to verify the ACE (access control entry) specified exists

**Parameters**

- **path** -- path to the file/reg key
- **objectType** -- The type of object (FILE, DIRECTORY, REGISTRY)
- **user** -- user that the ACL is for
- **permission** -- permission to test for (READ, FULLCONTROL, etc)
- **acetype** -- the type of ACE (ALLOW or DENY)
- **propagation** -- the propagation type of the ACE (FILES, FOLDERS, KEY, KEY&SUBKEYS, SUBKEYS, etc)
- **exactPermissionMatch** -- the ACL must match exactly, IE if READ is specified, the user must have READ exactly and not FULLCONTROL (which also has the READ permission obviously)

Returns (dict): `Exists' true if the ACE exists, false if it does not

CLI Example:

```
salt 'minion-id' win_dacl.check_ace c: emp directory <username> fullcontrol
```

`salt.modules.win_dacl.check_inheritance`(*path, objectType, user=None*)

Check a specified path to verify if inheritance is enabled

**Parameters**

- **path** -- path of the registry key or file system object to check
- **objectType** -- The type of object (FILE, DIRECTORY, REGISTRY)
- **user** -- if provided, will consider only the ACEs for that user

Returns (bool): `Inheritance` of True/False

CLI Example:

```
salt 'minion-id' win_dacl.check_inheritance c: emp directory <username>
```

#### class salt.modules.win\_dacl.daclConstants

DACL constants used throughout the module

##### **getAceTypeBit**(*t*)

returns the acetype bit of a text value

##### **getAceTypeText**(*t*)

returns the textual representation of a acetype bit

##### **getObjectTypeBit**(*t*)

returns the bit value of the string object type

##### **getPermissionBit**(*t, m*)

returns a permission bit of the string permission value for the specified object type

##### **getPermissionText**(*t, m*)

returns the permission textual representation of a specified permission bit/object type

##### **getPropagationBit**(*t, p*)

returns the propagation bit of a text value

##### **getPropagationText**(*t, p*)

returns the textual representation of a propagation bit

##### **getSecurityHkey**(*s*)

returns the necessary string value for an HKEY for the win32security module

##### **processPath**(*path, objectType*)

processes a **path/object type combo** and returns: registry types with the correct HKEY text representation files/directories with environment variables expanded

#### salt.modules.win\_dacl.disable\_inheritance(*path, objectType, copy=True*)

Disable inheritance on an object

Parameters

- **path** -- The path to the object
- **objectType** -- The type of object (FILE, DIRECTORY, REGISTRY)
- **copy** -- True will copy the Inherited ACEs to the DACL before disabling inheritance

Returns (dict): A dictionary containing the results

CLI Example:

```
salt 'minion-id' win_dacl.disable_inheritance c: emp directory
```

#### salt.modules.win\_dacl.enable\_inheritance(*path, objectType, clear=False*)

enable/disable inheritance on an object

Parameters

- **path** -- The path to the object
- **objectType** -- The type of object (FILE, DIRECTORY, REGISTRY)
- **clear** -- True will remove non-Inherited ACEs from the ACL

Returns (dict): A dictionary containing the results

CLI Example:

```
salt 'minion-id' win_dacl.enable_inheritance c: emp directory
```

`salt.modules.win_dacl.get`(*path*, *objectType*, *user=None*)

Get the ACL of an object. Will filter by user if one is provided.

**Parameters**

- **path** -- The path to the object
- **objectType** -- The type of object (FILE, DIRECTORY, REGISTRY)
- **user** -- A user name to filter by

Returns (dict): A dictionary containing the ACL

CLI Example:

```
salt 'minion-id' win_dacl.get c: emp directory
```

`salt.modules.win_dacl.rm_ace`(*path*, *objectType*, *user*, *permission=None*, *acetype=None*, *propagation=None*)

remove an ace to an object

path: path to the object (i.e. c:\temp\file, HKEY\_LOCAL\_MACHINE\SOFTWARE\KEY, etc) user: user to remove permission: permissions for the user acetypes: either allow/deny for each user/permission (ALLOW, DENY) propagation: how the ACE applies to children for Registry Keys and Directories(KEY, KEY&SUBKEYS, SUBKEYS)

If any of the optional parameters are omitted (or set to None) they act as wildcards.

CLI Example:

```
remove allow domain\fakeuser full control on HKLM\SOFTWARE\somekey propagated
↳ to this key and subkeys
salt 'myminion' win_dacl.rm_ace 'Registry' 'HKEY_LOCAL_
↳ MACHINE\SOFTWARE\somekey' 'domain\fakeuser' 'FULLCONTROL' 'ALLOW' 'KEY&SUBKEYS
↳'
```

#### 14.7.414 salt.modules.win\_disk

Module for gathering disk information on Windows

**depends**

- win32api Python module

`salt.modules.win_disk.usage`()

Return usage information for volumes mounted on this minion

CLI Example:

```
salt '*' disk.usage
```

#### 14.7.415 salt.modules.win\_dism module

Install features/packages for Windows using DISM, which is useful for minions not running server versions of Windows. Some functions are only available on Windows 10.

`salt.modules.win_dism.add_capability`(*capability*, *source=None*, *limit\_access=False*, *image=None*, *restart=False*)

Install a capability

**Parameters**

- **capability** (*str*) -- The capability to install
- **source** (*Optional[str]*) -- The optional source of the capability. Default is set by group policy and can be Windows Update.
- **limit\_access** (*Optional[bool]*) -- Prevent DISM from contacting Windows Update for the source package
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

**Raises**

- **NotImplementedError** -- For all versions of Windows that are not Windows 10 and later. Server editions of Windows use ServerManager instead.

**Returns** A dictionary containing the results of the command

**Return type** `dict`

CLI Example:

```
salt '*' dism.add_capability Tools.Graphics.DirectX~~~~0.0.1.0
```

`salt.modules.win_dism.add_feature` (*feature, package=None, source=None, limit\_access=False, enable\_parent=False, image=None, restart=False*)

Install a feature using DISM

**Parameters**

- **feature** (*str*) -- The feature to install
- **package** (*Optional[str]*) -- The parent package for the feature. You do not have to specify the package if it is the Windows Foundation Package. Otherwise, use package to specify the parent package of the feature
- **source** (*Optional[str]*) -- The optional source of the capability. Default is set by group policy and can be Windows Update
- **limit\_access** (*Optional[bool]*) -- Prevent DISM from contacting Windows Update for the source package
- **enable\_parent** (*Optional[bool]*) -- True will enable all parent features of the specified feature
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

**Returns** A dictionary containing the results of the command

**Return type** `dict`

CLI Example:

```
salt '*' dism.add_feature NetFx3
```

`salt.modules.win_dism.add_package` (*package, ignore\_check=False, prevent\_pending=False, image=None, restart=False*)

Install a package using DISM

**Parameters**

- **package** (*str*) -- The package to install. Can be a .cab file, a .msu file, or a folder
- **ignore\_check** (*Optional[bool]*) -- Skip installation of the package if the applicability checks fail
- **prevent\_pending** (*Optional[bool]*) -- Skip the installation of the package if there are pending online actions
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

**Returns** A dictionary containing the results of the command

**Return type** `dict`

CLI Example:

```
salt '*' dism.add_package C:\Packages\package.cab
```

`salt.modules.win_dism.available_capabilities` (*image=None*)

List the capabilities available on the system

**Parameters** **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

**Raises**

- `NotImplementedError` -- For all versions of Windows that are not Windows 10 and later. Server editions of Windows use `ServerManager` instead.

**Returns** A list of available capabilities

**Return type** *list*

CLI Example:

```
salt '*' dism.installed_capabilities
```

`salt.modules.win_dism.available_features` (*image=None*)

List the features available on the system

**Parameters** **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

**Returns** A list of available features

**Return type** *list*

CLI Example:

```
salt '*' dism.available_features
```

`salt.modules.win_dism.get_capabilities` (*image=None*)

List all capabilities on the system

**Parameters** **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

**Raises**

- `NotImplementedError` -- For all versions of Windows that are not Windows 10 and later. Server editions of Windows use `ServerManager` instead.

**Returns** A list of capabilities

**Return type** *list*

CLI Example:

```
salt '*' dism.get_capabilities
```

`salt.modules.win_dism.get_features` (*package=None, image=None*)

List features on the system or in a package

**Parameters**

- **package** (*Optional[str]*) -- The full path to the package. Can be either a `.cab` file or a folder. Should point to the original source of the package, not to where the file is installed. You cannot use this command to get package information for `.msu` files

This can also be the name of a package as listed in `dism.installed_packages`

- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

**Returns** A list of features

**Return type** *list*

CLI Example:

```
# Return all features on the system
salt '*' dism.get_features
```

```
# Return all features in package.cab
salt '*' dism.get_features C:\packages\package.cab

# Return all features in the calc package
salt '*' dism.get_features Microsoft.Windows.Calc.Demo~6595b6144ccf1df~
-x86~en~1.0.0.0
```

`salt.modules.win_dism.installed_capabilities` (*image=None*)

List the capabilities installed on the system

**Parameters** **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

**Raises**

- `NotImplementedError` -- For all versions of Windows that are not Windows 10 and later. Server editions of Windows use `ServerManager` instead.

**Returns** A list of installed capabilities

**Return type** *list*

CLI Example:

```
salt '*' dism.installed_capabilities
```

`salt.modules.win_dism.installed_features` (*image=None*)

List the features installed on the system

**Parameters** **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

**Returns** A list of installed features

**Return type** *list*

CLI Example:

```
salt '*' dism.installed_features
```

`salt.modules.win_dism.installed_packages` (*image=None*)

List the packages installed on the system

**Parameters** **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

**Returns** A list of installed packages

**Return type** *list*

CLI Example:

```
salt '*' dism.installed_packages
```

`salt.modules.win_dism.package_info` (*package, image=None*)

Display information about a package

**Parameters**

- **package** (*str*) -- The full path to the package. Can be either a `.cab` file or a folder. Should point to the original source of the package, not to where the file is installed. You cannot use this command to get package information for `.msu` files
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

**Returns** A dictionary containing the results of the command

**Return type** *dict*

CLI Example:

```
salt '*' dism.package_info C:\packages\package.cab
```

`salt.modules.win_dism.remove_capability` (*capability*, *image=None*, *restart=False*)

Uninstall a capability

**Parameters**

- **capability** (*str*) -- The capability to be removed
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

**Raises**

- `NotImplementedError` -- For all versions of Windows that are not Windows 10 and later. Server editions of Windows use `ServerManager` instead.

**Returns** A dictionary containing the results of the command

**Return type** `dict`

CLI Example:

```
salt '*' dism.remove_capability Tools.Graphics.DirectX~~~~0.0.1.0
```

`salt.modules.win_dism.remove_feature` (*feature*, *remove\_payload=False*, *image=None*, *restart=False*)

Disables the feature.

**Parameters**

- **feature** (*str*) -- The feature to uninstall
- **remove\_payload** (*Optional[bool]*) -- Remove the feature's payload. Must supply source when enabling in the future.
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

**Returns** A dictionary containing the results of the command

**Return type** `dict`

CLI Example:

```
salt '*' dism.remove_feature NetFx3
```

`salt.modules.win_dism.remove_package` (*package*, *image=None*, *restart=False*)

Uninstall a package

**Parameters**

- **package** (*str*) -- The full path to the package. Can be either a `.cab` file or a folder. Should point to the original source of the package, not to where the file is installed. This can also be the name of a package as listed in `dism.installed_packages`
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

**Returns** A dictionary containing the results of the command

**Return type** `dict`

CLI Example:

```
# Remove the Calc Package
salt '*' dism.remove_package Microsoft.Windows.Calc.Demo~6595b6144ccf1df~x86~en~1.
↪0.0.0

# Remove the package.cab (does not remove C:\packages\package.cab)
salt '*' dism.remove_package C:\packages\package.cab
```

### 14.7.416 salt.modules.win\_dns\_client

Module for configuring DNS Client on Windows systems

`salt.modules.win_dns_client.add_dns` (*ip*, *interface='Local Area Connection'*, *index=1*)  
Add the DNS server to the network interface (index starts from 1)

Note: if the interface DNS is configured by DHCP, all the DNS servers will be removed from the interface and the requested DNS will be the only one

CLI Example:

```
salt '*' win_dns_client.add_dns <ip> <interface> <index>
```

`salt.modules.win_dns_client.dns_dhcp` (*interface='Local Area Connection'*)  
Configure the interface to get its DNS servers from the DHCP server

CLI Example:

```
salt '*' win_dns_client.dns_dhcp <interface>
```

`salt.modules.win_dns_client.get_dns_config` (*interface='Local Area Connection'*)  
Get the type of DNS configuration (dhcp / static)

CLI Example:

```
salt '*' win_dns_client.get_dns_config 'Local Area Connection'
```

`salt.modules.win_dns_client.get_dns_servers` (*interface='Local Area Connection'*)  
Return a list of the configured DNS servers of the specified interface

CLI Example:

```
salt '*' win_dns_client.get_dns_servers 'Local Area Connection'
```

`salt.modules.win_dns_client.rm_dns` (*ip*, *interface='Local Area Connection'*)  
Remove the DNS server from the network interface

CLI Example:

```
salt '*' win_dns_client.rm_dns <ip> <interface>
```

### 14.7.417 salt.modules.win\_dsc

This module is Alpha

Module for working with Windows PowerShell DSC (Desired State Configuration)

This module applies DSC Configurations in the form of PowerShell scripts or MOF (Managed Object Format) schema files.

Use the `psget` module to manage PowerShell resources.

The idea is to leverage Salt to push DSC configuration scripts or MOF files to the Minion.

**depends**

- PowerShell 5.0

`salt.modules.win_dsc.apply_config`(*path*, *source=None*, *salt\_env='base'*)

Run an compiled DSC configuration (a folder containing a .mof file). The folder can be cached from the salt master using the `source` option.

**Parameters**

- **path** (*str*) -- Local path to the directory that contains the .mof configuration file to apply. Required.
- **source** (*str*) -- Path to the directory that contains the .mof file on the `file_roots`. The source directory will be copied to the `path` directory and then executed. If the `path` and `source` directories differ, the `source` directory will be applied. If `source` is not passed, the config located at `path` will be applied. Optional.
- **salt\_env** (*str*) -- The salt environment to use when copying your source. Default is `'base'`

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

To apply a config that already exists on the the system

```
salt '*' dsc.run_config C:\\DSC\\WebSiteConfiguration
```

To cache a configuration from the master and apply it:

```
salt '*' dsc.run_config C:\\DSC\\WebSiteConfiguration salt://dsc/configs/
↳WebSiteConfiguration
```

`salt.modules.win_dsc.compile_config`(*path*, *source=None*, *config\_name=None*, *config\_data=None*, *config\_data\_source=None*, *script\_parameters=None*, *salt\_env='base'*)

Compile a config from a PowerShell script (.ps1)

**Parameters**

- **path** (*str*) -- Path (local) to the script that will create the .mof configuration file. If no `source` is passed, the file must exist locally. Required.
- **source** (*str*) -- Path to the script on `file_roots` to cache at the location specified by `path`. The source file will be cached locally and then executed. If `source` is not passed, the config script located at `path` will be compiled. Optional.
- **config\_name** (*str*) -- The name of the Configuration within the script to apply. If the script contains multiple configurations within the file a `config_name` must be specified. If the `config_name` is not specified, the name of the file will be used as the `config_name` to run. Optional.
- **config\_data** (*str*) -- Configuration data in the form of a hash table that will be passed to the `ConfigurationData` parameter when the `config_name` is compiled. This can be the path to a .psd1 file containing the proper hash table or the PowerShell code to create the hash table.

New in version 2017.7.0.

- **config\_data\_source** (*str*) -- The path to the .psd1 file on `file_roots` to cache at the location specified by `config_data`. If this is specified, `config_data` must be a local path instead of a hash table.

New in version 2017.7.0.

- **script\_parameters** (*str*) -- Any additional parameters expected by the configuration script. These must be defined in the script itself.

New in version 2017.7.0.

- **salt\_env** (*str*) -- The salt environment to use when copying the source. Default is `'base'`

**Returns** A dictionary containing the results of the compilation

**Return type** dict

CLI Example:

To compile a config from a script that already exists on the system:

```
salt '*' dsc.compile_config C:\\DSC\\WebsiteConfig.ps1
```

To cache a config script to the system from the master and compile it:

```
salt '*' dsc.compile_config C:\\DSC\\WebsiteConfig.ps1 salt://dsc/configs/
↳WebsiteConfig.ps1
```

**salt.modules.win\_dsc.get\_config()**

Get the current DSC Configuration

**Returns** A dictionary representing the DSC Configuration on the machine

**Return type** dict

CLI Example:

```
salt '*' dsc.get_config
```

**salt.modules.win\_dsc.get\_config\_status()**

Get the status of the current DSC Configuration

**Returns**

A dictionary representing the status of the current DSC Configuration on the machine

**Return type** dict

CLI Example:

```
salt '*' dsc.get_config_status
```

**salt.modules.win\_dsc.get\_lcm\_config()**

Get the current Local Configuration Manager settings

**Returns**

A dictionary representing the Local Configuration Manager settings on the machine

**Return type** dict

CLI Example:

```
salt '*' dsc.get_lcm_config
```

**salt.modules.win\_dsc.run\_config**(*path*, *source=None*, *config\_name=None*, *config\_data=None*,  
*config\_data\_source=None*, *script\_parameters=None*,  
*salt\_env='base'*)

Compile a DSC Configuration in the form of a PowerShell script (.ps1) and apply it. The PowerShell script can be cached from the master using the *SOURCE* option. If there is more than one config within the PowerShell script, the desired configuration can be applied by passing the name in the *config* option.

This command would be the equivalent of running `dsc.compile_config` and `dsc.apply_config` separately.

**Parameters**

- **path** (*str*) -- The local path to the PowerShell script that contains the DSC Configuration. Required.
- **source** (*str*) -- The path to the script on *file\_roots* to cache at the location specified by *path*. The source file will be cached locally and then executed. If *source* is not passed, the config script located at *path* will be compiled. Optional.
- **config\_name** (*str*) -- The name of the Configuration within the script to apply. If the script contains multiple configurations within the file a *config\_name* must be specified. If the *config\_name* is not specified, the name of the file will be used as the *config\_name* to run. Optional.

- **config\_data** (*str*) -- Configuration data in the form of a hash table that will be passed to the ConfigurationData parameter when the config\_name is compiled. This can be the path to a .psd1 file containing the proper hash table or the PowerShell code to create the hash table.

New in version 2017.7.0.

- **config\_data\_source** (*str*) -- The path to the .psd1 file on file\_roots to cache at the location specified by config\_data. If this is specified, config\_data must be a local path instead of a hash table.

New in version 2017.7.0.

- **script\_parameters** (*str*) -- Any additional parameters expected by the configuration script. These must be defined in the script itself.

New in version 2017.7.0.

- **salt\_env** (*str*) -- The salt environment to use when copying the source. Default is 'base'

**Returns** True if successfully compiled and applied, False if not

**Return type** bool

CLI Example:

To compile a config from a script that already exists on the system:

```
salt '*' dsc.compile_apply_config C:\\DSC\\WebsiteConfig.ps1
```

To cache a config script to the system from the master and compile it:

```
salt '*' dsc.compile_apply_config C:\\DSC\\WebsiteConfig.ps1 salt://dsc/configs/WebsiteConfig.ps1
```

```
salt.modules.win_dsc.set_lcm_config(config_mode=None, config_mode_freq=None, refresh_freq=None, reboot_if_needed=None, action_after_reboot=None, certificate_id=None, configuration_id=None, allow_module_overwrite=None, debug_mode=False, status_retention_days=None)
```

For detailed descriptions of the parameters see: <https://msdn.microsoft.com/en-us/PowerShell/DSC/metaConfig>

#### Parameters

- **config\_mode** (*str*) -- How the LCM applies the configuration. Valid values are:
  - ApplyOnly
  - ApplyAndMonitor
  - ApplyAndAutoCorrect
- **config\_mode\_freq** (*int*) -- How often, in minutes, the current configuration is checked and applied. Ignored if config\_mode is set to ApplyOnly. Default is 15.
- **refresh\_mode** (*str*) -- How the LCM gets configurations. Valid values are:
  - Disabled
  - Push
  - Pull
- **refresh\_freq** (*int*) -- How often, in minutes, the LCM checks for updated configurations. (pull mode only) Default is 30.
- **note** (.) -- : Either *config\_mode\_freq* or *refresh\_freq* needs to be a multiple of the other. See documentation on MSDN for more details.
- **reboot\_if\_needed** (*bool*) -- Reboot the machine if needed after a configuration is applied. Default is False.
- **action\_after\_reboot** (*str*) -- Action to take after reboot. Valid values are:
  - ContinueConfiguration

- StopConfiguration
- **certificate\_id** (*guid*) -- A GUID that specifies a certificate used to access the configuration: (pull mode)
- **configuration\_id** (*guid*) -- A GUID that identifies the config file to get from a pull server. (pull mode)
- **allow\_module\_overwrite** (*bool*) -- New configs are allowed to overwrite old ones on the target node.
- **debug\_mode** (*str*) -- Sets the debug level. Valid values are:
  - None
  - ForceModuleImport
  - All
- **status\_retention\_days** (*int*) -- Number of days to keep status of the current config.

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' dsc.set_lcm_config ApplyOnly
```

`salt.modules.win_dsc.test_config()`

Tests the current applied DSC Configuration

**Returns** True if successfully applied, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' dsc.test_config
```

#### 14.7.418 salt.modules.win\_file

Manage information about files on the minion, set/read user, group data, modify the ACL of files/directories

**depends**

- win32api
- win32file
- win32con
- salt.utils.win\_dacl

`salt.modules.win_file.check_perms`(*path*, *ret=None*, *owner=None*, *grant\_perms=None*, *deny\_perms=None*, *inheritance=True*)

Set owner and permissions for each directory created.

**Parameters**

- **path** (*str*) -- The full path to the directory.
- **ret** (*dict*) -- A dictionary to append changes to and return. If not passed,
- **create a new dictionary to return.** (*will*) --
- **owner** (*str*) -- The owner of the directory. If not passed, it will be the
- **that created the directory, likely SYSTEM** (*account*) --
- **grant\_perms** (*dict*) -- A dictionary containing the user/group and the basic
- **to grant, ie** (*permissions*) -- {'user': {'perms': 'basic\_permission'}}.
- **can also set the applies\_to setting here. The default is** (*You*) --

- **Specify another applies\_to setting** (*this\_folder\_subfolders\_files.*) --
- **this** (*like*) --
- **code-block** (*.*) -- : yaml
 

```
{'user': {'perms': `full_control`, `applies_to': `this_folder`}}
```
- **set advanced permissions use a list for the perms parameter, ie (To)** --
- **code-block** -- : yaml
 

```
{'user': {'perms': ['read_attributes', `read_ea`], `applies_to': `this_folder`}}
```
- **deny\_perms** (*dict*) -- A dictionary containing the user/group and
- **to deny along with the applies\_to setting. Use the same (permissions)** --
- **used for the grant\_perms parameter. Remember, deny** (*format*) --
- **supersede grant permissions.** (*permissions*) --
- **inheritance** (*bool*) -- If True the object will inherit permissions from the
- **if False, inheritance will be disabled. Inheritance setting will** (*parent,*) --
- **apply to parent directories if they must be created** (*not*) --

Returns True if successful, otherwise raise an error

Return type `bool`

CLI Example:

```
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.check_perms C:\Temp\ Administrators '{"Users': {'perms': 'read_
↪execute'}}"

# Locally using salt call
salt-call file.check_perms C:\Temp\ Administrators '{"Users': {'perms': 'read_
↪execute', 'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.check_perms C:\Temp\ Administrators '{"jsnuffy': {'perms': ['read_
↪attributes', 'read_ea'], 'applies_to': 'files_only'}}"
```

`salt.modules.win_file.chgrp`(*path, group*)

Change the group of a file

Under Windows, this will do nothing.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps this function to do nothing while still being compatible with Unix behavior. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to set the 'primary group' of a file, use `file.chpgrp`.

To set group permissions use `file.set_perms`

Parameters

- **path** (*str*) -- The path to the file or directory
- **group** (*str*) -- The group (unused)

Returns None

CLI Example:

```
salt '*' file.chgrp c:\temp\test.txt administrators
```

`salt.modules.win_file.chown` (*path*, *user*, *group=None*, *pgroup=None*, *follow\_symlinks=True*)

Chown a file, pass the file the desired user and group

Under Windows, the group parameter will be ignored.

This is because while files in Windows do have a 'primary group' property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

If you do want to change the 'primary group' property and understand the implications, pass the Windows only parameter, `pgroup`, instead.

#### Parameters

- **path** (*str*) -- The path to the file or directory
- **user** (*str*) -- The name of the user to own the file
- **group** (*str*) -- The group (not used)
- **pgroup** (*str*) -- The primary group to assign
- **follow\_symlinks** (*bool*) -- If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

**Returns** True if successful, otherwise error

**Return type** `bool`

CLI Example:

```
salt '*' file.chown c:\temp\test.txt myusername
salt '*' file.chown c:\temp\test.txt myusername pgroup=Administrators
salt '*' file.chown c:\temp\test.txt myusername "pgroup='None'"
```

`salt.modules.win_file.chgrp` (*path*, *group*)

Change the group of a file

Under Windows, this will set the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

#### Parameters

- **path** (*str*) -- The path to the file or directory
- **pgroup** (*str*) -- The primary group to assign

**Returns** True if successful, otherwise error

**Return type** `bool`

CLI Example:

```
salt '*' file.chgrp c:\temp\test.txt Administrators
salt '*' file.chgrp c:\temp\test.txt "'None'"
```

`salt.modules.win_file.get_attributes` (*path*)

Return a dictionary object with the Windows file attributes for a file.

**Parameters** **path** (*str*) -- The path to the file or directory

**Returns** A dictionary of file attributes

**Return type** `dict`

CLI Example:

```
salt '*' file.get_attributes c:\temp\a.txt
```

`salt.modules.win_file.get_gid` (*path*, *follow\_symlinks=True*)

Return the id of the group that owns a given file

Under Windows, this will return the uid of the file.

While a file in Windows does have a `primary group`, this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps this function to provide functionality that somewhat resembles Unix behavior for API compatibility reasons. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to access the `primary group` of a file, use *file.get\_pgid*.

**Parameters**

- **path** (*str*) -- The path to the file or directory
- **follow\_symlinks** (*bool*) -- If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

**Returns** The gid of the owner

**Return type** *str*

CLI Example:

```
salt '*' file.get_gid c:\temp\test.txt
```

`salt.modules.win_file.get_group(path, follow_symlinks=True)`

Return the group that owns a given file

Under Windows, this will return the user (owner) of the file.

While a file in Windows does have a `primary group`, this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps this function to provide functionality that somewhat resembles Unix behavior for API compatibility reasons. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to access the `primary group` of a file, use *file.get\_pgroup*.

**Parameters**

- **path** (*str*) -- The path to the file or directory
- **follow\_symlinks** (*bool*) -- If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

**Returns** The name of the owner

**Return type** *str*

CLI Example:

```
salt '*' file.get_group c:\temp\test.txt
```

`salt.modules.win_file.get_mode(path)`

Return the mode of a file

Right now we're just returning None because Windows' doesn't have a mode like Linux

**Parameters** **path** (*str*) -- The path to the file or directory

**Returns** None

CLI Example:

```
salt '*' file.get_mode /etc/passwd
```

`salt.modules.win_file.get_pgid(path, follow_symlinks=True)`

Return the id of the primary group that owns a given file (Windows only)

This function will return the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

**Parameters**

- **path** (*str*) -- The path to the file or directory
- **follow\_symlinks** (*bool*) -- If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

**Returns** The gid of the primary group

**Return type** *str*

CLI Example:

```
salt '*' file.get_pgid c:\temp\test.txt
```

`salt.modules.win_file.get_pgroup(path, follow_symlinks=True)`

Return the name of the primary group that owns a given file (Windows only)

This function will return the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

The return value may be `None`, e.g. if the user is not on a domain. This is a valid group - do not confuse this with the Salt/Python value of None which means no value was returned. To be certain, use the `get_pgid` function which will return the SID, including for the system `None` group.

**Parameters**

- **path** (*str*) -- The path to the file or directory
- **follow\_symlinks** (*bool*) -- If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

**Returns** The name of the primary group

**Return type** *str*

CLI Example:

```
salt '*' file.get_pgroup c:\temp\test.txt
```

`salt.modules.win_file.get_uid(path, follow_symlinks=True)`

Return the id of the user that owns a given file

Symlinks are followed by default to mimic Unix behavior. Specify `follow_symlinks=False` to turn off this behavior.

**Parameters**

- **path** (*str*) -- The path to the file or directory
- **follow\_symlinks** (*bool*) -- If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

**Returns** The uid of the owner

**Return type** *str*

CLI Example:

```
salt '*' file.get_uid c:\temp\test.txt
salt '*' file.get_uid c:\temp\test.txt follow_symlinks=False
```

`salt.modules.win_file.get_user(path, follow_symlinks=True)`

Return the user that owns a given file

Symlinks are followed by default to mimic Unix behavior. Specify `follow_symlinks=False` to turn off this behavior.

**Parameters**

- **path** (*str*) -- The path to the file or directory
- **follow\_symlinks** (*bool*) -- If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

**Returns** The name of the owner**Return type** *str*

CLI Example:

```
salt '*' file.get_user c:\temp\test.txt
salt '*' file.get_user c:\temp\test.txt follow_symlinks=False
```

**salt.modules.win\_file.gid\_to\_group(gid)**

Convert the group id to the group name on this system

Under Windows, because groups are just another ACL entity, this function behaves the same as uid\_to\_user.

For maintaining Windows systems, this function is superfluous and only exists for API compatibility with Unix. Use the uid\_to\_user function instead; an info level log entry will be generated if this function is used directly.

**Parameters** **gid** (*str*) -- The gid of the group**Returns** The name of the group**Return type** *str*

CLI Example:

```
salt '*' file.gid_to_group S-1-5-21-626487655-2533044672-482107328-1010
```

**salt.modules.win\_file.group\_to\_gid(group)**

Convert the group to the gid on this system

Under Windows, because groups are just another ACL entity, this function behaves the same as user\_to\_uid, except if None is given, `` is returned.

For maintaining Windows systems, this function is superfluous and only exists for API compatibility with Unix. Use the user\_to\_uid function instead; an info level log entry will be generated if this function is used directly.

**Parameters** **group** (*str*) -- The name of the group**Returns** The gid of the group**Return type** *str*

CLI Example:

```
salt '*' file.group_to_gid administrators
```

**salt.modules.win\_file.is\_link(path)**

Check if the path is a symlink

This is only supported on Windows Vista or later.

Inline with Unix behavior, this function will raise an error if the path is not a symlink, however, the error raised will be a SaltInvocationError, not an OSError.

**Parameters** **path** (*str*) -- The path to a file or directory**Returns** True if path is a symlink, otherwise False**Return type** *bool*

CLI Example:

```
salt '*' file.is_link /path/to/link
```

**salt.modules.win\_file.lchown(path, user, group=None, pgroup=None)**

Chown a file, pass the file the desired user and group without following any symlinks.

Under Windows, the group parameter will be ignored.

This is because while files in Windows do have a 'primary group' property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

If you do want to change the 'primary group' property and understand the implications, pass the Windows only parameter, pgroup, instead.

To set the primary group to 'None', it must be specified in quotes. Otherwise Salt will interpret it as the Python value of None and no primary group changes will occur. See the example below.

#### Parameters

- **path** (*str*) -- The path to the file or directory
- **user** (*str*) -- The name of the user to own the file
- **group** (*str*) -- The group (not used)
- **pgroup** (*str*) -- The primary group to assign

**Returns** True if successful, otherwise error

**Return type** `bool`

CLI Example:

```
salt '*' file.lchown c:\temp\test.txt myusername
salt '*' file.lchown c:\temp\test.txt myusername pgroup=Administrators
salt '*' file.lchown c:\temp\test.txt myusername "pgroup='None'"
```

`salt.modules.win_file.makedirs` (*path*, *owner=None*, *grant\_perms=None*, *deny\_perms=None*, *inheritance=True*)

Ensure that the parent directory containing this path is available.

#### Parameters

- **path** (*str*) -- The full path to the directory.
- **owner** (*str*) -- The owner of the directory. If not passed, it will be the
- **that created the directly, likely SYSTEM** (*account*) --
- **grant\_perms** (*dict*) -- A dictionary containing the user/group and the basic
- **to grant, ie** (*permissions*) -- {'user': {'perms': 'basic\_permission'}}.
- **can also set the applies\_to setting here. The default is (You)** --
- **Specify another applies\_to setting (this\_folder\_subfolders\_files.)** --
- **this** (*like*) --
- **code-block** (.) -- : yml
 

```
{user: {perms: `full_control`, `applies_to: `this_folder`}}
```
- **set advanced permissions use a list for the perms parameter, ie (To)** --
- **code-block** -- : yml
 

```
{user: {perms: [read_attributes, `read_ea`], `applies_to: `this_folder`}}
```
- **deny\_perms** (*dict*) -- A dictionary containing the user/group and
- **to deny along with the applies\_to setting. Use the same (permissions)** --
- **used for the grant\_perms parameter. Remember, deny** (*format*) --
- **supersede grant permissions.** (*permissions*) --
- **inheritance** (*bool*) -- If True the object will inherit permissions from the
- **if False, inheritance will be disabled. Inheritance setting will** (*parent,*) --
- **apply to parent directories if they must be created** (*not*) --

---

**Note:** The path must end with a trailing slash otherwise the directory(s) will be created up to the parent directory. For example if path is C:\temp\test, then it would be treated as C:\temp\ but if the path ends with a trailing slash like C:\temp\test\, then it would be treated as C:\temp\test\.

---

**Returns** True if successful

**Return type** bool

**Raises** CommandExecutionError -- If unsuccessful

CLI Example:

```
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.makedirs C:\Temp\ Administrators "{ 'Users': { 'perms': 'read_execute
↪'}}"

# Locally using salt call
salt-call file.makedirs C:\Temp\ Administrators "{ 'Users': { 'perms': 'read_execute
↪', 'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.makedirs C:\Temp\ Administrators "{ 'jsnuffly': { 'perms': ['read_
↪attributes', 'read_ea'], 'applies_to': 'this_folder_only'}}"
```

salt.modules.win\_file.makedirs\_perms(*path*, *owner=None*, *grant\_perms=None*,  
*deny\_perms=None*, *inheritance=True*)

Set owner and permissions for each directory created.

**Parameters**

- **path** (*str*) -- The full path to the directory.
- **owner** (*str*) -- The owner of the directory. If not passed, it will be the
- **that created the directory, likely SYSTEM (account)** --
- **grant\_perms** (*dict*) -- A dictionary containing the user/group and the basic
- **to grant, ie (permissions)** -- {'user': {'perms': 'basic\_permission'}}.
- **can also set the applies\_to setting here. The default is (You)** --
- **Specify another applies\_to setting (this\_folder\_subfolders\_files)** --
- **this (like)** --
- **code-block** (.) -- : yml
 

```
{ 'user': { 'perms': 'full_control', 'applies_to': 'this_folder'}}
```
- **set advanced permissions use a list for the perms parameter, ie (To)** --
- **code-block** -- : yml
 

```
{ 'user': { 'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder'}}
```
- **deny\_perms** (*dict*) -- A dictionary containing the user/group and
- **to deny along with the applies\_to setting. Use the same (permissions)** --
- **used for the grant\_perms parameter. Remember, deny (format)** --
- **supersede grant permissions. (permissions)** --
- **inheritance (bool)** -- If True the object will inherit permissions from the
- **if False, inheritance will be disabled. Inheritance setting will (parent)** --
- **apply to parent directories if they must be created (not)** --

**Returns** True if successful, otherwise raise an error

**Return type** bool

CLI Example:

```
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.makedirs_perms C:\Temp\ Administrators '{"Users': {'perms': 'read_
↳execute'}}"

# Locally using salt call
salt-call file.makedirs_perms C:\Temp\ Administrators '{"Users': {'perms': 'read_
↳execute', 'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.makedirs_perms C:\Temp\ Administrators '{"jsnuffy': {'perms': [
↳'read_attributes', 'read_ea'], 'applies_to': 'this_folder_files'}}"
```

`salt.modules.win_file.mkdir`(*path*, *owner=None*, *grant\_perms=None*, *deny\_perms=None*, *inheritance=True*)

Ensure that the directory is available and permissions are set.

**Parameters**

- **path** (*str*) -- The full path to the directory.
- **owner** (*str*) -- The owner of the directory. If not passed, it will be the
- **that created the directory, likely SYSTEM** (*account*) --
- **grant\_perms** (*dict*) -- A dictionary containing the user/group and the basic
- **to grant, ie** (*permissions*) -- {'user': {'perms': 'basic\_permission'}}.
- **can also set the applies\_to setting here. The default is (You)** --
- **Specify another applies\_to setting (this\_folder\_subfolders\_files.)** --
- **this** (*like*) --
- **code-block** (.) -- : yml
 

```
{user: {'perms': `full_control`, `applies_to`: `this_folder`}}
```
- **set advanced permissions use a list for the perms parameter, ie** (*To*) --
- **code-block** -- : yml
 

```
{user: {'perms': ['read_attributes', 'read_ea'], `applies_to`: `this_folder`}}
```
- **deny\_perms** (*dict*) -- A dictionary containing the user/group and
- **to deny along with the applies\_to setting. Use the same (permissions)** --
- **used for the grant\_perms parameter. Remember, deny** (*format*) --
- **supersede grant permissions.** (*permissions*) --
- **inheritance** (*bool*) -- If True the object will inherit permissions from the
- **if False, inheritance will be disabled. Inheritance setting will** (*parent,*) --
- **apply to parent directories if they must be created** (*not*) --

**Returns** True if successful

**Return type** bool

**Raises** CommandExecutionError -- If unsuccessful

CLI Example:

```
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.mkdir C:\Temp\ Administrators '{"Users': {'perms': 'read_execute'}}"
```

```
# Locally using salt call
salt-call file.mkdir C:\Temp\ Administrators '{"Users': {'perms': 'read_execute',
↪ 'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.mkdir C:\Temp\ Administrators '{"jsnuffy': {'perms': ['read_
↪ attributes', 'read_ea'], 'applies_to': 'this_folder_only'}}"
```

`salt.modules.win_file.readlink(path)`

Return the path that a symlink points to

This is only supported on Windows Vista or later.

Inline with Unix behavior, this function will raise an error if the path is not a symlink, however, the error raised will be a `SaltInvocationError`, not an `OSError`.

**Parameters** `path (str)` -- The path to the symlink

**Returns** The path that the symlink points to

**Return type** `str`

CLI Example:

```
salt '*' file.readlink /path/to/link
```

`salt.modules.win_file.remove(path, force=False)`

Remove the named file or directory

**Parameters**

- **path (str)** -- The path to the file or directory to remove.

- **force (bool)** -- Remove even if marked Read-Only. Default is False

**Returns** True if successful, False if unsuccessful

**Return type** `bool`

CLI Example:

```
salt '*' file.remove C:\Temp
```

`salt.modules.win_file.set_attributes(path, archive=None, hidden=None, normal=None, notIndexed=None, readonly=None, system=None, temporary=None)`

Set file attributes for a file. Note that the normal attribute means that all others are false. So setting it will clear all others.

**Parameters**

- **path (str)** -- The path to the file or directory

- **archive (bool)** -- Sets the archive attribute. Default is None

- **hidden (bool)** -- Sets the hidden attribute. Default is None

- **normal (bool)** -- Resets the file attributes. Cannot be used in conjunction with any other attribute. Default is None

- **notIndexed (bool)** -- Sets the indexed attribute. Default is None

- **readonly (bool)** -- Sets the readonly attribute. Default is None

- **system (bool)** -- Sets the system attribute. Default is None

- **temporary (bool)** -- Sets the temporary attribute. Default is None

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' file.set_attributes c:\temp\a.txt normal=True
salt '*' file.set_attributes c:\temp\a.txt readonly=True hidden=True
```

`salt.modules.win_file.set_mode(path, mode)`

Set the mode of a file

This just calls `get_mode`, which returns `None` because we don't use mode on Windows

**Parameters**

- **path** -- The path to the file or directory
- **mode** -- The mode (not used)

**Returns** `None`

CLI Example:

```
salt '*' file.set_mode /etc/passwd 0644
```

`salt.modules.win_file.set_perms(path, grant_perms=None, deny_perms=None, inheritance=True)`

Set permissions for the given path

**Parameters**

- **path** (*str*) -- The full path to the directory.
- **grant\_perms** (*dict*) -- A dictionary containing the user/group and the basic permissions to grant, ie: `{'user': {'perms': 'basic_permission'}}`. You can also set the `applies_to` setting here. The default is `this_folder_subfolders_files`. Specify another `applies_to` setting like this:

```
{'user': {'perms': 'full_control', 'applies_to': 'this_folder'}}
```

To set advanced permissions use a list for the `perms` parameter, ie:

```
{'user': {'perms': ['read_attributes', 'read_ea'], 'applies_to':  
→ 'this_folder'}}
```

To see a list of available attributes and applies to settings see the documentation for `salt.utils.win_dacl`

- **deny\_perms** (*dict*) -- A dictionary containing the user/group and permissions to deny along with the `applies_to` setting. Use the same format used for the `grant_perms` parameter. Remember, deny permissions supersede grant permissions.
- **inheritance** (*bool*) -- If `True` the object will inherit permissions from the parent, if `False`, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created

**Returns** `True` if successful, otherwise raise an error

**Return type** `bool`

CLI Example:

```
# To grant the 'Users' group 'read & execute' permissions.  
salt '*' file.set_perms C:\Temp\ '{"Users': {'perms': 'read_execute'}}"  
  
# Locally using salt call  
salt-call file.set_perms C:\Temp\ '{"Users': {'perms': 'read_execute', 'applies_to'  
→ ': 'this_folder_only'}}"  
  
# Specify advanced attributes with a list  
salt '*' file.set_perms C:\Temp\ '{"jsnuffy': {'perms': ['read_attributes', 'read_  
→ ea'], 'applies_to': 'this_folder_only'}}"
```

`salt.modules.win_file.stats(path, hash_type='sha256', follow_symlinks=True)`

Return a dict containing the stats for a given file

Under Windows, *gid* will equal *uid* and *group* will equal *user*.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps these properties to keep some kind of compatibility with Unix behavior. If the 'primary group' is required, it can be accessed in the *pgroup* and *pgid* properties.

**Parameters**

- **path** (*str*) -- The path to the file or directory
- **hash\_type** (*str*) -- The type of hash to return
- **follow\_symlinks** (*bool*) -- If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

**Returns** A dictionary of file/directory stats

**Return type** dict

CLI Example:

```
salt '*' file.stats /etc/passwd
```

`salt.modules.win_file.symlink(src, link)`

Create a symbolic link to a file

This is only supported with Windows Vista or later and must be executed by a user with the SeCreateSymbolicLink privilege.

The behavior of this function matches the Unix equivalent, with one exception - invalid symlinks cannot be created. The source path must exist. If it doesn't, an error will be raised.

**Parameters**

- **src** (*str*) -- The path to a file or directory
- **link** (*str*) -- The path to the link

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```
salt '*' file.symlink /path/to/file /path/to/link
```

`salt.modules.win_file.uid_to_user(uid)`

Convert a uid to a user name

**Parameters** **uid** (*str*) -- The user id to lookup

**Returns** The name of the user

**Return type** str

CLI Example:

```
salt '*' file.uid_to_user S-1-5-21-626487655-2533044672-482107328-1010
```

`salt.modules.win_file.user_to_uid(user)`

Convert user name to a uid

**Parameters** **user** (*str*) -- The user to lookup

**Returns** The user id of the user

**Return type** str

CLI Example:

```
salt '*' file.user_to_uid myusername
```

## 14.7.419 salt.modules.win\_firewall

Module for configuring Windows Firewall using netsh

`salt.modules.win_firewall.add_rule`(*name*, *localport*, *protocol='tcp'*, *action='allow'*, *dir='in'*, *remoteip='any'*)

New in version 2015.5.0.

Add a new inbound or outbound rule to the firewall policy

### Parameters

- **name** (*str*) -- The name of the rule. Must be unique and cannot be ``all``. Required.
- **localport** (*int*) -- The port the rule applies to. Must be a number between 0 and 65535. Can be a range. Can specify multiple ports separated by commas. Required.
- **protocol** (*Optional[str]*) -- The protocol. Can be any of the following:
  - A number between 0 and 255
  - icmpv4
  - icmpv6
  - tcp
  - udp
  - any
- **action** (*Optional[str]*) -- The action the rule performs. Can be any of the following:
  - allow
  - block
  - bypass
- **dir** (*Optional[str]*) -- The direction. Can be in or out.
- **remoteip** (*Optional [str]*) -- The remote IP. Can be any of the following:
  - any
  - localsubnet
  - dns
  - dhcp
  - wins
  - defaultgateway
  - Any valid IPv4 address (192.168.0.12)
  - Any valid IPv6 address (2002:9b3b:1a31:4:208:74ff:fe39:6c43)
  - Any valid subnet (192.168.1.0/24)
  - Any valid range of IP addresses (192.168.0.1-192.168.0.12)
  - A list of valid IP addresses

Can be combinations of the above separated by commas.

**Returns** True if successful

**Return type** bool

**Raises** CommandExecutionError -- If the command fails

CLI Example:

```

salt '*' firewall.add_rule 'test' '8080' 'tcp'
salt '*' firewall.add_rule 'test' '1' 'icmpv4'
salt '*' firewall.add_rule 'test_remote_ip' '8000' 'tcp' 'allow' 'in' '192.168.0.1'

```

`salt.modules.win_firewall.delete_rule`(*name=None*, *localport=None*, *protocol=None*, *dir=None*, *remoteip=None*)

New in version 2015.8.0.

Delete an existing firewall rule identified by name and optionally by ports, protocols, direction, and remote IP.

### Parameters

- **name** (*str*) -- The name of the rule to delete. If the name `all` is used you must

- specify additional parameters.
- **localport** (*Optional[str]*) -- The port of the rule. If protocol is not specified, protocol will be set to tcp
- **protocol** (*Optional[str]*) -- The protocol of the rule. Default is tcp when localport is specified
- **dir** (*Optional[str]*) -- The direction of the rule.
- **remoteip** (*Optional[str]*) -- The remote IP of the rule.

**Returns** True if successful

**Return type** bool

**Raises** CommandExecutionError -- If the command fails

CLI Example:

```
# Delete incoming tcp port 8080 in the rule named 'test'
salt '*' firewall.delete_rule 'test' '8080' 'tcp' 'in'

# Delete the incoming tcp port 8000 from 192.168.0.1 in the rule named
# 'test_remote_ip`
salt '*' firewall.delete_rule 'test_remote_ip' '8000' 'tcp' 'in' '192.168.0.1'

# Delete all rules for local port 80:
salt '*' firewall.delete_rule all 80 tcp

# Delete a rule called 'allow80':
salt '*' firewall.delete_rule allow80
```

`salt.modules.win_firewall.disable` (*profile='allprofiles'*)

Disable firewall profile

**Parameters** **profile** (*Optional[str]*) -- The name of the profile to disable. Default is all-profiles. Valid options are:

- allprofiles
- domainprofile
- privateprofile
- publicprofile

**Returns** True if successful

**Return type** bool

**Raises** CommandExecutionError -- If the command fails

CLI Example:

```
salt '*' firewall.disable
```

`salt.modules.win_firewall.enable` (*profile='allprofiles'*)

New in version 2015.5.0.

Enable firewall profile

**Parameters** **profile** (*Optional[str]*) -- The name of the profile to enable. Default is all-profiles. Valid options are:

- allprofiles
- domainprofile
- privateprofile
- publicprofile

**Returns** True if successful

**Return type** bool

**Raises** CommandExecutionError -- If the command fails

CLI Example:

```
salt '*' firewall.enable
```

`salt.modules.win_firewall.get_config()`

Get the status of all the firewall profiles

**Returns** A dictionary of all profiles on the system

**Return type** `dict`

**Raises** `CommandExecutionError` -- If the command fails

CLI Example:

```
salt '*' firewall.get_config
```

`salt.modules.win_firewall.get_rule(name='all')`

New in version 2015.5.0.

Display all matching rules as specified by name

**Parameters** `name` (*Optional[str]*) -- The full name of the rule. `all` will return all rules.

Default is `all`

**Returns** A dictionary of all rules or rules that match the name exactly

**Return type** `dict`

**Raises** `CommandExecutionError` -- If the command fails

CLI Example:

```
salt '*' firewall.get_rule 'MyAppPort'
```

`salt.modules.win_firewall.rule_exists(name)`

New in version 2016.11.6.

Checks if a firewall rule exists in the firewall policy

**Parameters** `name` (*str*) -- The name of the rule

**Returns** True if exists, otherwise False

**Return type** `bool`

CLI Example:

```
# Is there a rule named RemoteDesktop
salt '*' firewall.rule_exists RemoteDesktop
```

## 14.7.420 salt.modules.win\_groupadd

Manage groups on Windows

---

**Important:** If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to `'group.info' is not available`), see [here](#).

---

`salt.modules.win_groupadd.add(name, **kwargs)`

Add the specified group

**Parameters** `name` (*str*) -- The name of the group to add

**Returns** A dictionary of results

**Return type** `dict`

CLI Example:

```
salt '*' group.add foo
```

`salt.modules.win_groupadd.adduser(name, username, **kwargs)`

Add a user to a group

**Parameters**

- **name** (*str*) -- The name of the group to modify
- **username** (*str*) -- The name of the user to add to the group

**Returns** A dictionary of results**Return type** *dict*

CLI Example:

```
salt '*' group.adduser foo username
```

**salt.modules.win\_groupadd.delete**(*name, \*\*kwargs*)

Remove the named group

**Parameters** **name** (*str*) -- The name of the group to remove**Returns** A dictionary of results**Return type** *dict*

CLI Example:

```
salt '*' group.delete foo
```

**salt.modules.win\_groupadd.deluser**(*name, username, \*\*kwargs*)

Remove a user from a group

**Parameters**

- **name** (*str*) -- The name of the group to modify
- **username** (*str*) -- The name of the user to remove from the group

**Returns** A dictionary of results**Return type** *dict*

CLI Example:

```
salt '*' group.deluser foo username
```

**salt.modules.win\_groupadd.getent**(*refresh=False*)

Return info on all groups

**Parameters** **refresh** (*bool*) -- Refresh the info for all groups in `__context__`. If False only the groups in `__context__` will be returned. If True the `__context__` will be refreshed with current data and returned. Default is False**Returns** A list of groups and their information

CLI Example:

```
salt '*' group.getent
```

**salt.modules.win\_groupadd.info**(*name*)

Return information about a group

**Parameters** **name** (*str*) -- The name of the group for which to get information**Returns** A dictionary of information about the group**Return type** *dict*

CLI Example:

```
salt '*' group.info foo
```

**salt.modules.win\_groupadd.list\_groups**(*refresh=False*)

Return a list of groups

**Parameters** **refresh** (*bool*) -- Refresh the info for all groups in `__context__`. If False only the groups in `__context__` will be returned. If True, the `__context__` will be refreshed with current data and returned. Default is False**Returns** A list of groups on the machine**Return type** *list*

CLI Example:

```
salt '*' group.list_groups
```

`salt.modules.win_groupadd.members`(*name*, *members\_list*, *\*\*kwargs*)

Ensure a group contains only the members in the list

**Parameters**

- **name** (*str*) -- The name of the group to modify
- **members\_list** (*str*) -- A single user or a comma separated list of users. The group will contain only the users specified in this list.

**Returns** A dictionary of results

**Return type** `dict`

CLI Example:

```
salt '*' group.members foo 'user1,user2,user3'
```

### 14.7.421 salt.modules.win\_iis module

Microsoft IIS site management via WebAdministration powershell module

**maintainer** Shane Lee <slee@saltstack.com>, Robert Booth <rbooth@saltstack.com>

**platform** Windows

**depends** PowerShell

**depends** WebAdministration module (PowerShell) (IIS)

New in version 2016.3.0.

`salt.modules.win_iis.create_app`(*name*, *site*, *sourcepath*, *apppool=None*)

Create an IIS application.

---

**Note:** This function only validates against the application name, and will return True even if the application already exists with a different configuration. It will not modify the configuration of an existing application.

---

**Parameters**

- **name** (*str*) -- The IIS application.
- **site** (*str*) -- The IIS site name.
- **sourcepath** (*str*) -- The physical path.
- **apppool** (*str*) -- The name of the IIS application pool.

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' win_iis.create_app name='app0' site='site0' sourcepath='C:\site0'
↪ apppool='site0'
```

`salt.modules.win_iis.create_appool`(*name*)

Create an IIS application pool.

---

**Note:** This function only validates against the application pool name, and will return True even if the application pool already exists with a different configuration. It will not modify the configuration of an existing application pool.

---

**Parameters** **name** (*str*) -- The name of the IIS application pool.

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' win_iis.create_apppool name='MyTestPool'
```

`salt.modules.win_iis.create_backup`(*name*)

Backup an IIS Configuration on the System.

New in version 2017.7.0.

---

**Note:** Backups are stored in the `$env:Windir\System32\inetsrv\backup` folder.

---

**Parameters** **name** (*str*) -- The name to give the backup

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' win_iis.create_backup good_config_20170209
```

`salt.modules.win_iis.create_binding`(*site*, *hostheader*=*u'*, *ipaddress*=*u''*, *port*=80, *protocol*=*u'http*, *sslflags*=None)

Create an IIS Web Binding.

---

**Note:** This function only validates against the binding `ipaddress:port:hostheader` combination, and will return True even if the binding already exists with a different configuration. It will not modify the configuration of an existing binding.

---

#### Parameters

- **site** (*str*) -- The IIS site name.
- **hostheader** (*str*) -- The host header of the binding. Usually a hostname.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*int*) -- The TCP port of the binding.
- **protocol** (*str*) -- The application protocol of the binding.
- **sslflags** (*str*) -- The flags representing certificate type and storage of the binding.

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' win_iis.create_binding site='site0' hostheader='example.com' ipaddress='*  
↪' port='80'
```

`salt.modules.win_iis.create_cert_binding`(*name*, *site*, *hostheader*=*u'*, *ipaddress*=*u''*, *port*=443, *sslflags*=0)

Assign a certificate to an IIS Web Binding.

New in version 2016.11.0.

---

**Note:** The web binding that the certificate is being assigned to must already exist.

---

**Parameters**

- **name** (*str*) -- The thumbprint of the certificate.
- **site** (*str*) -- The IIS site name.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*int*) -- The TCP port of the binding.
- **sslflags** (*int*) -- Flags representing certificate type and certificate storage of the binding.

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' win_iis.create_cert_binding name='AAA000' site='site0' hostheader=
↳ 'example.com' ipaddress='*' port='443'
```

```
salt.modules.win_iis.create_site(name, sourcepath, apppool=u'', hostheader=u'', ipad-
dress=u'', port=80, protocol=u'http')
```

Create a basic website in IIS.

---

**Note:** This function only validates against the site name, and will return True even if the site already exists with a different configuration. It will not modify the configuration of an existing site.

---

**Parameters**

- **name** (*str*) -- The IIS site name.
- **sourcepath** (*str*) -- The physical path of the IIS site.
- **apppool** (*str*) -- The name of the IIS application pool.
- **hostheader** (*str*) -- The host header of the binding. Usually the hostname or website name, ie: www.contoso.com
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*int*) -- The TCP port of the binding.
- **protocol** (*str*) -- The application protocol of the binding. (http, https, etc.)

**Returns** True if successful, otherwise False.

**Return type** `bool`

---

**Note:** If an application pool is specified, and that application pool does not already exist, it will be created.

---

CLI Example:

```
salt '*' win_iis.create_site name='My Test Site' sourcepath='c:\stage' apppool=
↳ 'TestPool'
```

```
salt.modules.win_iis.create_vdir(name, site, sourcepath, app=u'')
```

Create an IIS virtual directory.

---

**Note:** This function only validates against the virtual directory name, and will return True even if the virtual directory already exists with a different configuration. It will not modify the configuration of an existing virtual directory.

---

**Parameters**

- **name** (*str*) -- The virtual directory name.
- **site** (*str*) -- The IIS site name.

- **sourcepath** (*str*) -- The physical path.
- **app** (*str*) -- The IIS application.

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' win_iis.create_vdir name='vd0' site='site0' sourcepath='C:
↳\inetpub\vdirs\vd0'
```

**salt.modules.win\_iis.get\_container\_setting**(*name, container, settings*)

Get the value of the setting for the IIS container.

New in version 2016.11.0.

**Parameters**

- **name** (*str*) -- The name of the IIS container.
- **container** (*str*) -- The type of IIS container. The container types are: AppPools, Sites, SslBindings
- **settings** (*dict*) -- A dictionary of the setting names and their values.

**Returns** A dictionary of the provided settings and their values.

**Return type** `dict`

CLI Example:

```
salt '*' win_iis.get_container_setting name='MyTestPool' container='AppPools'
settings="['processModel.identityType']"
```

**salt.modules.win\_iis.get\_webapp\_settings**(*name, site, settings*)

Get the value of the setting for the IIS web application. .. note:

```
Params are case sensitive.
```

**Parameters**

- **name** (*str*) -- The name of the IIS web application.
- **site** (*str*) -- The site name contains the web application. Example: Default Web Site
- **settings** (*str*) -- A dictionary of the setting names and their values. Available settings: physicalPath, applicationPool, userName, password

**Returns** A dictionary of the provided settings and their values.

**Return type** `dict`

New in version 2017.7.0.

CLI Example: .. code-block:: bash

```
salt '*' win_iis.get_webapp_settings name='app0' site='Default Web Site'
settings="['physicalPath','applicationPool']"
```

**salt.modules.win\_iis.list\_apppools**()

List all configured IIS application pools.

**Returns** A dictionary of IIS application pools and their details.

**Return type** `dict`

CLI Example:

```
salt '*' win_iis.list_apppools
```

**salt.modules.win\_iis.list\_apps**(*site*)

Get all configured IIS applications for the specified site.

**Parameters** **site** (*str*) -- The IIS site name.

Returns: A dictionary of the application names and properties.

CLI Example:

```
salt '*' win_iis.list_apps site
```

`salt.modules.win_iis.list_backups()`

List the IIS Configuration Backups on the System.

New in version 2017.7.0.

---

**Note:** Backups are made when a configuration is edited. Manual backups are stored in the `$env:Windir\System32\inetsrv\backup` folder.

---

**Returns** A dictionary of IIS Configurations backed up on the system.

**Return type** `dict`

CLI Example:

```
salt '*' win_iis.list_backups
```

`salt.modules.win_iis.list_bindings(site)`

Get all configured IIS bindings for the specified site.

**Parameters** `site` (*str*) -- The name of the IIS Site

**Returns** A dictionary of the binding names and properties.

**Return type** `dict`

CLI Example:

```
salt '*' win_iis.list_bindings site
```

`salt.modules.win_iis.list_cert_bindings(site)`

List certificate bindings for an IIS site.

New in version 2016.11.0.

**Parameters** `site` (*str*) -- The IIS site name.

**Returns** A dictionary of the binding names and properties.

**Return type** `dict`

CLI Example:

```
salt '*' win_iis.list_bindings site
```

`salt.modules.win_iis.list_sites()`

List all the currently deployed websites.

**Returns** A dictionary of the IIS sites and their properties.

**Return type** `dict`

CLI Example:

```
salt '*' win_iis.list_sites
```

`salt.modules.win_iis.list_vdirs(site, app=u'')`

Get all configured IIS virtual directories for the specified site, or for the combination of site and application.

**Parameters**

- `site` (*str*) -- The IIS site name.

- `app` (*str*) -- The IIS application.

**Returns** A dictionary of the virtual directory names and properties.

**Return type** `dict`

CLI Example:

```
salt '*' win_iis.list_vdirs site
```

`salt.modules.win_iis.list_worker_processes`(*appool*)

Returns a list of worker processes that correspond to the passed application pool.

New in version 2017.7.0.

**Parameters** **appool** (*str*) -- The application pool to query

**Returns** A dictionary of worker processes with their process IDs

**Return type** `dict`

CLI Example:

```
salt '*' win_iis.list_worker_processes 'My App Pool'
```

`salt.modules.win_iis.modify_binding`(*site*, *binding*, *hostheader=None*, *ipaddress=None*,  
*port=None*, *sslflags=None*)

Modify an IIS Web Binding. Use *site* and *binding* to target the binding.

New in version 2017.7.0.

**Parameters**

- **site** (*str*) -- The IIS site name.
